**Glasgow.**—The new church of St. Aloysius, at Springburn, has just been consecrated. The building internally is divided into three aisles, with open timber roofs, the centre one being of the hammer-beam type. The three aisles are separated by finely-moulded arches, supported on clustered columns. The organ-chamber and baptistry are at the south end of the building. The entrance porch has an arched stone ceiling, while the tympanum over it is relieved by a carved panel, representing the bust of St. Aloysius. The side windows have all been filled with tinted glass in square quarries, by Mr. Adam, of Waterloo Street; the large front window, the rose-window, and those of the baptistry and Lady Chapel having stained-glass windows by Mr. Hooper, of Bothwell Street. The contractors were:—Mason, Mr. Marshall, Bishopbriggs; joiner, Mr. Henderson, Grant Street, Glasgow; plasterer, Mr. Bradley, New City Road, Glasgow; slater, Mr. Muir, Springburn; plumbers, Messrs. Fyfe & Allan, Newton Street, Glasgow; iron gates and railings, M'Dowall & Stephen, Glasgow. The church will accommodate about 1,000 worshippers, and has cost nearly 3,000*l*, the architects being Messrs. J. S. Bruce & D. Sturrock, West Regent Street, Glasgow.

## SCHOOL BUILDINGS.

**Barnard Castle.**—A meeting of the governors of the North-Eastern County School was held last week. It was resolved, also, that the school be erected on land near the Bowes Museum on the east; and Mr. Watson, Canon Brown, and Mr. Richardson were empowered finally to purchase or exchange land necessary for a square enclosure twenty acres in extent. A long discussion took place with regard to the employment of architects, and the proposition to throw the design open to general competition was negatived, as were also motions to limit the number to six, and even one. Several names were mentioned, and eventually it was resolved that three architects only be invited to compete, and were thereupon balloted for—namely, Messrs. Giles & Gough, London; Mr. Armfield, Whitby; and Mr. Johnson, of Newcastle-on-Tyne. The next meeting of the governors will be held on November 24, and it is hoped that the foundation-stone of the school will be laid on Lady Day 1883. The successful architect will receive no premium, his remuneration being the usual percentage on the building. The two unsuccessful architects will be awarded 40*l*. each.

**Oldham.**—At a late meeting of the Oldham Board of Guardians Mr. Cooper, the chairman, said that plans for the proposed new schools had been examined and decided upon. The committee had recommended that the plan in the name of "Charity" was the best, and they recommended the Board to sanction its adoption, and it would be understood that the architect bearing this pseudonym should have the superintendence of the construction of the schools. The next best was "Oliver Twist," for which, according to the understanding, he would receive 30*l*. as a premium. The next best was "A.R.A.," who would receive 20*l*. premium as per arrangement. Mr. Shepley moved that the recommendation of the committee should be carried out. Each plan had features and recommendations which could not fail to strike those examining them. The architects gave estimates of the probable cost, which varied from 14,000*l*. to 7,000*l*. The committee had gone through the whole of the plans with care, patience, and impartiality. They had taken into consideration the ground-plans, dormitories, and other features, as presented by the different architects, and they found the whole a creditable production. It had, indeed, been no light task to come to a decision as to which should have the first and second prizes, but they ultimately decided that the plan under "Charity" should have the first. Mr. Dunkerley, in seconding, said he fully endorsed the remarks of Mr. Shepley. Mr. Whittaker, in supporting the resolution, said the committee were unanimous as to the position of "Charity" and "Oliver Twist" but they had some difficulty in awarding the third prize. Mr. Horrobin remarked that the plans were so excellent he was only sorry they could not give all the architects a job. It is understood that the author of the plans bearing the motto "Charity" is Mr. T. Mitchell, the authors of the plans "Oliver Twist" being Messrs. Wild & Collins.

## ENGINEERING WORKS.

**Harbour Works at Rio Grande.**—Some years since Sir John Hawkshaw, who professionally examined and reported upon all the ports of Brazil, gave it as his opinion that the nature of the Rio Grande bar required for its proper improvement that two long breakwaters should be built; and while he estimated the cost of these at 2,000,000*l*., he stated that he was unable to guarantee that the result would be satisfactory. In consequence of this report the improvements have been postponed. A plan has been prepared lately by Mr. Henry Gore, C.E., which proposes to remedy the defects caused by the bar of Rio Grande by an outlay of about 220,000*l*., or one-tenth of the former sum. The principal feature in the scheme is a breakwater about 6,000 feet in length, which would be mainly of timber, in order to utilise the resources of the province. It is proposed to construct the breakwater in the following manner—Two rows of square timber piles to be driven in lines parallel to each other, inclosing a space of 18 feet in its transverse section. The outer rows of piles next the sea to be of an average length of 30 feet and 12 inches square, with additional guide piles at every 10 feet. The inner rows of piles next the harbour to be 30 feet long and 10 inches square. The space between these rows of piles to be filled in with rubble stone, carefully packed, with special contrivances for preventing the stone backing from sinking unequally into the soft land or mud. Outside the rows of piles, both on the sea and harbour side, rough rubble mounds are to be formed, thus making a convex foreshore upon which the sea waves would partially break before reaching the breakwater. The two rows of piles are to be connected together by means of strong transverse beams and wrought-iron tie-bolts and iron straps; and the structure is to be further strengthened by strong vertical piles driven centrally between each transverse beam. From these central piles braces are to be carried to the outside rows of piles as a further means of support to the breakwater, and to afford additional resistance to the lateral force of the waves a series of strong additional piles is to be driven some 8 or 10 feet from the inner

row of piles on the harbour side; from the heads of these piles struts and diagonal braces are to be carried to the inner row of main piles, so that the transverse section of the entire structure will form a parallelogram 30 feet wide by the height from the sea bottom to the top of the timber bracing. As soon as the rubble backing between the rows of piles has become thoroughly consolidated, the space above it up to the top of the transverse timber beams and diagonal bracing is to be filled in with strong concrete formed of Portland cement and broken stone or gravel, thus forming a uniform level surface throughout the whole length of the structure.

**New Quay at Parkeston.**—Owing to the enormous increase in the continental goods traffic, the Great Eastern Railway Company have opened their new quay at Parkeston for the landing and shipment of merchandise somewhat earlier than they contemplated. The quay is so far completed that three berths are available, with a depth of water alongside of from 16 feet to 27 feet, according to tide. One of the warehouses on the quay is also completed and part of the station building. The company intend running two extra boats a week from Rotterdam, and extra boats as required from Antwerp, and they hope that the extensive accommodation afforded by Parkeston, where there are nearly five miles of siding already open, will enable them to work the increased traffic without any danger of a block, such as they have been threatened with at Harwich. For the present, the company's daily service with passengers to and from Antwerp and Rotterdam will continue to run to Harwich, but the booking office, first and second-class refreshment, waiting, and retiring rooms at Parkeston are so far advanced that it will not be long before the passenger traffic is also transferred to Parkeston.

### ARCHÆOLOGY.

**Roman Remains.**—In the latter part of last year the remains of a Roman villa were discovered in the village of Box, and acting on a suggestion that a portion at least should be bodily taken up, Messrs. Stier & Son, of Bath, have arranged for an exhibition of the most remarkable relics. According to the *Bath Herald*, the relics comprise a crescent-shaped bath, the sides and floor of which are laid with tesserae of white lias. Apart from its historic interest this may be considered a novelty, as the customary method was to line the bath with solid stone or lead. The pavement on view (formerly portion of a long passage) also is laid with tesserae, the white cubes of which forming the groundwork of the pattern are apparently white lias of two varieties, the one crystalline and having the appearance of marble; the cubes of the border and pattern are evidently of blue lias. Messrs. Stier & Son also show sundry specimens of pottery and ornamental brick, together with the bones and teeth of animals, all of which were excavated on the site of the villa. The bath and pavement are beautiful specimens of work. The remains will be shown in some of the principal towns.

### ART WORKMANSHIP.

**A Volunteer Medal.**—Sir Noel Paton, R.S.A., has prepared designs for a medal to commemorate the twenty-first anniversary of the establishment of the Volunteer Force. The following is the artist's description of the design:—"In considering the object of the medal—the commemoration of the twenty-first anniversary of the Volunteer movement—it appeared to me that the primary fact demanding commemoration was the loving loyalty of the Volunteer Army towards the illustrious lady whose lively patriotism and far-seeing wisdom led her to extend to them the protection of her august sympathy at a time when the organisation was looked upon with but scant favour by certain departments of the State. I therefore determined that the obverse of the medal should bear a likeness of the Queen; and having had, in 1863, the privilege of making a careful study of her Majesty at Windsor, which was honoured with her approval, I have adopted that valuable authority as the basis of the likeness. For the reverse—in accordance with medallic tradition—I have adopted a purely ideal treatment. Under the significant legend, 'Pro Aris et Focis,' and filling the centre of the composition, I have introduced the armed figure of St. Michael with flaming sword, as the patron of righteous warfare, his shield charged with the freely-rendered crosses of St. George and St. Andrew. On the one side, under the shelter of his outspread wings, is a group of a mother with a sleeping babe and a child in prayer, intended to symbolise 'Altar' and 'Hearth'; behind them a plant of the emblematic olive. On the other side, facing the sea, kneel three male figures in the attitude of defence, and with shields locked, symbolising the Volunteers of the three kingdoms. They are represented in civil dress, but armed with helmet and spear. Beyond these figures is a war galley, in allusion to the Naval Volunteer Service. In this way I venture to hope that, so far as is compatible with the limitations of medallic art, I have fairly embodied what to my mind is the animating idea of the whole Volunteer movement." The drawings were submitted for the Queen's inspection by Mr. Macphail, of Glasgow.

### GENERAL.

**The Duke of Albany** has consented to accept the presidency of the Parkes Museum.

**The Duke of Hamilton** has agreed to relieve the Bo'ness Town Trust of their obligations under the lease of the Town-hall, and the building and site are to be handed over to them at a nominal rent. The building, part of which has fallen, is to be taken down preparatory to building a new hall.

**Mr. C. J. Phipps**, architect, attended on Monday in support of an application made at the Leamington Town-hall for a licence for the new Theatre Royal. Mr. Phipps explained that the building had been provided with all the improvements now enforced in connection with the best theatres. There was a separate and distinct approach to each part of the building, so that in the case of a panic arising there would be ample means for leaving the building. The licence was granted.

**Messrs. Allen, Anderson & Co.**, of Alexandria, have received orders to erect an electric light in the Mex forts. The business of the firm was resumed on the fourth day after the bombardment.

**Messrs. Whitaker Bros.**, of Leeds, have obtained the contract for the new bridge over the River Tees at Stockton. The amount is 38,000*l*.

**Mr. F. Happersberger** has obtained the commission for the Memorial of the late President Garfield which is to be erected in San Francisco.

**An Appeal** has been published to solicit subscriptions for the restoration of the Castle Church at Wittenberg, Germany, the sum required being estimated at 30,000*l*.

**An Exhibition of Pictures** was opened at Leicester on Thursday in aid of funds for the proposed local art gallery.

**The Exhibition of Sketch Designs** for the Glasgow Municipal Buildings was visited during the eleven days it was open by over three thousand five hundred people.

**A Committee** has reported to the Bridgewater Town Council in favour of widening the town bridge at an estimated cost of 2,000*l*.

**Works** are being carried out on the River Bann, between Coleraine and the sea, for the construction of a deep seaport. The original estimate is about 65,000*l*., which includes the cutting of the bar in the river and alterations and addition to the quays.

**The Parish Church of Peel**, Isle of Man, the erection of which is now nearly completed, has been proposed for the new cathedral for the diocese of Sodor and Man, but at a meeting held on Wednesday the Bishop stated he was in favour of erecting a cathedral in Douglas if the necessary funds, say 50,000*l*., could be raised.

**The Building Fund** of the proposed Educational Institute at West Bromwich now amounts to 5,745*l*. It is estimated that about 10,000*l*. will be required for the erection of the buildings, &c.

**The Leeds Fine Art Exhibition** will close on Saturday the 30th inst.

**The Brighton Town Council** on Wednesday approved of a recommendation of the Works Committee to offer premiums of 200*l*., 100*l*., and 50*l*. for projected improvements on the sea frontage at the east end of the town. The scheme comprises a tepid swimming-bath with a water area of about 200 feet by 50 feet for men, a swimming-bath with half the water area for women, about fifty private baths for men, and thirty for women, with suitable adjuncts, conveniences, &c., spacious places for promenade and recreation, with shops for the sale of newspapers and refreshments. It is proposed, also, to construct terraces, promenades, embankments, summer-houses, sheltered seats, grass slopes, &c. The premiums will be awarded in February next.

**Kensington House** will shortly disappear, as the remaining materials were sold on Monday and Tuesday. The total amount of the sales in June and September is 10,451*l*., which is not 5 per cent. of the original cost.

**The Autumn Exhibition of Paintings** opened at the Brighton Corporation Gallery on Thursday. The collection, which includes 468 works, is one of the best yet exhibited there.

**The Statue of Louis XIV.**, in the Place Royale at Caen, is being removed by order of the Municipality, ostensibly as a protest against the revocation of the Edict of Nantes.

**The University College, Bristol**, is about to reopen for the session. The erection of new buildings, which will be completed before the close of the current year, will give increased facilities for the study of science. The chemical department now contains accommodation for nearly fifty students, and is thoroughly equipped with the latest improvements for teaching which are in use in this country or on the Continent. Lectures are delivered on pure chemistry as well as on certain branches of applied chemistry. The physical and engineering departments are also provided with facilities for laboratory work. A special feature of the engineering department is the arrangement by which students attending lectures at the College during the six winter months are enabled to gain practical experience during the summer months, when they work as pupils in the offices and workshops of leading engineering firms in the neighbourhood.

# The Architect.

## ARCH CONSTRUCTION AND THE ACCIDENT AT ST. PATRICK'S, DUBLIN.

THE disastrous fall of a buttress at St. Patrick's Cathedral in Dublin illustrates in a forcible and interesting manner what has happened many and many a time in the long process of dilapidation by which so many churches of the Middle Ages throughout Europe have gone the way of all architecture. For as "leaves have their time to fall, and flowers to wither at the cold wind's breath," so also the stateliest structures of human handling have every one in its turn to succumb to decay.

Compared with other modes of building, that which is developed out of the employment of the common arch is vastly more difficult to deal with than most of us suppose. An arch at the best, if an arch it really be, is but a pile of stones, judiciously poised so that every one shall support the others by the mere counterbalance of what is always a movable scheme of pressures. Let but a single member of this excitable co-partnership prove unequal to the task assigned to it, and down comes the whole fabric into irretrievable wreck. It is of no use to plead that the others did their duty well; the failure of one is the failure of all, and ninety and nine that need no repentance cannot save the whole hundred from the fatal consequence of the vice of one whose reconsideration is too late.

Theoretically the arch is a most clever contrivance on a most clumsy principle. It is the architecture of the smallest stones, with all its obvious disadvantages, animated by a vaulting ambition to which fate offers a thousand opportunities of o'erleaping its selle and falling on the other side. The simplest of all arches, and perhaps the most characteristic, is the archer's bow, if we suppose it set upright to carry a load. Let the string snap; the arch is gone. Let the string hold good, but the burden be injudiciously imposed; the arch, like a living animal under some distressful yoke, begins and continues to move, until at last, if it cannot relieve itself by accommodating its configuration to its distress, it must bend till it breaks. There may be no string—of course there generally is none—but the immovability of an abutment is only a still more treacherous principle; and when the bow is but a congeries of little stones (in full scientific theory these might just as well be so many little spherical balls, so delicate is the problem of adjustment), the chances of the whole contrivance, by some unforeseen accident of unequal pressure, flaking suddenly off into a cloud of scattered elements, are so disagreeably patent to the cultivated sense, that, like the great surgeon who held on by the area railings as he crept along London streets for fear his neck should break, such a one as an over-scientific architect—if he were not so rare a bird—might be excused for avoiding every arch he passed as he already avoids every ladder.

And yet we see people dealing with ticklish adventures of arched work every day as if there were something in the mere helplessness of the thing to which, as in the case of children and drunken men, a special providence proverbially concedes its particular protection. Men who have no more idea of the mathematics of the matter than a hod of their own mortar will trust themselves, and be trusted by others, to construct, to repair, to alter, to load and unload, to heighten, to undermine, and, in short, to perform all possible tricks of violence upon these touchy organisations, as if there were no mathematics at all in the world. In nine cases out of ten the most venturesome arching is designed, criticised, approved, and executed, with all the complacency of which ignorant human nature is capable, by nothing in the world else than "the look of the thing." And yet, we repeat, every stone in such work, as an independent factor in the production of a resultant, is a thing which by a little mistake may not only itself get into trouble, but bring the entire fabric down to ruin.

Such reflections as these may appear to some readers to be overstrained; but this is because the commonplace archwork of modern building is not worthy of the scientific appellation.

But when we happen to have before us the arched work of the Middle Ages the case is very different indeed. The intricacy of adjustment into which the application of the principle was rashly carried by the builders of those times is indeed marvellous to contemplate. Whatever some of our modern revivalists of mediæval work may profess to think of themselves, and occasionally of each other, there is not one of them, we may safely assert, who, with all the advanced mechanics of the nineteenth century at his command, could be persuaded to venture upon similar construction in anything like an intelligent manner with a calm pulse. The quantity of it which during the last six or eight hundred years has tumbled to the ground all over the length and breadth of Europe is scarcely to be computed. As an obvious rule, the more clever the design, the sooner will it collapse. A great deal of it has been kept together, as every traveller knows, by the deplorable expedient of iron ties, everyone of which is of course an open confession of original sin; and there is a great deal more in which the same measure must be resorted to, so soon as funds will allow and pardonable reluctance submit. The converse of this proposition is equally true, that the more clumsy the work appears the more secure it is; massiveness, in short, is the vulgar virtue which wears best because it tries the temper least, and the exquisite effects of airiness which so inexpressibly charm the beholder are the very hothouse blossoms of artistic grace whose fragile forms may at any moment bow their heads and perish.

In the case at St. Patrick's Cathedral the structure which gave way was apparently a massive wall-buttress, surmounted by its pinnacle, which had for its work to resist firstly the thrust of an aisle roof, and secondly that of a flying-buttress springing across the aisle roof to sustain in its turn the thrust of a nave roof. The manner in which the buttress failed seems to indicate that the adjustment of pressures was not so thoughtfully balanced as usual; for, if it had been, the failure of the wall-buttress would have allowed not only the flying-buttress to fall as it did, but the aisle roof also; whilst the fall of the flying-buttress must have let the nave fall. Indeed, if we are so far right, it is to the aisle and the nave that the attention of the City Engineer ought to have been directed immediately, and to the other buttresses perhaps not at all. At any rate, in the description of the process by which the structure was observed to give way, one feature which has been a good deal commented upon is the statement that the wall-buttress as a whole, while retaining its form, parted from the wall as if it had not been in the slightest degree tied into it, which it is argued (surely erroneously in theory) it ought to have been. If we are to understand that the wall-buttress, being undermined, toppled forward on what is called its "toe," as a perfectly independent structure, letting the flying-buttress fall perpendicularly on the aisle roof, whilst, firstly, the aisle wall remained upright and intact, secondly, the nave wall remained upright and intact, and thirdly, the aisle groining maintained its form in spite of the shock produced upon it by the fall of the flying-buttress, we cannot help asking the simple question—What was the use of all this buttressing?

The answer to this inquiry brings us to the fact that almost all arching is held together, not so much by the accurate calculation of forces, as by virtue of the adventitious strength of mortar joints, dowels, and cramps. Not that theoretical instability is permanently made secure by such means, but there is an additional strength thus conferred upon construction otherwise theoretically sound, the effect of which may be to delay its inevitable fate for a long period, even for centuries. In the case of St. Patrick's, if we are right, the roofs are in themselves theoretically unstable but practically safe by means of the help alluded to; while, again, the theoretical need for the wall-buttress and the flying-buttress has led to similar over-strength in at least the wall-buttress, so that, in fact, when failure took place, the flying-buttress was the only member of the structural series which, on the removal of its support, actually gave way as it ought to have done. All this, even if we should be a little in error as regards particulars, offers us a lesson upon arched construction which is well worth our attention.

Another lesson, which all the world can read, relates to the danger of that unintelligent and merely superficial underpinning which in many forms meets the practical surveyor at every turn. In this case the foreman of the underpinning masons, who fortunately was standing "quite convenient" when "the little bit of mortar fell down" which warned his men and him-

self to run for their lives, appears to have no less hazy notions about underpinning than others of his trade. It would be useless to dwell upon the details of this good man's account of his excavations, and of his insertion of a foot of new stone-work on one surface and then a foot on another surface, doing it "as well as could be done by the hands of a man;" he did his best, and so let it be; it is only surprising, to those who understand the matter, that the failures of underpinning, numerous as they are, are not much more numerous still. The mysterious influence irreverently called "sticktion" is truly a most valuable friend to many a bold underminer all over the country, and we can only hope that it may long continue to lend its friendly aid.

## AN ARTIST'S HOLIDAY IN SOUTH ITALY.

BY A CORRESPONDENT.

A SUMMER TIME in Italy, though not altogether popular amongst foreigners to that country, is, nevertheless, not one of the most unpleasant things in the world. Even in Rome, much maligned as the climate may be, a summer can be passed by the prudent with as much safety to health as in other towns of South Europe, for the confirmation of which one need only consider the fact that of the 300,000 inhabitants of that city only a small proportion leave it, and yet that it is statistically one of the healthiest cities in Europe. Indeed, Rome is only seen in its thoroughly Italian character in the summer months when the bustling foreigners are absent from it. Its antiquities may then be studied at leisure in silence and solitude, as is most fitting, when the spirit of the past seems to brood over its ruins and the imagination takes upon itself the office of *cicerone*. Pleasant excursions and short sojourns may be made to the nearest seaside bathing station, Palo; to the sulphur baths of the Campagna, the ancient *Aquæ Albulæ*; or to the Tusculan and Sabine mountains which bound the Campagna in an easterly direction. To those who would go farther many places unknown to the ordinary tourist are easily attainable, amongst the least frequented of which the little town of Sora, on the borders of the Abruzzi, where these remarks are written, is one. It has the advantages and disadvantages of being three or four hours from a railway station. Booking from Rome, one leaves the railway at Rocca Secca, a station about halfway between Rome and Naples, and taking the lumbering diligence of the country, a dusty and fatiguing drive, interesting withal, will place the traveller at Sora, situated at the foot of the Apennines, on the little river Liri, which takes smaller dimensions than its bed during the summer months. The interest of the journey thither must not, however, be quite passed over. The frowning old castle of Rocca Secca is not without an important name in history. The town of Aquino (ancient *Aquinum*), visible from the road, was the birthplace of THOMAS AQUINAS and of a Roman Emperor. Before reaching Sora a charming and remarkable little town is passed through, that of Isola, so-called from being situated on a mimic island formed by the Fibreno, which here unites with the Liri. It was here that CICERO had his villa, inherited from his father, the family belonging to Arpino (*Arpinum*), about three miles distant. This place was intimately connected with the personal life of the philosophic orator, and it was here that his recorded conversations ("De Legibus") with QUINTUS and ATTICUS were held. He speaks of it in terms of the greatest affection, and no wonder; for the spot has all the charms which Nature can give, rendering the assistance of art almost superfluous. Situated on the banks of the river are some very extensive paper-works founded by M. LEFEBVRE, and now amongst the most important in Italy. The grounds attached to the residence of the proprietor are exceedingly beautiful. They include one of the loveliest passages of the river, which, broken in successive falls, flows between picturesque banks shaded with foliage. It is skirted by lawns and rocks overgrown with luxuriant vegetation and penetrated by natural caverns half-hidden with straggling boughs and gnarled roots. It might have furnished to the poet his ideal of

Rivers to whose falls  
Melodious birds sing madrigals.

The painter, too, might select it as the very spot where the sylvan DIANA and her nymphs would assemble for a refreshing bath, shady and cool, at the midday hour. I asked

permission of the proprietor to allow me to return thither for the purpose of making some sketches, when, with true Italian politeness, he assured me that I was not only welcome to come, but that he should be honoured by my making use of his grounds whenever I chose. A little lower down the river are two fine falls, one over a perpendicular precipice 80 feet in height into a picturesque basin in the town, and the other over a series of rapidly-descending rocks.

Leaving Isola, the church of S. Domenico claims attention as occupying the site of CICERO's villa, of which some remains exist. The place has ecclesiastical interests also, for the famous HILDEBRAND, subsequently Pope GREGORY VII., was a monk in the convent here. Two miles along a straight road running between the richest vineyards, fields, and orchards, is Sora.

Of Sora it would require a volume to embrace its history in ancient and modern times, for surely never little town had so eventful a one. It was founded in unknown antiquity. One of the principal towns of the Volscii, it was taken by the Romans, the Volscians afterwards admitting the Samnite, who were also driven out. The Romans re-colonised it in the time of AUGUSTUS. Nor has its subsequent history been less stirring. In the middle ages it was robbed and plundered by the Lombard Dukes of Benevento, and governed or misgoverned by successive Lombard Counts. It was destroyed by FREDERICK II. After many vicissitudes it fell into the hands of the Popes under PIUS II. After being separated from the Church it was bought by GREGORY XIII. and bestowed on Don GIACOMO BUONCOMPAGNI, remaining in the possession of that and other powerful families until it became a part of the kingdom of Naples at the end of the eighteenth century. Repeatedly burnt and destroyed, it has always risen again from its ruins, from which the learned MORONI infers the high spirit of the people, which has never been crushed; the excellence of the site, which has never been changed; and the rich fertility of the soil.

Of the latter, at least, there is good evidence to this day. Stretching from the mountains, at the foot of which Sora is situated, the plain of the Liri is like a garden for miles. It is watered through the long summer heats by irrigation, the water being taken from the river by means of water-wheels driven by the stream, with buckets attached. The peasantry are active and well-to-do. Prosperity is apparent on every hand. Not less now than in the days of HORACE is the reserve of the poet to be admired whose acquisitive desires were not excited by such a territory:

Non rura, quæ Liris quæta  
Mordet aqua, taciturnus amnis.

Well, indeed, might JUVENAL assign it as the enviable retreat of an honest old age wishing to hide itself from a world of corruption. Its turbulent and belligerent history is also commemorated in the remains of walls of cyclopean structure, constituting the ancient citadel, and the extensive ruin of a mediæval castle which glares on the town from its rocky height. It is said that in laying the foundations of some recent buildings near the river remains of a spacious temple were brought to light, but hastily covered up to prevent the intervention of the authorities to compel the conservation of them. If such were the case, it is a thousand pities, as works of high value might have been found there.

Of architecture there is not very much that is important in Sora. The antique cathedral has been restored more than once. Only on its naked façade is a doorway of retiring arches worthy to be looked at, together with some disinterred sculptures and inscriptions built into the wall. Perhaps amongst the most ancient structures is that of the campanile of the little church of St. GIOVANNI, the church itself being restored in the most rapid manner. The campanile rises beside it, hoary and solemn with the impressiveness time alone can bestow, its depressed cupola sparsely covered with weeds and grass, like the few lingering hairs of old age. The town has been flanked with round towers in its more active days, now shorn of their strength and split with the wild fig and ivy which have forced their way between the crevices. Of course there are the usual quaint nooks and corners in some of the streets which hardly any town in Italy is without. There is one architectural feature of many old houses which may be worth a moment's notice: it is that of the chimneys. Often there is expended on these a simple ingenuity and tastefulness which is very pleasing. They are of many forms of design, from the funnel-shape of Venice to the miniature dome

or turret of central and southern Italy. A few bricks or tiles skilfully disposed, probably at the workman's own will and pleasure, are sufficient to produce an object which the eye falls upon with pleasure. A little collection of these designs, now fast vanishing in the uniformity of the modern style of building, might be worth preserving. If such a method were carried out in our towns in England, the dweller in the upper regions of the house would not have his eyes and taste offended by the hideous abortions which there meet his gaze in every direction, and if to this were added a decorative tile or a little good surface decoration, it might have a well-appreciated value to many a forlorn heart in the neglect of the attic.

Sora has even more attractions to the student of the figure than of the landscape. The men and women are mostly erect and well-formed. With the women the former is more especially the case, owing to the habit of carrying everything on the head, from a gourd or a water-melon to a baby in the cradle. This is done without any assistance from the hand. A pitcher of water is placed upon the head, inclining perhaps to one side or the other, but it is henceforward immovable. It is carried away with a quick and easy stride, and the head occasionally turned, without any danger of it falling. These pitchers are here of a very beautiful shape, either of earthenware or copper, probably retaining the form of the most antique times. The men also are fine manly figures, with the conformation of a good type and race. The good points of both the men and women are enhanced by their graceful and elegant dress, which is here unspoilt by modern alterations. The men during the summer months wear coarse but clean linen shirts, and shorts tied at the knees. They have long brown knitted stockings, with folds under the knee. The foot and leg up to the calf have a further covering of white linen, upon which is bound the sandal with straps passing several times round the leg. The sandal is generally made of prepared cow-skin, and is turned up at the toe in a pretty and piquant manner. The women wear the sandal also. Their dress consists of a chemise and low bodice, with lacings at the back and a rather short skirt of some home-spun material. It must be confessed that the gait of the women is rendered somewhat less pleasing, in spite of their erect carriage, owing to the habit of carrying heavy burdens on the head, which gives a rather awkward swing from the hips.

Specially was I interested one evening at the great annual *fiesta* of S. Domenico, held at the church before mentioned, two miles from Sora. Here the country-people assembled from miles round. Tents were erected, bivouacs improvised, and an universal bustle and energy prevailed. Here, as the night fell, would be seen a fire burning for cookery, about which were arranged groups worthy of the pencil of REMBRANDT; there the lover addressed himself to his mistress, who was too coy to listen to him, or perhaps she was offended with him for some unloverlike dereliction; beggars walked about, or stood asking alms, as if from the very paper on which CALLOT had placed them; country dandies dressed their hats with favours; every sort of vendor cried his wares with a loud voice. Most of all, I was interested in the church, which was quite scenic. At a raised altar the priest officiated amidst solemn music, whilst crowds of worshippers thronged for a sight of the relics displayed. It was hard to imagine one was not at some spectacle specially got up for its pictorial effect. Many prepared themselves to spend the night in the church, lying or reclining on the floor. Again and again the eye was arrested by these characteristic groups. A woman sat upon the floor, her hands clasping her knees, her face shaded by a projecting head-dress; serious and stern, her attention was fixed on the ceremonial. She looked as if a lifetime of emotion lay in her strongly-marked features. No Sibyl of MICHAEL ANGELO could be more impressive. A lame beggar leaned against a column, old and battered, with torn garments; RAPHAEL might have selected him for a model in one of his cartoons. Possibly our decadent art has lost something of the old epic character, in that such marked and individual types are no longer commonly seen.

Another evening my visit was enlivened by an entertainment of the nature of a ball given by myself and some artist friends, also staying there, in the garden of the hotel. To this were bidden several peasants who had served us as models, their friends, some dependents of the hotel, and others, to the number of forty or fifty persons. Coloured lamps were suspended beneath magnolia and oleander, whilst we sat under a vine-trellis to observe the spectacle. Two guitars and a mandoline had been engaged for the occasion; one of the guitar-

players being blind, with a certain uncanny leer in his sightless orbs. The *tarantella* was danced vigorously to a late hour by peasants who had laboured from dawn. Indeed the Italian of the south seems never tired of this exercise, no measure of exertion appearing to fatigue him. The entertainment was interspersed with dramatic performances highly characteristic. An assassination scene was rendered with great spirit and verisimilitude: a jealous lover stabbing his rival, who was mourned over in the most extravagant terms by his mistress. A grotesquely-dressed doctor was then called upon the scene, who would not examine the patient until his fee was paid. This produced a comical altercation between the friends of the man who had been stabbed and the doctor, in which a great deal of broad fun was vented freely. Of course it ended in the restoration of the patient and a general dance. Other buffoonery was gone through, something like our own old-fashioned country Christmas mummery. It may be remarked that the assassination scene probably gained its graphic character from the frequency of these encounters, two of them having happened within a fortnight during my stay. They generally arise in quarrels over wine or between lovers. Both the dances and dramatic scenes were more or less of a saturnalian description, and very likely had their origin in a remote antiquity. The entertainment wound up with an improvisation, two men answering each other to music in verse.

Another characteristic sight was the departure of bands of pilgrims to Loretto, two or three days' journey distant. They started with scrip and staff in true pilgrim fashion, singing hymns to the Madonna by the way. It was difficult to imagine one had not gone back to the Middle Ages—to the time when jolly old CHAUCER laughed with his pilgrims to Canterbury and told his stories gleefully. This pilgrimage, too, seemed to be considered a sort of holiday, and was certainly more like a pleasure excursion than a religious observance. We walked along the road a considerable distance, and were entertained by accounts of horrible brigandage—now, happily, extinct. Returning, we mounted a *charabanc*, the vehicle of the country, consisting of a springless cart with seats in it. The weight being too light on the horse's back, a little boy was called up as a make-weight. His delight was great. He sat in front of my friend, who playfully pinched his cheek. The little fellow looked up with a face quite radiant and said, "Grazie per la visita!" (Thank you for taking notice of me!)

Sora may be considered the portal of the Abruzzi, though not actually in that region. In the company of some pleasant Italian acquaintances, an excursion was made one day into the mountains to a little place called Balsorano. A terraced village was surmounted by an old castle suggestive of Mrs. RADCLIFFE and stories of mystery. The imagination of a DORÉ could not have portrayed anything more romantic. It was a showery day, and the lowering clouds embraced it as if for old friendship's sake. It formerly belonged to the PICCOLLOMINI family, but has been recently purchased by the wealthy proprietor of the paper-works at Isola, together with the title of Count BALSORANO. The castellano being known to my companions, we had a pleasant lunch there. It is an enormous structure, the exterior walls being twelve feet in thickness throughout. Its terraces are delightful, embracing fine views of the fastnesses of the Abruzzi and the valley of the Liri, here not much more in the summer time than a brawling stream. The castle is being fitted up as a modern residence by the present proprietor, it must be confessed not altogether in the best taste. A series of Gothic windows have been opened in the upper walls, which have a *bizarre* and injurious effect on the old structure.

One cannot help being continually struck with the strict conservatism and unprogressive character of the Italian race. If it were not for external influences brought to bear upon the people, there is little doubt that they would be at present in the condition of the Middle Ages. There is a singular absence of the reasoning power, or of its exercise, indicated at every moment. The oxen still labour under the awkward yoke resting on a single point of the spine. Every object of daily use is the same for generations. No change or improvement is made by the ingenuity of the people themselves. All the changes that take place are adopted from the outside. The use of a wheelbarrow, for example, is utterly unknown here. Every article, even to the manure carried to the fields, is borne upon the head. Just as their religious faith has been unquestioned ever since it was imposed upon them, so it is with all the economies of social and domestic life. From father to son

traditional modes are faithfully transmitted and received. The art of the preservation and repair of property is strangely wanting. At the hotel at which I am staying a large additional wing is in course of erection, and yet with every shower the water is allowed unnoticed to penetrate the ceiling of several of the rooms already inhabited. A remonstrance on the subject was only received with a shrug. This characteristic, it must nevertheless be confessed, adds considerably to the picturesqueness of their daily life. Their beautifully-shaped and tastefully-coloured pottery is much more pleasing than anything produced by the conventionalities of modern manufacture. Many things are to be seen which the utilitarianism of to-day would at once condemn and abandon. The saddle of their draught horses, for instance, is embellished with a bright brass pagoda-like structure, surmounted by a vane and pennant in the same material, quite imposing in its size. This and other graceful adjuncts only wait the incoming of exterior influences to be lost in disuse; and that period—one does not know if it is not really to be regretted—will arrive before many years are passed, with the construction of a new railway which will unite the region of Sora with the commercial activities that are now awakening in Italy by sheer pressure of surrounding energy.

### CULTIVATION OF THE FINE ARTS.\*

By GEORGE AITCHISON, A.R.A.

ALTHOUGH in the course of the next few days you will hear papers read on the different fine arts by those engaged in their pursuit, nevertheless it is considered expedient that some remarks should be made on the fine arts generally, on the causes that hinder or help their progress, on the means to be adopted to widen their scope, and, if possible, to heighten their aim, and also on the best means of spreading their influence amongst the people at large.

The fine arts are trumpet-tongued, and the mere mention of them stirs up within us a jostling crowd of emotions and memories inextricably connected with civilised man. All the eloquence that has thrilled our souls or fired our ambition, all the painting that has entranced us by its splendour of colour, all the sculpture that has fascinated us by its perfection of form, all the poetry that has enchanted our ear by its melody and rhythm and enthralled our minds by its beauty or passion, all the music that has stirred our blood or softly cradled our tired spirit, all the anguish and rapture, the tears and laughter, that have been called forth in us by the drama, all the architecture that has awed us by its vastness and its shade or charmed us by its dignity and grace—all point back to the fine arts. At the sound of these magic words, the Fine Arts, our imagination hurries us to Athens, and we thread our way amidst the faultless temples of Ictinus and Callicrates, see the sculptured triumphs of Phidias, hear the persuasive words of Pericles stilling the multitude; we listen to Socrates in the hour of the siesta, his apron and chisel laid aside while he is arguing with the young bloods; we make one of a crowd round a declaimer reciting Homer, or witness a drama of Æschylus, Sophocles, or Euripides. Or it takes us to Rome, where the hawk-eyed Caesar of imperial soul, in his white robe, walks pensively in the Forum, pondering on the decay of the Republic and the chances of his future triumphs; to Antony, revelling and swaggering; to Cicero, entrancing the Forum or the Senate. Or to later times, when Agrippa is building the Pantheon and Virgil is at his books, while Horace, on his stool at the treasury, is painfully casting up his ledger, not without letting his thoughts occasionally wander to the banquet he is going to at the palace, and the servile ode he is so carefully polishing, in the hopes that his fiery republicanism may be condoned by the crafty tyrant; where Livia plotted and Tiberius scowled, and where the lovely Julia charmed her crowd of lovers with her perfect dressing and her witty jests. Or to that Athens of modern times, Florence, where Giotto was building, sculpturing, and painting, and the grim Dante, deeply pondering the affairs of state or high poetry in some secluded by-street, had his gown wantonly smeared with the muddy boots of some gorgeously-dressed young noble who trotted past, and who learned too late that poets of Dante's calibre are awkward subjects for practical jokes. And then suddenly the quiet streets echo to the cries of a *white* or a *black*, and the painter throws down his brush and palette, and seizes his buckler and his falchion, the workman leaves his trowel or his chisel for the crossbow or the pike, mailed horsemen dash furiously down the streets, opposite palaces rig out their fighting-decks above the combatants, the great bell of the watch-tower clangs out the tocsin, and the podesta, the standard-bearer, and the trained bands march down to quell the tumult.

We can hardly picture to ourselves the present civilisation without the fine arts. Every emotion of the past, every past form of beauty, every past melody would be gone. How truly does Horace

say: "Brave men lived before Agamemnon, but they had no inspired poet to hand down their deeds." Without the fine arts all our present forms of beauty, all our noble struggles, all our passionate impulses would pass away into space, as our scientific men tell us that most of the energy of matter is dissipated into cosmic dust, and the passionate and rapturous side of man's nature must be left with empty yearnings, or at best be assuaged with some sort of transcendental enthusiasm, or with bloodshed or drink.

Fortunately for us we have inspired poets, who have given to us some of the same gifts as their mighty predecessors—"Odes, and jewels five-words-long, that on the stretch'd forefinger of all Time sparkle forever." We have admirable painters, who are striving to rival the giants of the Renaissance; we have sculptors who chisel for us with exquisite perfection the features of beauty or the lines channelled on the brow by thought, struggle, or command; we have written eloquence. Some writer said of George Eliot's "Middelmarch" that he read it but by little bits: its flavour was as exquisite as a choice liqueur that you only sipped, fearing to come to the end. We have spoken eloquence, though I have never had the good fortune to hear any of our great parliamentary orators, but I once heard Kossuth, in the Council Chamber at Guildhall, harangue the commonality on the wrongs of Hungary, and no man or woman who was there can ever forget that impassioned address, which at one moment raised them to the frenzy of enthusiasm and at another drowned them in tears: had instant war been his theme and muskets at hand, every man would have seized one and rushed to the front. We have exquisite musicians, and, I am told, admirable composers. Our architecture is improving, and architecture has been called "petrified music"; and we have acting.

Most of the dancing in Europe may, I think, be excluded from the fine arts and take its place amongst difficult gymnastics, though we may see amongst Greek bas-reliefs and vase paintings how perfectly dancing once realised its claim to be the poetry of motion.

I think I may say that all here cultivate, or at least are interested in, one or more of the fine arts, but what is now mainly wanted is that each person should endeavour to cultivate a taste for all the fine arts, so as at least to be an intelligent admirer of their excellence—firstly, for the sake of his own culture; secondly, for the public advantage, in choosing only worthy works; and thirdly, for the encouragement of the artist, so that he may receive his meed of praise; though I do not recommend the absolutely colour-blind to study colour, nor the absolutely music-deaf to study music.

The Greeks found that those who practised the five exercises were finer men than those who even excelled at one. We train every boy and girl in gymnastics, to give them the perfect use of their bodies, we try to train their intellect so that every faculty may have full play; if we systematically trained the will we should try and exercise every moral force, and we want equally to train the emotions and the sense of beauty.

The fine arts have been hindered, if they are not still hindered, by asceticism; if it be our duty to shut our eyes and ears to everything beautiful, not only to avoid, but even hate and loathe it, then we must necessarily cause the death of the fine arts; but I believe that, except at special times, really times of war, when we are fighting for some high principle, and must "scorn delights and live laborious days," it is not only not our duty to shut our eyes to the beautiful, but it is a positive disregard of one of the most important lessons Nature offers for our learning.

It seems to me that Nature silently points out that the contemplation of beauty in form, colour, and sound, is the true recreation of man, that if he will but partake of this banquet which she spreads without cost and almost everywhere for him, he will be both happier and more noble. She seems to me to say, Set yourself to unfathom my laws by patient and laborious effort, and I will give you health and riches, power and understanding; I will fill your mind with thankfulness and wonder, my forces shall be your slaves, and they shall toil for you—you shall have every bodily want supplied, you shall have delicious things to eat and drink, you shall even find things to cure sickness produced by your ignorance or by accident; but if you would have delight, look at the sunshine, at the sky, at the rivers and mountains, at the trees and flowers, enjoy the perfumes, listen to the birds and the waters. Nay, I will do even more for you, I will inspire those whose hearts throb with emotion at the sounds and sights of beauty, to fix for your enjoyment the fleeting beauties of the hour, and I will inspire them to create things which are more in unison with your apprehension than my own works.

The fine arts have, again, been neglected through the astounding discoveries in natural science, and the development of the applied arts. No fairy story, no vision of the poets has ever realised the marvels that have passed before the eyes of the few last generations. We have caught the lightning and weighed the sun, put a girdle round about the earth in forty minutes; no jin nor Marid ever did the work that the steam engine has done for us; statisticians tell us in how short a time Lancashire can weave calico enough to wrap up our globe. If a little gold found near the surface, or a few diamonds, will cause the emigration of the inhabitants of half a continent, eager to be rich with little labour, and

\* A presidential address, delivered in the Art Department of the Social Science Congress at Nottingham on Tuesday, September 26.

who are absorbed in that desire and in that search; what has been the rush of mankind to make use of the new powers and new machinery which have created more wealth than a hundred gold or diamond fields! How could mankind, in this struggle for power and gold, attend to those things which the casual observer would call the smaller amenities of life? It is like asking a man, amidst the clang, the smoke, and the madness of battle, to admire the landscape. And how can the sense of beauty be generally cultivated when each new wondrous machine is more hideous than the last?

Now as to the encouragement of the fine arts, the poet tells us that the poet is born and not made, and this is equally true of all the master spirits of the fine arts—nay, of those in every department of human greatness. We cannot, like the bees, make a queen bee out of any common worker by better air, better food, and more attention. We know that great poets, at least, only come after events which have stirred the emotions of a whole nation to their utmost depths: after great and successful wars for independence, after social convulsions, when the better principle has got the upper hand. But this alone is not enough; the budding poet must have to his hand the masterpieces of his art to study. See how Dante is always pouring forth his praises to Virgil for being his master and his guide, and Horace is urging the study of Homer and the Greek poets. Had Dante never read Virgil we may well imagine that he would have been but one of the ballad-makers whose works are now being unearthed for us by scholars. Where is Ennius?

There must, too, be a general passion for such a work, and a desire to honour the poet; he must have rivals in the art, to sharpen his desire for perfection, and such ease and leisure as may make the task not impossible.

Gray admirably sums up the causes of dumbness:—

But Knowledge to their eyes her ample page,  
Rich with the spoils of time, did ne'er unroll;  
Chill penury repressed their noble rage,  
And froze the genial current of the soul.

And yet perhaps the poet is more independent of circumstances than the great artist of any other art; his language is ready-made for him, his mind may serve both for a tablet and a storehouse, paper and ink are both cheap and common, and books "with the spoils of time" are widely spread; or else we might say that Burns was in the position of "some mute inglorious Milton." But these natural facilities are by no means available for the possible painter, sculptor, architect, musician, or actor. Many a shepherd lad who has drawn one of his sheep on a bit of slate has not, like Giotto, met with an appreciative Cimabue to carry him off to the very centre of art, to keep him, and to teach him: good examples of contemporary art must be spread broadcast over the country, and masterpieces of former times at no impossible distances; and for the poor student there must be opportunities of support as well as of instruction. The old monasteries supplied much of the machinery now wanting. A peasant lad could be taught in the school, and, if promising, could be kept and passed on from monastery to monastery till he became a pope, a cardinal, a bishop, or till he was fit to act as a minister of State or to become a great artist.

If heaven alone sends us the seed, we must at least see that it is not destroyed—that it has proper soil and water, sunshine and shelter, and some fostering care.

We will try and look at the actual occurrences amongst the great artistic efforts of the past. Heaven blessed the Greeks and the Italians with a piercing intellect and with artistic invention, and accident gave a scope.

After the Persian war Athens had to be rebuilt; the temples and statues of the gods had to be re-made; the nation's triumphs and thanksgivings had to be recorded by painting and sculpture, by poetry and music, and various lessons had to be enforced by the drama. When each Italian town had won its freedom, this had to be commemorated by a town-hall and a bell-tower. The bell-tower was the sign of freedom, and people who had won their freedom soon wanted to show the results of their successful industry; and above all the Church had to show its new energy, imparted by the teachings of St. Benedict, St. Dominic, and St. Francis, and it too allied itself with the arts, and was their greatest patron. In the North the nations had got new knowledge and new impulses from the East, gained during the Crusades, and the Church was as busy here as in Italy. In trying to find a roof that would neither burn nor fall, this marvellous, cloud-piercing style—the Gothic—got evolved, the most wonderfully scientific and inventive use of stone the world has yet seen, and it became grand, mysterious, and melancholy; rude carving and sculpture adorned it, and gorgeous stained glass heightened its interior effects.

It is only under enthusiasm that man attains his full height; and the only enthusiasms that have hitherto had a great hold on mankind are the religious, the patriotic, and the benevolent, though perhaps we are on the eve of a scientific one. Though all religions have made the future their goal, they have not been insensible to the advantages of enlisting on their side, and for their use, all the arts and sciences that were not in conflict with them. At one time all that existed of the drama was in their service, but since

the Church has severed this connection it seems strange that the State should not take it up. When properly conducted it has the greatest influence on manners and morals, and the State is concerned with the present and not with the future life.

The drama, in the hands of great and finished actors, is certainly the most striking and impressive of all the fine arts, though, like the lightning, "'tis gone ere you can mark its place;" we not only may hear the most sublime eloquence or poetry, but with the very accent and gesture of the person represented, and, though they be but minor accessories, with all the surroundings of scenery, all the gorgeousness of pomp, and with all the power of music in the interludes. If some inducement could be offered by which all our good actors now scattered about could be gathered into one company and work together, we might have the more impressive pieces of the past played with effect; and surely our own age is not so barren of imposing incident, deep emotion, or of genius, that we cannot find writers to embody this in worthy words; but they must at least have bread and honour.

How can we widen the scope of the fine arts? Although I speak with due reserve, I do not know that much more can be done in the case of books, though on the written fine arts I shall have something to say; but in many of the fine arts their scope is much restricted. How narrow is that of painting; and yet at the present moment it may be said to be one of the most favoured arts in England. Yet there is scarcely a public building that is permanently adorned with paintings of the more striking events of our history; barely a fine historic mosaic; and, as far as I know, not one outside a building. And yet the back walls of porticoes seem to call for them most vehemently; and as for sculpture, it can scarcely be said to have any scope at all, except in portrait busts and statues.

The highest triumphs in the imitative arts is to attain imaginative perfection of certain types. Now, man at his best, and under the most favourable circumstances, rarely comes up to our idea of bodily perfection; the pursuits, the surroundings, and the accidents of life have left some parts of the frame undeveloped, and caused other parts to be overgrown.

It was the discovery that ideal perfection must be sought that gave the crowning glory to the painting and sculpture of the Italian Renaissance, and this lesson was learnt by the aggregation of many Greek and Greco-Roman statues, bas-reliefs, coins, and gems, which showed the Italian artists that the Greek perfection of beauty was imaginative. And yet the Greeks had almost everything that could tend to the perfection of man's form: a climate in which clothes were scarcely needed for a great part of the year; the young men were daily trained naked in the open air in running, quoits, leaping, wrestling, and hurling, besides having to undergo their drill in arms; and everything too was done to promote beauty. Every man was taught music; it was looked upon as part of their moral training, almost a part of their religion; yet Alcibiades' excuse for not learning the flute was considered sufficient when he pleaded that it distorted his face.

Now, if we cannot expect the perfection of the nude figures of the Greeks, even if we do not desire it, the whole range of sacred and profane history is open to us for sculptured illustrations. Every town of Italy is full of sculptured friezes, every church of sculptured pulpits and fonts, tombs, doors, and tablets. We do not expect to find sculpture on the poor man's cottage, but we might hope that even a modest house might be adorned with one little bit of this lovely art. Civilised man should have some more feeling for dignity than to live in a house that is but a sort of aggregation of dog kennels, and would be scorned by a savage. I confess that the imitation Gothic now so rapidly passing away has had something to answer for. Though the real Gothic reached the highest pitch of inventive and scientific construction in stone, and embodied the taste and skill of its age, modern Gothic is but the reproduction of the taste of a semi-barbarous time, and cannot bear comparison with the refined productions of the best modern painters and sculptors.

About music, "that gentler on the spirit lies, than tir'd eyelids upon tir'd eyes," I will say but one word, and for this most cogent reason, that I am absolutely ignorant of it; but I am happy to say that my defect will be atoned for by a discourse on the subject by one who does, and the presence of my friend Mr. Statham ensures an able discussion. But I would beg all of you to reverse Lord Chesterfield's advice to his son, "If you love music, don't fiddle yourself, but hire a fiddler." All of us must have some indoor recreation, and the time will come to most men when failing eyesight makes reading irksome, and music is said to be the only fine art people will practise purely for their own delight: how much sweeter would it be to most men if they could delight themselves with the concord of sweet sounds than be driven unwillingly to whist or billiards.

How can we heighten the aim of all the fine arts? The answer is simple, but complete: let everyone heighten his own aim, and the thing is done. You are the public, from whose hands the artists are to receive sympathy, reward, and honour. If you are ignorant, vulgar, and commonplace, you can only delight in what is crude, vulgar, and commonplace too; if you are learned, refined, and high-minded, you will ask for work exhibiting knowledge, refinement, and a noble ideal. Recollect the truth of the line in

some peasant ballad of Italy, "Poverty does not destroy high feeling." We may well be proud of knowing that a nobler literature does not exist than that in our own language, from the sumptuous imagery of Shakespeare, the stately verse of Milton, where every word thrills us like the blast of a trumpet, to the exquisite music and pathos of the peasant-poet Burns. I defy any lines in any language to exceed in truth and simplicity, melody and plaintiveness—

Ye flowery banks o' bonnie Doon,  
How can ye blume sae fair;  
How can ye chant ye little birds,  
And I sae fu' o' care!

It is the true nobility of nature that pervades our race that makes the very highest literature equally admired by the Queen on the throne as by the poorest peasant: "One touch of nature makes the whole world kin."

Horace's maxim, that if you want your hearers to weep you must weep yourself, is true of every art. It is the intense feeling of a passionate nature expressed by the subtlety of skill that makes all true and noble art:—

'Twas partly love, and partly fear,  
And partly 'twas a bashful art,  
That I might rather feel than see  
The swelling of her heart.

In painting this master chord of Nature is sometimes touched, and then, though the beholder may be ignorant of the technical merit of painting, he is forcibly impressed. No one ever looked at Francia's Madonna mourning over the dead Christ, in the National Gallery, without tears coming into his eyes. Sir Edwin Landseer knew, loved, and honoured dogs, and his *Chief Mourner* is one of the most popular pictures of modern times, not in England alone, but amongst all civilised nations—you may see engravings of it in the shops of every capital in Europe; but, as a rule, both in painting and sculpture we must look upon anything that is the mere petrifying of a momentary emotion or movement as nothing but a feat of skill; beauty and calmness, dignity and composition, are much higher and more proper qualities, as the same action or the same expression is ever with us. The great Italian painters, when they painted a martyrdom, avoided the physical agony and dwelt on the seraphic calm and resignation of the saint, who was already tasting the delights of Paradise. We look for gorgeousness and exquisiteness of colour in painting as its peculiar attribute, and we also look for perfection of form and grace, and subtlety of composition, in sculpture and painting. If we want the expression of passion and violent action we look for it in the drama.

When we deal with genius in one line of achievement we may perhaps make an approximate scale, but we have no means of comparing different classes of genius with one another. To discover a natural law or the application of one, to invent a machine, to solve a great engineering problem, may require as much genius as to paint a picture or carve a statue, to write a poem or to compose an oratorio; so I shall not attempt to exalt the great architects above the great men in the other fine arts, but at any rate I know more about the difficulties of architecture than about those of any other fine art. A building has to be made convenient for its purpose, and to be securely built—both difficult arts, though perhaps not fine arts. It must be imposing, dignified, or graceful, before we admit it to be architectural, and yet the difficulties may be almost insuperable; to take a high rank, it must plainly declare its object, it must at all events not be mistaken for a class to which it does not belong, and moreover it must be in accordance with the tastes of the age. But what if the age have no taste, and only asks for a brick wall with holes in it—what is to be done then? You may point to many a fine front as a contradiction, but be sure that, however fine that front may be, if there be a back that only the owner sees, it is a plain brick wall with holes in it. If it were done for the owner's delight, he would be more anxious for the part he sees to be beautiful, than the part he rarely or never sees.

A real love for anything is the beginning of culture, and is a stimulus to the creative artist, but a pretended love is merely a blighting curse. To love plainness is the honest confession of insensibility; to love dignified or elegant simplicity is to love the very highest form of art. I would fain see every man having his own house built to meet his own requirements, both of arrangement and beauty, and not living like a soldier-crab in the left-off shell of someone else; and that he should at least have something put on it that is interesting to him, and have this done by a good sculptor or a good painter—an episode of his life, a family tradition, or something natural that he loves, be it but a dog, a cat, a sparrow, or a flower.

There is one thing we all desire, and which appeals not only to architecture, but to all the fine arts, namely, to have art classes of all large towns, not drawing schools only, but art itself flavoured by the genius of the place. As the French sometimes said in praise of one of their wines, "It smacks of its native soil, we do not want everything to have a London flavour." In Italy we have the Tuscan, Umbrian, Venetian, Lombard, and Bolognese schools, and even the Florentine and Sienese. And why should we not

have a school of Nottingham, of Birmingham, and Liverpool, York, and Manchester? Separate schools would cause a generous rivalry, which would not be without its effect.

There are two theories of government at each end of the scale—one in which government does everything and possesses everything, down to the penny steamboats and the apple-stalls; the other which confines it to external and internal police and the enforcement of contracts; and I think, as a rule, our prayer should be that of the French merchants, "Let us alone." Still there are certain things to be done and certain contributions to be made by all for the good of all, and this the Government alone can enforce.

Every Government should at least desire to have the people free, virtuous, and healthy; courageous, industrious, and happy. Doubtless the way of obtaining these six desirable conditions is being shown in the other sections, but we want more; we want every one of our people to be raised by the exercise and enjoyment of all his higher faculties, and for the sake of the nation we want all our human raw material to be worked up. When we use the word "free" as applied to costly things, we know that nothing is free but light and air, and few of us can get our due allowance of these; what we mean is, that they must be bought by national co-operation, every man paying his quota, and every one getting his full enjoyment. So I say we want free parks and gardens, free lending and reference libraries, free picture galleries and museums, and—I suppose the musicians will say—free music; and that these may be used and enjoyed by the bulk of the nation they must be open on the one day in the week when the people are free from toil. And I would add fine contemporary buildings and monuments enriched by the sculptor and painter. Such things stimulate emulation more than any number of triumphs of bygone days, and can be seen Sundays and week-days alike.

The Government does something for architecture when it picks out the best architect for a public building, and it did something once for painting and sculpture when it had the frescoes and statues at the Houses of Parliament executed; but, as far as I know, it has never done anything for poetry, for music, or for the drama. It must be a great incentive to excellence to have a poem declaimed, an oratorio played, or a drama acted before the assembled people, and with all the excellence and appropriate surroundings that a nation only can afford.

We have colonies and dependencies in Asia, Africa, America, and Australia, and nothing is more wanted than a means by which all these branches of the English race may be knit together. Our one national holiday is the Derby Day, devoted to horses alone. Is it too much to suppose that we might have combined with it for one week, and with the betting-ring suppressed, a festival to celebrate the highest achievements of men? If the ancient Greeks could do it, why could not the England of to-day?

## POPULARISATION OF ART.

THE first question set down for discussion in the Art Department of the Social Science Congress at Nottingham was—"In what way can the influence of Art be best brought to bear on the masses of the population in large towns?"

Mr. T. C. Horsfall read a paper in which he maintained that a strong love of beauty was, as a rule, gained only by those who in childhood habitually saw beautiful things, had many pleasant associations with them, and were taught to perceive their beauty by persons whose opinion they cared for; and of those who had gained sensibility to beauty, many lost it if they cease for a long time to see beautiful things and to think about their beauty. Many of the children who lived in large towns had no chance of becoming familiar with birds, flowers, grass, ferns, trees, or any other beautiful things; but most town children saw such things occasionally, and as they saw them chiefly on holidays, probably they had some pleasant associations with them. If love of art was to be common among the people of large towns, the slight acquaintance with beautiful things thus gained must be increased by the help of art. Good coloured pictures of common birds, flowers, trees, butterflies, country lanes, farmyards, coast scenes—that is, of the beautiful things and places which town children saw in town parks and when they go out of town—should be placed in every school, and the attention of the children should be directed to the pictures by brief addresses and by labels containing brief explanations, so that when they saw any of the things represented they might look at them more carefully, and come back to the pictures with more interest for having seen the things. There should also be pictures of historical incidents and places mentioned in the children's lesson books. To induce attention to and interest in art-methods, coloured plates and good woodcuts of the same objects should be placed side by side, and the differences in the modes of representing form and colour in different arts should be pointed out. Full descriptions of wood engraving, etching, and other processes, with all the appliances used in the processes, should be placed in an art gallery in the town, and the fact that they can be seen there should be stated on the labels attached to the woodcuts, &c., in the school collections. Each collection should contain a few examples of well-shaped jugs, cups, &c., which should have labels stating that

they are well shaped, and each school should have a large glass case for growing plants, and at least two casts from sculpture, showing what the bodies of men and women ought to be like. When chromo-lithographs were used in school collections each should have a label referring to a good picture of the same subject in the art gallery. The central art gallery ought to be opened on Sundays, and to induce workpeople to come to it often, music ought to be given in it on one or two evenings every week. As good art was essentially right beauty of appearance, if we wished busy people to care for it, we should show it to them applied to things which they care for. One principle of great importance was almost entirely disregarded by managers of art galleries. To make people take a keen interest in art we must show them things that really interested them. Judging from the language of many people, one would think they placed the greatest value on things the most worthless. Success in bringing the influence of art to bear upon the masses would only be attained by persons who knew the importance of art, and of the right appearance of the whole life, which was of more importance than what was usually called art. Rightness of appearance was of far greater importance than things which did not deeply influence human feeling. In the art gallery there should therefore be a model small house to show how a small house in town can be made to look pleasant, which should contain all the things which are needed in such a house, all well made, of good form and colour, and it should have on its walls a few good pictures. The gallery should contain a small collection of casts from the best Greek sculpture, and good examples of the products of all the industrial arts. Each should have a label stating that it is good, and, if this be possible, explaining why it is so. Some of the pictures in the gallery should represent the most beautiful places near the town, the most interesting buildings in and near it, interesting events in its history, the trees, flowers, birds, butterflies, &c., to be seen near it. Of pictures of this kind copies—photo-engravings, etchings, good chromo-lithographs—should be made. Framed examples of the copies should be shown in the gallery, and the price of a copy and of a frame should be stated on a label. Similar labels should be attached to other good etchings, engravings, &c., in order that workpeople may learn how many kinds of good art can be obtained at a small cost. Every picture should have an explanation of its subject, and if the subject be one which is not familiar to most people, its connection with familiar things should be pointed out. To encourage study of art-methods pictures should be placed side by side with etchings and other copies of them, and groups should be formed of representations by different kinds of art of the same subject. By the masses of the population acquiring a knowledge and love of art, we would obtain more and better designers. It was surely unquestionable that the knowledge and love of art was indispensable to our population. Religion was one of the strongest motives to resist temptation, but it behoved them to declare the truth that thousands must be incapable of just feelings unless they first felt the influence of art, unless by the help of art the beauty of the world could be brought within their reach. The masses required more interesting recreations for their leisure time. Till then he did not think any great change would take place in the way they spent their time.

A paper by Mr. Hodgson Pratt, on behalf of the Sunday Society, was next read. The author said that the available means of producing artistic influence will occur to everyone, such as galleries of sculpture, painting, schools of art, works of architecture, &c., but practically they were closed to the mass of the people. If the people were to be reached, those influences must be brought to bear on Sundays or not at all. For many years he had organised parties of workmen to visit museums, cathedrals, and galleries, under the guidance of men specially qualified to explain the meaning, history, purpose, and beauty of the objects exhibited. The visitors listened with the keenest interest and pleasure to such teachers and expositors as Sidney Colvin, Professor Owen, the late Dean Stanley, the Rev. Canons Shuttleworth and Gregory, Dr. Samuel Birch, and many others. In the name, therefore, of social and political justice—in the name of the true education and elevation of the whole people—in the name of religion as understood in its broader and noble sense, he called upon the Association to answer the question, "In what way can the influence of Art be best brought to bear on the masses of populations in large towns?" by supporting the Sunday Society in its beneficent work of opening to the working people of the country, on Sunday afternoon, the public museums, art galleries, and libraries.

Mr. Statham said that Mr. Horsfall had treated the subject methodically. With regard to accustoming people to the sight of beautiful and well-shaped objects, these were very wide terms; while it was possible to govern people too much. For instance, a society had been formed to supply, not the lower, but the upper classes with furniture which was warranted to be in correct taste. People might thus be led to accept a particular style as the only right thing; and they might be inculcated, not with general principles of correctness, but with the idea that Mr. Morris's, perhaps, was the only good furniture.

Mr. C. Hill denied that the opening of museums and galleries on Sundays was necessary. If paintings were refining, was not

music? Why, then, not open opera-houses and theatres? And then, where was the day of rest? A Continental Sunday would be the result, and work of every kind would be done. This was undoubtedly the tendency of opening museums on Sunday.

Mr. J. A. Jacoby maintained that to do practical good, art galleries and museums must be made popular with the working classes; and Sunday was the only day on which they had really leisure to visit them. He had perfect confidence in the ability of trades unions to look after the interest of working people, and to ensure that the Saturday holiday should not be withdrawn. Although the Nottingham Castle Museum had succeeded beyond expectation, there was a falling-off in the attendance of the working classes, which he attributed to the fact that they could not visit it on the day on which they had most leisure.

Mr. T. C. Hine dwelt on the influence which art might exert through street advertisements if they were well got up. People were not sufficiently ready to appreciate the connection between the good and the beautiful.

Mr. Rathbone said it would be unwise to burke the question. He objected to museums being closed on Sundays, because that was the working man's only day of visiting them. It was, in fact, as unjust to prohibit a man from going to a library or an art gallery, as to prescribe the particular place of worship he should attend. Referring to the importance of surrounding people with beautiful things, Mr. Rathbone remarked that a large calico-printer told him he was compelled to send his designers to Paris because the atmosphere of art around was necessary to keep up their ideas. The speaker submitted as a great advantage derived from museums and picture galleries that they placed before people representations of things, the mere description of which would be practically meaningless.

Mr. Judge supported Mr. Horsfall's paper.

Mr. Horsfall moved the following resolution, which was adopted:—"That this section recommend that the Council request the Science and Art Department to seek to acquire the power of preparing and of selling at cost price to persons or societies interested in public education representations of trees, birds, and other beautiful natural objects, good in respect both of fidelity to nature and of artistic quality."

The Chairman (Mr. Aitchison) said it was of the greatest importance to give to every person as much delight in this world as was consonant with fulfilling their duty in other directions. He was hoping to live until that day when people should be enabled to devote less time to providing the necessities of life, and more to the study of those things which art was taken to express. An old Italian peasant ballad said "Poverty does not spoil high feeling." Referring to Mr. Horsfall's plea for more beautiful things in schools, he remarked that he had not seen many beautiful things in such Board schools as he had visited, nor was such his recollection of his own schoolroom. He thought the Legislature might well expend a little more in embellishing schoolrooms. He did not think it was the nature of Englishmen to be deficient, as they were, in feeling for form and colour. He advocated drawing from natural objects, almost all of which were beautiful, and few of which were calculated to inspire a horror or repulsion.

## RESTORATION OF ANCIENT BUILDINGS.

ON Monday last "The proper limits of Conservatism in regard to the treatment of Ancient Buildings" formed the subject for discussion in the Art Section at the Social Science Congress.

Mr. H. H. Statham read the first paper. He said we lived in a time of what were called "movements," which were often followed more from fashion than from knowledge or conviction. Among these movements had been one for the restoration of ancient buildings, which had been followed by a reactionary movement condemning any kind of interference with ancient buildings. Twenty-five years ago it was thought a mark of "culture" to be eager for the restoration of ancient buildings; now it was a mark of culture to oppose all such restoration. What was the truth which lay between these two extremes? The mistake of the anti-restoration party lay in looking at buildings only in the light of their historical interest. This was very well in regard to that class of structures which were in actual ruin and the practical usage of which had long been given up. To such remains only could the anti-restoration principle—the "let alone" method—be applied in its entirety. But buildings not ruined and still in practical use had two other elements of interest—their artistic or architectural value and their practical utility. Architecture was a form of artistic design, and, a complete architectural design being necessarily rendered imperfect when any of its details had altogether decayed and fallen away, it was in accordance with reason to restore such details and, in so doing, to restore the original design. In regard to additions made in another style from that of the original building (such as "classical" additions to a Gothic church), it might be desirable to leave the additions when they were of high excellence in their own style; but when they were not so they were only excrescences on the otherwise homogeneous style of the building. Why was that

which was bad taste originally to be regarded with enthusiasm because it had existed for 100 years. It seemed to be quite forgotten that buildings were made to be used, and must be kept safe. Many of the anti-restoration zealots absolutely refused to believe any statement about the dilapidation of a building. When it was proposed, for instance, to put a new roof on St. Albans Abbey, persons who had never seen the old roof were ready to protest against the renewal as a scandalous proceeding, and solemn warnings were given against injuring the painted ceiling of the nave, as if this were a valuable relic of mediæval art. From personal inspection he could testify that the old roof was in such a condition that it was surprising that it had not been down in the church twenty years before, and that the painted ceiling was a coarse imitation of mediæval work, roughly painted on thin wood, which was rotting all to pieces. In the past ages of architecture there had never been any hesitation about repairing, altering, or even removing any old building when it was thought that improvement would result. There was hardly a cathedral in England of which some of the finest parts were not built on the foundation of a Norman structure which had been swept clean away because the architects of the thirteenth or fourteenth century thought they could improve upon it. Excessive sentimentality about old buildings was the result of a spirit of hopelessness and indifference about the present, of aimless brooding over the past, which showed itself in regard to other subjects besides architecture, and was a sign of a very unhealthy state of social and artistic feeling. Architecture, at least, was a thing of the present, not of the past. To renew and decorate such a building as a cathedral once in a century was as much a necessity as to repair, redecorate, and refurnish a dwelling-house which happened to be of old date. The Gothic revival had no doubt been itself a "craze"; the restorers had done some harm which could not be undone; but the movement did much towards putting new life into modern architecture and the subsidiary arts. The anti-restoration *régime*, on the contrary, did neither evil nor good.

A paper on Church Restoration, by Mr. Samuel Huggins, was next read. The author said that every ancient building, whatever its condition, ought to be conserved. When such a building became decayed it should be repaired, not "restored," which it could not be in reality. There was no such thing as architectural restoration; it was an architectural delusion. No man could recall the original design of a dilapidated ancient building in its pristine perfection; or if he could would be able to execute it for want of the mediæval craftsmen. There should therefore be no such committee as a Restoration Committee, which undertook a duty which was morally impossible. When an ancient building became decayed or cracked, let it be secured from further harm by every known means. Let any deeply decayed, unsculptured stone be replaced. If needful, let the highest engineering skill of the day be brought to bear upon it. If it could not be rescued from ruin by this treatment, it could not by the so-called restoration process, which was calculated to render it less secure than it was before by the deep cuttings necessary for the insertion of the numerous bonding stones, to unite the new to the old work. When an ancient cathedral was too far decayed for any repair to fit it for use, he would neither attempt to restore it nor pull it down, but supersede it by a new transept or chapel, and let the old building enjoy a sinecure. One advantage of this plan was that it would be the most economical course. He objected to the so-called restoration of ancient buildings because they ceased to be ancient buildings under the process. It was a mode of preserving them which destroyed that which rendered them peculiarly worthy of preservation. The varied historic interest of those buildings, which were the best exponents of the English mind of the most mysterious and interesting period of our history, and for some ages almost the only exponents of it, gave them, in addition to what remained of their architectural beauty, a charm which it was impossible to over-estimate. In this changing scene they seemed, by their durability, ordained as the only stable things on earth to connect the fleeting ages and generations of men; and, viewed in this light, they were absolutely priceless. He protested against any meddling with interiors, as being equally disastrous with disturbance of the exterior. He had no sympathy with any prejudice for or against any particular period of the Middle Ages, and protested against the rule that the monuments and ecclesiastical arrangements of the three last centuries should be removed or destroyed, which had been generally obeyed, and asked, "Are not these the foot-prints of Protestantism in England since the Reformation, and supports to the architectural and ecclesiastical history embodied in the buildings?"

Mr. T. C. Hine quite agreed with Mr. Statham that we were all too apt to run into extreme and exaggeration. His own idea was that there was in this matter a *via media*. He was in favour of preserving those parts of the church which represented the feeling—religious or political—of the day to which they belonged, and, as regarded the furniture, he would have it in harmony with the requirements of the day. As an instance of mistaken restoration, he said that a few years ago the old western front of St. Mary's, Nottingham, had been destroyed because it did not harmonise with the rest of the building. A Gothic front was substituted. If they had expended the money which that front had cost in the erection

of a grand organ chamber in the chancel, they would then not only have provided that which was really needed for the requirements of the day, but they would have avoided the hideous thing which was blocking up part of the east window, and would have preserved what was characteristic of the eighteenth century.

Mr. R. Denny Umlin protested at the suffering which they underwent at the hands of architects, who appeared so anxious to show their own ability that they showed a disregard for the ability of their predecessors. Restoration, he thought, was a wrong word to use. Reparation, substitution, might be more accurately used; but the word restoration was most inappropriate. Architects did not restore, and often they did not know what was the original condition of the fabric they restored. They might profess to bring back to us buildings built in the time of Edward I., but the building had been so patched since that they represented different periods of history. A structure which began with William Rufus and finished with Charles I. was a very interesting object. He strongly objected also to the habit of making churches brand new, and instanced Worcester, and to a certain extent Hereford Cathedral, which by their restoration were made too new, the impression on the spectator being that they were built a few years ago. He deprecated the destruction of the ancient parish church of Hull, which had been for so long intimately connected with the Brontë family, and of which only the tower remained. The proper course would, he contended, have been to build a new church half a mile from the old one, which might have been utilised as a parochial hall. He also instanced the old church of Tuam, which had not been pulled down, but which had been made into a lecture hall. In conclusion, he said it was the architects who dictated what was to be done, and the people followed like a flock of sheep.

Mr. T. C. Horsfall said in regard to the question of church restoration those who were not architects would be anxious to know the bane and the antidote. Either Mr. Statham, who advocated restoration, or Mr. Huggins, who opposed it, was right. Judging from their own experience, those of them who were not architects would think there was far more sense in Mr. Statham's statements than in those of Mr. Huggins. You could not repair an old building by erecting a new one. As to building a new church a mile or a mile and a half distant, it was not possible in the majority of instances to raise the money, and in the case of village churches it was quite impracticable. If we cared more for architecture than we did, the question under discussion would not be occupying their attention. As a people we were content to care very little for architecture, and thus they were discussing the question of the limits of conservatism as regarded ancient buildings. No nation with any love for architecture had ever hesitated to repair its old buildings in the style which best suited the wants of its age. Restoration, he urged, would not be properly conducted unless we looked upon the churches as a means of reaching the hearts of the people, and at present the usual services of the church left people entirely unaffected.

The Rev. C. Yeld said there was hardly a word in Mr. Statham's paper with which he did not cordially agree. Mr. Huggins' objection was that restoration destroyed the beauty of old buildings, and that a landscape-painter, for instance, would consider that a restored building would have no beauty; but for his part he believed that a landscape artist would make a better picture of a ruined mill than of the western front of Lincoln Cathedral, but it was known that in the opinion of Sir Gilbert Scott the whole west front would have been unsafe unless something was done. It had been said that restoration of the churches to anything like the grandeur they formerly possessed would unfit them for Protestant services. The steps taken for the restoration of St. Mary's would represent their fitness to Protestant services. The restorers had found out that the old choir stalls must give a dignity which was unfitting in a Protestant church. They were accordingly sold for 10*l.*—transferred to the church at Sneinton. Yet their exact counterpart was to be found in the new stalls in St. Mary's, which Sir Gilbert Scott said must be put in. In olden times men found certain features in a church which did not please them, and when they did so they made changes and alterations as they pleased. Mr. Yeld referred to the ancient Norman chancel of Southwell Minster, which was bodily pulled down to make way for the present chancel. In conclusion he contended that in making modern additions to a church you were simply adding to its history. He endorsed a great deal of what Mr. Statham said regarding the craze for preserving things because they were old, however old and ugly and useless the thing itself might be.

The Rev. Frederick Boeg said it was a fallacy that because a church was restored it thereby lost its historic interest or identity. It was assumed that its identity was lost if any change was made in the building. The anti-restorationists allowed the changes that nature made in buildings, then why not those made by man?

Mr. Rathbone confessed to sharing the feeling against restoration. He particularly deprecated the replacing of old carving by British workmen who did not understand what was the grotesque feeling of the old carving. For that reason he thought carving should be carried out with the greatest care and the greatest conservative feeling. He thought that the difficulties of the subject really lay in remembering that we did not live in the

past but in the present. If we were going to build in the same spirit as mediæval builders we would be meeting one of the pressing wants of the day. Instead of lamenting that we could not do anything equal to what already existed, we ought to set to work and see what we could do to imitate it.

The President, Mr. Aitchison, A.R.A., after observing that it was not unnatural that the discussion should have been confined to the question of the preservation of churches and places of religious worship, said these were undoubtedly places of practical utility. It was obvious that it was much more desirable that they should be preserved for practical use than that new buildings should be erected in their place. The difficulty was to find a building which had not been dealt with within the last forty years. They should seek the reparation of the old buildings as opposed to the restoration, and apart from reparation of the old structure and the arresting of decay, their great object should be not servilely to imitate what had been done by men of a previous generation, but to make additions of such a character as would harmonise with the structure of the church, while they would yet carry the characteristics of the day with them, each addition carrying its own character. In conclusion, he thought that every building should be a chapter of history carved in stone.

Mr. Statham, in reply, said he could not omit to make one reference to Mr. Huggins' paper. He agreed with him on the one point. He felt painfully as to the restoration of Chester Cathedral, which, under the hands of the restorationists, had been entirely recased outside, and made into a new church. He contended that the movement which revived the churches would always revive the buildings. Why, he asked, should they assume that modern workmen should do everything in a mechanical way, as might be inferred from what had been stated regarding the replacing of old carving. He agreed with the chairman, that their object in restoration should not be servile imitation, but the production of something which had a mark of our taste about it.

### THE PRUSSIAN SYSTEM OF TESTING MATERIALS.

A PAPER on "The Royal Prussian Institute for Testing Materials of Construction," by Dr. Hermann Wedding, was read at the meeting of the Iron and Steel Institute at Vienna on the 20th inst. The author said that the necessity of securing a *modus vivendi* between the producer and consumer has led in Germany to the establishment of three public institutes wherein it could be ascertained how far the chemical constitution of a material influences the mechanical properties. They were constituted and formed by law on January 23, 1880. Of the three institutes, two were occupied in mechanical examinations, the other being devoted to chemical tests. One of the mechanical institutes examined the strength of iron and other metals, as well as timber; while the other was engaged in examining building materials, such as bricks, lime, cement, &c. The chemical institute made assays and analyses in both directions. The management of these establishments was entrusted to directors, superintended by a commission under the presidency of the Under-Secretary of State for Trade and Commerce—viz., the head of that department whose duties were devoted to the equitable development of all branches of industry. Two technical members of the Ministry of Public Works, from the department for mines, smelting works, and salt works, and the department of railways and architecture, represented producers and consumers respectively; the third member was deputed by the Ministry of Culture, as the authority for technical education. Full freedom was allowed the superintendents in the carrying out of the experiments, the commission preserving the harmony of the three institutes, and giving impulse and direction to them. Regarding the work of the institutes, two groups might be distinguished, the first of which embraced the tests ordered by the State authorities and private individuals. These were made on payment, and to a great extent covered the work of the institutes. The second group included the examination of whole series of assays for the purpose of solving the question how the quality of the whole bulk could be ascertained with sufficient reliability from the examination of a small part of a material. It embraced experiments not connected with single cases of ordinary practice. The results here obtained filled up the void which inevitably remained in the results of the first group, and gave the scientific connection between the methods of production and the equality shown in use, a connection which really was the true end and aim of the institutes. In the prosecution of these series of experiments consisted the most important work of the commission. In this direction the work done could be ranged under four divisions—viz. (1) condition of the samples; (2) the method of testing; (3) the connection between the chemical and mechanical qualities, and the relation of the latter; and (4) the deviations from the quantities demanded in practice. The work of the institutes might be spoken of as small, but in so judging of it, they must not lose sight of the fact that these institutes had only been in existence a short time, and were working in fields which a few years ago were quite undeveloped, and partly even a complete *terra incognita*. In conclusion, he thought

it desirable that an international commission should be formed constituted of experts from all iron-producing nations, who should agree upon the conditions to be everywhere employed in testing materials of construction, and he should be glad if the idea was adopted as a proposal emanating from the Iron and Steel Institute.

Professor C. Roberts said that in view of the great progress that had been made in conducting mechanical tests, it was difficult to realise how comparatively recent such tests were. When the early work was done by Runt, Styffe, and Kirkaldy, chemists did not know what important factors one-tenth per cent. of carbon or 1-100th per cent. of phosphorus could really be, nor had the present era of molecular metallurgy dawned, in which the chemist shared with the physicist the responsibility of success or failure in the manufacture of iron and steel. He considered that in England the work might very well be left in the hands of private individuals, and pointed to the work done by Professor Kennedy at University College, London, as a proof that no other control was needed.

Professor Kennedy said that a Government institution for the testing of materials was not one which would find favour in England. The members of the German Commission could not themselves do the work, and there was no reason for supposing that the under-officials of a department, who would actually be responsible for the accuracy of the experiments, would be more trustworthy, more capable, or less open to undue influence than were private gentlemen under the present system. The originator of the present system of testing, to whose efforts more than to those of any other single man was owing the present great importance attached to testing in Europe, had worked throughout as a private individual, and the system inaugurated by him was that which would commend itself most in England. The advantages of uniformity were no doubt great, but there were also considerable disadvantages in the mechanical uniformity apt to be created when a Government department took in hand the execution of scientific work of this kind.

Mr. Snelus said that they must not draw conclusions from too few samples. On the other hand, it was difficult to insure that all the samples should be alike. As they had heard, differences in the material itself produce results far greater than differences in the mode of preparing the samples. As to the formation of an international commission, it was known that a manufacturer had one person telling him that his material should bear a tensile strain in 10 inches of length, another in 8 inches, and another in 2 inches. This made a great difference, and it was desirable that the international commission should, if possible, be carried out, and come to some definite conclusion as to the composition, the shape, and the length of the samples, and every other condition under which tests were to be carried out.

Mr. D. Adamson observed that chemical tests did not meet with the requirements of modern days, when the whole life of the structure, in a large measure, depended upon its ultimate ductility. In testing for practical purposes, they should test with the bar or plate. He believed the 2-inch test to be impracticable, and it would not form a proper guide. He did not wish all the testing machines to be the same, for it would be better to get results from different private sources, so that they might find out where their real difficulty lay.

Mr. Jeremiah Head said there was an advantage in having a public testing place. In the interest of the producer there should be some public officer who knew thoroughly what he was doing, and whose operations should be above suspicion. He was not, however, an advocate of Government testing, for the simple reason that Government had enough to do without undertaking works which could be done by other people. He suggested that the producers should name the tests to which the materials should be submitted, rather than the engineer under whom they were to be used up. If a technical committee of the Iron and Steel Institute were to draw up some test it would do good.

Mr. Lowthian Bell, the chairman, said there was nothing more embarrassing than the want of uniformity in measurement, and, therefore, any committee taking up the question of testing should also go fully into that of measurement. Testing was a question of a very complex character. They had not only chemical considerations but molecular structure, which might be altered and modified by a great many considerations and conditions. The temperature at which iron cooled, and the treatment to which it might be subjected had not yet received sufficient attention. Among engineers there was an opinion that railway axles cease being reliable in consequence of the distress experienced by long use. Mr. Menelaus, whose experience and judgment no one would venture to dispute, would not allow a fly-wheel to be made of steel in consequence of the great disposition of steel to be altered by long use; and he had been told that the large steamers constantly renewed their propeller shafts, and that the Atlantic steamers do not use their propellers beyond a certain number of years. Upon the North-Eastern Railway, of which he was a director, they made a point of examining every rail that broke, and they analysed specimens of all the rails which were taken up after a certain number of years. If a committee of the Institute were appointed he would be very glad to take out the analyses and give them every assistance in his power.

## NOTES AND COMMENTS.

PLANS AND PLANNING is the subject selected by Professor ROGER SMITH, for the public opening lecture of the courses of Architecture, Construction, and Modern Practice, at University College, London. This lecture, to which there is free admission, will be delivered at the College on Wednesday evening next, October 4, at six o'clock, and will be very fully illustrated. The work of the various classes, dealing with Architecture as a Fine Art, Architecture as a Science, and Modern Practice, will commence, as may have been learned from our advertising columns, the following week.

It is to be hoped that the Archæological Commission at Cairo will be reconstructed. Although it was but recently formed, the Commission has been the means of preserving the minarets of the gate called the Bab-el-Metwally, which had been officially recommended for demolition, on the plea that some stones had fallen from them into the street, to the danger of the people passing by. The minarets were examined, and were found to be perfectly secure. The stones which had fallen belonged to some Arab hovels which had been constructed over the gate. The Commission also reported on the condition of one of the mosques, which, although containing beautiful mosaics, is little known; but the political disturbances prevented further measures being undertaken to secure the building.

THAT a coroner's jury in Dublin brought in a verdict of culpable negligence against the architect and builder who were engaged at St. Patrick's Cathedral in Dublin, is enough to suggest the soundness of the conclusions at which we arrived in referring to the accident in our last number. The coroner himself took a common-sense view of the evidence; but a jury that was drawn from the slums in the neighbourhood of the building could hardly be expected to do otherwise than seek vengeance on the officials. In the opinion of the leading Dublin architects the responsibility does not rest with Mr. FULLER. It would be impossible to discover whether the buttress was equal to the work, inasmuch as the stone groined arch of the choir with which it had been connected was removed years ago, and lath and plaster substituted. Mr. FULLER has loyally endeavoured to shield the builder from what is in reality an outbreak of popular fury, and we hope that he may not have to suffer in consequence. If actions for damages follow, it will be unfortunate, unless a different class of jurymen is empanelled.

THE French Ministers of Public Works and War have decided to demand of the Chambers the necessary funds for effecting an exhaustive series of levels of the whole country, an accurate contouring being absolutely necessary for the execution of the schemes of public works and national defence now being carried out or projected. The only survey of the kind available is that made by the Staff Corps between 1857 and 1864, which stands in need of correction and completion. It is calculated that a catalogue of the levels of each department may be included in one large volume. This is to be completed by a graphic repertory, in which every standard point or bench-mark will be shown. In the preparation of the levels the existing Government survey for valuation purposes, reduced to the scale of one ten-thousandth, will be used; and at the same time the War Office will be able to perfect and complete its maps of France on the one fifty-thousandth scale. The cost of this vast undertaking is put at 19 million francs, but it is probable that the burden upon the State will be considerably lightened by subventions from the departmental and communal authorities.

It is generally supposed that the Rue Lafayette is much the longest street in Paris. This notion has doubtless arisen owing to the street being straight throughout, and therefore impressing its length upon the observer; that it is erroneous may be seen by the following list, taken from a work lately published by the municipal authorities:—Rue des Pyrénées, 3,515 mètres; Boulevard St.-Germain, 3,150 mètres; Avenue Daumesnil, 2,930 mètres; Rue de Rivoli, 2,850 mètres; Rue Lafayette, 2,789 mètres; Boulevard Péreire, 2,540 mètres; Avenue du Trocadéro, 2,440 mètres. On the other hand, the shortest thoroughfare in Paris is the Rue Brongniart, near the Bourse, which is 23 mètres in length, and contains only two houses, one of which is in course of construction.

THE contracts for marbles, stoves, heating-apparatus, and paving-work, for the new Hotel-de-Ville in Paris have been let by public tender. In the interior, and especially for the grand staircase and Salle des Fêtes, white veined Carrara marble will be used in profusion, and numerous large columns of the Royalked marble of Flanders will relieve the prevailing absence of colour. The grand staircase will have 100 steps—each 5 mètres long by 40 centimètres in width—of Carrara, the total estimated cost of these being 1,600*l.*, or 16*l.* per step; moreover, on the same staircase are to be erected four red Flanders columns at 84*l.* each, sixteen Carrara columns at 14*l.*, and sixteen pilasters at 10*l.* The flight leading to the apartments of the Prefect of the Seine is designed to consist of fifty-four steps (3 mètres long) in pure white marble, which will cost 10*l.* apiece.

ONE hundred and ten ordinary marble mantelpieces will be erected in the various rooms on the first and second floors of the building; fifteen of a more elaborate kind for the principal apartments of the Prefect of the Seine and the offices of the Municipal Council; four extremely large for the chief rooms of the first floor; and, finally, two of quite monumental dimensions, to cost 840*l.* each, for the grand salons. The granite pavement of the two main courts and various outside passages will cover an area of 1,703 square mètres, calculated at about 16*s.* per mètre. In round figures the cost of the marble work may be put down at 22,000*l.*, the heating apparatus 1,000*l.*, and the paving 4,800*l.*

AN exhibition of works by the students of the Villa Medici (who have gained the Grand Prix de Rome) will be opened on October 15 next, in the Salle Melpomène at the Ecole des Beaux-Arts. It will remain open to the public for eight days, from 10 A.M. to 4 P.M.

M. MASPERO, the Director of the Boulak Museum, started on his return to Cairo last Tuesday, with the intention of continuing his researches and excavations in the Nile Valley. Previous to his departure he read a paper before the Académie des Inscriptions, describing the discoveries already made under his direction, particularly in the pyramids of Rega, Kafr-Litch, and Meïdoun, and at Thebes, where he has recently unearthed the tomb of Queen NITOCRIS, of the twenty-sixth dynasty, whose sarcophagus will shortly be removed to the Boulak Museum.

THE "Loan Collection" of the Ecclesiastical Art Exhibition, which will be held in Derby during the Church Congress week, is much larger than last year, and embraces upwards of 400 separate exhibits. Embroidery, both ancient and modern, is largely represented. There are numerous specimens of modern work, including sets of vestments from Prestbury, a cope worked for St. Clement's, Bournemouth, and an altar frontal, cope, and dalmatic, by Messrs. JONES & WILLIS; the two last having been shown at the Great Exhibition in 1851, when they received a prize medal. Modern embroidery is also well represented by specimens of the work of the East Grinstead Sisterhood. Metal work and enamels form an important branch of the collection, and include *champlevé* work of the twelfth century, bronze plaques, Græco-Roman bronze crosses and crucifixes, together with a triptych and a pectoral plate in bronze and enamel. There is a brass crucifix of uncertain date, found built up in the wall of a Derbyshire farmhouse. A paten, dated 1490, belongs to Stow Longa Church. Mr. BERESFORD HOPE contributes a painting of the interior of Westminster Abbey, showing the marble altar piece put up in 1705 on the advice of Sir CHRISTOPHER WREN, in which the altar is represented with a crucifix and seven candles. The gem of the collection is without doubt the model of the Shrine of St. URSULA, the original of which is at the Hospital at Bruges, and is the work of HANS MEMLING. Pictorial art is represented by various photographs and chromolithographs of ancient pictures, illuminations, drawings of churches and ecclesiastical furniture, engravings of chalices, and a large collection of rubbings of monumental brasses and incised slabs. The Rev. J. FULLER RUSSELL sends a very interesting and valuable collection of manuscripts and early printed books. Amateurs of ivories and wood-carving will find much to admire in Mr. CLARK's collection, which includes about a hundred examples of plaques, statuettes, triptychs, caskets, &c., mostly belonging to the sixteenth century; and there is a situla or holy-water vessel dating from the eleventh century.

## ILLUSTRATIONS.

HOUSE FOR MR. J. THORNYCROFT, C.E., CHISWICK MALL.

THIS house, now in course of erection, overlooks the Thames, and embraces a stretch of the river of two miles in length. The large bay window, and flat, have been therefore so placed as to take advantage of the extensive view. Externally, red bricks, gauged work, and tiles have been employed. A special feature of the interior will be the inner hall and staircase of oak. A novel method of warming will also be introduced, founded on the principle of the old hypocaustum.

Messrs ADAMSON & SON are the builders, and Messrs. JOHN & JOHN BELCHER, F.R.I.B.A., are the architects. The illustration is from Mr. JOHN BELCHER'S drawing exhibited in the Royal Academy this year.

BOAT-HOUSE, WALLINGFORD-ON-THAMES, BERKS.

THIS boathouse is being built for Mr. G. D. LESLIE, R.A., from the designs of Messrs. CHRISTOPHER & WHITE, architects, 16 Bloomsbury Square, W.C.

Leave was granted by the Thames Conservancy to project the building 4 feet beyond the line of the present banks, so that it stands well out into the water. It is solidly constructed of local red bricks; the upper portion of the walls are plastered, the exposed woodwork is of oak, and the roof is finished with Coalbrookdale plain tiles and lead. The contract, together with that for considerable alterations to the house, is being carried out by Mr. J. WELLER, builder, Wallingford.

DESIGN FOR ALMSHOUSES.

THE view of almshouses which forms one of our illustrations is reproduced from a coloured drawing which was in this year's exhibition of the Royal Academy. The buildings were designed by Mr. C. E. POWELL, of the firm of Messrs. MEDLAND & POWELL, with a view to their erection in one of the eastern counties, and comprise three sides of a quadrangle with a covered corridor towards the inner side.

A common hall, for the exclusive use of the inmates, is designed to be on the ground floor of that part of the building to the right of the principal entrance, with a hall above it for the purpose of entertainments, &c. At the opposite angle of the building is the residence of the caretaker, with a dispensary adjoining it.

No steps have as yet been taken with respect to the commencement of the work.

SHOPS AND BATHS, FONTHILL ROAD, FINSBURY PARK, N.

THE buildings shown in the illustration are to accommodate the district adjacent to Finsbury Park, in which the population is increasing more rapidly than in other parts of the metropolitan suburbs. There are five shops, ladies' swimming and private baths, and gentlemen's swimming and private baths; covering, in all, an area of over 10,200 superficial feet, of which the baths occupy about 6,440 feet.

The gentlemen's swimming-bath will be one of the largest in London, being 100 feet long, 35 feet wide, and 45 feet high from the floor of the bath to the soffit of the roof. The roof is carried by iron girders assisted by ornamental cast-iron spandrels, supported by twelve pilasters with moulded capitals, the moulding of which forms an impost running between the pilasters, and giving an ornamental effect, as it is in character with the panelled walls and ceiling between the girders. The bath is lighted from the top, which is arranged over the louvre ventilators running the whole length of the building. The gallery, fitted with ornamental railing, will be for dressing-boxes; or on gala days for visitors. There will be thirty-seven dressing-boxes on the platform. The floor and the sides of the bath will be lined with Minton's white glazed tiles. There are forty-four private (porcelain) baths, to be fitted with all the latest improvements.

The swimming and private baths will be heated by two Cornish boilers, which will give a temperature of 72° in the swimming-bath all the year round. The boiler-house, washing-rooms and drying-rooms, are in the basement, the height of which is 10 feet. The outside of the building, including the tower, is of red brick picked facings; and the stone used in the dressings is from the contractor's quarry, Prior Park.

The architect is Mr. JOSEPH JEFFREY BENNETT, of Broad Street, City; and the contractor is Mr. P. J. McMANUS, of Brook Green, Hammersmith, W.

## THE ACCIDENT AT ST. PATRICK'S CATHEDRAL, DUBLIN.

THE adjourned inquest on the people killed by the fall of one of the buttresses of St. Patrick's Cathedral, Dublin, was held on the 21st inst.

The Coroner said that in compliance with the request of the jury he had written to the Chief Secretary, or rather to the Private Secretary, asking that the authorities should place an independent architect at his disposal. He had not received a reply. Counsel for the contractor said they had asked Mr. Drew to examine the building, but if the jury did not wish he need not appear.

Mr. Carnegie, verger, said he was standing in the choir with the Dean when the buttress fell. Some of the stones of the flying arch fell on the groined arch of the roof. The mortar was like sawdust. The buttress was not one of those renovated by Sir B. L. Guinness. One of the stones was inscribed "Rebuilt by Henry Kingsmill, 1845." It was never suggested that the buttress was in a dangerous condition.

Mr. James F. Fuller, architect to the Cathedral Board, said he had been twenty-five years in the profession, and under the late Ecclesiastical Commissioners was entrusted with a large district, in which his duties were to superintend the erection and repairs of churches. The works at St. Patrick's Cathedral had been ordered by him. He was absent when the excavation at the fallen buttress was made, and had not seen the work for a week, but he did not think it would be fair to shirk the responsibility. He had confidence in the contractor. The underpinning was well done, the stones used were sufficiently large; but his instructions had not been followed, as mortar had been used instead of cement. He did not believe that any man could say positively what caused the fall of the buttress. There was water flowing, but it was intercepted from entering the excavation. If he had been informed that a crack was seen by the workmen, steps would have been taken to support the buttress, or, if time did not allow of that, he should have warned the people to keep away. He maintained that the buttress, which was cased-up in 1845, separated from the wall years ago—it might have been centuries ago. The masons employed in 1845 could have observed the separation. After the buttress had fallen a stone shoot to convey water from the roof was discovered. It was embedded in the heart of the wall, and after the separation the water percolated down between the buttress and the wall. A quantity of soot was found at the base, which satisfied him that the water brought it down from the roof. He could form no absolute opinion about the immediate cause of the catastrophe, but he believed that it arose from the defect in the construction of the buttress. If it had been properly built and bonded into the wall the underpinning would have been quite safe. If beforehand he had been asked by the contractor whether the buttress should be shored, he should have said decidedly not.

In cross-examination Mr. Fuller said that the contractor had been working on a schedule of prices, and it would have been more profitable to him if he had shored the buttress and used cement instead of mortar. If the buttress were properly built into the wall the base would be 4 feet by 5, and the foundation that was removed was about one-fourteenth of the area.

The Coroner said the inquest need not be proceeded with further if the jury thought they had evidence to enable them to decide whether there was criminal responsibility on the part of anyone connected with the works. They all desired to have independent evidence. The difficulty they were in with regard to Mr. Fuller was this, that while he had given his evidence frankly and fairly, he was to a certain extent trammelled by the fact that he did not like to throw the responsibility on the person acting under his instructions. He (the Coroner) had not the power of calling in another architect, but he did not think they could get any more evidence from any architect than that they had before them.

After a short adjournment the Coroner summed up. He said the duty of the jury was to ascertain, in the first place, whether there was negligence. Negligence was of three kinds. Criminal negligence was that in which life was lost by reason of the wilful and obstinate neglect of any person to do what he ought to do; culpable negligence was that in which serious blame attached to a party for not doing a certain thing, but which fell short of criminal responsibility; and there was a third degree of negligence, which arose from the doing of anything in such a slipshod manner that the party doing it deserved to be visited with censure. The contradicted evidence in this case showed that the work carried on at the base of the buttress unquestionably precipitated the accident. This accident was in preparation probably for centuries, and it might have been postponed indefinitely if some work had not been undertaken at the bottom of the structure, which accelerated its occurrence. As to the question of responsibility, the point arose whether the architect and builder ought to have foreseen the danger, and provided for it accordingly. In connection with that the jury were bound to consider the state of the buttress itself, and the fact that it had been separated from the wall. The blame for that, if any blame was to be attributed, rested upon the persons who cased the buttresses, and failed to discover, or, having discovered it, neglected to notice this deficit in the structure.

According to Mr. Fuller's evidence the persons working at the base recently could not have discovered the defect, because nothing in the roof or in the pillar itself would have indicated it. Therefore to his mind they could hardly fix the responsibility on any one person. If they came to the conclusion that it was an accident, and was unpreventable, because the danger could not be foreseen—and he thought they might fairly come to that conclusion—then the evidence was not strong enough to fix the responsibility on any individual. He thought it was a case of all others in which the jury might fairly ask the parties interested to do something for the representatives of the poor people who lost their lives.

The jury retired, and after a half-an-hour's absence the foreman announced that twelve were for holding Mr. Fuller and Mr. Pile responsible. The remaining juror was for holding Mr. Fuller alone responsible.

The Coroner: But you are agreed that it was an accident?

The Foreman: Yes.

The jury again retired, and after a short absence the foreman announced that they unanimous in finding the following verdict: "We find that Sarah Egan, John Ward, and James Bolger were crushed to death at Patrick's Close on September 14, 1882, by the accidental fall of one of the stone buttresses of St. Patrick's Cathedral, and we consider that the accident was due to the culpable negligence of Mr. Pile, the builder, and Mr. Fuller, the architect, then engaged in works at the said Cathedral."

### THE OBJECT AND SCOPE OF AN ART PROFESSORSHIP.

ON Tuesday (the last day of meeting in the department) a paper was read at the Social Science Congress by Mr. P. H. Rathbone on "The Object and Scope of an Art Professorship." He said:—The first question that arises is, What ought to be the distinct object of such a professorship? Should it be that of training up the artists that are to produce, or should it be the direction and stimulation of an enlightened public appreciation of art as the necessary condition of the production of art? To the existence of a great school of art an enlightened, healthy, and liberal public demand for such art is a necessary preliminary condition, and to create and direct such a demand seems to be the proper function of a professor of the fine arts. Incidentally he may be of use to professed artists, but these have to learn their profession by hard and serious study and practice under practical masters of their several arts. What I want particularly to prove is that the public appreciation of sound art is a first essential to the production of it. Once created, the demand will cause the supply of such art, and for want of a stimulant of this kind opportunities have been lost, for which posterity will bitterly reproach the blindness of the present age. The wealthier part of the public have not been educated in the relations of sculpture to architecture, and herein is one of the explanations of failure of our public monuments. I believe that this is a truth that only requires to be enforced upon the public mind to be acknowledged, appreciated, and acted upon. I believe there are opportunities slipping through our fingers now, and that we may yet be in time to save some part at least of the genius of artists still living amongst us. To mural painting the same moral applies still more forcibly. What should we have known of the genius of Michael Angelo as a painter if we had only his easel pictures to judge by? Another point as to which a professor of the fine arts may be of great use is in directing the public taste as regards art in daily life, as it has been termed; that is to say, as applied to articles in daily use—furniture, china, textile fabrics, &c.—and this is of serious consequence to us economically as a nation. We must look forward to losing our advantages over other nations in cheapness of coal and labour, and shall have to depend more every year upon the goodness of our work; and though it is upon the schools of art and design that we must depend chiefly for the supply of art for domestic purposes, yet the professor may greatly aid in creating a healthy public demand. These, then, are some of the objects of a chair of the fine arts; and the next question is, by what method are these objects to be attained? Here we must distinguish between art and archaeology. I find many people imagine they are studying art when they are only learning facts about art. With few exceptions, lectures on art ought to be illustrated either by examples shown at the time or allusion to those familiar to the audience. The subjects upon which the professor should lecture should embrace all the various branches of the fine arts; but his efforts should be addressed to the question of what is good art, and why it is so, rather than to the technical methods by which it is produced. Another subject to which an art professor ought seriously to direct public attention is the relation of sculpture and painting to architecture. At present they are treated as subjects entirely apart, and sculpture especially suffers in consequence. The finest sculpture of most ages has been created with a view to occupying a definite place in some building, and with a distinct loss to its effectiveness when removed from there. Very important also is it that the relation and importance of painting to architecture should be fully insisted upon. For want of a due appre-

ciation of this question, invaluable spaces of wall in our public buildings are left cold and bare which might be instinct with beauty and life, and money now expended in costly and rare raw material might be rather directed to remunerating the skill and intellect which makes a thing of living beauty out of the commonest raw material. But in order to achieve this end, its feasibility and desirability have to be impressed upon the governments and municipalities, and upon those who elect them. Town councils will be quite ready to spend money in these directions as soon as they feel their constituents believe in it. As soon as this is the case, as soon as we have a healthy demand for mural paintings, we shall not want artists to carry out our views. I will not go into the courses which naturally occur, such as the history of art, &c. The only fear is that these may occupy too exclusive attention. I lay much importance upon the lecturer's studying and explaining the relative cost of various media of art, as it is an element which enters into the question of demand. For example, the future of the English school of sculpture may greatly depend upon the free use of terra-cotta ornaments. In marble the cost of material and manual labour is so large an element that it is like to trench severely upon the margin left for skill and genius. Above all, the professor ought to bring home to all the essential beauty of the lines of the perfect human form, and as subsidiary, but also of first importance, the lines of drapery, and of the method of so disposing as to emphasise the beauties, and to indicate the lines of that form. Rash as may be the assertion, I think he might do great good in lecturing on dress. A drawing-room ought not to be a place where every woman has done her best to throw herself out of drawing, as must be the case while the atrocity of high heels prevails, which throw the body out of balance, deprive the step of that springiness which Virgil describes as the distinguishing charm of the goddess Venus, and the whole body of its liteness and elasticity, which is the essence of living grace; or while ladies indulge in that still worse abomination of tight lacing, ruinous to health, and almost more ruinous to beauty of line. I know that this abuse of dress is not nearly so prevalent as it was a generation ago, but it still prevails to a lamentable extent. Any lecturer could explain how drapery should be arranged on the living form so as to indicate the most beautiful lines of the individual form, and to slur over those which are less perfect. Another function of an efficient professor of the fine arts would be his value as an adviser to those who have the control over the galleries and museums of art which are becoming a necessity of all large towns. The great danger to these museums is the admission of faulty, or, still worse, mediocre examples of art, which may do more mischief than good. Also, if he be a man of real enthusiasm, he may be of great value in assisting the rise and evolution of artistic manufactures, and in the encouraging and organising of amateur societies for modelling in clay or wax, and the careful study of special forms of art, and in many other ways keeping alive an active love of and interest in art. It is evident, therefore, that an efficient professor of the fine arts should be a man of wide culture and varied experience. A knowledge of ancient and modern art, with some knowledge of technique and a practical power of drawing and modelling sufficient to exemplify his lectures, is of course necessary; and, above all, a broad and catholic taste, and a living, active sympathy with that human nature which is the foundation and essential of all great art, and without which it becomes an agent of corruption and death.

The Rev. J. F. McCallan said that Mr. Rathbone's paper dealt with a subject of peculiar interest to a town like Nottingham, having one of the first schools of art and one of the first art galleries in the kingdom. Indeed, it seemed to him that the ideas of the essayist were already to some extent being realised in Nottingham. To such a town, whose manufactures depended so much on artistic skill, a professor who could not only descant on the lines of beauty but draw them was of the greatest importance. He trusted that one day, by the aid of persons of wealth, benevolence, and taste, Nottingham would be placed in actual possession of a complete museum of beautiful things—not merely loans—by the contemplation of which the youth of the town might be inculcated with artistic tastes.

The Rev. W. Vincent Jackson, while admitting the advantage of having a lecturer who would go round with his audience to inspect various works in museums, said he thought that many people did not realise the value of the Castle collection. He suggested that labels, pointing out the excellences or even failings of works of art should be attached. This would reach persons who might be unable to attend lectures.

Mr. G. W. Taylor insisted on the importance of more artistic dress. He welcomed the idea of an itinerant professor.

Signor Tito Pagliardini urged the necessity of inculcating children with a love of art from the very first. He pointed out that the artistic education of an Italian child began with its senses—it saw good sculpture and fine architecture, and heard good music. Thus the least spark of artistic intelligence in a child's mind was speedily fanned into a flame. Since his arrival in England, thirty years ago, he had remarked a great improvement in the artistic taste of the people, which he attributed largely to the International Exhibition. Begin a child's artistic education at the plastic age, he again urged. It would do more than profes-

sional lectures to limited audiences. And in this connection he pleaded for light and airy schoolrooms, embellished with good engravings, or even with chromo-lithographs.

Mr. W. H. Freeland did not think there would be any difference of opinion as to the value of such an art professorship as had been described. He hoped that a subject to which Mr. Rathbone had had the courage, with delicacy and taste, to refer would commend itself to the sex which was so largely represented at the meeting, and that ladies would endeavour to dress with regard for beauty of form as well as of feature. He remembered a time when the Chinese ladies were much ridiculed for distorting their feet. He was sorry to see English ladies imitating that cruel and barbarous, he might even say wicked, fashion.

Mr. Joseph Brown, Q.C., fully admitted the justice of Mr. Rathbone's contention, that public appreciation of sound art was a first essential to the production of it. The wealthier classes were more artistic, because their wealth enabled them to surround themselves with works of art. The masses would never get this until the museums and art galleries were open on the one day on which they were able to visit them. He did not see how the poorer classes were to become acquainted with works of art by any other method. Their only other opportunity for seeing works of art was in shop windows; and he must say he was extremely interested when he saw a number of working-men and boys crowding round an art dealer's shop in the Strand.

Mr. T. C. Hine said that in the Nottingham Art Museum they had a collection of the most important treasures in the country, which was pronounced indeed the best out of London. But the public could gain little from these works of art beyond what was simply recorded on a card underneath. He suggested that a card should be affixed to each work of art giving the painter's name, birth, and any interesting incidents that marked his life. He was quite sure that any institution without this failed in accomplishing the object for which they professed to be established. As he was intimately connected with the initiation of the museum he would ask the chairman to put this resolution before the meeting, directing that the committee of the Nottingham Museum should be requested to place on each picture a printed card recording information which was deemed desirable that every man should have in this matter.

Mr. Aitchison thought it quite possible to get art professors to come down and give a few lectures. An art professor was almost an unknown bird. He was required to contain within himself such an immense variety of gifts that he must be a man of considerable education and extensive knowledge. He would be required to have the knowledge of a professor of each particular art. He would certainly have devoted himself to some particular branch of art to which he would give preference. Mr. Aitchison then proceeded to pass a eulogy on the President of the Royal Academy, as one in whom would meet the gifts requisite for such a post. More important than an art professorship was the infusing a love of art into the people for its own sake. You must have a love for the thing, else you will not find any art that is worth anything. People were stimulated by seeing anything done better by other people, and they excited an emotion which they themselves felt. Regarding what Mr. Tito Pagliardini said, who was not an Englishman, and who had left the room, Mr. Aitchison thought no doubt to some extent it was true. We must take the greatest trouble to get our children surrounded by things of beauty, and see that they had nothing that would cause ugly or unfavourable impressions. Although Italy was a more art-producing country than England from the middle of the thirteenth to the end of the seventeenth century, they had advantages which no other nations possessed—advantages of natural character. With the exception of music, however, there was now no comparison with that and other fine arts between Italy and England. Regarding certain peculiarities in the dress of ladies to which Mr. Rathbone had adverted in his paper, Mr. Aitchison thought the dress of men almost as hideous and almost as destructive to the human form. He suggested that if women shared in the exercises that were indulged in by men, this would result in giving way to a more natural form.

At the afternoon meeting a paper on "Oriental Art," by Mr. Pfoundes, was read in his absence.

**The Foundation-stone** of new works for the manufacture of Braby's corrugated iron and unsoldered patent zinc roofing was laid last week in Glasgow. The area of the works is over three acres.

**Manchester Cathedral.**—The restoration of Manchester Cathedral is progressing. With the exception of the carving of a few bosses, the first or most westerly bay in the north arcade of the nave is entirely finished from the floor to the roof, including the piers, the arch, and the clerestory. The second bay is also approaching completion. It is now possible to compare the graceful and slender stonework in its original dimensions as the first architect designed it with the more bulky cemented pillars. We understand that there are sufficient funds to warrant the restoration committee in proceeding rapidly with the whole of the north arcade from the western doorway to the great chancel arch.

## THE MANCHESTER SHIP CANAL.

REPORTS have been prepared by Mr. E. Leader Williams, C.E., and Mr. H. Hamilton Fulton, C.E., who were appointed by the Provisional Committee to make detailed surveys of the rivers Mersey and Irwell, and report as to the feasibility of constructing a navigation to Manchester available for ocean-going vessels. The Committee also retained the services of Mr. James Abernethy, F.R.S., as consulting engineer. Under the direction of Mr. Williams and Mr. Fulton, a complete survey of the navigation, with levels and borings, has been made, and reports, together with plans and estimates, have been prepared and submitted to Mr. Abernethy, who, after an inspection of the proposed course of the navigation, reported to the Committee upon the schemes thus submitted to him. The reports show that Mr. Williams and Mr. Fulton differ in opinion as to the mode of carrying out the object the Committee had in view—viz., of bringing ocean-going vessels up to Manchester. Mr. Williams proposes to improve the present tidal portion of the river from Garston to Latchford, to make it from that point to Irlam semi-tidal, and thence to Manchester to construct a ship canal; whilst Mr. Fulton's proposal is to make a tidal navigation the whole distance. Mr. Abernethy to the fullest extent approves of and endorses Mr. Williams' scheme; and after giving the matter their most careful consideration, the Committee have unanimously arrived at the conclusion that such scheme is perfectly feasible, and in every respect desirable. The Committee believe that the grounds upon which Mr. Abernethy has approved of Mr. Williams' scheme in preference to that of Mr. Fulton, and the reasons which have guided the Committee in their decision, will be apparent upon a perusal of the various reports. The Committee therefore strongly recommend that Mr. Williams' scheme, as approved by Mr. Abernethy, be adopted, and earnestly request the co-operation of the subscribers to enable the same to be carried out. It is felt that application should be made for Parliamentary sanction to the project in the approaching session, and the Committee desire to point out the steps which, in their opinion, should be taken to this end.

Mr. Williams in the course of his report says:—I propose to continue the tidal river from Garston to Latchford, above Warrington, and above that point to Manchester, a distance of 15 miles, construct a ship canal with locks to raise the water-level to nearly its present height at the proposed site of the docks at Manchester. At Latchford there will be a group of three locks of different sizes, placed side by side, close to and parallel with each other. Intermediate gates will be provided to each lock, so as to allow of the large locks being used for shorter vessels, or barges, without waste of water. Through a similar group of locks on the Amsterdam Ship Canal nearly 700 vessels of different sizes have been passed in one day, so that detention need not be feared, as the largest locks will hold several vessels at once, or a tug and large train of barges. The gates and sluices will be worked by means of hydraulic power, for which purpose the fall at the locks will be utilised, and vessels will be able to pass quickly through the locks. Except at low tides the gates of this set of locks will be all open about high water, as the tide will rise to above the level of the upper pound. At such times vessels will pass through the locks or through special large tidal gates without any detention. The large flood sluices (which are provided at each set of locks) will also be opened, and thus through the tide gates, the three locks, and the sluices a free flow of the tide will pass up to the first pound (which will be thus partly tidal) to the next group of locks near Irlam, a distance of about eight miles. As soon as the tide turns on the ebb, the gates and sluices will be closed, and the level of high tide maintained in that long reach of river. The locks at Irlam will be above the railway bridges of the Cheshire lines, which will therefore have no higher water level under them than high tides. These locks will be the same in every respect as those described at Latchford, except that the tidal gates will not be required, as the second pound (four miles long) will be above the level of tidal influence. The Irlam locks and sluices will pen back the water to a short distance above Barton Aqueduct, where the third and last set of locks, similar to those at Irlam, will be constructed. The Barton locks will maintain the ordinary level of the river to a height 8 feet less than at present below Throstle Nest Bridge, a distance of three miles, and give a level for the water in the proposed docks which will enable trade to be carried on with facility and dispatch. Steam power will be provided at each lock to work the hydraulic apparatus in dry weather, when the whole of the flow of the river might be required for lockage. If necessary this power could be utilised at such times to pump water back to the pound above by means of large centrifugal pumps. In ordinary seasons the river will afford an ample supply for the Irlam and Barton locks; but I propose to excavate the channel through those pounds 4 feet lower than will be required for purposes of navigation, so that the surplus depth may act as large reservoirs in exceptionally dry weather. The Irlam pound will also have the advantage of the supply from the Mersey, which will be taken when required by a conduit through which the river will flow into the canal above the Irlam locks. The locks will be connected with each other by culverts and sluices, which will allow of a great part of the water in a lock being passed into the adjoining locks,

and utilised again for lockage. The Welland Ship Canal in Canada, which has cost a much greater sum than is proposed to be expended on the Manchester Ship Canal, has no less than twenty-seven locks, with a total rise of 330 feet. The rise by lockage above ordinary spring tides at Irlam will be 35 feet by two locks. There are few docks that are not entered by a lock, and as a vessel going up on high tides to Manchester will pass the Latchford locks when the gates are all open, it will only have to pass one lock more than usual at many seaports. The width of the canal between Manchester and Warrington will be 100 feet at the bottom. The Suez Canal is 72 feet wide, and the Amsterdam Canal 87 feet wide at bottom. In the case of the Suez Canal, however, large steamers can only pass at certain places, where the canal has been widened for the purpose, and I consider it essential that the Manchester Ship Canal should be of sufficient width to enable large vessels to pass at any point. From Warrington the canal will gradually increase in width, until it is 300 feet wide at the bottom as it approaches Runcorn; through the tidal portion of the canal the depth will be dredged to 22 feet at low water; on the upper part of the canal it will be 26 feet deep at ordinary water level.

The following is the report of Mr. Abernethy:—Since the period of my inspection of the rivers I have given the subject my most careful consideration, and from long experience in the design and construction of similar works, aided by the valuable information furnished by Mr. Williams, I have arrived at the conclusion that the general arrangement to be observed in the design of the proposed improved navigation is to prolong the tidal portion from Liverpool upwards, so far as to enable vessels of a large class to navigate safely to a certain point during a flood tide, passing thence into a canal independent of tidal influence—in other words, to canalise the upper portion of the river to Manchester—by the construction of three sets of locks, forming three pools of the respective lengths of eight, four, and three miles, which can be navigated rapidly and with perfect safety, as by the modern system of working locks by hydraulic power the loss of time in passing them is inappreciable. I approve, therefore, of the salient features of Mr. Williams' design—*i.e.* the straightening, widening, and deepening of the river beds from Manchester to Latchford, 15 miles, and the gradual widening, straightening, and deepening of the tidal portion of the River Mersey seaward towards Liverpool. In the canal portion ample provision is to be made by weirs and sluices for the passage of flood waters and the scouring out of the deposit brought down to them, and it is obvious that the rectification of the present tortuous course of the rivers and increased sectional area of channel will minimise the effect of floods; while the rectification of the tidal portion in the manner proposed will tend to improve the lower portion of the navigation at Liverpool, and seaward to the bar. I approve of the proposed dimensions of the canalised portion of the navigation—*i.e.* a bottom width of 100 feet, with a depth of 26 feet at the ordinary level. These dimensions are greater than those carried out in the cases of the Suez or Amsterdam Canals, and are capable of accommodating and allowing the free passage of vessels of large tonnage. A less depth at low water will suffice in the tidal portion, having regard to the rise of the tide, but I recommend that it should be increased from 22 feet, as proposed by Mr. Williams in his report, to 24 feet. In connection with the tidal channel at Warrington, Mr. Williams proposes the construction of a lock, forming the present bed of the river into a float; but, having regard to the commercial importance of the town, I further recommend the formation of a dock of 12 acres area, by widening out on the right bank of the present river, immediately below the crossing of the London and North-Western Railway, and the construction of quay walls. I approve also of Mr. Williams' suggestion for the formation of docks at Irlam and Barton. The canalisation of the river, as proposed, raises the surface of the water in the proposed dock at Manchester so as to admit of the quays being at a convenient level for communicating with the various railways and streets of the town, an advantage of great importance for the interchange of traffic. The proposed dock at Manchester is of great area, but it may be proportionally executed, from time to time, as the requirements of traffic may demand. Mr. Williams deals generally with the important question of the crossing of the various railway bridges, and points out that the lowering of the low-water level at Runcorn will give a clear headway of 75 feet at high springs, or 90 feet at ordinary tides, amply sufficient for the free passage of the largest class of steamers, or sailing vessels with their topmast struck; the number of the latter are fast decreasing. He refers to the fact that by the various Acts of Parliament the railway companies are required to provide swing bridges on the improvement of the navigation for sea-going vessels. I have considered this question, and have no doubt that arrangements can be made to execute the required works, and thereafter carry on the free navigation of the canal, without impeding, even temporarily, the railway traffic, or that of the Bridgewater Canal. I have confined my observations to the general features of the scheme proposed in Mr. Williams' report, and shown on the relative plans and sections, without reference to matters of detail, requiring more mature consideration. The bearings transmitted by Mr. Williams generally indicate that the foundations for the various locks, sluices, and

walls will be of a favourable character, and that the construction of the works is attended with no peculiar engineering difficulties, and if energetically prosecuted may be executed within a period of four years. Without detailed designs of the various works their exact cost cannot be arrived at, but from long and varied experience in the design and construction of similar works I am of opinion that the sum of 5,400,000*l.* may be considered as a sufficient estimate for the tidal channel canal and dock works at Manchester.

Mr. Fulton proposes a practically straight and newly-excavated channel, with passing places at intervals of three or four miles. His estimate of the expense of the excavation of the new tidal channel, basin walls, training works, including bridges, paving slopes, culverts, drains, diversion of brooks and watercourses, new roads, and compensation for lands and buildings, is 5,072,921*l.*

A meeting of the promoters was held in Manchester on Tuesday, when it was resolved that steps should be forthwith taken by the Provisional Committee to raise the necessary guarantee fund, and to apply for Parliamentary powers to carry out the scheme as proposed by Mr. Williams, and that as soon as an adequate fund had been raised a further meeting should be convened to appoint a permanent committee to prosecute the undertaking.

## TECHNICAL EDUCATION.

A SPECIAL question assigned for discussion in the Education Department at the Social Science Congress at Nottingham was, "How can technical training be best associated with (a) primary schools, (b) intermediate schools, and (c) local colleges?"

Professor Silvanus P. Thompson, in his paper, said that scientific training of a simple practical kind should begin in the primary school, where also the teaching should be accompanied by constant reference to the industries carried on in the district. But something more than this must be done, and he looked to an extension of the practical exercises used in Kindergarten schools as furnishing a valuable means of promoting this kind of training. The manual primary schools of France had shown how such a course of training was possible, the manual exercises therein given consisting chiefly of models in wood, iron, and clay of pieces of constructive work, embodying scientific principles, and executed from working drawings prepared by the scholar himself. In England neither the school nor the workshop afforded a boy the chance of a technical training, and he became an inferior workman, and the productive capacity of the nation suffered exactly in proportion as the productive power of the workman as an industrial unit fell below what it might be. In seeking to develop a system of technical education for themselves, it was not enough to educate foremen and masters in technical colleges and schools, because, owing to the want of apprenticeship, that training did not filter directly downwards to the rising generation of workmen. He was of opinion that to meet that necessity something should be done in direct connection with primary schools. A system of manual exercises in making constructive models in wood, iron, clay, wire-work, &c., was possible, and might be regarded as an extension of the Kindergarten system to more advanced and really useful work. Every child ought also to be taught to make working drawings, with plan and elevation, and to understand the principles of the method, for in all the constructive industries that was the way in which instructions were given. The time wasted on showy productions of bad art might well be given to useful industrial drawing, of which many workmen were woefully ignorant. Those subjects, he maintained, should be recognised among the subjects of the educational code, and adopted as part of the teaching of primary schools.

Alderman Cropper read a paper in which he gave the following description of a local college:—Animated by that spirit of enthusiasm without which no such college can succeed, some of the engineering firms of this town have contributed the material, and their employes are contributing the labour, for the manufacture of such necessities as a steam engine, lathes, and other tools; and it will add no little to the success of our enterprise for a working man, as he passes through the building and points to the various machines, to be able to say, "I gave a day's work to the making of that." One very important part of the apparatus will be a museum of models, showing in chronological order the various inventions in the departments to which especial attention will be directed. In many cases a plain, inexpensive wood model, in section, will suffice. For want of such a museum many a man has spent weary years in perfecting an invention which had been completed and probably abandoned long before. The pupils should be selected from those who have either passed or are passing certain classes in the college. I think this is essential, because the workshops are intended simply to illustrate the subjects taught, and are not in any sense intended to perfect the pupils in mere handicraft. The apprenticeship system will do that. The teachers will naturally be the professors of the college, but a considerable augmentation of the staff will be necessary. It would be unreasonable to suppose that the professors will be able to enter into the technicalities of a trade of which they must be profoundly ignorant. For such branches as weaving and the manufacture of textile fabrics an

intimate practical acquaintance with these manufactures will be required, and I see no other plan than the engagement of the best men to be found in each department, such men to supply the art (practice) while the professors supply the science (instruction). The method of teaching should be theoretical—the mere teaching of principles on a scientific basis, whilst the tools or apparatus should be used only for the demonstration of the principles taught. The professors should confine themselves to the teaching, and leave the demonstration to others. The best amateur workman is a mere tyro compared with an apprentice, and it is impossible that in the actual use of tools a professor can ever be more than an amateur. So long as the professors talk our apprentices will believe in them, but when they work our apprentices will “find them out.” If we do but confine ourselves to the useful application of scientific principles to our manufactures, technical education will be a blessing to the country. My chief fear is that professors, committees, and managers will be attracted by the “pretty side” to the neglect of the “seamy side,” which is, after all, that on which the real work is done.

The Rev. H. Solly, speaking as the representative of skilled artisans and employers, said that specific technical training should not be attempted at primary schools. But the Kindergarten mode of training supplied admirable hints as to what may be done at an early age in training all children to those habits of observation, manual quickness and dexterity in handling tools, copying patterns, &c., which are invaluable as a preparation for almost any subsequent occupation. And something might be done at primary schools to continue or commence this kind of training imparted at Kindergarten schools. By means of workshops, *e.g.* admission to which would generally be regarded as a privilege, lads might be instructed in the use of tools, in the rudiments of chemistry, in modelling, &c., especially on half-holidays, winter evenings, and so forth, whereby the ordinary school instruction would not be interfered with. Lastly, the elements of geometry should form part of the regular curriculum, if possible, in all cases; and drawing, both freehand and machine. By the time a lad enters an intermediate school it will generally be possible to determine the particular trade for which he is to be trained, if any. He will also be of an age for apprenticeship. At present very few apprentices or lads of any status receive specific, *i.e.* technical training for their trade in any workshop or factory. They have to pick up a knowledge of it as they best can, from chance hints, sharp observation, obliging journeymen, “standing treat,” running errands, &c. Hence apprenticeship schools or classes for technical training have become an absolute necessity. But in every case the main points in this connection were—1. That technical training must be given by scientific and practical workmen. 2. That to apprentices and all intended for specific trades it must be given outside of the actual workshop, and in addition to the manual dexterity and manipulative training they must get in the workshop. 3. That in these technical classes science and art teaching must be given them in connection with the actual materials and tools used in their trade.

Mr. T. Heller, Secretary to the National Union of Elementary Teachers, confessed to a sense of disappointment at hearing Professor Thompson giving so great a preponderance in his account of elementary technical education to mere manual dexterity rather than to intellectual instruction and culture. He deprecated any burdens being added to the already over-burdened teachers in elementary schools, and said that, representing, as he did, 14,000 elementary teachers, he would say on their behalf that any attempt to force the system of technical education on the elementary classes would fail in its purpose, and damage the general instruction which the teachers had to give. What they wanted in the elementary schools was to give such a sound general instruction as would enable a pupil to understand and assimilate the thoughts of others, and in that way to be able to educate himself.

The Rev. Capel Sewell, Inspector of Schools, concurred in what had been said by the last speaker. He thought it would be a good thing if the Congress would put its foot down on the project for connecting technical and primary schools, and put a stop to it; for if this were done it would save a great deal of trouble. If they were to have technical education they must make up their minds as to what they wanted, and take care to confine themselves strictly to that instruction. An elementary teacher was expected to teach everything nowadays, but it was not fair to add to the burden.

Mr. Charles Walker deprecated the proposal to abolish the old system of apprenticeship, which did much to keep a young fellow steady. He did not think that much good could come from local college technical instruction, but he thought it a good plan for young men to attend some evening school where he could be instructed in the rudiments of his trade. College professors were too apt to look at technical training as an abstract question merely, and not (as it ought to be regarded) a practical matter.

Professor Clowes quite agreed with what had been said as to leaving the task of teaching technical matters to soundly-trained workmen. He thought the system of scientific education ought to be supplemented by the examples of skilled workmen versed in the manipulative part of the work.

Professor Garnett recommended that the pupil on reaching a certain standard should be left to work out his own advance, the

limit of that advance being fixed by the teacher. He believed that if that were done greater progress would be made than under any other system.

The Rev. J. F. McCallan said, with regard to the connection between primary and technical education, he maintained that if arithmetic or mathematics were taught to a child, the foundations of technicology were being laid. One of the greatest obstacles to the advancement of working men was that they had no knowledge of mathematics, for with that knowledge they could do much better than without it. Technicology was the teaching of the scientific principles which underlie the art of the workmen; if they taught a child geometry or free-hand drawing, they were paving the way for that child in after-life being an accomplished workman.

## EXTENSION OF THE BRITISH MUSEUM.

ON Saturday morning the corner-stone of a block of buildings connected with the south-eastern side of the British Museum was laid by Mr. Edward A. Bond, Principal Librarian, in the presence of the chief officers of the Museum and others. Mr. Bond took advantage of the occasion to make known that the new buildings—consisting of a frontage to Montague Street of 120 feet, with two sides carried up to the Museum walls—were being erected from funds bequeathed by Mr. William White, a gentleman who had resided in the neighbourhood, and who at his death, in the year 1823, left the reversion of a sum of 63,941*l.* to the trustees of the British Museum, to be used at their discretion, but with the expression of a hope that it would be expended on an extension of the Museum buildings. The actual terms used by the testator are as follows:—

“The money and property so bequeathed to the British Museum I wish to be employed in building or improving upon the said institution; and that round the frieze of some part of such building, or, if this money is otherwise employed, then over or upon that which has so employed it, the words ‘Gulielmus White, Arm. Britanniae Dicavit 18—’ be carved, or words to that import. It is a little vanity of no harm, and may tempt others to follow my example, in thinking more of the nation and less of themselves.”

The bequest fell in early in the year 1879. By payment of the legacy duty—rigorously exacted by the Government—it was reduced to 57,572*l.* Of this sum about 11,000*l.* has been expended in the erection of a new gallery for Greek sculptures, between the Elgin and Assyrian Galleries, and in other works connected with it. The remainder is now being spent on the new block of buildings. It was further explained that this would give accommodation on the ground-floor for the rapidly-increasing collection of newspapers, which has outgrown the space designed for it in the library, together with a convenient reading-room in which they could be consulted, and, on the two upper floors of the front and north side, rooms for the department of prints and drawings, with ample space for exhibition. On the ground-floor of the south side the department of manuscripts would obtain extension, and the upper floor would give space for the exhibition of part of the archaeological collections.

The plans of the building have been prepared by Mr. John Taylor, surveyor to Her Majesty's Office of Works; and the contractors are Messrs. John Mowlem & Co. It is expected that it will be completed within about twelve months from the present time. It occupies the site of the garden attached to the official residence of the Principal Librarian.

## TRURO CATHEDRAL.

THE Truro Cathedral works are progressing rapidly. According to the *Western Morning News*, the structure now presents a very striking appearance, the part contracted for being about half-way towards completion. The present contract is for the choir and choir aisles. A fair idea of the extent of this part is now obtainable. The length of the chancel is about 150 feet and 29 feet wide between the walls. The width of the chancel aisles are 13½ feet each between the walls. There is a narrow aisle on the south side 6½ feet wide, which divides the Cathedral proper from the old south aisle of St. Mary's Church, which is being restored, and the old work, as far as admissible, re-used. Among the pieces of old work preserved are a niche surmounted by the Tudor arms (the architectural style of this old part being late Tudor), the priest's door, and some of the finely-carved moulding. A careful cast has been taken of all the pieces which were too decayed to be utilised, and those stones which replace them will be carefully carved, as nearly as possible after the original designs. The height of the chancel, from the nave floor-line to the point of the groin ceiling, is about 70 feet. Below the nave is the crypt, which is about 12 feet high, and will be used for vestries. From the groin ceiling to the roof will be about 25 feet, giving a total height of about 110 feet. The highest part of the Cathedral will be the main tower, which will be about 220 feet from the nave floor to the roof. This, however, is not included in the present contract. The entire building, when completed, will be over 300

feet in length from end to end. The north and south arcades are in a fair way towards completion, the choir arches being all set. The eastern wall is up as high as the window cap of the lower tier of windows, and the workmen are now engaged in setting the window arches. The north aisle walls are ready for the parapet, and in the south aisle the east window is set, and the others are in various stages of progress. The most conspicuous parts of the structure at present are the two great tower piers, of enormous girth and beautiful design. They are ready for turning the tower arches. As the building is now seen it is just half what its height will be, measuring from the crypt-floor to the vaulted ceiling. The size of the completed Cathedral may thus be faintly conceived. The south aisle will form the Lady Chapel, and the parish church daily services will be held there. The walls outside are faced with Mabe granite, and inside with St. Stephen's granite; all the other interior masonry is of Bath, Doulting, and Hamhill stone. The present contract, it is expected, will be completed in about two years, and divine service will then be held in the finished chancel, which will be blocked off from the remaining portions with a temporary wall. The completion of the entire building is simply a question of funds.

### WELBECK ABBEY.

A PARTY of members of the Social Science Association visited Welbeck on Saturday last. The following account of the place and of the excursion has been prepared by Mr. Hine, architect:—

It may be said briefly that the Welbeck and other magnificent estates in this county known as the "Dukeries" were inherited from Sir William Cavendish, who was knighted by Henry VIII., and married Elizabeth Hardwick, afterwards Countess of Shrewsbury. This notable lady had three other husbands, and being of a selfish and rapacious nature, and withal very shrewd, she managed to get their estates into her own hands, and from the daughter of a plain squire with a portion of 40 marks she rose to be the richest woman of her day, and by the great alliances which she secured for her children she became as it were the foundress of the noble families whose palatial mansions adorn the northern portion of this county. Her ruling passion was for building, in which she may have been influenced by the prediction of the witch, who is said to have told her, and perhaps safely enough, that as long as she continued building she would never die; but whether or no, it is quite true that after completing Chatsworth, Hardwick, and Worksop Manor, she commenced a large house at Owlcotes, when in 1607 a cruel frost put an end to all her building operations, and may possibly have been the cause of her death, for she was then at even a more advanced age than her grandson the duke when he commenced to build his town abode at Nottingham. Her husband, Sir William, is credited in biographical dictionaries and encyclopædias with being the Gentleman Usher of Cardinal Wolsey, also the author of the very interesting MS. narrative giving the life of the Cardinal, and first published in 1641. This, however, is ably disputed by Singer and Hunter, no mean authorities, who contended that it was George the poet, an elder brother, who was the man, and that the author was robbed of his literary honours for the aggrandisement of his more fortunate brother Sir William. She had issue, only by Sir William Cavendish, and was the grandmother of the first Cavendish, Duke of Newcastle, who, after being victorious in fifteen battles and sieges in the Civil War, and spending what would in the present day represent more than a million of money in the Royal cause, supplemented his Welbeck and other mansions by the erection of the modern Castle of Nottingham. He was the grandmother of Henry Cavendish, Earl of Ogle. This young nobleman was married to Elizabeth Percy, and had he lived to secure posterity, the Welbeck estates might have continued in the possession of the Newcastles, and be increased enormously by those of his wife's, who was heiress to Jocelmi, eleventh Earl of Northumberland. Some remarkable incidents are recorded in relation to this lady, who when a mere child had been married to the young nobleman before named. The latter died in 1680, soon after the family took up their abode in the new Castle of Nottingham, leaving his virgin wife a widow. Shortly afterwards, through the agency of her grandmother, the old Countess of Northumberland, she was contracted to Mr. Thomas Thynne, the princely lord of Longleat, on condition, however, that by reason of her extreme youth, a twelvemonth should elapse before the consummation of the marriage. In the meantime Count Konismark, a descendant of the noble family of Bradenburgh, having previously met the young lady, conceived the daring project of marrying her, and, as a preliminary step, coolly decided on the murder of Thynne. With this vile purpose in view, he engaged the services of three foreign adventurers, who on a winter's evening posted themselves at a spot where they had ascertained the equipage of Thynne would pass. This was near to the present Opera Arcade, in those days a dark and retired neighbourhood. As soon as the coach appeared the three men rode up to the window, and by their imposing attitude easily compelled the coachman to stop. Only one shot was fired, but so sure was the aim that the unfortunate victim expired shortly

afterwards. Konismark, by bribery and influence, managed to get acquitted; the other three were executed. On Thomas Thynne's tomb in Westminster Abbey the circumstances of this atrocious act are recorded in a bas-relief, which, as a work of art, has some claim for admiration. The Welbeck estates first came into the hands of the Bentinck family by the marriage of William Bentinck, the 2nd Duke of Portland, with Lady Margaret Cavendish Harley, granddaughter of John Halles, Duke of Newcastle, who met his death in 1711 by a fall from his horse while hunting. This nobleman entertained William III. at Welbeck in 1695, and the Nottinghamshire squires were invited to a grand meet on this occasion. There were no less than 400 gentlemen on horseback, who were charmed to hear the King say, "he hoped this was not the last run he should have with them over the vast domains of his host, and that he must hire a hunting-box amongst their delightful woods." Apart from the notable relics, it is to be regretted that so few of the old oaks should now be found standing within the woods round Welbeck, but the following letter, found in the archway of the Abbey, from Sir Christopher Wren will account for the disposal of many of them:—

"For Mr. Richard Neale, steward to his Grace the Duke of Newcastle at Welbeck.

"London: April 4, 1695.

"Sir,—Having in my letter of June 23, 1695, signified to you a particular of all the scantlings of the Timber wee might use in the rooffe of St. Paule, that his Grace's noble benefaction might be as useful as may be to the worke, and understanding that what is already designed is none of the great beams which is what wee are most solicitous for, and being given also to understand that wee must expect this season but Ten of his great Trees, I presume once more to acquaint you with the scantlings of the great Beames to prevent mistake." After furnishing these dimensions, he concludes: "I beseech you to present with all advantage our utmost sense of his Grace's favour, of which also I am very sensible as becomes,—Your humble servant,

"CER. WREN."

About the only distinguishable portion of the house erected by the first Duke of Newcastle is the riding-house built by him from plans by Smithson, who would doubtless be engaged in the erection of the riding-house at Bolsover. The Welbeck riding-house is 182 feet long by 40 feet wide, and has a fine curvilinear braced open roof, the oak timbers of which are unfortunately painted white. In this room were seen portraits of some of the horses which this duke is supposed to have bred. He contributed greatly to bringing our Flemish mares into something like hunting shape. He was said to be the first equestrian in Europe, and the MS. of his celebrated work on horsemanship is in the possession of the present Duke of Portland, but it happened to be in London on the occasion of the excursion.

The most notable attraction to the party, and one of intense interest, was the silver chalice from which Charles I. took the Communion on the day of his execution. As a special favour the conductor of the party was allowed to remove this from the glass case, or, to speak ecclesiologically, the ciborium in which it was enshrined, and carry it round for the inspection of the visitors. A tattered and discoloured document within the chalice certified to its authenticity. Among other objects of interest to which the visitors were conducted were the gardens, and the acres of glass conservatories: the walled-in portion of the gardens alone represented an area six times as large as Nottingham market-place. The attractions of the place generally were found to be so great that the majority of the party decided to deviate from the programme by staying for a later train. It is needless to say that the whole were highly gratified with the kind and hospitable reception they met with, and will doubtless retain a lasting recollection of the marvels of Welbeck.

**The Swinton Drainage Works.**—The members of the Swinton Local Board lately went over the Swinton Bridge Sewerage Works to inspect them on the completion of No. 1 contract by Mr. Wortley, of Doncaster. A substantial engine-house has been raised upon a high bank of dirt and ashes, and has been furnished, for about 6,000*l.*, with engines and machinery by Tangye, of Birmingham. The system is filtration by irrigation. Satisfaction was expressed with Mr. Wortley's work. The work under the contract for the sewerage has been begun by Mr. Norbran, of Rotherham. Contracts are also being sought for the waterworks, which are to cost about 10,000*l.* of the 24,000*l.* loan. The amount of Mr. Wortley's contract was 1,397*l.*, the machinery cost 600*l.*, and the amount of No. 2 contract just begun is 1,500*l.* The pumps were seen on the occasion to lift a thousand gallons a minute. A little subterranean forest has been discovered in the course of the digging, consisting chiefly of black oak trees, the trunks and branches being in good preservation. One monster, 23 feet below the engine-house, is 3 feet 6 inches in diameter. In one part were a number of filbert nuts. Several of the hard trunks have been dug out, and given away to the men for firewood. The soil appears to be a sandy warp, and probably was once part of the river.

**Christ Church, Zanzibar.**

SIR,—I beg to forward copy of a letter addressed to the *Times*, which has some bearing upon the practice and value of training in our profession. As such I ask you to insert it, as the *Times* has not noticed it. The article implied more boldness than wisdom in the Bishop in being his own architect, whereas he had the wisdom always to employ an architect (myself), though he had his ideas well defined, and so was able to give clear instructions, and personally to carry out on the spot the designs which might otherwise have been useless.

I wish there were many more like Bishop Steere, as I claim him on the side of professional architects (even from the time when we as boys first studied together), and not, as the writer of the article in the *Times* would imply, as being ready to ignore them and depend upon himself alone.

I am, &c.,

C. FORSTER HAYWARD.

20 Montague Street, Russell Square :

September 25, 1882.

(To the Editor of the *Times*.)

September 20, 1882.

As one who knew the late Bishop Steere intimately from the time we were schoolfellows together, and as one deeply interested in the new building called the Cathedral at Zanzibar (the late Bishop always called it "Christ Church"), having made all the designs for it myself, I feel impelled to add a few words to your excellent statement of his life and work in your issue of the 19th inst. The Bishop is there spoken of as a bold man, because he was his own architect, and, it is added, that he felt himself equal to the task. I think I alone can fully appreciate this, inasmuch as the Bishop came to me as to an old friend with his original ideas, and bringing his crude sketches with him, asked me to undertake the task of designing the building therefrom, putting the whole into a proper architectural form. This was done, and therefore the boldness referred to was less than the wisdom which sought and accepted help in the form which was needed.

Subsequently the Bishop himself superintended the whole of the work on the spot (put together under his own eye)—the centering for the vaulted roof, which I had caused to be made and sent from England, as well as set up the marble work for columns, &c., stained glass for windows, font, and altarpiece of marble and mosaic.

These sketches I have referred to were no surprise to me, as we had gone together in small church-hunting expeditions many years ago, he studying the glass and such internal details while waiting for the conclusion of my architectural study of a building, neither of us dreaming how in after-life such studies would blend together in forming a distant edifice—a church in the slave market at Zanzibar—and scarcely less so when, on his first appointment to the living of Little Steeping, he called on me to build his parsonage, and subsequently the schools, after his first visit to Zanzibar.

**ARCHÆOLOGY.**

**Preservation of Ancient Monuments.**—At the excursion of the members of the Penzance Natural History and Antiquarian Society, a few days ago, Mr. Borlase, M.P., said he would take that opportunity of saying something about the letter which appeared in the *Times* the other day from his friend, and the friend of many of them, Canon Venables, calling the attention of antiquaries of the west country to the fact that the Cornish pre-historic monuments were not inserted in Sir John Lubbock's Bill, the reason assigned being that they were in Duchy property. He (Mr. Borlase) did not for one moment believe that if a proper application were made to the Duchy to have these monuments, which might be upon its ground, included in the Bill, there would be the least difficulty about the matter. The reason why they were not inserted in the Bill was because there had really not been time to do so. It was thought it would be better to get the Bill through in its present form, with a schedule containing a certain number of the most important monuments in England worth preserving. He was glad to say that the societies of Cornwall, and the people of the county generally, were found to be anxious to preserve these monuments, and more especially in later years. He would again say there would be no difficulty whatever in adding the ancient monuments of Cornwall to the schedule of the Bill by a resolution which might afterwards be moved upon the subject, and he would be extremely glad to do all he could in the matter. The Bill of Sir John Lubbock he thought everyone would acknowledge was a most valuable one, and he hoped it would not only tend to the preservation of pre-historic monuments, but stimulate an interest in them. Mr. Borlase also stated that plans of the rude stone monuments of Cornwall, most carefully prepared by Mr. Lucas, were at present

in the hands of the Society of Antiquarians, who were about to print them at their own expense. Seeing the pains and the cost which the Society had gone to, he hoped a large number of copies would be sold in Cornwall.

**ENGINEERING WORKS.**

**The Metropolitan Railway.**—A section of the extension of the line between Aldgate and Trinity Square was opened on Monday morning. The High Street, Aldgate, is carried over the line by a bridge with a span of 82 feet, constructed of heavy wrought-iron girders, with iron plates to bear the great gas-mains of the Gas-Light and Coke Company. The railway here is sufficiently wide to allow four lines of way and two platforms to be used. The tunnel further on is 25 feet wide, with vertical side walls and a segmental arch, the side walls and retaining walls of the open cutting being made of Portland cement concrete, and thick and strong enough to bear any buildings that may be erected above them. The arch is of stock bricks laid in mortar, and in some places is 3 feet thick. In passing under the Blackwall Railway it was necessary to underpin the abutments of the arch, and much care had to be exercised in making this portion of the line, as the traffic from Fenchurch Street had to be carried on without interruption, and trains were continually passing and repassing on the archways of the railway beneath which the new line was being made. The temporary station at Tower Hill is a wooden building placed saddlewise above the line, with a single staircase for the platforms, which are 300 feet long by 12 feet wide, and, like the stairways, covered with an ornamental iron roof. After passing under the High Street, Aldgate, the line runs for seventy yards in an open cutting, then through the tunnel under the Minorities, through another piece of open way, next by a covered way beneath the Crescent, whence it emerges into the open-air station. The works have been constructed under the direction of Mr. Tomlinson, C.E., and Mr. Seaton, by Mr. T. A. Walker, contractor. In the tunnel under the Minorities the experiment has been tried of lighting the line with the incandescent electric lamps of the Swan United Electric Light Company, with a view to determining whether sufficient illumination could not be obtained in this way without lamps in the carriages.

**NEW BUILDINGS.**

**Maidstone.**—A new children's ward has been opened at the West Kent General Hospital. Accommodation is provided for from twelve to sixteen beds. The building is a plain substantial structure of red brick on an elevated site in rear of hospital, and connected by a corridor 70 feet long. Day-room, bathroom, nurses' room, kitchen, storeroom, lavatories, &c., are comprised. The architect is Mr. E. W. Stephens, of Maidstone, and Mr. Avaré is the builder.

**Public Baths, Glasgow.**—The new public baths in Kelvin Street, North Woodside Road, were opened on the 13th inst. The building has been erected from designs by Mr. Carrick, master of works. A flight of steps lead up to the main bathroom, in which there is a large swimming-pond, measuring 75 feet in length and 40 feet in breadth, with a maximum depth of 6 feet 6 inches, and a minimum of 4 feet. It is lined with white enamelled tiles, and there are the usual gymnastic appliances, which hang from the open timber-work roof. Along either side of the hall are twenty-four dressing-boxes, with entrances from a separate passage as well as from the bathroom. A gallery capable of accommodating about 300 spectators runs round three sides of the apartment. In another portion of the building is a ladies' swimming-pond, which measures 40 feet long by 23 feet broad. There are twenty-seven private bathrooms for gentlemen and seven for ladies. The washing-house has sixty-seven tubs, and is in the basement of the building. It contains a full equipment of boilers, wringing-machines, and drying apparatus. The total cost of the building has been about 19,000*l.*, including site.

**Lancaster.**—On Wednesday the new hospital which has been erected in the grounds of the Royal Albert Asylum for Idiots and Imbeciles of the Northern Counties, which is the gift of Mr. Edward Rodgett, of Darwen Bank, Preston, was formally opened by the Earl of Lathom. The new building is detached from the main building of the asylum, and is intended for the reception of infectious cases of disease among the inmates. Mr. James Hatch, of Lancaster, is the builder. The hospital, which is placed on a sunny site, south of the asylum, is a plain substantial structure built of local freestone, and roofed with green Westmoreland slates. The building faces due south, and consists of a central block two storeys in height, and east and westward wings one storey high, with washhouse and other offices detached, and enclosed by a yard wall. Altogether accommodation is provided for thirty-three patients, and both floors can, in case of an extensive epidemic, be used in conjunction by opening a door of communication. All the rooms are airy, well-lighted, heated, and ventilated. The heating and ventilation are effected by Manchester warm-air grates, with

open fires, supplemented by a hot-water apparatus placed beneath the floors in chambers and conduits, from whence fresh air, warmed or otherwise, can be admitted into the wards or rooms, either at the floor level or through upright shafts seven feet high (at will), whilst a constant change of air is effected by means of vertical extracting shafts connected with gratings in the ceilings of the wards. All windows open in three heights, so as to admit air at any required level. The hospital is surrounded by its own separate grounds, which will be laid out with shrubberies, walks, grass slopes, &c. The contractor for the hot-water apparatus, combined with ventilation, was Mr. A. Seward, of Lancaster. The sub-contractors for Mr. Hatch were—slating and plastering, Mr. Cross; plumbing, Messrs. Calvert & Heald; and painting, Mr. H. Warbrick, of Lancaster. The furniture has been supplied by Messrs. Gillow & Co., of Lancaster and London.

**Paisley Library and Museum.**—This institution has been enlarged at the expense of the original founder, Sir Peter Coats. The ground rises rapidly towards the back, and the new building has been planned to rise with it to avoid the expense of deep excavation, as well as the disadvantages of sunk building. The result is that the floors of the new portion of the museum and reference library are on the same level as the gallery of the old museum. The access to the new portion, which now contains the largest and most handsome of the apartments in the combined structure, is by two spacious flights of steps directly opposite the principal entrance. These lead to a circular-shaped central hall 30 feet in diameter, laid with marble mosaic flooring of elegant design. The hall is roofed with a coffered dome, supported on Corinthian pillars. Entrance is afforded by this hall to the new portion of the museum, fine art galleries, and new reference library. The library, 50 feet long by 24 feet wide, is surrounded by bookcases, with which the timber mantelpieces of two fire-places are designed to harmonise. In a panel over the northern fireplace there has been introduced a piece of sculpture in bronze executed and presented by Sir Noel Paton, R.S.A., whose early years were spent in Paisley as a designer. The art galleries consist of a sculpture gallery 30 feet square, and a picture gallery 80 feet long by 27 feet wide. A handsome panelled cove rising from the cornice gives an effect unbroken by cross-ties, the necessity for which has been avoided both in this gallery and in the museum by a free use of iron in the construction of the principals. A fine hall has also been provided to the extent of 90 feet long by 48 feet wide, divided by a row of Ionic columns, carrying with the walls two semicircular ceilings, the centre of which is largely composed of glass. Adjoining the reference library are lavatories and a large room for storing specifications of patents, while under part of the hall is a large, well-lighted work-room. The reference library is partially and all the other rooms are wholly heated by hot-water pipes. The entire work has been carried out according to the designs of Mr. John Honeyman, F.R.I.B.A., architect, Glasgow, who planned the original building. The contractors were:—Mason, Mr. John Tod, Glasgow; joiner, Mr. George Ferguson, Glasgow; slaters, Messrs. W. Gillespie & Son, Paisley; plumbers, Messrs. Wallace & Connell, Glasgow; plasterer, Mr. James Hutcheson, Paisley; tiles and mosaic, Messrs. Galbraith & Winton, Glasgow; heating, Messrs. James Boyd & Son, Paisley; painting, Messrs. D. Murray & Son, Paisley.

**New Hydropathic Establishment, Seaforth.**—On Monday the Earl of Lathom opened the new establishment of the International Marine Hydropathic Company, on the Lancashire shore of the estuary of the Mersey. Seaford House, Seaforth, a few miles north of Liverpool, on the Liverpool, Crosby, and Southport line of the Lancashire and Yorkshire Railway, was until lately the residence of a Liverpool merchant; but since its acquisition by the above company it has been greatly enlarged and altered to suit the purposes of a high-class hotel as well as those of a hydropathic establishment. The main building, constructed of Yorkshire stone, has a frontage to the sea of 659 feet, and on its flat roof, at an elevation of 80 feet from the ground, is constructed a very spacious and properly-guarded *ascianda*, where visitors may promenade in suitable weather. From this lofty position fine views are obtainable. This *ascianda*, which may be reached by either staircase or elevator, has an area of 150 feet by 40 feet; and on the southern section of the building there is another similarly lofty promenade. The house has accommodation for 200 visitors, while its culinary arrangements are sufficient to provide for about 500. There are reception, reading, and card rooms, general and ladies' drawing-rooms, large dining-hall, picture-gallery, billiard-room with five tables, besides other apartments; and on the main floor the rooms are so arranged that on the occasion of *conversazioni* they may be opened for promenade all round. For the baths provision is made for an abundant supply of sea-water brought into the reserve tank by a system of upward filtration, a large quantity being obtained at each flow of the tide. On the roof there is also an arrangement for securing a plentiful supply of clean rain-water, the tank having a capacity of 250,000 gallons. Attached to the house are glass-covered conservatories, vineries, and fruit-houses. The grounds on the sea side of the house are protected by a raised terrace and promenade; and between this terrace and the house is a lake 650 ft. long, filled to a depth of

5 feet or 6 feet with filtered sea-water, constantly pumped in at one end, while there is an outflow at the other. It is intended to utilise this in summer for bathing on the Continental principle—ladies and gentlemen being in the bath at one time. In winter the water may be lowered and the area used for skating purposes. The works have been carried out under the direction of Messrs. Weightman & Son.

### CHURCH BUILDING AND RESTORATION.

**Leith.**—Plans of Messrs. Sloan & Balderston, of the United States, arranged and adapted by Mr. Thomson, architect, of Leith, have been selected for the erection of a church in Lorne Street. The building will have a frontage to Lorne Street, and is in the form of an octagon. A circular arrangement of the seats is adopted in the ground plan of the interior, and in the gallery, which is of a horse-shoe formation, the seats will be similarly constructed. The area of the building will be 76 feet square, and, with a roof span of 80 feet, without intersecting beams. The estimated cost of the building, which will provide sitting accommodation for over 1,200 persons, is about 6,000*l*.

### GENERAL.

**Lord Derby** has purchased from the Walker Art Gallery two pictures by Mr. Joseph Knight, of Manchester—an oil painting, *The Raven's Crag*, and a water-colour, *In the Ogwen Valley*.

**The First Premium** in the competition for a proposed new market at Stoke-on-Trent has been awarded to the plans of Mr. Charles Lynam, and the second to those of Mr. Taylor, of Longton. Plans by Mr. Stevenson, of Manchester, have been reserved in case the cost of the plans of the two first mentioned exceed the estimates.

**Mr. J. A. Chatwin**, of Birmingham, has prepared plans for the proposed Art Gallery at Wolverhampton, and a contract for the erection of the building has been taken by Messrs. P. Horsman & Co., of Darlington Street, Wolverhampton.

**Lord Robartes** intends to build the north arcade of Truro Cathedral as a memorial of his father. The south arcade will be the memorial of the Hon. George Fortescue.

**Plans of Messrs. Giles & Brookhouse**, architects, of Derby, have been adopted for enlarging and restoring the parish church at Turnditch.

**Messrs. Heaton, Butler & Bayne** have filled the east window of Staplehurst Parish Church with stained glass, as a memorial of the late Mr. Henry Hoare and Lady Mary Hoare.

**Messrs. Braddock & Matthews**, of Southport, have obtained the contract for the construction of the branch line of the Caledonian Railway between Whiffle and Airdrie.

**The "Capitan Fracassa"** is informed that at the recent meeting of the Commission for the erection in Rome of the monument to Victor Emmanuel, Signor Depretis spoke warmly in favour of the monument being erected on the Capitol. Apparently, the site chosen is that where now stands the celebrated bronze equestrian statue of Marcus Aurelius, which will be removed and placed in a museum.

**A Peal of Bells** has been cast in Belgium for the church of St. Nicholas, Aberdeen.

**A Vicarage** is now in course of erection at Great Broughton from plans by Mr. W. C. Jennings, of Cockermouth.

**The Contract** for the erection of the new bridge across the Tees at Stockton has been taken by Messrs. Whitaker Bros., of Leeds, at the sum of 38,000*l*. The total cost is estimated at from 46,000*l*. to 56,000*l*.

**The National Competition Drawings** are now on view at the Manchester School of Art. They will afterwards be exhibited in Glasgow and Belfast.

**The New Buildings** at Somerville Hall, Oxford, will be opened during October. They were designed by Mr. T. G. Jackson.

**A Parochial Hall** is to be erected at a cost of 1,000*l*. in the parish of St. Jude, co. Dublin, in recognition of the services of Sir Garnet Wolseley.

**The Brentford Local Board** on Wednesday accepted provisionally tenders for the construction of extensive sewage works and of a river wall on the Thames near the town. The works are estimated to cost 25,000*l*., and have been designed by Messrs. Gotto & Beesley.

**The Trustees of the British Museum** have in the press a catalogue of early German prints compiled by Dr. Wiltshire. The collection of these prints is considered the finest in Europe.

**Miss Duthie**, of Aberdeen, has granted a site in the Duthie Park, which has been suggested by Sir Noel Paton, for the Wallace monument, which is to be presented to Aberdeen under the will of the late Mr. Steill, of Edinburgh. It is to take the form of a colossal statue in bronze to cost not more than 3,000*l*.

**A Tender** of Messrs. Laphorne & Goad, of Plymouth, has been accepted for the erection of the Plymouth Post Office. The cost of the building will probably be about 11,000*l*.

# The Architect.

## MR. AITCHISON ON THE CULTIVATION OF THE ARTS.

HE CONGRESS-CROP of the current year—if we may be permitted to use such a term without disrespect—seems to be, if not exceptionally good, at any rate of very fair quality all round; and, so far as fine art goes, we were able to report last week so many good papers and speeches that we may confess to a slight embarrassment now that we desire to say something

more concerning the best of them. Mr. AITCHISON, A.R.A., in the chair of the Art Section of the Social Science Congress at Nottingham, read an exceedingly interesting address on the Cultivation of the Arts. Mr. H. H. STATHAM discoursed with much good sense on the Conservation of Ancient Architectural Monuments. Mr. T. C. HORSFALL dealt with the great practical problem, how to bring the influence of art to bear upon the masses of the people in large towns. Mr. HODGSON PRATT expounded the policy of the Sunday Society in the same direction. The long-known critical writer, Mr. SAMUEL HUGGINS, discussed Church Restoration. Mr. P. H. RATHBONE took up the subject of Art Professorships. Besides these more formal dissertations, there were also plenty of extempore deliverances of opinion in debate. On the whole the Nottingham meeting has done well by art, whatever else it may have done better by, or worse. Out of so much material we may take leave to select the discourse of Mr. AITCHISON, if only because it came from the President of the Assembly.

The question why fine art should be considered a matter of social science is best answered by simply giving to the term "social science" a sufficiently comprehensive meaning; indeed this is the only way to dispose of it. The welfare of communities, as promoted by, amongst other influences, that of intellectual culture, is a perfectly fair rendering of the term; and if so, then one of the most attractive and genial of such influences is undeniably the enjoyment of the fine arts. Not only so, but the precise state of the cultivation and appreciation of fine art becomes one of the most veritable tests of the general progress of the people. Where art is despised or discouraged, or even no more than neglected, the graces of the mind must not be expected to be found. Where artistic sensitiveness is carried to excess or affectation, mental indiscipline and moral Bohemianism may always be looked for. But where earnestness and common-sense combine to confer upon the pursuit of art a character of calm, sincere, and steady assiduity, with sufficiently vigorous ambition and at the same time adequate self-restraint, the artistic faculty may be said to be almost at its best, or at least at its safest and most satisfying point of development. We are happy to think that England of to-day is by regular steps attaining this favourable position. We hold it, therefore, to be an idea especially characteristic of England just now that fine art is a question of social science. English people at large may have much yet to learn, but they have already learnt much; and the process by which the knowledge has been, and is to be acquired, and the particular results which its acquisition is to accomplish, are well worthy of scientific investigation on such ground in the public interest.

Mr. AITCHISON, although an unassuming man, has long been known for one who has opinions of his own coupled with the courage to declare them. He is an enthusiast and a logician combined. He can upon occasion demonstrate his propositions, or he can with equal decision decline to subject them to the indignity of argument. Now that he is in the Academy we must compare him with such men as BURGESS and STREET; for, although of quite a different school of thought, his mode of thinking is very much like theirs. They were above all things passionate; he is passionate also, although not above all things. Their processes of thinking were—so most people will say—eccentric; his are eccentric in the same sense. Theirs were violent, his are not. They took public taste by the throat; he takes it by the button-hole, which is at

least more conducive to quiet and profitable discussion, even in controversy.

Mr. AITCHISON touches the keynote of his doctrine when he says he would have every person who is interested, as so many are nowadays, in one or other of the fine arts, to take to the cultivation of the whole of them, as very few attempt to do. Firstly, this is to be for the sake of his own personal culture; secondly, for the sake of the public culture; and thirdly, for the encouragement of professional artists—the encouragement, of course, in a generous spirit, of a generous vocation, one of the most generous of all. That is to say, he would wish to see all specialist artists devoting their attention primarily to all art, and secondarily to their specialties; not, as the rule is, primarily to the specialties, and secondarily, if at all, to a vague understanding of the correlation of the arts as a whole. Some writers and speakers tell us now and then that all art is one art; but this is only a play upon the word and a paradox; what is true is that the intelligence of the specialist, when fairly applied to the superficialities, if no more, of as many other arts as he can undertake to know, acquired the very great advantage of discovering for itself an occult unity of purpose and of essence which pervades the whole, and the comprehension of which gives a peculiar force and vigour to his pursuit, whether of one or of all. In other words, he finds that the artistic aim is one, however many may be its manifestations; and the achievement of that aim one achievement, however various its forms. Nor is this all; for, as Mr. AITCHISON boldly says, "the contemplation of beauty is the true recreation of man;" the enjoyment of art is the most congenial of all amusements for the refined intellect, the wisest, the safest, and the surest. We may convince ourselves of this by looking around us from whatever standpoint we may chance to occupy; whether the business of life be science or philosophy, medicine or law, commerce or manufacture, the studies of travel or the explorations of archæology, even the adventures of warfare, or their opposite, the teachings of religion, the tired intelligence finds a relief, so welcome that it may not untruly be called the most welcome of all, in turning to the pleasing exercise of the imagination and the consideration of its charming productions. To call this "Art" is merely to give it a very general name; and to say that it has many forms, and call these "the Arts," is but to recognise our being endowed with many senses, and combinations of sense, to which the one virtue of successful fancy is equally able to appeal. No human creature is so low in the scale of mental development (excepting in cases of disease) that the graces—whether of form, of colour, of music, of movement, of speech, of simulation, or of thought—are not in some way or other a source of pleasure; and the higher the intellect aspires, the greater does this pleasure become.

Asceticism, says Mr. AITCHISON, is one thing which has hindered the development of art, and, we presume, its enjoyment. The present generation in England can speak feelingly on this point. There are more kinds of artistic asceticism than one; and perhaps that which was thrust down the throats of our forefathers by CROMWELL'S Puritans was almost less rather than more offensive than that which quite recently, by the violence of perverted archaicism, has been forced upon ourselves, and is indeed still being so although with a rapidly diminishing pressure. The contempt of the beautiful for the sake of art—if the terms of the proposition be not self-contradictory—is a doctrine that cannot but be most pernicious. Such vigour and muscularity are a mere affectation, not perhaps of the heart, but, what is much worse, of the head. To train one's judgment to dislike grace is the outcome of a very odd twist of culture, the strength of a strangely paradoxical intellect degenerating into a melancholy weakness. We may, however, now congratulate ourselves that the disagreeable era of this spurious masculinity is apparently drawing to a close. The gaunt beauties of so called pre-Raffaellite painting and sculpture, and the equally grim features of the corresponding fashion of building and decoration, so far as they were the intentionally dreadful exemplifications of perverted ingenuity and not the helpless conceits of struggling incapacity, seem to be getting out of fashion, and the influence of asceticism so far becoming a lost chord, which in our day at least it is to be hoped may never be recalled.

Mr. AITCHISON ventures to be severe upon the once so much admired art of "imitation Gothic." "Civilised man," he says, "should have some more feeling for dignity than to live in a house that is but a sort of aggregation of dog-kennels."

This is shocking language; and, if the colleagues of the new A.R.A. at Burlington House have half the "feeling" we used to give them credit for—or those who put them where they are—some of them ought to be found expostulating with him in phraseology, if a little more courteous, not a whit less uncompromising. The story goes that one of the "too, too" eminent apostles of revived mediævalism, upon being rallied one day by an admirer of the other persuasion, because he did not live in a Gothic house, had the shameful candour to confess that he was prepared to build any number of Gothic houses for such as liked them, but that to live in one of them himself was more than he could undertake to try! We make Mr. AITCHISON a present of this anecdote; and will only add that, when he comes to think his own thoughts in this wicked way, not of imitation Gothic houses alone, but possibly in the course of time—who can tell?—of imitation Gothic churches no less, we hope he may find gentler words in which to point out the fact that all such imitations, which are imitations and no more, are only imitations of that which is inimitable, namely, of genuine art.

But if, as Mr. AITCHISON further teaches us, "it is only under enthusiasm that man attains his full height," we can not only pardon the enthusiasm which characterises his own utterances, but go so far as to wish that other thinkers like him would take heart of grace, and speak as plainly as he does.

## IN VIENNA AND BUDA-PESTH WITH THE IRON AND STEEL INSTITUTE.

BY A CORRESPONDENT.

FOR the fourth time since its foundation the Iron and Steel Institute has held its autumn meeting away from England. After visiting Liège in 1873, Paris in 1878, and Düsseldorf in 1880, the Institute this year accepted a cordial invitation from the ironmasters of Austria and Hungary to hold its congress in Vienna, and make excursions to Gratz, Leoben, Buda-Pesth, Rechitza, &c.

Probably no English body has done so much to break down the barriers of class, of race, and of frontier as the Iron and Steel Institute. It welcomes men of every nationality, the only condition being that they contribute to the general stock of information as to the metallurgy of iron and steel, and thus further progress in that science. Never was there a more cosmopolitan *réunion* than that which assembled at Vienna on the morning of September 19. Besides Englishmen, there were Frenchmen, Belgians, Germans, Austrians, Swedes, and Americans, while speeches were made in French, German, and English.

The members were the immediate guests of the Ingenieur-und Architekten-Verein of Vienna, whose magnificent premises, and also those of the Building and Architecture Club adjoining, were placed at their disposal. The meetings were held in the handsome hall of the former body, which is admirably adapted to the purpose, the acoustic properties being perfect. It is, as may be supposed, in perfect taste, the walls being panelled throughout with different woods inlaid. A gallery, high up, supported by carved Caryatides, extends along three sides; while a spirited portrait of the Emperor, FRANCIS JOSEPH, hangs over the platform.

The members were warmly welcomed by the president of the reception committee, Herr C. AUGUST VON FREY, who is also president of the Vienna Alpine Club; by the Statthalter of Lower Austria in the name of the Government; by the burgomaster in the name of the city; and by the president of the Engineers and Architects' Association. On account of the regretted illness of the president of the Iron and Steel Institute (Mr. J. T. SMITH, of Barrow), Mr. I. LOWTHIAN BELL, M.P., past president, was called to the chair.

A paper by the eminent Austrian metallurgist, Prof. VON TUNNER, on "The Iron Industries of Styria and Carinthia"; and another by Prof. VON KERPELZ, of Buda-Pesth, on that of "Hungary," were read and duly acknowledged. The general secretary, Mr. J. S. JEANS, then read the third paper, by Herr A. KURZWERNHARD, of Teplitz, on "The Manufacture of Bessemer Steel with Brown Coal." This called forth a speech from Mr. PERCY GILCHRIST—one of the inventors of the THOMAS-GILCHRIST process—and who subsequently received, on behalf of his partner, a magnificent casket, made of THOMAS-GILCHRIST metal, presented by the Austrian Iron-

masters' Association, in token of their appreciation of the services rendered to their struggling industry.

The members then adjourned to an elegant luncheon in the Imperial Volksgarten, to which they were invited by the Austrian ironmasters. The great charm of this gathering, where all the surroundings were novel to the majority of the visitors, was enhanced by some delightful Strausslike music, played by the band of the 34th Austrian Infantry. The party next proceeded in omnibuses to the immense arsenal, a rectangular pile of buildings, erected from 1849 to 1855, and covering 331,200 square metres of ground. The entrance tower is surmounted with sandstone statues, by GASSER, representing Austria surrounded by the arts of war. At the opposite side of the pile is the chapel containing a statue of the Virgin, which is held in high esteem on account of its having escaped injury in the destruction of the former arsenal during the insurrection. Within the rectangle formed by the barracks and magazines is the Waffen Museum, in rich Roman style, by HANSEN, containing twelve groups of pillars, ornamented with fifty-two white marble statues of the heroes of Austrian history. The upper floor contains a most interesting collection of historical relics connected with the House of HAPSBURG. This day's proceedings, in which the *utile* was at least equalled by the *dulce*, were wound up by the annual banquet of the Institute.

On the following day, the 20th, Professor WEDDING, of Berlin, read a paper describing the work of the Prussian State Institute for testing iron and steel used for constructive purposes. In the discussion which followed, the members were, on the whole, averse to any intervention of the Government in the matter, at least so far as England is concerned, but thought that a technical body like the Iron and Steel Institute might undertake the official testing with advantage. After a paper on "Recent Progress in the Manufacture of Steel Castings" had been read by M. POURCEL, of the Terre-Noire Steel Works, the meeting was adjourned at the early hour of twelve. The members then visited the premises in Vienna of the Danube Steam Navigation Company, and proceeded in steamers provided by that company along the newly-regulated Danube as far as Nussdorff, whence they ascended, by the central rack-rail railway, to the top of the Kahlenberg Hill, from which a magnificent view of Vienna was obtained, the city appearing stretched out like a map. Luncheon was served, through the hospitality of the city of Vienna, at the large hotel, formerly a nunnery; and, after admiring the hanging woods, the party descended in the same way through the vineyards which produce one of the choicest wines of the country.

On the third and last day of the meeting, M. POURCEL'S paper formed the subject of a long technical discussion, to which that gentleman replied eloquently in French. Mr. LOWTHIAN BELL, M.P., Mr. SNELUS, and Mr. JOHN GJERS all read papers on metallurgical subjects, which were briefly discussed. Cordial votes of thanks were accorded to those to whom the Institute was indebted for favours; that to the Engineers and Architects' Association, for the use of their premises, called forth an eloquent speech in French from M. A. NOBLET, of Liège, in which he expressed the sentiment that when scientific bodies are thus sumptuously lodged, they give evidence of exerting great influence on the industrial advance of their country.

After partaking of luncheon in the Imperial Volksgarten, as on Tuesday, the members were taken in hand by the leading architects of Vienna, and conducted in parties over the new Parliaments Gebäude, the Rathaus, and the University, pausing as they passed to deplore the destruction of the Ring Theatre, the site of which is now cleared, ready for a new building. It was remarked with a certain amount of surprise that, notwithstanding the propinquity of Vienna to beds of excellent building stone on the banks of the Danube, and therefore easy of conveyance, a large proportion of the houses in Vienna are built of brick faced with stucco. Some of the members visited the Imperial Summer Palace at Schönbrunn, while others inspected the locomotive works at Floridsdorf, crossing the Danube by a fine wrought-iron girder bridge. In the evening a most agreeable *réunion*, with dancing to a splendid band, was given by the local committee in the fine hall of the Gartenbau Gesellschaft.

This agreeable *fête* brought to a close the doings at Vienna, and on the following morning the members separated into two parties. One party, with the president, proceeded by the Southern Railway to Mürzzuschlag, the Neuberg Steel Works, Leoben, Segeabben, Donawitz, Trofaiach, Nordenberg, the

Handharp, Praebicht, and Gratz, where they were hospitably entertained by their *confrères* of the Styrian iron trade.

The other party, with two vice-presidents and the general secretary, proceeded by the Austrian Staatsbahn to Buda-Pesth, the capital of Hungary, and certainly had no cause to repent their selection. The special train was composed of new carriages, on the American continuous principle, that had been hastened forward for the occasion; and the visitors appeared greatly to enjoy the walking from one carriage to another and, after the great plain of Hungary had been traversed, admiring the grand scenery on the banks of the Danube. At Pressburg, as the train drew up to the platform, a surprise was in store for the party. They were saluted with strains from a real Hungarian band, in which the stringed "cymbalus" takes the place of wind instruments; and here a very welcome luncheon was spread in the waiting-rooms. The pleasant looks and quaint costumes of the inhabitants, the fruit and flowers on the table, the variety of light Hungarian wines, and the Oriental tinge which embraced all the surroundings, lent a charm to this hurried repast which can never be forgotten. On re-entering the carriages, the train soon passed round the cathedral, and Bishop's Palace, of Pressburg, that looks like a Turkish mosque, and which was seen to great advantage in the beams of the morning sun, standing out against a background of high hills.

On reaching Buda-Pesth, the members were welcomed by the reception committee and billeted off to the leading hotels, being then left to their own devices until the evening. At seven o'clock they were entertained at a magnificent banquet, of quite a Hungarian character, at the Grand Hotel Europa, in a splendid hall, the roof of which is supported by massive columns of grey marble. Loyal and other toasts were drunk in Hungarian champagne; speeches were made in almost all European languages, and nothing could exceed the cordiality of both hosts and guests, who seemed equally charmed with each other.

On the following day, Saturday, 23rd, the party proceeded by steamer on the Danube to the engineering works of GANZ & Co., one of whose specialties is the making of Hungarian roller mills. They then inspected the works of the Danube Shipbuilding Company, the manager of which is an Englishman, Mr. MOORE JACKSON. Besides examining in detail the various departments, in one or other of which everything connected with a vessel is manufactured, the visitors were much interested in two Roman baths discovered here about six years ago while digging the foundations of a building. They are in a remarkably good state of preservation—all the flues for heating, the piscina, the seats, &c., being clearly traceable. It is said that the frescoes on the walls were as fresh when discovered as on the day they were painted, while the casual scribbling on the wall of a bather could also be deciphered as at Pompeii.

As the party entered the foundry a ladleful of metal was run into a mould, arranged so as to form in glowing letters the words "Welcome to the Iron and Steel Institute;" and then the remainder of the charge was run into the centre of a pile of foundry sand, running down the sides and sending up volumes of flame and showers of sparks to imitate a volcano in eruption.

Another surprise awaited the visitors immediately after they had regained the steamer through a double file of firemen. The bugle sounded an alarm, as if a house, represented by the adjoining magazine, was on fire, and the firemen all rushed to their posts. A man jumped out of a window, being caught in a contrivance for the purpose; and a woman with a baby appeared at an upper window. With scaling-ladders the men mounted the walls, and lowered the woman in a fire-escape, while the steam fire-engine played far higher than the four-storey building. As soon as the fire was supposed to be extinguished, the firemen who had entered the house were lowered slowly, one after another, by means of a waist-band, hook, and rope, keeping themselves clear of the wall by their outstretched legs, and having their arms free to render assistance.

Passing a cascade of mineral water on the Margaréthen Insel the party were landed on that island, which is the property of the Archduke JOSEPH, the cousin of the king, and contains his summer palace. It is open to the public, and, being beautifully wooded, serves for a promenade. After a luncheon in the restaurant, and some more Hungarian music, the members inspected the locomotive works of the Hungarian State Railways.

In the evening a special performance was given in honour of the Institute at the Volkstheater, a piece being specially selected to illustrate the national character, costumes, music, and dances. This splendid building, designed by FELLNER, was only completed in 1880, and is distinguished by great width of stage in proportion to the height. It is built entirely of stone and iron, and an iron curtain with large meshes can be let down from the outside in case of fire.

After spending the following day in admiring the beauties of the town and scenery the party again split up, one portion going to see the ironworks of Salgó-Torian, and the other proceeding to the extreme south-east of the kingdom, near the Bulgarian frontier, to visit the new Rechitza Steel Works, which are doing a great deal towards carrying Western civilisation Eastwards.

The practical difficulties attending the construction of the Tower of Babel can never, perhaps, be more fully realised than at Buda-Pesth, for here the confusion of tongues is great indeed, and the first question is, "What do you speak?" The Hungarians, of course, use their native Magyar tongue, while German is the language of commerce. Then there are a large Slavonic and Bohemian population, and some Italians and Servians. French is, of course, spoken more or less; and English is spoken to a remarkable extent considering that there are no very direct relations between England and Hungary. Indeed, an English club has lately been started, not of Englishmen, but for cultivating the English language.

The new portion of the city is most beautiful, situated as it is, the old portion, Buda or Ofen, on the right bank of the Danube, and the new and larger portion, Pesth, on the left bank.

Taking a drive through the city of Buda in a *zweispänner*, or two-horse chaise, we start from its nucleus, the Stadt-haus, which is the oldest building, and pass the new, handsome, and very extensive Post-gebäude, in the Italian style, as are most of the buildings in Buda-Pesth. We drive through the two most frequented streets—viz., the Hatwan-gasse and Weitzner-gasse—and see the Seviten and Franciscan churches. We pass the Athenæum; the Kasino, where the *élite* of Buda-Pesth amuses itself; and the National Theatre.

Traversing the Karapaser Strasse, about fifty mètres wide, we enter a typical house. It has a large square well staircase in the middle, with separate apartments on the different floors, and a balcony running the whole length of the back. The floor is of mosaic, and the steps of roughly-hewn red marble, while the ceiling is decorated with a mythological subject in fresco, in a frame giving the appearance of raised-moulding. Many of the rooms, especially in the basement floor, have domed or arched ceilings like those of Italian houses; and, indeed, the strong impression of being in Italy is favoured by the rows of acacia-trees in the streets and the bare feet and costume of the passers-by.

Nearly every house has double windows, with a space of six inches between. The outer casements open outwards, and the inner inwards. The latter are secured by a kind of turning latch, which clasps them both tight, and the former by hooks drawn tight over the upright. Very frequently one pane of the outer casement opens separately. Persiennes are used in aspects exposed to the sun, and either the slats are movable to different angles, or the bottom part of the blind or shutter may be pushed outwards.

Continuing our drive, we enter the fine Central Strasse, the longest and widest street in the city. We pass the Wagner Opera-house, being built at the King's expense at a cost of 280,000*l.*, and to be completed in 1884. We notice a pile of old bricks, 12 by 6 by 2½ inches, which are no longer used, being replaced, on the adoption of the metrical system, by those of 25 by 12 by 6 centimètres.

The Oktogone recalls the rond-point of the Champs Elysées, Paris, but a better effect might have been produced with the houses, uniform on all the eight sides, as they look plain without cornice, and with a higher portion in the middle of either side. We pass in succession a private palace adorned with rich mosaics; the Musik Akademie, with front perfectly flat, but decorated with a band of large encaustic tiles; the Kunstler Haus and the Kunst Akademie, the front of which is also perfectly flat, but decorated with gold and dull colours in fresco.

We now enter the suburban portion of the street, which is shortly to be called Andrassy-Strasse. It gives one the idea of Palace Gardens, Kensington, but the villas are far more artistic

and original. There are indeed some remarkable specimens of various styles of architecture that are well worth an autumn holiday's visit.

Turning now into the Stadt Wald, a beautiful park, we admire the fine fountain constructed in remembrance of the Princess STEPHANIE's entry last year, and catch a glimpse, in passing, of the Wertas Mountains in the distance. Leaving, on the right, the Arena Theatre, built in the old style of framed timber filled in with bricks, we drive along an avenue of fine old acacia-trees, and see the Arm-haus, for the accommodation of 100,000 poor people, and the old citadel, built by the Turks in 1450, at the top of the Gallert Hill. Passing the Jewish Blind Asylum, we came upon the site of the central station, whence, when completed, eighty trains a day are to start.

All important buildings are of stone, and present a very imposing appearance, though none are very old. A walk along the Donau Quai and Corso on a moonlight night, with the hills of Buda rising in wild irregularity on the other side, dotted with houses and sparkling with the street lamps and coloured lanterns, affords a fairy spectacle which is truly *wonderschön*.

The three hotels in which the members of the Iron and Steel Institute were drafted are the Hungaria, the Europa, and the National. The first is certainly very grand and has more than three hundred bedrooms; but both this and the second are reported as being very dear. Your correspondent purposely waited until the last to receive his billet, in order not to go to a cosmopolitan hotel; and he quite succeeded in his object of seeing indigenous customs by putting up at the National. The *cuisine* is entirely Hungarian, including the favourite *páprika-hahn*, or fowl stewed with red pepper. Everyone is civil without being obtrusive, the landlord taking almost a paternal interest in his guests. The charges are certainly most moderate, and as the custom is for each meal to be paid for at the time, there are no long bills to run up. Having preserved the labels of two red Hungarian wines that I have tried and found delicious, I transcribe their names, Villányi ó Bor, 1 gulden (1s. 8d.), and Budai Sashegyi, 1 gulden 40 (2s. 2d.), a bottle. What a delightful country, where the wine is so cheap that it is not worth while to adulterate it!

On the occasion of the marriage of the Archduke RUDOLPH of Austria with the Princess STEPHANIE of Belgium, second-class return tickets, available for a month, were established between the two capitals of Vienna and Brussels for about 6*l.*, and have continued in force during the summer months. The journey from Vienna to Buda-Pesth can be made cheaply and agreeably by steamboat on the Danube, and that from London to Brussels by the Great Eastern Co.'s excellent daily service of steamers to Antwerp.

### SIR EDMUND BECKETT, Q.C., ON SCIENCE AND ART.

THE prizes obtained by the students of the St. Albans School of Science and Art were handed to the students on Wednesday in last week by Sir Edmund Beckett, Q.C.

In addressing the meeting Sir Edmund Beckett said his mind was in an entirely unscientific state as to the business of that evening. All he knew was that there was a School of Art and a School of Science, in connection with which they had met. Science was a very good thing, and art in its way was a very good thing too, but he was afraid that both subjects and the meaning of both words were a good deal less understood than they should be, and he was afraid that owing to that want of understanding the two things were commonly put together nowadays. He remembered that some years ago Cardinal Wiseman was invited to give a lecture in London on what was called the connection between science and art. He (the speaker) was very curious to know what the Cardinal would manage to say of that connection. If anybody could make out a good case at all he was sure that the Cardinal could do it. However they might differ from each other on one subject—on the subject of art and in some degree on the subject of science they would all agree that the Cardinal was as capable of talking as anybody. So he set to work; he gave a very ingenious and amusing lecture, full of more eloquence than he (Sir Edmund) could give them. When he arrived at the end of the Cardinal's lecture he amused himself by thinking, "How much real connection between science and art has this good gentleman shown?" It seemed to him to resolve itself into this: Being the distinguished person he was in the Roman Catholic Church and spending a good deal of time at Rome, the Cardinal naturally talked of St. Peter's—a triumph of art of a certain kind, belonging to a city in the world

now the most famous of any for art. So Cardinal Wiseman thought he could not go wrong in talking of St. Peter's, and he said something of this kind—that St. Peter's was a very famous place, a triumph of art, its dome was the largest in the world, and taking height and width together was the largest in the world; the dome cracked, and so people had to set to work to mend it. That was very shabby and disgusting language to use about such a thing as St. Peter's; and it was not the Cardinal's, but his. He was in the habit of "boiling things down," and seeing what the meaning of a thing was reduced to its simplest elements. The best case the Cardinal could make out in support of his idea was that the dome of St. Peter's cracked, and that scientific men got to work to mend it, and mended it by putting a chain round it. That did not seem to him (the speaker) much like a connection between science and art; it seemed to him rather like a severance. It appeared to show that the artistic people who designed the dome had not much science, and it certainly demonstrated that the scientific people had not much art. He had been thinking about a good many things of the same kind with a view to finding the connection between science and art, until the other day he read one of the papers which the secretary of the school was good enough to send him. There he saw that the students painted on china, and that the china was fired or burnt afterwards. That was a connection between science and art, no doubt. There was the art of painting, but the art of painting would not do much in regard to china without the science or art of burning. Art was a multiplex subject. It meant a good many things. There was the art of making bread, and the art of making clothes. People who called themselves artists were equally liberal and comprehensive in their terms. He had had to do a good deal with architects, and he always found they for some reason or other wished to call themselves artists, though he had never been able to make out why. It seemed to him that an architect was not an artist. An artist must do something with his fingers; it was not with his mind he worked entirely. An architect did not do anything with his fingers; he produced no result; he simply told people how they were to lay out a work. That circumstance suggested to his mind the fact that there were a number of people who claimed the title of artists with much better reason than architects. There was a good deal of talk about art, but he suspected that many people did not know what they were talking about. Who were artists? Painters and sculptors were; no doubt about them. In modern times singers were called artists in the newspapers. He did not know much about singing, and never went to the opera. Actors were often called artists. Going a little further down, he thought he had heard hairdressers called artists. Dressmakers were frequently called artists, and he knew also that tailors were called artists. So they ought to be, because they produced very excellent results, and he was not sure but that when they had good subjects to work upon—very unlike him—they produced more successful results than architects generally. He remembered once giving tremendous offence at the Architectural Museum, or some such place where he was making a speech, by venturing to say that the carvers who executed the ornamental work, such as was now going on at St. Albans Abbey, were really people of almost as great importance as the architects themselves. Some would not speak to him for a week after he made that statement. Yet surely they could not deny that a carver was an artist. The man got up on a scaffold, and with his few tools chiselled out those flowers and heads such as might now be seen by going to the west front of the Abbey. An architect could do nothing of the kind, though he might do what was much greater if he did it well. Art, if it meant anything, meant the art to do something; it might be a good or a bad thing; by usage it might come to be associated with a beautiful thing, or what people called beautiful. But it was very difficult to say what was beautiful, for there was no canon of beauty that he knew of; no rule, except a certain amount of similarity to Nature. He was certain of this, that there was no unquestionable standard of beauty except Nature. Nature never copied herself. There were millions of leaves on trees, but he defied them to find two alike. This was a lesson he had endeavoured to impress upon the workmen with whom he had to do here and elsewhere. They imitated their work to too great an extent; he urged them not to be too exact, but to use a little freedom. Let them remember what Nature did and what the old builders did. He had pointed out to workmen over and over again pieces of old work. He had asked them to look at a moulding. Examining it at first the moulding would seem to be the same throughout; but close inspection showed that the work varied. The old builders' workmen were really artists, and they did as Nature did. They made both sides of their buildings tolerably alike and symmetrical, just as both legs, and arms, and the two sides of a man's face were alike. But let anyone hold up his two hands and look closely at them, and he would find that they were different. The two sides of a person's face are not exactly alike. The same thing applied to the colours of animals. Did they ever find two dogs or tigers coloured alike, or with both sides alike? That was the way with Nature, working by general uniformity, and not by precise and particular uniformity. Nature never copied herself. What he had said was the result of observation of Nature, which was the source of all beauty. What did they mean by Nature? There were a

set of philosophers nowadays who were always ready to tell them that Nature did everything, and that what they called "natural selection" did everything. What was Nature? Most of them had heard, he had no doubt, of Professor Huxley, who is considered a most advanced philosopher, a gentleman who believed in nothing but matter—and himself, as a great man said once. What did Professor Huxley say? He was too much of a philosopher, whatever else he might be, not to know the true meaning of Nature. He said, "Nature was only the general result of all causes." He might have said—they were not exactly his words, but he might easily have said—"Nature is the result of all causes, and the cause of no result." Nature could not be talked of as if she were the inventor and creator of all things. Let them look at what the thing called Nature had done in the way of beauty. Some of them had been reading, he had no doubt, that the colours of flowers were produced by the action of bees. That might be true to a certain extent, but let them consider to what a small extent it went. What were bees fondest of? According to his observation in that neighbourhood they were fondest of mignonette flowers and lime-trees. There was a fine tree of that kind in the rectory garden, and he never went there without being struck with the number of bees about that tree. How much colour had the bees managed to impart to those two favourites of theirs—mignonette and the lime-tree. They were two of the dullest coloured things in Nature. According to the philosophy to which he had referred, bees had been at work millions of years making colours, but they had laid none on those two things. He said therefore that they had been a very small cause. If bees had made the colours of the trees, had they made them the shape they were? had they made the beauty of hills and dales and mountains, and all the forms of water and clouds and ice and snow and everything of that kind? That which they called Nature had made those things, and these again it was the object of art to imitate. They imitated them in pictures; and in other ways they might imitate them by having regard to their results. As a great man said some time ago:—Take the rainbow, the most beautiful thing in Nature, and the northern lights, or *aurora borealis*—what was it produced them? The regular laws of Nature were the cause. It would take a good many bees to account for the *aurora borealis*, or the rainbow either. They heard this phrase used very glibly—art and Nature. Art meant nothing except producing beautiful results, or not even beautiful results; useful results, or not even useful results—for there might be an art of doing bad things: Nature was the result of natural causes—the action of all causes, the action of the Creator, and nothing else. So much then for the kind of art of which he had spoken. Next came science. He had begun by pointing out that although that was a school of science and art, there was very little connection between the two things. It did not follow, however, that all things to be learnt together should be connected. There were very little connection between classics and mathematics—yet they ought both to be learnt. The real distinction between art and science was that art was uncertain and science was certain, or ought to be certain. A great many people talked about science and pretended to arrive at certain results when they were very uncertain in their knowledge. That was not true science. Science was simply a fine word for knowledge, and knowledge was certainty, or such certainty as was to be achieved. Mathematics was the only branch of science in which certainty existed. If a man thought to show him that the two sides of a triangle together measured no more than its third side, he said to that man, "Sir, you are a lunatic. That is only fit for a lunatic asylum. Go there to be believed; don't come and teach it here." So it was with everything connected with mathematics. He had been looking over the books to be awarded as prizes, and he saw that one of them was on linear perspective. Linear perspective was mathematics—there is certainty; and that reminded him, by-the-by, talking about art, that many artists had not the slightest idea about perspective. If a man told him that his colours were right, he could not tell him that they were not, not having the knowledge which the artist was supposed to have on that point; but if a person told him that a drawing which was manifestly out of perspective was in perspective, he could say, "Sir, I know you are wrong. You may just as well tell me that four times four are fifteen." Coming to another part of the list, he saw that free-hand drawing was taught in the school; that was hardly what might be called a certain subject, though a near approach to it and a valuable study. He was glad to see that among the prizes was a book on practical geometry; there was also a volume on "Practical Rules of Drawing." He could not say that he thought much of painting on china, which was one of the things taught in the school. Having gone through the list, he was sorry to say that he must, after all, end as he began. He was going to parody the saying of a great man, but he must tell them the story first. They had all heard of Sydney Smith. He was invited by a nobleman who was not celebrated for hospitality to go and see his house and pictures. Smith accepted the invitation, but on going to the house was treated with a shabby luncheon. He, however, was shown a lot of gildings and fine pictures. When he was about to leave, the host said to him, "Well, Mr. Smith, I hope you like it." Smith replied, "Oh yes, it is all very fine; but I would rather have seen more carving and less gilding." So he

(Sir Edmund Beckett) would rather have seen in connection with the school more science and less art. They must, however, take things as they found them. It was better to do art than nothing, though he had not a high opinion of it from its uncertainty, and other qualities which he would not now mention. He thought by this time he had detained them quite long enough; well if they wanted a little more they should have it.

There was one other thing mentioned to him by the secretary. He did not see it in the list of prizes, but in his letter to him, the secretary said that they also taught the art of building in the school. He was very glad to hear it. He hoped they did; but inasmuch as he did not know how they taught it, he could not do more than express his opinion that it was an art that very much wanted teaching. A great many errors had crept into it. There was one error with regard to the old builders which he should like to correct. It was said that the builders of old times knew a great deal of science and art. Of art they did know something, but of science little. Among other characteristics of art, there was one thing to be noticed, which was that it did not, somehow or other, accompany and go along with civilisation, as one might expect. It seemed somewhat to get squashed by civilisation. People nowadays were infinitely above savages in knowledge; yet they lacked notions of art, which some savages possess. Ever so long ago, when he was at college, they used to be shown some weapons made by South Sea Islanders out of stones and sticks. When they came to be examined, he found that the handles of the weapons were decorated and cut rather nicely. In Indian art the work in silver and brass was very beautiful—beautiful in shape, beautiful in ornamentation, and following Nature in not being too uniform. Let them take the statuary of Greece, the most famous in the world. They had very little science in those days, and even in the Roman days. At the time the best English buildings were done, and when the Abbey of St. Albans was erected, down to the fourteenth century, when the work manifestly began to deteriorate, there was hardly any science. People thought there must have been a tremendous lot of science among the old builders, because they constructed those high towers, stone vaults, and other things of the kind. But he had been behind the scenes and found that a great deal of that work was done very badly indeed. It was true they had science enough to make their buildings stand for a number of years, but they were bad builders; did not know how to make their mortar; they did not know how to select their stone; they designed contrary to all rules of mathematics, and therefore contrary to all rules of mechanics; the buildings began to split and almost to fall down from time to time. So it was at St. Albans. The Abbey had been a succession of ruins and repairs from the earliest times until now. The state of a great deal of it had been before their eyes in the last three or four years. Therefore, they should not run away with the idea that the old builders, by some sort of inspiration or magic, possessed science and art. John de Cellâ was a bad architect; he did not know how to build and make his work stand, or what sort of mortar he should use. He knew nothing of those things, though he was a good artist as far as mere beauty went. If they taught in that school the art of building he hoped they would teach how to make mortar, how to make proper abutments for arches to stand against; not allowing large arches to rest against 9-inch walls, as was done in the case of the abbey. Two or three architects wanted to do the same thing again, and more than two or three—the whole Institute of Architects wanted to do it, and if they hadn't had such an obstinate customer as he was to deal with they would have succeeded. He liked walls like himself. Where John de Cellâ had a wall nine inches thick, over which he put a great arch and window; he had put nine feet. He did not wish to impose his figures on everybody, but what he had done was the result of mathematical teaching. If they were going to begin building let them begin at the bottom, with a mathematical knowledge of mechanics. Mothers with young gentlemen who could draw "pretty things," put their sons into architects' offices, there to develop their admirable tastes. A young man of this sort was set to work to copy his master's specifications and drawings. He did that over and over again; then the parents paid the architect 300*l.* or 400*l.*; afterwards the young gentleman took an office, affixed a brass plate to his door, and he was "an architect."

---

**The Black Gate, Newcastle-on-Tyne.**—At the last meeting of the Newcastle Society of Antiquaries, it was reported that the committee dealing with the question of the Black Gate had a meeting at which Mr. Johnson, architect, laid before them views and elevations of the Black Gate in its present condition. The question arose as to what kind of a roof should be put upon the structure. There was no evidence as to what roof had been upon it previously, and it seemed to be a question of cost, whether to put on a flat roof or a pitch roof. A flat roof, if of lead, would be more costly, but it might be made partly of glass. The question, however, was not definitely decided. As to the number of floors, they had decided upon making three, but it was left an open question whether the third floor should be lighted from the sides or from the roof.

## PAINTING IN RUSSIA.

A CORRESPONDENT of the *Times* has visited the Moscow Exhibition, and sends the following account of some of the pictures by Russian artists:—

I am afraid we do not know much in England of the artists of Russia. I distinguish between Russian art and the artists of Russia for reasons to which I may revert. Vereschagin is a recognised name, and so is Aivassofsky. They are both represented at Moscow, but not in their strength. There are none of the great pictures of Turkestan which introduced Vereschagin to London, first at the Crystal Palace and then at South Kensington. Something is said about Vereschagin being just now out of favour in his native country. There is a suggestion that he has depicted too much of the miseries of war, which may be permitted in a Callot, since no one can suppose that what he had seen in his native Lorraine in his generation could happen now, but is a grievous error on the part of a patriotic Russian. So the gossip runs that Vereschagin was not asked to send any of his larger pictures, and there are only seven of a cabinet size which have been collected for exhibition. One of them, a group of Tartar opium smokers, I remember seeing in Paris in 1867, when I first made the acquaintance of Vereschagin's work. It is greyer in tone than his later pictures, and in this respect probably shows the influence of his master Gérôme. Two others are after-battle scenes from Tashkend, and both sufficiently grim. In one of them two men are going over the field, one decapitating the dead, while the other receives the severed heads in a sack. The head of a young Russian has been cut off, and is being held up and inspected in a careless fashion before being tossed into the bag. A strong natural affinity certainly drew Vereschagin to Gérôme's *atelier*. Each is as resolute as Swift in exposing the brutality of man, although Gérôme expounds the doctrine with more varied illustrations. By-the-by, *The Duel after the Masked Ball* is in the Academy at St. Petersburg. Every one knows the reproductions of this picture in photographs and etchings, but I do not know whether every one has been struck with what impressed me more than ever in studying the original—namely, the extraordinary suggestion of unruffled wickedness in the walk of the harlequin who is going off arm-in-arm with the huron. Another of Vereschagin's pictures is a view of the Taj Mehal. This must have been sketched when he was in India eight years ago, and some Anglo-Indians doubted whether a possible Russian spy should be permitted to make drawings about the country. The view is taken a little up on the river, and secures the white reflection of the dome in the water; but the special character of the Taj cannot be seized in this way. The supreme, the unique loveliness of this memorial of love lies in the association of tomb and garden; the beauty of each makes perfect the beauty of the other, and the memory of the dead queen is preserved for ever in a shrine of pensive submission and of peace. The genius of Vereschagin is not, perhaps, in complete accord with the spirit of the scene he has attempted to reproduce.

It may be questioned whether the ruthless character of Vereschagin's art, a character as apparent in the drawing of a mosque as in the presentment of a man, is common among his countrymen. There is no evidence in this exhibition that it is so. Some trace of it may be supposed to be found in a picture of great power by Bronnikoff, but in truth the sentiment is here altogether distinct. It is a gallows field, a *campus sceleratus*, where on a row of crosses receding from the spectator hang the bodies of as many men. Away on the right is a passer-by, taking little note of the dismal spectacle at his side, while in the middle foreground is a crouched form of a woman in agony, whom we may suppose to be the mother of the young man hanging dead above her. The thought of Rizpah, the daughter of Aiah, involuntarily comes into the mind, but the painter could not have had her story before him, for the down-stricken woman is not protecting the dead from outrage, and they, indeed, number eight instead of seven. The picture is strong, but it has also a noble quality of pathos, and we read in it, not the brutality of man, but an awful sense of the sanctions of violated law. There is, in fact, more affinity with Vereschagin in another picture by Répine, which some may remember to have seen at Paris in 1878. A squad of hapless men are towing a heavily-laden barge up the Volga. They are struggling along on the sandy bank of the river beneath a fierce sun, and they exhibit in their figures all ages and degrees of development of social misery, if not of actual crime. The scene is pitiless, but the picture is a real picture, and not an essay on the treatment of criminals.

A certain number of scenes of Gospel history are exhibited—more, I think, than we should find in a corresponding collection in England—and they are characterised by much independence of tradition in their treatment. One, a great favourite with visitors, represents Judas going out from the Last Supper. It is by Nicholas Nicholaievitch Gee, and the artist has remembered, what very few painters have borne in mind, the words of the Evangelist, "He then having received the sop went immediately out: and it was night." Often as the Supper has been represented, I do not remember a suggestion of night in the pictures so well known. Judas is standing, facing the spectator, on his way outwards, but his face is in complete gloom, for the illumination of the room

comes from a torch immediately behind him. This light is at the same time thrown vividly on the disciples, who are in the background, and on Christ, who is on the left, half reclining, troubled in spirit, waiting for that which shall come. The arrangement may be thought somewhat theatrical, but it is honestly conceived, and has a striking effect. The same painter exhibits the *Agony in the Garden* more in accordance with tradition; but another depicter of the same scene, Letofschensko, represents Christ advancing alone beneath a grey moonlight. Another artist of considerable merit, whose imagination has brooded over Christian history, is Semeradsky. In one of his pictures Christ and His disciples are passing a house and garden of revelry. No such incident is directly described in the Gospel history, but it may be easily inferred, and as the painter has conceived it the approach of the Teacher strangely stirs, and here and there awakens the slumbering consciences of the people of pleasure. In another picture by Semeradsky, which was at Paris, we have an illustration of the persecution of the early Church at Rome. Roman luxury and pomp fill the greater part of the picture, with Caesar himself borne across it, and the spectator may be reminded of *La Décadence des Romains*, by Couture, at the Luxembourg; but on the right some half-a-dozen Christians are triced up against poles in the air with tow and other combustible materials swathed about their feet, so that they may make a festal flare at nightfall. Some watch these preparations with languid curiosity, but caricatures scratched on the wood represent the popular view of the superstitions of this Jewish sect, and each pole has a formal tablet attached declaring the upborne martyr one of the enemies of the human race. There is, perhaps, a little tendency to blackness in some of the shadows of the picture, but it is, on the whole, very well composed and brilliant in its effect. A word should be said for an *Entombment* by Kosheleff. No event has been oftener depicted, but the Russian artist represents the body of Christ borne on a bier, headed by Joseph of Arimathea and accompanied by his mother and weeping disciples, to the sepulchre hewn out in the rock in the garden. The grave funeral procession is certainly as impressive as the familiar pictures in which attention is drawn to the handling of a helpless corpse.

Aivassofsky would naturally lead the way among painters of land and sea; and his admirers, among whom I confess I have never been able to count myself, will find eight or nine pictures of his here fairly characteristic of his power. Bogoluboff has a couple of good pictures of Moscow and a very fair one of St. Petersburg fixed in ice. Klever has a winter scene near Revel, which struck me. Lindholm (*A Steamer Making its Way Through Ice*), Oldenbyrski, and Sydkofski may be mentioned.

There is a fair proportion of *genre* pictures, which probably derived their inspiration from Paris rather than Russia. Berndtson and Bekker are names known in the Salon, and Edelfeldt has managed to exhibit an illustration of the Revolutionary period of 1793 in the person of a girl who might be taken by some as Charlotte Corday. Reggione (who must be of Italian origin, if not of Italian birth) exhibits some illustrations of the lives of cardinals at Rome, such as Heilbuth used to amuse us with, and Postnekoff, along with a catechising scene at St. Clement's, in Rome, has a chorus of dancing maidens on St. John's Eve, which is a kind of sober reminiscence of Jules Breton's exquisite scene. A picture by Ivanoff of boys bathing is more akin to poor Fred Walker's work. Basil Maksemoff has an illustration of peasant life, full of grave and simple feeling, reminding one of the genius of Israels. Vladimir Makofsky, on the other hand, exhibits some half-a-dozen pictures full of delightful native humour. An old lady going to church with a page behind her carrying her books of devotion is a type not unknown elsewhere. Richer in feeling is a picture of an old married couple at the piano playing a duet.

On the whole, the Russian artists may be credited with a certain freshness of spirit, akin to original genius, if it be true that in their choice of subjects we are often reminded of what has been done by apparent precursors and tutors of other lands; but I fear it would be very misleading to attempt to deduce any characteristics of Russian art from these works of artists of Russia. These men are but a handful, and their pictures are known and appreciated by a comparatively limited number. There is a French theatre at St. Petersburg, but the dramatic art of Russia is not to be found there; nor is its pictorial art to be found among these painters. In the churches, the houses, the dress, and, where reading is widely disseminated, among its illustrated books, the range and character of a national art may be detected; and, tried by these standards, the artistic development of the Russian people is extremely limited.

**Winchester.**—The church of St. Michael has been reopened, consequent on the completion of various alterations and improvements carried out under the direction of Mr. Butterfield. The exterior works are executed in stone and flint, the walls of the east gable and the porch being in chequered or diapered work, in harmony with ancient Gothic work. A new south porch is erected close to the tower, and will materially strengthen that ancient work, pending the reconstruction of its ruined arch, which, with other work, must depend on the necessary funds being obtained.

## LOCAL INFLUENCE IN ENGLISH ART.

THE annual meeting of the Reigate School of Art was held on September 28, when an address by Mr. S. W. Kershaw, F.S.A., was read by Mr. R. L. Hesketh in the absence of the author. The following is an extract:—

To us here and art students, our English school will have greatest interest. The subjects depicted are most allied to national feelings, habits, and thoughts. A very helpful lesson is this school of art, for vigorous and changeable like our climate is our modern English school. We have examples on all sides for guidance in subject and treatment—for cattle with landscape, the well-known Sidney Cooper, R.A.; and for scenery, be it the rocky shore, the mountain side, the wooded slope, or the river's course, we have the works of J. E. Millais, Brett, Vicat Cole, W. B. Davis, Peter Graham, Linnell, and many others. In history, both sacred or secular, are examples from the brush of Armitage, Eyre Crowe, Pettie, and several noted artists, known to you by their reputé or works.

Such is a rapid glance of the names only of a very few leading painters of our day. Let me go back one hundred years or so, and recall the school of landscape painting at that time, for I would speak of landscape only at the present, and how it then found exponents in the great names of Gainsborough, Constable, Turner, and others. These artists came to Nature directly. No one will deny the truth and beauty of their work, specially in the delineation of thick glades, rolling skies of summer brightness, or storm clouds with their fine atmospheric effects. In all their pictures the claims of Nature are uppermost, and the influence of scenery very apparent. This brings me to a home subject—our climate and its surroundings as affecting English art. We have not the sunny effects of Italy or France, or the bright glow of an Eastern sky; but is there not beauty in this most uncertain climate of ours, and are not the effects, though transient, the more worthy to be transferred to canvas? and for all this we must go to Nature in her varying moods. The student will then see the artistic value of the mists, mists which have such glorious value in the low evening light. A cloudy day with pouring showers supplied Constable with his best subjects, and Turner's delicacy of atmosphere is well known to those who have only scanned his famous paintings.

Then each district of England has its own peculiar type of beauty. The wild sternness of the North, with its moors, wastes, and mountains so rich in subject; the hills and dales of Derbyshire and Yorkshire; the flat but not unpoetic fen lands of Eastern England, divided by dykes, fringed with reed grass and wild flowers, over which clouds loom in calm expanse, have given abundant themes for such artists as De Wint and others. For sea-coast our island has the wave-washed rocks of Cornwall and Devon, so often transferred to canvas by our best living painters; and to come quite home, the rich pastoral scenes of Surrey offer great attractions, and have produced a school of artists, among whom the name of Linnell, so honoured and known among you, will have a lasting and grateful claim.

You, inhabitants of this small but beautiful county, have in this and its western district large and varying opportunities for studying the rich aspects of Nature, be they wooded upland or hidden vale, the rugged common or the roadside village, with its church, mill, homestead, and trimly-thatched cottage. For your example and guidance are men who have studied, painted, and sketched in this very district, and whose names will be familiar to you as "household words." The late John Varley, one of the earliest of the school of water-colour painting, knew this locality well. Nowhere, perhaps, will the lover of colour find more scope for his brush, whether in oil or water colour. For are not the village homesteads and cottages a little picture jewel of themselves? The moss-grown roof, sprinkled with patches of stonecrop, or rich in purple clematis, afford a lesson and ready subject for colour treatment. Do not the narrow lanes, with their tangled hedgerows, and their bright golden-coloured banks, tempt the brush of the tyro to transfer these local tints to canvas? And are not the unsuccessful attempts to reproduce what is so rich and beautiful a great incentive to a closer study of Nature? Then if range of landscape is needed you have but to go farther westward, and a range of hills, of dusky paleness, with spring tints, or rich with purple heather, rising in crested beauty like waves of the sea, will give you all the effects of distance, atmosphere, and colour needed. I speak of that district round Haslemere, Hindhead, Lynchmere, Blackdown, where, as in a picture of this year's Academy Exhibition, the charms of this scenery is depicted in a painting, by that known artist Keeley Halswelle, called *A View over Three Counties*.

Surely then there is material at one's very door for subjects in oil, water, or pencil, and so you students of this art school and inhabitants of Surrey might strive to become like the Norwich school of painting, which was the leader of that time of a very recognised method of English landscape. The originators of this school were men of humble origin, who rise to fame through steady, patient study of nature, of course with much personal talent.

Here I may remark on the growing power of centralisation. Art students wish to get to London, and the great means of educa-

tion there. A very laudable wish, but may I remind them had they not also better strive and work to do honour to their local school of art, for by so doing they will identify themselves with local influences, and maintain that bond of union which was so great an element of success in the art guilds of old. The great Italian painters studied at and were called from their native towns; and surely with moderate success every student will in after life be proud to have been connected with and worked in a school identified with his birthplace and home life.

But we are not all painters, and there are other branches of art which develop our faculties and influence our daily life, and one of these is architecture. For this we have examples all around; the great English cathedrals, the ruined abbeys, picturesque by their age and situation, the market cross, and the humbler timber house afford every variety in construction and design. In our vast metropolis the examples are endless; the spires and towers of the City churches alone form a subject for the pencil, their graceful outlines framed by the genius of Wren, which is so stamped upon them; above all, the noble Cathedral of St. Paul's, a witness to the energy and perseverance which marked his career. After fifteen years of controversy, having made several designs, the king and the Government fixed on that now carried out, and it was with almost singular chance that the stone brought by a mason to form the centre stone of the dome had on it the word "Resurgam"—"I shall rise again."

The larger churches of our land are a valuable lesson to the architectural student. Each ecclesiastical district has its local interest; the noble towers of Somersetshire, the fen and marsh-land churches of Eastern England, the minsters of the centre, each and all supply varied characteristics to the intelligent sketcher and observer. The lesser village churches are also a storehouse of study. If near an abbey or convent, you may have in the carving, arches, or details the same master builder who guided the one and the other building to perfection. Even the encaustic tiles may assimilate in pattern; their history and architecture unite in their common aim of instruction. Let no one hastily pass by our village church, for of it the late eminent architect, Mr. Street, R.A., thus spoke:—"The small village church is the special glory of England, and nowhere will you find it in more primitive perfection than among the downs and woodlands of Sussex."

Not only will you find in church architecture that highest embodiment of the art, abundant sources of study and delight, be it in notes or the small sketch of some font, bracket, corbel, or foliage; but in mediæval architecture there is abundant wealth in our land. These houses are truly the early monuments of our country, the work of our forefathers, a work at its best during the reigns of the Tudor sovereigns; their mellow brick or stone contrasts most pleasingly with the verdant lawns or terraced woods around them, while many are noted for richness of ornament or minute detail. The chimneys were made a decorative feature—with moulded shafts, a carved cornice of terra-cotta is occasionally inserted; while the interior is replete with elaborate mantelpieces wrought in wood or plaster, staircases of rich oak, and ceilings with Tudoresque devices and panellings of the well-known "linen" or other pattern. For examples of these houses you have not far to seek even in this our small county. Sutton Place, near Guildford, is a typical and fine example, and embraces all the requirements of a mediæval mansion. Loseley, near Guildford, and more in the centre part of the county, the hall of Beddington, and the smaller moated grange of Crowhurst, near Godstone. From such houses many a lesson may be traced as to internal arrangements, planning, &c., and we see how the growing taste for adapting this style of architecture to everyday use has spread.

Here let me warn those who seek to adapt these structures not to be led into servile copyism, or to overload their designs with ornament, all which makes the modern imitation a vast sham. Rather seek to fathom in what consists the lines of simple artistic beauty in these houses—the fitness and charm of ancient art—and so by gaining the *spirit*, and not the letter, of their construction, they will serve as rightly as they are—the proud inheritance of our land and a special study for architects. On a much smaller scale, and somewhat reflecting the style and treatment of these mansions, are the homestead, and cottage, with its chimney stacks, porch, and thatched roof, on which luxuriate the lichen and moss, the whole a picture of English country life. Form, colour, and variety of subjects are here, and in the very villages around you have examples in plenty, which have been painted by our best artists. The cattle browsing on the common, the hill-side cottage, and the deep hedge-row recall scenes familiar to you by the brush of Birket Foster and others. So, I repeat, you have, both in your locality and in those artists who have made it a feature, great incentives to study.

**Erdington.**—The foundation-stone of the new chancel of the church of St. Barnabas has been laid. In planning the enlargement of the church north and south transepts are introduced, the body of the church being too wide for nave and aisles. The extension will provide increased accommodation for 360 persons, and the work is being executed by Mr. B. N. Smith, of Birmingham, from the plans of Mr. J. H. Chatwin, architect, also of Birmingham.

## NOTES AND COMMENTS.

THE report of the Norwich Diocesan Bellringers' Association calls attention to the great number of towers where the bells are either unringable or go very badly. It expresses a desire that the care which those in authority have been led to bestow of late years on the fabric of churches, with such beneficial results, could be extended to the towers, which are too often excluded. A visit of inspection now and then, a moderate amount of attention, and the judicious expenditure of a little money—possibly of a few shillings—might, according to the report, make many peals ringable for years to come, whilst many a belfry might be rescued from impending ruin.

THE extension works in connection with the French National Library are being actively pushed on, and at the same time a number of improvements are being made in the organisation and administration of the establishment. The electric light is to be used for part of the new wing now in course of erection in the Rues Vivienne and Colbert, so that the library may be used by students during the long winter evenings; the new light will first be tried in two small rooms on the ground-floor, and, should the experiment prove successful, will be gradually introduced throughout the building. Another improvement, and one which has become absolutely necessary, owing to the existing confusion in the classification of works, is about to be carried out in the compilation of a new catalogue on the double alphabetical system (1) by titles of the works, and (2) by author's names. This will be a boon to readers, who have now often to wait more than an hour before obtaining the work demanded of the librarian.

THE great work of surveying India continues, and the triangulation is expected to be completed by the end of 1882. According to the latest report the following work has been executed during the past year: 6,016 square miles surveyed on the  $\frac{1}{2}$ -inch scale; 6,610 on 1-inch; 16,073 on 2-inch; 76 on 4-inch. Five towns and three cantonments, of an aggregate area of 61 square miles, have been surveyed on various scales ranging from 6 to 24 inches to the mile. Village surveys on the 4-inch scale, and of hutted camps on the 12-inch scale, are also in progress. One important rule has been laid down by the Government in regard to river surveys that, "whenever a river happens to be under survey professionally, the operations, though they may be immediately required in connection with the settlement of a district on one bank of the river, are carried across to the opposite bank, and embrace the entire area between the permanent lines of village boundaries on both banks. The completion of the survey up to the permanent boundaries of the villages on either bank obviously possesses administrative value, and is likely to facilitate the more equitable adjudication of proprietary and tenant rights on the banks of rivers which shift and change their courses in the rainy season." In British Burmah nearly 2,000 square miles have been surveyed, and the natives of the country have been freely employed as field surveyors and draughtsmen, and have continued to give great satisfaction.

Two new galleries have lately been opened at the Conservatoire des Arts et Métiers, both of them situated in the left wing of the building looking on the interior garden. In the one on the ground-floor, to which has been given the name of Galerie des Constructions civiles, is a splendid collection of objects appertaining to the art of building; models and plans of timber and iron structures, mosaics, specimens of ceramics, instruments for descriptive geometry, &c. The other gallery, on the second floor, has been devoted to an exhibition of the arts of printing. It contains models of machines used in the manufacture of paper, besides printing machines and presses, photographic apparatus, appliances used in photo-engraving and phototyping.

AN archæological discovery of exceptional importance has just been made in France. According to a report drawn up by M. LISCH, Inspector of Historic Monuments, that gentleman, in his last tour of inspection, unearthed a Gallo-Roman city, near Poitiers. The remains include a temple of 70 mètres frontage and 114 mètres in length; a thermal establishment, covering about five acres, with its ponds, hot-air baths, water-courses, piping, pavements, &c., still existing; a theatre with a

stage 90 mètres wide, rows of seats, entrance lobbies, &c., intact; whole streets, houses, inns—covering in all upwards of eighteen acres of ground—in fact a small Pompeii in the heart of France. The excavations are not yet finished, but many sculptures of first-class execution and style, dated by M. LISCH from the second century, as well as an immense number of articles in iron, bronze, earth, &c., have already been found. M. MANTZ, the Director of Fine Arts, is naturally taking a great interest in the matter, and without doubt measures will speedily be taken to secure and preserve these important remains of old Roman Gaul.

M. FREMIET, the sculptor, has received a commission from the Municipal authorities for the execution of an equestrian statue of a herald bearing a cresset. The work is destined for the new Hôtel de Ville, and the artist will receive for it 24,000 fr.

It may be remembered that the Prix du Salon in sculpture was awarded to M. LONGPIED for his fine marble statue of a *Fisherman bringing Orpheus' Head to Land*. According to the regulations the age of competitors for the Prix must not exceed 32 years, and one of M. LONGPIED's rivals protested against the award on the ground that at the time of the Exhibition the prize winner exceeded his 32nd year by several months. On inquiry being made, the assertion was corroborated, and M. LONGPIED at once admitted the fact. The Prix had to be withdrawn from him, and cannot now be adjudged during the present year.

THE new arrangements of the Institute of Painters in Water-Colours almost amount to a revolution. Henceforth it will not be necessary to be a member in order to have a drawing hung on the walls at the exhibitions. Works may be sent in without restriction, and those which can sustain the scrutiny of a committee will be accepted. In other words, the Institute will resemble the Royal Academy. The alteration will hardly be accepted without a protest. The annual exhibitions will be said to lose the character which for many people formed the chief attraction at Pall Mall. But more vigour and variety may be anticipated. It may also be mentioned that the Princess BEATRICE has been elected an honorary member of the Institute.

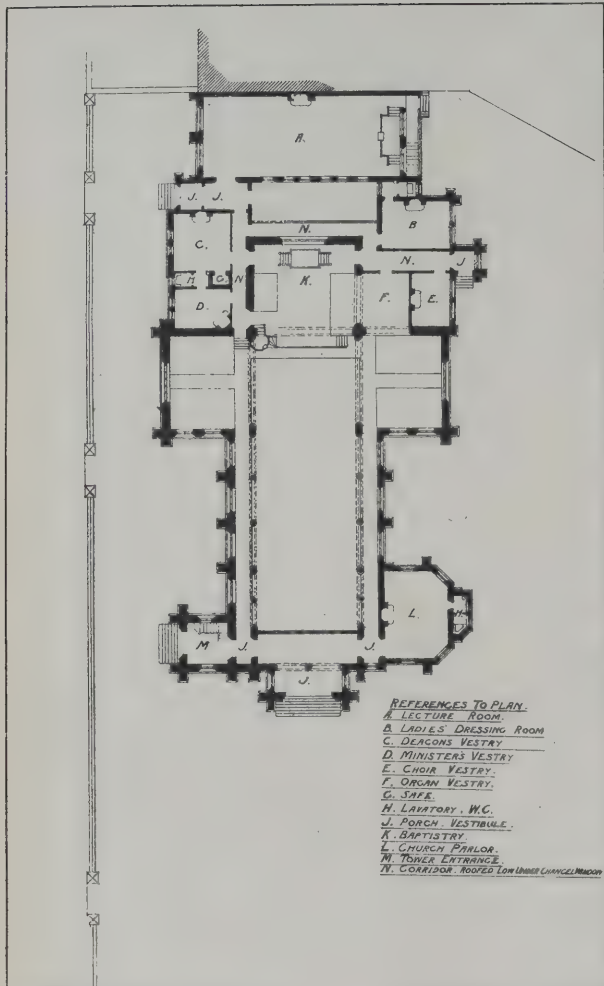

A NEW gallery of contemporary furniture has been added to the Exhibition of Decorative Art, now open at the Palais de l'Industrie, Paris. It contains the chief articles of furniture, upholstery, &c., that have taken prizes at the various exhibitions held in France and abroad during the past twenty-five years. The exhibits are necessarily of the most varied kind, and include many articles that, from the artistic design and wonderful finish of their execution, ought rather to be ranked as works of art than of furniture. The new gallery is situate on the first floor, to the left of the President's Salon, and is an important acquisition to the Exhibition, which is now one of the most attractive sights of the French capital.

No ruin in Scotland has been more often painted than Kilchurn Castle on Loch Awe, which, with its surroundings, forms a picture that needs no idealisation. But unless precautions are taken the castle will no longer be available as a subject for the artist. According to a letter in the *Times*, it is becoming a mere heap of stones. The mischief began early in the present century, when the building was unroofed for the purpose of utilising the timber in the construction of two modern dwelling-houses—it is fair to add, in the absence of the then earl, and without his permission. But the wood so abstracted does not seem to have been restored, and neglect must have been continuous, for at this moment nobody, except the cattle who creep in there for shelter, can walk about the interior, which is choked with fallen stones and towers, large portions of which, with the staircase, have tumbled down within the last few months. Other portions of the walls will certainly give way before the next high winds, and the trees and ivy, which have attained a rank luxuriance, must aid in precipitating the catastrophe. It is stated that last year something was done to the masonry, and that a few of the cracks were cemented over, but the interference must either have been trifling or ill-judged, as the recent mischief shows. Kilchurn Castle was one of the strongholds of the Campbells, and it has acquired sufficient interest to ensure that funds could easily be raised for its preservation.

## ILLUSTRATIONS.

HOLLOWAY COLLEGE, MOUNT LEE, EGHAM, SURREY.

OUR illustration is of the tower which stands in the centre of the two quadrangles of this building, which is now approaching completion so far as the main building is concerned, under the direction of the architect, Mr. W. H. CROSSLAND. The lower floor of this tower will be used for a heating chamber, the main floor as a central hall, having the dining-hall on one side and the kitchen and school of cookery opposite. This hall has a vaulted ceiling supported on detached columns. The upper chamber will be furnished with slate cisterns, which will serve the low-pressure water service.

Mr. FUCIGNA is the sculptor engaged, and Mr. JOHN THOMPSON, of Peterborough, is the contractor.

The illustration is a reproduction by the ink-photo process of a large drawing which was exhibited this year at the Royal Academy.

EBENEZER CHAPEL, DEWSBURY.

THE corner-stone of this building was laid on Tuesday in last week by Mr. E. CROSSLAY, of Halifax, when Mr. W. HANSTOCK, A.R.I.B.A., of Batley, the architect, gave a description of the building. The old chapel was 79 feet long and 49 feet wide externally. The new building will be 87 feet long and 54 feet wide. The plan of the chapel is a simple oblong, without any projections in the shape of transepts, &c., whatever. The entrance is in the centre of the front gable, consisting of two doors 4 feet wide, each opening into a corridor 8 feet wide; the corridors are divided with swing doors so arranged that all persons must pass through three swing doors before entering the chapel proper. The internal dimensions of the chapel are 69 feet long and 47 feet 6 inches wide, exclusive of organ chamber. There will be two aisles in body of chapel, the seats in centre being straight and those at the sides splayed. The organ chamber is recessed from centre of end of chapel, and is 20 feet wide and 13 feet deep, the ground floor vestries being on each side of organ chamber. The rostrum pulpit is directly in the centre of the organ chamber, and the choir stalls are treated in an original manner for chapel work by placing them on each side the rostrum, and forming the sides of communion, so that they will sit face to face, similar to the choir stalls in the chancel of a church. Galleries will continue along each side of the chapel quite straight, and the gallery over entrances will be much deeper for children's seats. The chapel floor falls from front entrance to rostrum slightly. The roof is all in one span, but divided internally into nave and side aisles, and the clerestory arches are supported by ornamental cast-iron columns. The height from floor-level to eaves of roof is 27 feet, and from floor-level to apex of roof 51 feet. The style of architecture adopted throughout is Decorated Gothic of the thirteenth century, and, as the photo-lithographic views will show, the treatment is anything but of a plain character. The whole of the front gable is out of the best white Holmfirth ashlar, and wallstones clean boasted. The slating will be the best Westmoreland with dressed stone ridges. The woodwork throughout will be of the best quality of pitch-pine, which is intended to be varnished. The accommodation in all is for 836 persons, allowing 20 inches for each in length, being 436 in the body of the chapel and 400 in the galleries. The contractor is Mr. T. H. THORP, of Leeds.

MOSELEY BAPTIST CHAPEL.

THIS illustration is reproduced from a competition drawing by Mr. JOHN P. OSBORNE, A.R.I.B.A. The chapel accommodates 784 persons, 656 of whom are on the floor, the remainder being in a small gallery at the back of chapel and over entrance. The lecture-room seats 253 persons, and is provided with suitable retiring or cutting-up rooms, which are placed underneath. The cost of the whole of the buildings is estimated at 5,750*l*.

MISSION HALL, CARLISLE.

THE Mission Hall which is the subject of one of our illustrations this week is now nearly completed, and will shortly be opened by the Lord Bishop of the diocese.

It is built, in connection with the parish of St. Paul, on a site generously given by the Duke of DEVONSHIRE, and is situated at the corner of Compton Street and Swift's Row, with entrances from both streets.

The building is designed in an Early Gothic style of unpretentious character, and is built of pressed brick with stone

dressings sparingly introduced. Internally the room has a homely appearance, and is well lighted and ventilated. The roof is partially open, the pitch-pine timbers (which are exposed) dividing the ceiling into panels. The hall will accommodate nearly 300 worshippers. The heating is by hot water, so arranged that the hall and class-room may be warmed separately or together. In the execution of the work the design has been altered by the addition of a stone belfry to the principal gable, not shown in the view.

The cost of the building, exclusive of fittings, will be upwards of 900*l*. The contract is being well carried out by Mr. GEO. BLACK, under the superintendence of the architect, Mr. GEO. D. OLIVER, of Carlisle and Workington.

ENGLISH PRESBYTERIAN CHAPEL (CALVINISTIC METHODISTS), BANGOR, NORTH WALES.

THIS chapel has lately been opened; it is erected on an eminence near the Normal College, facing the Menai Straits. It has a nave, north and south transepts; the chancel is divided from the chapel with a partition wall up to the roof; the bottom floor of the chancel is used for a vestry; there is another floor level with the sill of the east window, and the room formed thereby is for Sunday school. The materials for the outside are granite from Newry, in shoddy work, and the dressings of lime stone from Anglesey. It is plastered inside and ceiled at the collar. The vestibule is divided from the nave with a glazed screen. The chapel seats about 260. The cost was 2,000*l*. The contractor was Mr. EVAN WILLIAMS, Bangor, and the architect Mr. RICHARD DAVIES, Bangor.

## THE SANITARY CONGRESS.

THE annual meeting of the Sanitary Institute was held last week in Newcastle-on-Tyne, under the presidency of Captain Douglas Galton, R.E. The following are abstracts of some of the papers which were read:—

## Sanitation in relation to Building.

An address in the section of Engineering and Architecture was delivered by Professor Henry Robinson, C.E. He said it is no exaggeration to state that not one quarter of the dwellings of all classes, high or low, rich or poor, are free from dangers to health due to defects with respect to drainage, water, or ventilation which were capable of being easily avoided at the outset. The public are now more alive than they were to the necessity for inquiry into these matters, and consequently sanitary authorities (who cannot go much ahead of public opinion) are better able to enforce regulations, and are more willing to bear the expense of doing so. To ensure healthy homes local authorities should have bylaws requiring compliance with general rules, which are now well known and hardly require to be specified. It is obvious that the condition of the drains, soil pipes, ventilation, &c., of the old houses should also be the subject of investigation. But it is not till the attention of the medical officer of health is arrested by the occurrence of fever, or other form of illness, that their condition is inquired into at all, although they might have been in so insanitary a state as to be unfit for habitation. The conversion of unhealthy old dwellings (which form so large a proportion of the houses in large towns in this country) into healthy ones, is a task which without reference to bylaws presents no attractions from an architectural point of view, but has nevertheless to be undertaken by those who are best fitted from their position and influence to deal with the subject. These observations apply with the greatest force to the houses of the poorer classes, who have not the opportunities of exercising any critical supervision of their own. As regards the houses of the better classes, the same remarks apply to an extent greater than should be the case, considering the irretrievable mischief consequent on treating these matters apathetically. In order to arrest attention to the condition of houses, and to expose their unhealthy state, the following plan is suggested:—It should be compulsory on the part of medical men, or of the occupier, after notification by the medical man, to return to the officer of health for the district any case of illness of the classes agreed on as arising from sewer gas, infected water, and the like. This notice should be accompanied by particulars of the house in which the illness occurred, and whether it was an imported case or originated in the house. It should then be the duty of the sanitary authority to have affixed to a plan of the district a coloured wafer or dot corresponding with each disease. This plan should be open to public inspection, as well as any reports explanatory of each case. The effect of this would be that a house, or group of houses, in which those diseases occurred would be revealed at once to the eye of an intending occupier by the array of wafers, warning the unwary against the danger they are running. On the efficient way in which the plumbing and sanitary work in a house is executed depends, to a large extent, whether a house is healthy or not. Experience proves continually that much of this work is done by incompetent or

careless people, and requires subsequent rectification, probably after illness has caused an investigation to be made. In America legislation has aimed at correcting this evil by making it a penal offence for plumbing work to be badly carried out. He contended that an intending purchaser or occupier of a house should require a certificate that certain stipulated conditions have been fulfilled. This would render it necessary for the landlord or vendor to ascertain (what is only equitable that he should) that the house is fit for habitation before he derives any benefit from his property in it. Similar certificates should be required for all new houses, and no one should be allowed to let or sell a new house until the local authority had given a certificate. This would involve more inspection and a larger staff than now exists, but the cost of this might fairly be borne chiefly by the builders, who should pay according to a sliding scale. The cost should not fall wholly on the rates. This plan is now in successful operation in several towns, and heavy penalties are imposed where a house is allowed to be inhabited without a certificate. The cost of the increased staff no doubt will be thought an objection were it to be charged on the rates, especially in a town where, as frequently happens, the members of the governing body for the time being prefer a low rate to such safeguards as those indicated. Further legislation on certain matters is necessary to meet altered circumstances, or to enable the experience which has been gained to be put into operation. The arrangement of sanitary districts, according to the old Poor Law divisions, requires modification. The distinction between urban and rural districts in regard to the power to make bylaws regulating buildings and streets or roads is anomalous, inasmuch as many districts that were rural at the time the Public Health Act was passed have so changed by the increase in population, and its congregation in large groups, as to have become urban in parts of it, and to require the same bylaws as urban authorities have. According, however, to existing legislation, there is no power on the part of rural authorities to make bylaws regulating buildings, streets, or roads, even where the conditions of population are similar to those which obtain in urban districts. Manufactories in some cases have been erected outside urban districts in order to avoid the borough and general rates. These works lead to houses being built around them, without, however, being under sanitary supervision. It is desirable that a heavy penalty should be imposed by law where a house was let or sold when in an insanitary condition. Parliament has made it an offence to sell food which is unfit for consumption and a danger to health. It should be made an offence to sell or let a house which is equally a danger to health. What is required is that existing anomalies and ambiguities in legislation be removed, that compulsory powers should be substituted for permissive in every matter connected with the department of health, that a central local authority should have power to deal with matters concerning the group of local authorities in its county, and (as has been often urged) that a department of health, with a permanent chief, might be created. The training of those who are appointed to positions such as surveyors to Local Boards and inspectors of nuisances, requires careful attention. Their duties are important ones, and good or bad results follow the efficient or inefficient discharge of them. Men filling positions of this kind ought to be required to comply with some test, or to pass some examination. They should also be more independent than they are of the influence of members of the authority whom they have to serve, and this can only be effected by making their appointment incapable of being cancelled without the consent of the higher authorities. On the conscientious and efficient discharge of their duty by those who have to carry out sanitary work, depends the health and welfare of the community, and a negligent or incompetent person can produce enormous mischief. This responsibility, whilst entailing a corresponding anxiety to those engaged, is accompanied by the knowledge that their work is one which, if well done, results in diminishing the death-rate and improving the health of those in whose midst they are called upon to devote their energies.

Captain Galton proposed a vote of thanks to Professor Robinson for his address. He said he had long felt that they had solved many problems which related to the larger questions of sanitation, but there remained very much to be done in the sanitation of houses. No doubt the Artisans and Labourers' Dwellings Act enabled the worst tenements to be pulled down, but there were an immense number of houses which could not be touched under that Act. Of course it was very difficult to interfere in every individual house, but he had always thought if new houses, both in town and country, were subject to the approval of some local authority, so that no new houses should be built unless they fulfilled certain sanitary requirements, they would make a very rapid increase in providing healthy dwellings.

Mr. E. C. Robins seconded the motion, which was agreed to.

#### Scullery Sinks.

Mr. W. Eassie, C.E., read a paper on "The desirability or otherwise of providing town and country houses with grease-intercepting chambers to scullery sinks." He said that there was a difference of opinion on the subject. Some tried to wash away the grease by a plethora of hot water, and in a small house inhabited

by a limited number of persons, such might answer; but it was not necessarily to be supposed that because it would do with a small house, it would also do in the case of a large residence, with ten or a dozen of a family and a number of servants, or in any large establishment, where it might be expected a large amount of grease would find its way into the drain-pipes. He did not think that in the case of a large establishment any amount of flushing power would scour the grease from the drain. The sand used for household purposes found its way to the drain-pipe, and its progress was arrested by the grease adhering to the sides, resulting ultimately in the stoppage of the pipe. Surely then some provision should be made for grease interception. Having described the class of grease trap which he thought would best answer the purpose, he said that it was only begging the question to say that the grease traps was the old cesspool system renewed. That could not be so, because nothing but the fat could enter the grease trap. Provided trap were cleaned out regularly, they would prove sanitariously beneficial.

The President moved a vote of thanks to Mr. Eassie for his excellent paper.

Mr. R. B. Grantham seconded the motion.

Mr. H. S. Snell said he thought that by the best constructed traps devised only a small proportion of the fat passing through the sink was effectually caught.

Mr. E. C. Robins described practical experiments on the subject carried out in his own house. The trap he had used did catch the fat, and to his mind it only remained a question which was the best—a large trap requiring cleaning out once in three months or a small one to be cleaned out by the servants of the house every day. In the latter case the accumulation of fat could be removed by the servants of the house with a spoon without inconvenience from offensive effluvia.

Mr. H. Laws said the result of his experience in connection with the grease trap at his house pointed to the fact that the apparatus shown failed to act in a measure because it was confined in its space and there was a want of ventilation to it.

Mr. Eassie: There is a ventilating pipe in each case.

Mr. Laws meant to say they should be entirely open to the air. It was clear that these traps should be kept clean in order to prevent rats coming to them.

After remarks from other gentlemen, Mr. Eassie replied, and said it must be taken for granted that the grease traps were always ventilated.

#### Sewer Gas.

Mr. E. C. Robins, F.S.A., read a paper "On the original experiments of Dr. Renk, of Munich, with sewer gas, and the mode of its exclusion from dwelling-houses." He said Dr. Renk opened his paper with an explanation of the term sewer gas, and gave a *résumé* of the experiments which have been made in the composition of sewer gas, and the amount of gas given off by the decomposition of excrementitious matter. He admitted the presence of solid particles, bacteria, &c., but expressed himself a disbeliever in the so-called sewer gas theory; that was to say, while he believed that inhaling sewer gas was prejudicial to the nervous system, and was one of the many causes of the impurification of the air we breathe, he did not consider it provocative of specific forms of disease, and he questioned the possibility of solid and liquid particles passing from sewage into the superincumbent air. Mr. Robins then went on to show by means of diagrams Dr. Renk's view of the causes which lead to the escape of sewer gas, and also the syphon traps which he thinks are best fitted to resist the pressure of sewer gas.

Professor de Chaumont said the German, and especially the Munich School, had a theory of their own, to which they stuck through thick and thin. They considered the question of sewer gas as a mere subsidiary one.

Mr. Alcock said he had hoped to have heard of some means of intercepting sewage gas before it entered houses. He described an intercepting manhole used in London, which he had adopted in connection with his own house, and found it valuable. The drain itself was open to the manhole, which was kept continually sweet and well ventilated by means of a pipe; and this enabled them to test each house drain and see whether it was working efficiently.

Mr. Grantham explained that at Slough sewers were now ventilated by means of pipes carried up inside the gas-lamps, and said this system had proved so efficacious that the gratings had been covered over with zinc plating.

#### Sewer Ventilation.

A paper on "Sewer Ventilation" was read by Mr. W. G. Laws, Borough Engineer of Newcastle. Sanitary engineers have, he said, long recognised the fact that no water-trap is secure against occasional pressure of gas in the sewers and drains, which must, and does, more or less effectually break the water seal and allow the gas to pass into the house. They have, therefore, very generally adopted the plan of carrying an open-ended ventilating pipe from the soil pipe at least up to the eaves. This effectually prevents pressure on the closet or sink traps, and is a most commendable arrangement. Architects, however, are very naturally averse to disfiguring their elevation by an unsightly pipe, and the result frequently is that this safety valve of the drains is rendered

worse than useless by being terminated at, or even below the eaves. Few but can call to mind some instance of an open soil-pipe ventilator, ending with a handsome cap, within a few feet of a bedroom window, into which, if open, the gas must be blown in at least one direction of the wind. This open-ended soil pipe is, however, the true germ of efficient and safe ventilation, not only of the house drains, but of the sewers. All that is necessary is that it should be connected directly with the drain or sewer, without a trap, and that it should be carried to the highest point of the building, above all windows and openings. This would be effected by forming the soil pipe of well-glazed sanitary pipes, such as are now used for the best chimneys, and building it into the chimney stack—making, in fact, a separate gas chimney—through which all noxious gases from either drains or sewers could freely escape. This “gas chimney” should preferably be laid alongside or between the kitchen chimneys, the heat of which being partly communicated to the gas would assist in securing an upward draught in all seasons. The sewer would be delivered among the freshly-made and finely-divided carbon of the smoke from the kitchen fires—a most powerful deodoriser and disinfectant—and it would be delivered far above all occupants of the houses or passengers in the streets, securing, at least, that before it reached them it must be very largely diluted, and so rendered less harmful. It has frequently been proposed to ventilate the sewers by erecting tall chimneys, with a furnace to create a draught, and connecting them with the drains. This seems feasible at first, but has one fatal objection. The sewerage of a large town may be compared to the “arterial” system of the body—the flow of gas is naturally towards the capillaries (the house drains); and to render the furnaces effective it would be necessary either to erect the shafts over the main drains in the lower parts of the town near the outfalls, and so reverse the natural course of the gas and make it flow in the same direction as the sewerage; or to add a “venous” system to collect the gas from the house drains into larger “veins” upon which the furnaces could be placed; or otherwise to place a furnace shaft at the end of each house drain. This latter is practically the system proposed by the writer, as every house drain would terminate in a warmed ventilating shaft, while openings would be provided in the lower parts of the town on the main sewers to allow of the entrance of fresh air. It is a system that could be readily and economically carried out in all towns which have the power of making building regulations. All builders of new houses might be compelled to provide the additional “gas chimney,” and the cost would be so small (about 50s. in an average three-story house) as to create no opposition among the builders, while architects would not object to a plan which makes no unsightly blot on their elevations. Among houses already built, its introduction would be of course slower and more costly, but even there the constant pulling down and rebuilding going on in the heart of large towns would soon secure a sufficient number of ventilators in each street—a dozen gas chimneys, for instance, would amply ventilate a 3-feet by 2-feet main sewer.

Professor Robinson said he did not approve of the principle of ventilating sewers recommended by Mr. Laws, and contended that foul gas could be avoided if care and skill were exercised, but if gas did exist in sewers, it would be better to get rid of it in the open air than by running the risk of introducing it into houses.

Mr. Alcock said he would be sorry if the system advocated by Mr. Laws was adopted. His experience of builders was that they would be almost certain to carry out Mr. Laws’ system in such a way as to make it a means of bringing gas into buildings. Openings from the sewers into streets were exceedingly desirable; the moment anything went wrong in a sewer, the stench from the grating caused it to be observed, and the sanitary authorities could put the evil right.

Mr. J. Lemon urged the importance of sewers being kept clear of the ventilation of house drains; both should be ventilated and should not be mixed together. He thought the objections to open gratings in streets were very much misunderstood and overrated. When there was a smell from an open grating it was the duty of the authorities to investigate the cause of it.

Mr. H. Laws considered that an absolutely open ditch, with a smooth channel, was the best means of getting rid of sewage matter by water carriage. He advocated openings wherever they could get them. He preferred smells coming out into the streets to smells going into houses. He agreed with the writer of the paper that the more openings there were the better.

Mr. T. P. Barkas explained the practical difficulties connected with ventilating sewers by means of large furnaces. If sewer gas was taken up pipes alongside of a house chimney, it would not only be diffused into the air, but would also get up into the upper bedrooms. It was of the greatest importance that all noxious gases should be kept as far as possible from houses. He was not quite sure whether the best plan was not to approach to the system of open draining, which was practically this—to have a very large number of openings in the middle of main streets for the escape of effluvia, and to diffuse the gaseous matters to make them practically harmless. He would be very sorry to dogmatise as to the best mode of ventilating sewers; but he was rather disposed to think that the mode recommended in the paper was very nearly one of the worst.

Professor Chaumont thought the system of having shafts and furnaces for ventilating sewers had been long ago exploded.

Mr. E. C. Robins contended that if sewers were ventilated by means of pipes in chimneys, there would be a risk of gases being introduced into houses.

Mr. H. E. Armstrong said he had at first differed from the views of the author of the paper, but he had thought the matter carefully over in the last few months. He had had some painful experience of infection caught by children playing over street grates, and had come to the conclusion that it would be much better to deliver sewer air at a greater height from the ground, so that it might have a fair chance of being diluted. The chance of sewer gas being carried down chimneys was not great. He thought advocating open sewers was a retrograde proposal.

Mr. D. Balfour said the confinement or concentration of the contents of sewers was the cause of complaints. Where there was free ventilation there was little fear of gas.

Captain Galton said he had always strongly held the opinion that it was undesirable to use house drains as a means of ventilating town sewers, and advocated having a trap between a house drain and a sewer.

Mr. G. W. Laws, in replying, said that where the system of ventilation advocated by him had been tried it had proved a perfect success.

#### Elevated Houses.

A paper on “The Improvement of Climate with Slight Elevation” was read by the Hon. F. A. Rollo Russell, in the author’s absence. It stated that repeated observation had proved that at points artificially or naturally raised above the surrounding district the range of temperature was smaller. The practical conclusions seemed to be that invalids and delicate persons would generally be best placed in high-sheltered situations, in the highest rooms of a house, and by no means on a ground floor; that a climate resembling that of the seaside, but less damp, could be obtained by living at the top of a high house; that every house ought to be built on arches, or thoroughly ventilated below and raised on piers above the ground level, and that no house or cottage which is not ventilated underneath, with damp-proof walls, should be considered habitable; and that in the country no house should be considered habitable of which the floor is on a level with or below the ground.

#### HOSPITAL CONSTRUCTION.

THE Sanitary Act of 1866 conferred upon local authorities the power of erecting and maintaining isolation hospitals for cases of infectious disease, and similar powers were given to both urban and rural sanitary authorities by the Public Health Act of 1875. From a return made to the Local Government Board in 1879, it was found that 296 authorities had made arrangements for dealing with such cases, and although in some places they were insufficient, in others excellent fever and smallpox hospitals had been provided. In consequence of the difficulties which arose from want of experience and from prejudice, the Local Government Board found it necessary to obtain accurate information about those hospitals, and Dr. Thorne Thorne was instructed to make inquiries into the conditions by which the greatest usefulness was attained. He inspected 67 hospitals of every variety of size and construction in England and Wales, and in the following report Dr. Thorne has summarised in a compendious form the lessons which have been learnt during his lengthened investigation:—

Where the shape of a site and the necessary conditions attending the arrangement of the buildings have permitted of choice, it has under most circumstances been found desirable that the opposite side windows of the ward-pavilions should as nearly as possible respectively face somewhat to the south of east and to the north of west, and that any departure from this rule should be in the direction of a south-easterly and north-westerly aspect, rather than in that of a south-westerly and north-easterly. By this means both of the side walls of the hospital wards are in turn brought under the influence of the sun’s rays, a large amount of daylight is secured, the spaces between any two or more parallel pavilions become well warmed and lighted, and, at the same time, direct exposure to the east wind is avoided.

The necessity of having every site so effectually enclosed as to prevent any communication between persons in the hospital and those outside is obvious, and a spread of infection to the outside public was in several instances ascertained to have been due to the imperfect manner in which this had been carried out. As a rule, a substantial wall or close fence at least 6 feet 6 inches high is found necessary for this purpose.

The more efficient hospitals for infectious diseases, which have been provided by sanitary authorities in order to meet the wants of their districts, have under ordinary circumstances consisted of (1) an administrative block; (2) at least four wards, in two separate pairs, and in which patients of both sexes, suffering from two different infectious fevers, can be simultaneously treated; and (3) certain out-buildings, such as washhouse, mortuary, &c. These buildings have been either permanent or temporary. As regards permanent buildings attention to the following points has been found necessary.

The administrative block is nearly always so constructed that the offices and apartments it contains are in excess of the requirements of the permanent ward buildings, and are hence adapted, without having recourse to further erections, to the wants of such permanent or temporary extensions as may at any future date become necessary. Having regard to economy of space, it has as a rule consisted of more than one storey; and in its general construction the rules and regulations governing the erection of good modern dwelling-houses have been observed. The accommodation it affords must necessarily vary very much according to circumstances, but as a rule it has been found to contain adequate accommodation for a caretaker and his wife, or for a matron when a porter or other male servant is maintained on the premises; a kitchen, together with scullery, larder, pantry, &c., so fitted as to serve the requirements of all the hospital inmates; sleeping accommodation for nurses and staff, that for nurses being, in most cases, on an upper floor, where those who are at work at night may rest by day without being disturbed; a medical officer's room and dispensary; bath-room, and closets for the staff, &c. In larger hospitals it is also found necessary to make provision for the accommodation of a resident medical officer, and to provide a mess-room for the nurses and staff. The administrative block is always either completely detached from the ward buildings or it communicates with them by means of a passage, either in part or in whole open at the sides, so that a cross-current of air may pass between the respective buildings. It is also, as a rule, so placed with regard to the entrance to the hospital premises that visitors or other persons can enter it without passing the buildings containing the wards.

The ward buildings which have been met with in so-called permanent hospitals have been constructed either of brick, stone, or concrete, alone or in combination, or of corrugated iron, or again of wood. By far the majority have consisted of brick, with stone or glazed coloured brick ornamentation; some, as at Bradford, are throughout of stone, lined with brickwork; and in one instance—namely, in the Weymouth port district—very excellent results have followed the use of concrete. Corrugated iron is not in frequent use; it has generally been resorted to when an effort has been made to cope with a threatened or an existing epidemic; the buildings have been hurriedly erected and the result has not been satisfactory. Even when the iron has throughout been lined with match-boarding, it has often been found impossible to keep the wards sufficiently warm in winter, or sufficiently cool in summer, and it has in some instances been deemed risky to use them at all during the colder season of the year. One of the better examples of iron buildings which were met with is that at Southport, but there was no available information as to the temperature at which its wards could be maintained in winter.

Of the wooden ones much the same may, as a rule, be said. Nearly all have been erected under the influence of panic, and hence they have generally been very imperfect in point of construction. But even where the walls, as also the wooden or tiled roofs, have been well lined with match-boarding, a space of some 5 or 6 inches, either filled in with sawdust or not, thus intervening between the outer and inner layer, it has during the winters of 1879-80 and 1880-81 been, as a rule, found impossible at all times to maintain within them a sufficiently equable or sufficiently warm temperature, even when the fireplaces were good as regards both construction and position, and when the window surface and the means of ventilation into the outer air have been by no means excessive.

At Nottingham, where the two layers of wood forming the walls are 6 inches apart, the interspace being filled in with sawdust, it was on one occasion found impossible, even when large fires were maintained night and day, to raise the temperature near some of the beds beyond 32° Fahr.; in the Alcester rural district, where there is a very similar building, the temperature was found in the winter of 1880-81, and under the same conditions, to fall to 38° Fahr.; in several such hospitals I heard of water freezing near the beds of patients; some are designedly not used in winter weather; and in one instance one of the more substantially constructed wooden buildings was closed during a recent winter because it was believed that the death of two patients had been brought about by the low temperature which it had been found impossible to obviate. In some of the more solid wooden constructions, as at Birmingham and Oldham, so low a temperature has evidently been avoided, but in neither of these districts was I able to procure thermometric observations as to ward temperature. Having reference, however, to the experience which has been acquired, I cannot but conclude that, as regards permanent hospitals in this climate, wooden and iron buildings as ordinarily constructed are not, as a rule, well adapted to the purposes of wards. That they can be constructed so as to ensure a reasonable and a fairly equable ward temperature I do not doubt, but when so constructed, their original cost would probably not fall short of, if it did not indeed exceed, that incurred in the erection of ordinary brick buildings; they would be less durable than these, and the cost of maintaining them in a proper state of repair is undoubtedly greater than that needed for the maintenance of the more substantial structures.

Having regard to the desirability of securing surfaces which are easily kept free from dirt and infection, and which dry rapidly

after being cleansed, it has appeared to me that wooden-lined wards are not adapted to the varying needs of a permanent building, especially in cases where the several sets of wards cannot always be reserved for the same diseases. On the other hand, no information has been forthcoming during the course of my inquiry tending to show that wards composed of the more permanent materials, but which are well constructed, well ventilated, and well administered, became in process of time less fitted for the reception of the sick than they were when first erected.

By far the majority of hospitals visited had all their ward accommodation on the ground floor, an arrangement clearly the most convenient for administrative purposes and also possessing other advantages. Where, however, a site was necessarily limited, there was advantage in the hospital buildings being of two storeys and having a belt of unoccupied land around them, in place of being of one storey only and covering the site up to, or nearly up to, the limit of the ground. The former plan allowed of something in the shape of airing grounds being provided, besides favouring such reasonable distance between the hospital and neighbouring roads and houses as is desirable for the purpose of giving confidence to the public and of reducing any real risk there may be from the proximity to hospital. Where these conditions have been complied with and where the wards on both floors, as also the buildings generally, were well ventilated and well administered, I was not able to learn of any experience tending to show that such an arrangement had in any way acted prejudicially.

Instances were, however, met with which tended to show that in the interests of the patients themselves, and this even where a site was properly chosen, any such overcrowding of buildings, or of patients, on site, as could either hinder, or interfere with the purity of, the air entering the ward windows, should be carefully avoided. Especially did it appear necessary so to arrange the buildings as to prevent the possibility of dead-house, laundry, kitchen, and neighbouring ward emanations, from interfering with the purity of the air surrounding the patients. So also disregard of the chance of offending or injuring neighbouring dwellings by reason of the proximity of the hospital buildings to them, was found in some cases to have led to much inconvenience and to subsequent expense.

Among the hospitals visited, and where these several necessary conditions have been fulfilled, I would name those in the Bradford, Cheltenham, Tonbridge, and Warrington urban districts, in the Berkhamstead and Solihull rural districts, and that belonging to the Weymouth port authority. In none of these instances does the number of patients per acre exceed twenty. As typical of the reverse conditions the wooden pavilions at Birmingham, which are deemed to suffice for the purposes of some seventy patients per acre, and the three-storeyed buildings at Salford, where some sixty-five patients per acre are accommodated, may be specially noted.

(To be continued.)

## BUILDING IN GLASGOW.

ACCORDING to custom the retiring Dean of Guild of Glasgow gave a summary of the business which had been transacted in his Court during the year ending August 31. He said:—As regards new work the year just closed, and which I will for simplicity's sake still refer to as the present year, has witnessed the turn of the tide. There was, if I may so express it, a full flood tide in 1876. That year 5,746 dwelling-houses were sanctioned. Since then there has been a continual ebbing, until last year, when there were only 418. This year there have been 512. Again, in 1876 the total valuations of the work authorised by the Court amounted to 2,125,249*l*. The falling off from that point was uninterrupted down to last year, when the sum was only 307,640*l*.; but this year the valuation is 378,690*l*. These figures are gratifying so far as they go; but it is to be doubted whether it is even desirable to see them go up again with a rush to anything approaching their height in what may be called the building mania years, 1876 and 1877. The gravitating of the population to the suburbs, and the consequent check on its rate of increase within our boundaries, as well as the great number of empty houses in the city, still give warning on this point. It appears that during the five years 1871-2 to 1875-6 the houses unoccupied averaged 3 per cent. of the whole. During the four succeeding years, notwithstanding the check suddenly put on building, the proportions were found to be 4.9, 6.5, 7.9, and 10.2 per cent. respectively. Last year, out of a total of 119,421 houses within the municipality, 13,407, or no less than 11.22 per cent., were given in the city chamberlain's report as unoccupied. This year there are 119,727 houses in the same area, and 11,804, equal to 9.86 per cent. of them, are still empty. This is not far short of the whole number (12,665) authorised during the last seven years, and represents a loss in annual rental of 118,833*l*. In fact, as the dwelling-houses occupied a year ago were 106,014, and now are 107,923, being an increase of 1,909—against which linings have been granted for 512 new houses—leaving only 1,397 to diminish the quantity of unoccupied property, it would take six years at the same rate to bring down the proportion of empty houses to even the reasonable point of 3 per cent. already

mentioned. The various grades of rent are about proportionally represented in these empty houses, with a preponderance, however, in the case of houses of one apartment. It is a gratifying fact that the percentage of the population pent up in single apartments is gradually diminishing. Nine or ten years ago, as nearly as possible one-third of all the houses in Glasgow had no more accommodation than this; but a year ago the number had fallen to 30·1 per cent., and it seems to be still decreasing. Pointing in the same direction—viz., that of the increasing comfort of the people—is the circumstance that in the half-dozen years preceding this one, the houses of one apartment averaged only 18½ per cent. of those for which linings were granted, and this year they are as low as 7·8 per cent. It is to be hoped that the beneficial influences at work will obviate any temptation in future to the wholesale manufacture of unhealthy habitations of one apartment, by the subdivision of larger houses. Of the warehouses, stores, and workshops authorised this year, it is unnecessary to say more than that their gross valuation is 154,755*l*. Alterations and additions mount up to 71,670*l*. About a quarter of a mile of new streets is included in the year's figures; also halls to the value of 10,065*l*. It may be interesting to note that when the mania for other buildings was at its height, the building of churches seems to have been equally stimulated; for in the two years 1876 and 1877 linings were obtained for twenty-one churches, with a total valuation of 101,500*l*.—almost exactly the same amount as the value of all that have been sanctioned ever since. This year the number is four, and the value 11,700*l*. in all. When additional churches are really required to accommodate the persons willing to attend, no more desirable feature could appear in the records of the Court; but where the effect is simply to subdivide existing congregations already thin—to occupy, in a still more attenuated way, buildings erected in a spirit of ecclesiastical competition—perhaps no other form of overbuilding can be more regrettable. The last item in this year's list is one of 40,500*l*. in all, for five schools—a class of building which happily still requires periodical extension.

#### PROTECTION FROM FIRE IN THEATRES.

A REPORT has been prepared for the Fire Brigade Committee of the Metropolitan Board of Works by Captain Shaw, suggesting the precautions which are supposed to be necessary for the safety of the public in London theatres. At the end of his report he makes some suggestions, among which are the following:—Every theatre should be divided into at least two distinct and separate risks, one before and the other behind the curtain. An outlet for smoke should be made at the back part of the roof over the stage, with an area equal to one-tenth of the area of the stage, and that this outlet be always partly open, and capable at a moment's notice of being thrown completely open. A proportion of each part occupied by the audience should be allowed for passages or gangways, which should always be kept free during a performance. All rows of seats should be divided by gangways, and not more than twenty seats should be allowed between the gangways. The corridors or passages should not be obstructed, as at present, by cloak-rooms, refreshment-rooms, or ticket-boxes. The exit from each part occupied by the audience should be wholly separate from that from any other part, and the several streams should not meet until they reach the open air. After recommending certain other exits, Captain Shaw goes on to say that the gas for the auditorium and that for the stage should be wholly separate and distinct from each other, and in addition to the gas, the auditorium should be lighted with a sufficient number of oil or candle lamps in case of the gas failing. The storage of properties and lumber under the stalls or pit should not be permitted; and no carpentering work should be allowed to be carried on in those places. In all new theatres it would be advisable to lay down as a condition that the large stage opening should be fitted with a metal curtain or screen capable of withstanding for fifteen minutes the effects of any heat likely to come upon it. In old theatres double woollen curtains might be used, with a perforated pipe on top, which could be filled instantly with water by the turning of a handle on the stage side. Captain Shaw then recommends that there should be a universal system of naming the different parts of the house, as at present what was called one thing in one house was called by another name in another house, thereby leading to great confusion. In dealing with the important question of exits, Captain Shaw thought there should be some limit to the distance from the spot in which the most remote visitor was seated to the point of absolute safety. This should not exceed 200 feet or 250 feet, as every audience contained a proportion of stout and old and weak persons, who could not go quickly further than this distance without becoming exhausted, and who in any case influenced the speed of the whole audience in getting away. The practice of closing any of the regular exits during a royal visit was most dangerous, and should on no account be permitted. A separate exit should be made from the royal box to the outer air, which would not interfere with any of the ordinary exits. It should be impressed on all persons employed in and about a theatre that in the event of a panic the essential conditions of safety for an audience were light and air. Of these light came first in import-

ance. However dense smoke might be, it was quite possible for persons to make their way a short distance to fresh air provided they had light; but without light the calmest individual with plenty of room became confused, and a dense crowd is instantly affected with panic, even although there might be no smoke or flame. It was hardly too much to say that, however fiercely a fire on the stage might burn, if it were possible instantly to remove the whole roof and to turn on a very strong light not a single life would be lost. That was a point which did not appear to be sufficiently understood by those engaged in and about theatres, and it should be laid down as a rule that in the event of a panic the first steps to be taken by those responsible should be to turn on all possible lights, to drop the heat-proof curtain, and to open the smoke outlet over the stage. With such an arrangement there would be little probability of a panic continuing, and under the most adverse circumstances the loss of life would not be serious.

#### The Question of the "Apollo" of Calamis and the "Omphalos" at Athens.

SIR,—It will probably be within the memory of readers of *The Architect* who are interested in the subject, that at the close of the correspondence respecting the Choiseul-Gouffier statue—the *Athletic Apollo*—of the British Museum, I left one question respecting it open as awaiting independent and competent evidence. This is the point respecting the supposed relation of an original statue—of which ours, among numerous others, is a copy—to a marble object at Athens, as having originally served it for a base. This object represents the Delphic fillet-bound *Omphalos*—the sacred stone—so called as marking the centre or navel of the world. It is constantly introduced upon the vases in scenes at Delphi as in the very adytum of the temple. The Athenian symbol bears on the top of it impressions prepared to receive a pair of feet; and Mr. A. S. Murray, who gives an engraving of them in his work, had no doubt that their position would suit that of the lost feet of the Athenian copy of our statue. It was a fair inference that the statue must have been dedicated with especial reference to a Delphic oracle, to such an oracle as the Athenians acknowledged their obligation for by the dedication of the *Apollo Alexicacus* of Calamis. So might not irrationally be "thickened other proofs which did demonstrate thinly" that we are in possession of many statues which fairly preserve for us the characteristics of the art of that celebrated early sculptor. Dr. Waldstein, however, expressed himself equally decidedly that the feet of the statue could not be consistently restored to suit the impressions on the *Omphalos*, and so he disposed of one objection to his view that the statue is no Apollo at all but simply represents a human athletic victor.

The question which was left open may now be considered as settled, and so far in favour of Dr. Waldstein, by testimony beyond cavil. A letter has been received from Sir Frederic Leighton at Athens, which gives us this conclusion:—

"I have examined with care the *Omphalos* in the Museum here, and in Vienna a cast of it, over which the Apollo is rather clumsily poised on irons, and I cannot escape the conviction that the footprints and the figure could in no case be brought into harmony. I say 'in no case' because I do not think that the best case is made for the combination in the arrangement at Vienna."

It will be observed that the disposal of this matter of the adventitious *Omphalos* in no way affects the general question of whether our statue is divine or human—Apollo as patron of athletes or an athlete; it does not even weaken materially the not unimportant force of presumptions that it may even be a representation of the celebrated work of Calamis. Among these presumptions the strongest are accordance of style with what is recorded of his work and epoch—precarious as this may be when relied on alone; then the peculiarly Delphic ascription of athletic proclivities to Apollo; and in conclusion the intimation obtained from the scholiast of Pindar that the Apollo of Cyrene—from whose temple we have a repetition of the head of our statue—was venerated for the very functions which are implied in the title *Alexicacus*.

Cordial acknowledgments are due to the President of the Royal Academy—the sculptor of the *Athlete and the Python*—for a service so carefully and cordially rendered.

Your obedient servant,  
W. WATKISS LLOYD.

**Ongar.**—The foundation-stone of a small church at High Ongar has been laid; the cost of the edifice is estimated at about 1,150*l*., exclusive of fittings, architect's fees, &c. Mr. J. Clarke is the architect.

**Ardwick.**—The church of St. Thomas has been reopened after repair. The work has been carried out under the superintendence of Messrs. Royle & Bennett, architects, of Manchester, at a cost of about 1,700*l*.

## GENERAL.

**Mr. William Moffat**, architect, died on Monday last at Hamilton, where he had practised for twenty years.

**Sir Joseph Whitworth** has presented the Manchester Corporation with four paintings by W. Etty, R.A.—the first gift received by the Corporation for the future art gallery. They comprise Etty's *Last Judgment*, *Godfrey de Bouillon*, a portrait of the artist, and a painting of a peacock.

**Mr. Lansdown and Mr. Lockwood** have consented to an amalgamation of their plans for the erection of a new Town-hall at Newport, Mon.

**Mr. F. Elkington** has intimated to the Birmingham Corporation his intention of presenting the Art Gallery with a picture by the late Henry Dawson, and one by James Docharty, the Scotch artist.

**Mr. A. W. Smith**, architect, of Manchester, has prepared plans for the new church of St. Gabriel, Middleton Junction.

**Sir Massey Lopes** has given 200*l.* to be invested as the nucleus of a trust fund for the repairs of Westbury Parish Church.

**Mr. John Burnet** has prepared a design for new offices for the Clyde Navigation Trust in Glasgow, and on Tuesday the trustees gave instructions for the working drawings to be prepared.

**Messrs. Dockwray & Thompson**, architects, of Newcastle-on-Tyne, have dissolved partnership. The practice will be carried on by Mr. J. W. Thompson.

**Mr. J. E. Stafford, of Liverpool**, has been appointed borough surveyor for Burnley. There were ninety-three applications for the office.

**Messrs. Robert Boyle & Son's** system of ventilation has been selected by the committee and architect for the ventilation of "Lloyd's," Royal Exchange, where it is being at present applied. Messrs. Boyle's system is also being applied to Claremont, the residence of H.R.H. the Duke of Albany, and has been adopted for the ventilation of Portland Prison.

**Mr. R. Anderson, F.C.S.**, is preparing for publication the papers on lightning-conductors read by him at meetings of the British Association.

**The Sales of Pictures** at the Liverpool Autumn Exhibition amounted this year to 4,344*l.*, as against 3,371*l.* last year. The receipts were 1,272*l.*, against 1,310*l.* of last year.

**A Meeting** of the subscribers of the proposed new County Buildings for Forfarshire has been held. As the Commissioners of Supply were of opinion that no new buildings were necessary, it was resolved to redistribute the funds collected, which amounted to 3,425*l.* 4*s.* 7*d.*

**Mons. A. de Neuville** has been commissioned by the Fine Art Society to proceed to Egypt to paint a large picture illustrative of the campaign. The storming of Tel-el-Kebir will probably form the subject of the painting.

**The Kidderminster Board of Guardians**, at a meeting on Tuesday, selected the plans of Messrs. Watkins & Scorer, of Lincoln, sent in in competition for extension of the Workhouse, the estimate for carrying out which is from 10,000*l.* to 11,000*l.* Mr. Morton, of South Shields, obtained the second premium.

**Mr. J. Gordon** has prepared a report for the Trades' House, Glasgow, in which he recommends the reconstruction of the whole property of the Trades' House situated between Glassford and Virginia Streets, at an assumed cost of from 12,000*l.* to 15,000*l.*, and an estimated new rental of 1,500*l.*, exclusive of hall and saloon. According to a former estimate, the outlay would be 40,000*l.*

**The Parish Church of St. James**, Clerkenwell, which has been restored by Mr. A. W. Blomfield, will be reopened by the Lord Mayor and Sheriffs on the 13th inst. Two large painted windows have been presented by the Crusader Lodge of Freemasons, which were executed by Mr. C. Evans.

**Mr. J. Tilman, F.R.I.B.A.**, of Sunderland, was on Tuesday, at Newcastle, re-elected President of the Northern Architectural Association.

**Messrs. W. H. Lindsay & Co.**, of the Paddington Iron Works, designed and constructed the iron roof without tie-rods, and the whole of the constructional ironwork of the Baths at Finsbury Park, which were illustrated in *The Architect* last week.

**The Church of St. Nicholas**, at King's Norton, near Birmingham, has just been restored, under the direction of Mr. William Hale. The whole of the encaustic tiling was executed by Webb's Worcester Tileries Company, Limited, Worcester.

**"The Pictorial World."**—It is difficult nowadays to introduce a novelty into newspaper illustrations, but the portraits of the English generals engaged in the Egyptian war may well claim that title. Apart from the present interest, as specimens of lithography they are deserving of preservation. They are truthful portraits and vigorous examples of draughtsmanship.

**A Large Vault** belonging to the Hales family has been discovered, immediately in front of, and to all appearance extending under the altar up to the east wall of Thanington Church, Kent.

**A Statute** has just been issued to establish a market for fish and other provisions near the Elephant and Castle, Newington Causeway. The capital of the company is to be 250,000*l.*, and property for the market can be compulsorily purchased within three years.

**A Conversazione of the Manchester Literary Club** was held on Monday evening at the Grosvenor Hotel. There was an exhibition of the works of some of the members, including Messrs. Houghton Hague, Richard Wane, J. H. E. Partington, W. Robinson, Ward Heys, William Percy, H. F. Warden, George Hayes, and F. J. Shield.

**The Palatine Hall, Lancaster**, is to be altered and improved early next year. A design by Mr. G. D. Oliver, of Carlisle, has been adopted by the Committee of Trustees.

**The Hotel de Ville, Sens**, being no longer required for municipal purposes, is in danger of demolition.

**The Designs** which were prepared by Mr. J. A. McBride, sculptor, of Liverpool, for the competition for the panels of St. George's Hall have been purchased in order that they may be presented to some public institution.

**A Memorial Window** is to be erected in Newbury Parish Church to John Winchcombe, the clothier of the sixteenth century, familiarly known as "Jack of Newbury." Newbury Church was chiefly built by him.

**Plans** for the extension of the Town Hall, Ripon, prepared by Mr. Hiscoe, architect, of Harrogate, have been forwarded to Lord Ripon in India for approval.

**St. Bartholomew's Parish Church**, Radcliffe, is being restored under the direction of Messrs. J. Medland and Henry Taylor, architects, of Manchester.

**Ashborne Parish Church**, restored from the plans of Mr. G. L. Abbott, architect, has just been reopened.

**The St. Nicholas Parochial Board**, Aberdeen, have adopted a report recommending the erection of a lunatic asylum for 250 to 300 patients, at a cost of from 12,000*l.* to 15,000*l.*

**The Theatre Royal, Leamington**, built from the designs of Messrs. Osborne & Reading, Birmingham, and Mr. C. J. Phipps, London, was opened to the public on Monday.

**The Clyde Trustees** have decided to obtain Parliamentary powers for the construction of a dock on the south side of the river to cover about eighty acres of ground, at an estimated cost of a million sterling.

**Six sets of plans** have been submitted by Edinburgh and Leith architects in competition for the proposed Sailors' Home at Leith.

**Messrs. Siemens** have lighted part of Hull with the electric light. There are altogether twenty-six street lamps. Four are each of 3,000-candle power, and are large alabaster globes on tubular stands, the light being suspended at a height of about 50 feet. Twenty-two lamps are of 350-candle power each, and are also placed in alabaster globes, but only at a height of 20 feet from the ground. The contract is for twelve months.

**The Sanitary Institute Awards.**—The following medals have been awarded in connection with the exhibition at Newcastle-on-Tyne:—Messrs. Hayward, Tyler & Co., London, for "full flush" valveless closet; Messrs. Mather & Armstrong, Newcastle-on-Tyne, for Siemens' patent regenerative gas-burner; Mr. C. D. Ward<sup>1</sup> London, for household closet; the British Sanitary Company, for dry earth closet; Messrs. Wilkinson & Co., Newcastle-on-Tyne, for damp-proof concrete pavement; La Société and Hygiène Française, Paris, for their exhibit of books on hygiene; Messrs. Manlove, Alliott, Fryer & Co., Nottingham, for Fryer's patent destructor and Fryer's patent carboniser; Firmen's patent dessicating and rendering apparatus; Messrs. Thos. Bradford, London, for washing machines; Mr. James Stott, Oldham, patent mercury gas governor; the Wilson Engineering Company, London, for improved Wilson range with steel boiler and non-conducting jacketting; Mr. J. A. G. Ross, Newcastle-on-Tyne, patent silicate cotton (stag wool).

**Rateable Value of the Metropolis.**—The rateable value of the several parishes and districts of the metropolis is thus stated in a return just issued by the Local Government Board:—Bethnal Green, 364,336*l.*; Camberwell, 851,469*l.*; Chelsea, 489,531*l.*; Fulham, 584,951*l.*; St. George's, Hanover Square, 2,293,015*l.*; St. George-in-the-East, 199,752*l.*; Bloomsbury, 362,206*l.*; Greenwich, 630,677*l.*; Hackney, 970,299*l.*; Hampstead, 439,228*l.*; Holborn, 923,537*l.*; Islington, 1,485,436*l.*; Kensington, 1,665,983*l.*; Lambeth, 1,307,746*l.*; Lewisham, 568,098*l.*; City of London, 3,566,394*l.*; Marylebone, 1,392,531*l.*; Mile End Old Town, 337,513*l.*; St. Olave's, 794,444*l.*; Paddington, 1,206,054*l.*; St. Pancras, 1,479,484*l.*; Poplar, 682,074*l.*; St. Saviour's, 947,225*l.*; Shoreditch, 585,452*l.*; Stepney, 319,653*l.*; Strand, 716,470*l.*; Wandsworth and Clapham, 1,239,944*l.*; Westminster, 789,227*l.*; Whitechapel, 371,520*l.*; Woolwich, 289,349*l.*; Lincoln's Inn, 18,800*l.* Total, 27,872,398*l.*

# The Architect.

## ARTLESS ARCHITECTURE AT ST. ALBANS.

THE world of culture has been so long accustomed to call Architecture an Art, one of the Fine Arts, the Queen of the Arts, the Metaphysics of the Arts, and so forth, that even in this practical country of England, even amongst this nation of *boutiquiers*, even in these most plain-speaking days of all days, and even under the teaching of so astute a philosopher as Sir EDMUND

BECKETT, we must be allowed to claim a little forbearance if we are unable all at once to see the jest, or solve the conundrum, or appreciate the paradox, or in whatever other way realise the idea, that an architect is never an artist but always something else. But Sir EDMUND BECKETT is urging upon us this novel sentiment with so much authority, and with such persistent iteration, that if we do not attempt to arrive at some kind of understanding upon it, the very bases of our technical terminology may be shaken. "Art," says at St. Albans the other day this undeniably expert and experienced critic of men and words, "is a multiplex subject." No doubt it is. "It means a good many things." No doubt it does. "There is the art of making bread, and the art of making clothes." Of course; and there is the art of making the worse appear the better reason. "People who call themselves artists are equally liberal and comprehensive in their terms." This also is true enough; if the word *Art* is vague, so will the word *Artist* be vague. "I have had a good deal to do with architects," Sir EDMUND goes on, by way of a particularly pointed illustration; "and I have always found that *they*, for some reason or other, wish to call themselves artists, though *I* have never been able to make out why! It seems to me that an architect is *not* an artist. An artist *must* do something with his fingers. It is not with his mind that he works entirely. An architect does not do anything with his fingers;" and so on. If we close this quotation with the remark that, according to some other critics, the architect of modern times does not do much with his mind either, or with what, in the late Lord WESTBURY'S well-known phrase, he is pleased to call his mind, Sir EDMUND may possibly thank us for completing the picture of that perfect professional incapacity of the artful order upon which he is so passionately fond of descanting, as himself a competitor and rival of the artless order, emphatically artless.

Now, to an architectural person of sufficiently vertebrate character—if any such there be—Sir EDMUND BECKETT must be the most delightful of men. Like TENNYSON'S tower, he "stands four-square to all the winds that blow." From his cradle—if he ever condescended to use one—he has been the supreme Bogie of architects of the temperament that may be called meek and mild. Even the more courageous leaders of the craft have quailed before him, and something more. By a characteristic stroke of genius the Brahmins of the Council recently elected him, for instance, an Honorary Associate of the very Institute itself. This was in the childlike hope that, by holding the candle to him, they might propitiate him and induce him to abate his plain speaking. Vain thought! Ever since that very day he has paid his two guineas yearly to their funds, laughed at their beards, and scoffed more than ever at their fatuous confidence. They invite him now and then specially—affecting to regard him as one of themselves—to attend a meeting and make a speech; and any one who wishes to hear, not covert, but open sarcasm at its keenest, ought to hear that speech. He lectured them once upon Domes. He quietly began his lecture by saying that he would ask them to take the principal part of it "as read," inasmuch as there was not one man amongst them who could possibly understand it, or only one who was a mathematician. On another occasion they asked him to take up the amiable subject of Competitions; and when some one in debate ventured to suggest that, as in the learned gentleman's own profession, and all others of any intellectual respectability, junior architectural practitioners ought to behave towards their seniors with a little consideration, he treated the idea with

open and loud laughter—so little in the way of intellectual respectability did he see around him. More recently, as everybody knows, he has taken into his own strong hands, by *force majeure*, the restoration of one of our cathedrals; and when our chief ecclesiastical architects pointed out in their timorous way that such an undertaking, as a matter of most difficult design, ought, in the interest of public taste and patriotism, to have the ordinary advantage of expert professional handling, he snapped his fingers at them all, and at everybody who thought as they thought; and, to the disgrace of even a nation of *boutiquiers*, he is consequently allowed by bishops and chancellors and other such trustees of our national monuments and ecclesiastical honour to do as he lists with the edifice, so long as he finds the money and takes the risk of the inevitable posthumous shame. But what makes such a man especially admirable is that he does all this with such perfect good humour. Hitting as hard as he possibly can at every architectural opponent, whom he succeeds in catching before he can run away, he not only permits, but appears to expect, every one of them to hit him as hard as he possibly can in return. He is none of your thin-skinned fighters; if he gives no quarter, he asks none; if he laughs you to scorn, he lets you laugh at him again, your best and your loudest laugh. What think ye, O ye architects! is the origin of you all? It is "Mothers"—says he—be it observed *Mothers*—"with young gentlemen who can draw 'pretty things,' that put their sons into architects' offices"! That is the way it is done. The master, he further explains, takes three or four hundred pounds of the widow's money for this; sets her boy to copy his specifications and drawings, and to copy them over and over again; and then the young gentleman takes an office, affixes a brass plate to the door, and is "an architect"! It would be idle to deny that this is very hard hitting, even if scarcely honest. May we express the hope that the President of the Institute, in the brilliant address with which in about a fortnight's time he will open another laborious and splendid session of that body, will have a kind word to say in acknowledgment of this pleasing witticism? One thing we can promise is that the more he has to say, and the more pointedly he may say it, all the better pleased will this jocular tormentor be.

Of course architecture is not an "art" if done in the artless way in which it can be done, and, alas, is done, by such an architect as Sir EDMUND himself is at St. Albans Abbey; and inasmuch as, in architecture as in all else, every operator takes its merits at his own valuation, we may get at the bottom of the paradox that an architect is not an artist by the simple explanation that the Art goes before the Architecture, and not after it. Our school children have a question which is considered very great fun when one does not remember the answer—When is a door not a door? The answer is, When it is a-jar. Well, when is an architect not an artist? May we suggest the frivolous reply—When he is a Q.C., a baronet, or any other kind of artless amateur. He who, being a non-artist, designs a building as best he can, however well pleased he may be with himself, remains as he was, a non-artist; just as he who, being an artist, does not design a building at all, remains the artist he was nevertheless. The sort of architects with whom Sir EDMUND BECKETT appears to be just now more particularly dissatisfied, or perhaps satisfied—the gentlemen who are made architects by their mammas—may probably be not great artists; especially if to acquire the title of artist (it must be an enviable one, or it would not be so very earnestly dealt with by Sir EDMUND himself) they do nothing more than pay a premium, copy a few specifications and drawings, and affix a brass plate to a door. We may even go so far as freely to own that a large proportion of the commonplace "architects and surveyors" of our London streets and provincial towns make no particular pretension to be artists; and if what Sir EDMUND BECKETT means is no more than this—that a man need not be of an especially artistic turn of mind in order to practice the design and supervision of building business in this unpretentious but most useful way, no architect, artist or not artist, need disagree with him. But this is quite a different thing from affirming as a philosophical proposition that architectural design is not one of the forms of fine art. If Sir EDMUND only wishes to have a fling at the principle of regular ordination, for the purpose of asserting his own personal independence of all regulation and order as a free lance, let us enjoy his pleasantry and have done with it; but if he professes to be teaching us something that we do not know, we must beg him to go into a little further explanation.

If the artist be only one who "does something with his fingers," is the fiddler the artist whilst HANDEL and BEETHOVEN are not? Does the art of "Paradise Lost" pertain, not to the grand old blind man whose lips spoke, but to the grudging daughter whose fingers held the pen? Fingers or no fingers, is there no "art," or artifice of grace, or artificial beauty, in the composition of St. Paul's or Westminster Abbey, the Parthenon, GIOTTO's Campanile, or the Taj Mehal? Are all these mere piles of stones fortuitously aggregated? Have the form and fashion of them grown out of the ground like a cabbage; or come forth from the egg by process of animal mechanism; or, heaven knows how, been brought about by the necessities of masonry, which the mere fitness of things would cause to collapse but for those cornices and string-courses, columns and piers, vaultings and traceries, and all-pervading intricate proportions, full of mysterious thought and exquisite calculation? The writer of an argument like the present need not be himself a great artist—he may even be content to feel that he is a very small one as Nature made him—and yet he may be permitted to assert that amongst all the pleasures of intellectual life there is perhaps absolutely nothing that surpasses, and little that equals, the delight of architectural design, as an exercise of the specially instructed imagination. To this there are so many that can testify, and there have always been so many, that it is utterly vain even for Sir EDMUND BECKETT to pretend to believe that he can dispute their testimony. And thus it is that all through the ages, and all over the globe, in one degree or another, the *art* of architectural composition has been one of the most conspicuous products of the genius of mankind. To say that art is a thing that has to be done by one's fingers, and not in one's head, is at the best a perfectly unsupported and pedantic affectation of language. In the mouth of an audacious forensic advocate, the artifice may be characteristic enough; and it might have what is called its weight with a tribunal ignorant of the subject; but no artist in the world could for a moment be so mystified, and architecture, in spite of such frivolous and empty sophisms, remains as it has always been, not only an art, but the grandest of all.

If we may venture to offer a word of advice, not to Sir EDMUND BECKETT who is inaccessible to it, but to those who read his clever books, listen to his clever speeches, and may be tempted to imitate his clever ways, we would observe that, at the present critical time in our national progress, no greater wrong or greater folly can be committed than to degrade the character of artistic work for the sake of a splenetic jest, or discourage the ambition of artistic workers in the interest of pragmatical assurance. The utmost concession that we can honestly offer to the proposition before us is the expression of our perfect willingness that the author of it may go down to posterity, if he so desires, under the name of *the artless architect of St. Albans*.

#### ANCIENT MARBLES IN GREAT BRITAIN.\*

THE private collections of ancient sculptures in this country, though valuable and attractive in many ways to the archæologist, have a special interest for architects. In most cases it was not for their importance as works of ancient art that these sculptures were collected. The first necessity was that they should fit into places carefully planned and prepared in the mansions of our aristocracy with a knowledge that sculptures of such and such a kind were obtainable. Provision was made for so many busts and so many statues. Agents in Rome or elsewhere were directed to be on the outlook for what was wanted, and to make excavations on promising sites. During the last century this form of activity was at its best, and though there may have been a great want of originality in it there was yet a fine sense of stately effect and an appreciation of solid and substantial workmanship. The interior of a mansion was more thought of than its exterior. It may be said that mistakes were frequently made in the interiors also, on the ground that ancient sculptures, if they were worth collecting, should not be sacrificed to what was supposed to be a stately effect in the rooms or galleries in which they are placed. But, as we have said, these sculptures were brought together for the secondary purpose of helping out this effect, and either this purpose

was radically wrong or the statues are properly placed in secondary positions. What justifies the purpose is the fact that these sculptures were collected openly without regard to their being great masterpieces. It was enough if they were fairly well executed, and it was imperative that they should be carefully restored and made to look complete. With pride in the possession of ancient works of art was associated a taste for finish; even the vexatious finish of the restorer was welcome. Men like PAYNE KNIGHT, who ruled the taste of his day, saw nothing to admire in the headless statues of the Parthenon; the frieze being more perfectly preserved pleased them much more. What pleased them best was a fairly well executed Græco-Roman copy of a good original.

No doubt in these mansions the task of the architect was sometimes hardly worthy of his vocation and gave little scope for his originality. In any case it is a task which cannot well recur now, since ancient sculptures are no longer to be obtained in necessary numbers. Yet the classicalism of this country in its relation to ancient sculptures is a feature in the history of architecture which cannot be despised, and if its literary and archæological details are to be studied anywhere with advantage it is in the large volume just issued in an English dress by Professor MICHAELIS. He has bestowed infinite care on his subject, and if nothing else was to be gained from his book, it would be a sense of the vast amount of decorative materials that exist in the mansions of this country.

The principal object of Professor MICHAELIS was to present in a convenient form an account of all the private collections of ancient sculptures for the use of students of archæology, who hitherto had to search for such information as they wanted in scattered catalogues and notices, most of them difficult of access and many so far behind the time as to be useless. To these students he has rendered a valuable service. They can see at once what sculptures there are, for instance, in Lansdowne House, Woburn Abbey, Ince-Blundell Hall, or Petworth House, and can find where engravings of them are to be seen, when such exist. But he has not altogether confined himself to private mansions. His plan embraces the sculptures belonging to the Universities of Oxford and Cambridge, the Antiquarian Museum in Edinburgh, and the Soane Museum in London; while even as regards the British Museum he gives a sketch of how some of the collections afterwards absorbed in it were originally formed. When he imagines that the British Museum must ultimately receive these scattered collections which he now describes, we can only hope that he is, on the whole, mistaken. For although they contain not a few specimens which would grace any national museum, yet the rank and file of the sculptures are better fitted for where they are. The *Amazon* in Lansdowne House and that other ancient copy from the same original in Petworth House might with advantage be placed side by side in a public gallery; and so with many others, such as the fine bust at Petworth engraved in the present volume.

The passion for collecting ancient marbles dates from the beginning of the seventeenth century, the then Earl of ARUNDEL AND SURREY being its first great representative, and being, as it appears, largely influenced in his tastes by INIGO JONES. It was not Rome so much as Asia Minor and the Greek Islands that were then laid under contribution. Next followed the Duke of BUCKINGHAM, CHARLES I., and others, who to obtain sculptures against such competitors as Cardinal MAZARIN or Queen CHRISTINA of Sweden had often to pay prices which would now be regarded as very exorbitant. The principal collections formed during the age of the STUARTS were the Royal, the Arundel, and the Pembroke collections, and of these only the last has remained to our time.

It is, however, the eighteenth century that Professor MICHAELIS describes as the "Golden Age of Classic Dilettantism" in England, and of this period he gives a long and interesting account. It is a story such as few could picture of extraordinary activity in the pursuit of works of art, and it is a story which few could read without pride. For the early part of this period Rome had been the chief source of supply. But towards its close the spirit of acquisition, if not also of a truer taste, began to lead men to Greece, and in time such fortunate discoveries were made as those of the *Ægina* sculptures now in Munich, and the temple of Apollo at Phigaleia in Arcadia. In those days STUART and COKERELL represented English architecture in its classical side, and under their influence knowledge at least was vastly extended. The climax of collecting was reached by Lord ELGIN, not only in the quality

\* Ancient Marbles in Great Britain. By Professor A. Michaelis. Translated from the German by C. A. M. Fennell. Cambridge: The University Press. 1882.

and quantity of what he obtained, but in the purpose by which he was guided. That purpose was not the embellishment of a private mansion, but the enrichment of a public museum. He began, it is true, like his predecessors, in what is called the Dilettanti spirit, with the object of acquiring new ideas for the decoration of his own house. But that was soon forgotten in the desire to rescue the sculptures of the Parthenon, and secure them for the English nation.

In our time ancient sculptures are difficult to obtain, most of all by private persons, and accordingly the spirit of collecting, so far as it extends to classical antiquities, is directed to smaller and more portable objects, such as gems, coins, and vases. There are still scattered through the country a number of very valuable collections of vases and gems, little known beyond the circle of their possessors. A catalogue of them also would be interesting. Loan exhibitions, such as have brought the "Old Masters" within general knowledge, are hardly to be thought of. Sculptures of this kind are not easy to move with safety to them, while again many of them, as we have said, would have little charm outside of the niche or gallery where they stand at present. Vases, and especially engraved gems, can only be seen slowly and with far more minute attention than could be bestowed on them in a public exhibition of a temporary nature. We must be satisfied, therefore, with looking forward to an ample catalogue of them such as Professor MICHAELIS has produced for the ancient marbles.

### THE DUNDEE FINE ART EXHIBITION.

THE sixth Fine Art Exhibition held in Dundee was opened on Saturday by Sir William Fettes Douglas, President of the Royal Scottish Academy. The ceremony was carried out in the Albert Institute Buildings. Mr. Frank Henderson, M.P., presided, and introduced the President of the Royal Scottish Academy to the meeting.

Sir William Fettes Douglas said: The attention now given to art in this country is one of the most curious of the innumerable reasonable, unreasonable, and fantastic fashions of the day. Even fifty years ago art was recognised only by the few, and they recognised it as a very trifling, although sometimes pleasant, accomplishment, and never dreamt it could ever become, as it is daily becoming, a great power in the world; indeed, it seems not unlikely to usurp a larger share of the world's attention than it can or ought legitimately to claim. Books of to-day very often consist of pictures, with a word or two of letterpress—not, as in a proper division of labour, of letterpress, with accompanying pictorial illustrations. And we seem fast returning—though under very different influences—to the style of the earliest printed books—viz., "The Bibles for the Poor," which consisted of pictures only, or pictures with a word or two incorporated in the woodcuts. Indeed, unless it be in the gloomy regions of abstract science, every department of human activity calls in the assistance of art. Natural philosophy claims its help, history claims its illustration, and romance seeks to add art's piquancy to its own; and I need not speak of its activity as an advertising medium. The work of the physicist is explained by it, and the mind of the child is ripened by it. Much of all this, as I said before, is the result of fashion; but it is to be hoped that before the fashion can change art will have become incorporated, so to speak, in the very nature of the next and succeeding generations, and will then hold its position permanently as a necessity of life. Nowhere has this change in art's position shown itself more remarkably than in the picture-books of the nursery. They represent a real advance; a generation ago they were worse than weak and uglier than bad—now they are prodigies of luxuriant ability; and in this matter we must recognise a vital factor in the progress of art generally, because the unconscious education children receive from these silent companions, their picture-books, must have a permanent effect upon their future tastes and habits; and the improved and really high quality of many of the children's books of to-day will render even the most obtuse among them impatient of the presence of all that is rude and unrefined. As in morals constant contact with pure and upright conduct is the best, indeed the only true, education, so in art familiarity with beautiful—not necessarily expensive—objects will inform better than a thousand schools. They speak a language which does not need to be learned, and is more eloquent than the thousand conventions and rules of a thousand teachers. Next to the influence of children's picture-books in the formation of art feeling—but, as I sincerely believe, only next to, and not before them—is the influence of art exhibitions. They appeal, no doubt, to the riper and more cultivated mind, and ought to carry on and further the education earlier begun; but though theoretically true, this is not always practically possible. We have the best art power of the whole world producing children's books and illustrations to popular literature; while all local exhibitions must depend more or less upon local ability. Keeping this in view, the

Committee of the Dundee Fine Art Association deserve no ordinary praise for the collection they have this year gathered together in these rooms. It is probably the finest exhibition hitherto seen north of the Forth, and it is to a great extent free from any local or provincial character. Some of the most eminent of our English contemporaries are well represented upon the walls, and a large proportion of the members of our Scotch school seem to have put their best foot foremost, and show themselves literally in their best colours. The public and artists themselves are quite unable to appreciate the labour and the various annoyances and difficulties—I've even heard of dangers—encountered in getting together such an exhibition as this, and no one who has not served on a committee of arrangement, or, as it is termed professionally, a hanging committee, can understand the embarrassment, and not seldom the pain, experienced in making final decisions. A member of the hanging committee ought to begin his labours with the principle that he must have no friends, and when he has finished he will probably find himself blessed with many enemies. It is almost impossible to do justly and love mercy in exhibition arrangements; these two qualities are generally found to be absolutely incompatible with each other; moral reasons, conventional reasons, and mechanical reasons, all make a tangled skein of his best intentions, and he who went in as a man of principle and benevolence comes out of the ordeal a demoralised cynic. I see it stated in your leading journal that your last exhibition was relatively in one respect more successful than any other in the country, or, indeed, in the empire. And the exhibition committee of a smaller and more local exhibition, in a town not a thousand miles from this place, makes a somewhat similar assertion. The statement is founded simply and solely upon the large amount of sales effected during the season; and there is a congratulatory chuckle accompanying this very satisfactory statement which would be allowable enough did it not stand alone in an apparently all-sufficient isolation. I sincerely hope, and do not doubt, the present exhibition will afford its promoters an equal amount of satisfaction from the same point of view; and there is no doubt men must live before they can enjoy life; but Committees and Councils may not forget that such gatherings of works of refinement and beauty are not mere bazaars, and are, or ought to be, primarily for the advantage of the public, and the advancement of local, and ultimately of national, taste. In this country, and in the vast majority of the very best of us, a love of art is an artificial accomplishment, and not a spontaneous feeling. Probably the spontaneity will supervene after ages of culture, for habits of mind are as certainly transmissible as habits of body, aptitude for culture not less so than tendency to crime; and with our mind's eye we may look forward to our successors possessing intuitively that sense of the beautiful and the true which may make life in itself and its surroundings one long enjoyment. I have nothing further to add than to say that after repeated examination of the exhibition I am quite convinced it is the finest I have ever seen almost north of the Tweed, certainly north of the Forth, and I hereby declare it open.

Lord Strathmore proposed a vote of thanks to Sir William Fettes Douglas for his very interesting address. They would have observed that there was a vein of quiet humour running through the address, which freed it from that stiff character which so often attached to addresses of that sort. They had much pleasure in hearing it, and it was worthy of being read over again in the newspapers.

Lord Kinnaid, in moving a vote of thanks to the chairman, remarked that the address just delivered by Sir William Douglas was the most interesting he had ever heard.

The President, in replying, said he was exceedingly obliged to them for the vote just given to him. It was now his duty to inform them that the galleries were open for their inspection, and to express the hope, which many there had secretly expressed to themselves during the course of the preparations for this exhibition, that it would not be less successful than any of its predecessors, and that it would still further encourage gentlemen who had taken much trouble and pains to bring such a collection of pictures together to do so on future occasions.

In the afternoon Sir W. Fettes Douglas was entertained at a luncheon, at which Mr. Henderson also presided.

In replying to the toast of "The Royal Scottish Academy," the President said that the Royal Scottish Academy had shown itself to be a very good mother to artists, and that the existence and progress of the Academy, the progress in art, and the improvement in general feeling and culture in Scotland, were nearly synonymous. The Academy at the present day had a very severe struggle, because it had to fight against the loss of its own body; it had to fight against its artists' going away from its own bosom. But many of its best men still remained in Scotland, and some of them were present at the ceremony in Dundee that day. If they had all their men from London, there would not be a better exhibition than theirs on the face of the earth. If they were only able to keep their men from those rascally English, and that sink of iniquity London, they would be able to hold their own with the world, because the Scottish school was very distinctive in its character. He hoped the strong tendency the younger men had nowadays to copy the French school would not make them forget

their nationality altogether. There was a feeling that it had introduced various improvements, and done much good in the school, but still, while he felt those advantages, he would rather see the artists utterly Scotch, and almost local in their views, than see them leave Scotland altogether.

Mr. Vallance, R.S.A., proposed "Success to the Dundee Exhibition." He was most anxious to get the prayers of the gentlemen present for the success of the exhibition, but, he asked, could there be any doubt about its success? This was its sixth year; it had served an apprenticeship; and there were such men at the head of affairs—such hands upon the rudder steering—that they could scarcely fear for its future. He was much delighted going through the galleries in the Albert Institute that day. Picture after picture seemed to force itself upon him, and one which struck him very much was the little picture of a girl with a bird upon her shoulder. It was a charming piece of art, and while he was looking at it anxiously he heard a good lady say, "Aye, it's a grand gift; a grand gift to the permanent gallery." He was rude enough to ask who presented it, and although he was told it was rather a secret, yet he learned that it was Mr. Orchar. When they had such men as Mr. Orchar, Mr. Simpson, Mr. Ritchie, and a host of others working with and working for art in such a living way, did they fear? He did not. He hoped that the exhibition would be a great success, and that its promoters would be long spared to work in the cause of art.

Mr. Orchar said the exhibition was not so well known at one time as it was now, and one of the great difficulties the promoters had to contend with was to get pictures from the best artists. Now, however, they were getting such pictures; and he was sure from what he saw that year after year they would be able to show something at least not inferior to what was on view that day. The promoters were disappointed in not getting pictures from gentlemen whom they wished to see represented in the galleries, but a few collectors had kindly granted the use of works by the gentlemen he referred to; and to those collectors—especially to Mr. Macdonald, of Aberdeen—they desired to tender their warmest thanks. It was a great satisfaction to the promoters to know that their services had met with approval, and he hoped the fruit of their labours would be seen in the success of the exhibition.

Mr. Ritchie proposed "Local Art and Artists," mentioning that there were about 200 collectors of pictures in Dundee, and seventy local contributors to the exhibition last year; while twenty or twenty-five years ago there were no artists, and only some half-dozen collectors.

## HOSPITAL CONSTRUCTION.

(Concluded from page 226.)

IN all efficient hospitals which have, within a recent date, been provided for the isolation and treatment of cases of different infectious fevers the buildings are so constructed that patients suffering from each separate disease may be in a separate building, having no enclosed means of communication with any other hospital building. This result is, as a rule, obtained by the construction of pavilions, standing at a proper distance from each other, and from the administrative building. In the case of a one-storeyed building each pavilion contains as a rule two wards, one at either end, for each sex, the wards being separated in the centre by an entrance lobby and certain administrative apartments. In the case of a two-storeyed building the pavilion has a male ward on the ground floor, and a female ward upstairs, each floor having a separate lobby and administrative rooms.

In the arrangement of the buildings it has been found that the distance between the several pavilions, and between them and the administrative block, should, if possible, be equal to one and a half times their height when the buildings are of equal height, and, if otherwise, at least equal to the full height of the higher of the two adjacent buildings; also that the means of communication between them should be limited to a roofed passage, either entirely open at the sides or having permanent openings facing each other in the opposite side walls, or again to a roofed passage fitted with a central partition and being completely open on both sides of the partition, the persons using the passage walking on the lee side of the partition.

In the case of a smallpox pavilion, it has appeared to me that the separation between it and the other hospital buildings should, if possible, be even more complete, and where such an arrangement can be carried out, that the administrative apartments it contains should be such as to reduce communication with the administrative block to a minimum. Especially should there be in connection with the pavilion separate sleeping accommodation for nurses. In some districts, as at Folkestone, the smallpox hospital is an entirely separate institution, situated at a distance from the hospital for the other infectious fevers. In several hospitals visited smallpox is not admitted.

With reference to the construction of the pavilions, regard has, in all good hospitals, been had to the conditions deemed necessary in the construction of a good dwelling-house. The foundations

have been laid in a soil free from animal or vegetable matter; the whole ground surface of the site has been underdrained when necessary, and in some of the better examples of hospital buildings it has been covered with a layer of cement concrete or asphalt, or it has been otherwise prepared so as to exclude both dampness and also emanations from the soil, which might subsequently become contaminated, as by accidental leakage from a drain. The walls have consisted of good bricks, of hard stone, or of a combination of the two, or of some similar material such as concrete; they have been provided with an efficient damp-course; and with a view to the maintenance of an equable ward-temperature, it has been found necessary that they should be at least 14 inches in thickness. It has also been found necessary to provide windows in each of the opposite side walls. The roof, whether of slates or tiles, has been in great part or entirely ceiled within. Where, as in Sheffield, flat roofs have been made, they can conveniently be constructed of concrete, asphalt, or other similar material.

The floors, provided beneath with means of ventilation into the outer air, have in all cases consisted of wood, and when this has been both well-seasoned and so laid as to prevent the occurrence of spaces between the planks, the result has been fully satisfactory. Where such interspaces have taken place, they should at once be filled in with wood, or some other suitable material. The internal surface of the walls are best made of glazed bricks, or of cement, so that they can be at regular and frequent intervals washed or otherwise cleansed. The glazed-brick walls, as in the Delancey Hospital, Cheltenham, are attractive, and admit of easy cleansing; and Parian cement when put on, as at Weymouth, so as to present a hard, impervious, porcelain-like surface, is well adapted to the purposes of hospital wards. Ordinary brick or cement walls which are periodically lime-washed and then covered with a slightly-toned wash, are also neat and cleanly.

Architraves and cornices or other projections in connection with the walls have often, as at Weymouth, very properly been avoided, for they all tend more or less to harbour dust containing infective matter. For a similar reason flat ceilings are found preferable to any pitched roofs which need to be supported by projecting beams or rods.

The windows should be made for the purposes of ventilation as well as of admitting light, a point that has been overlooked in some of the more modern buildings, where I found that only small portions of the several windows were made to open. Having these objects in view, I am of opinion that a double-hung sliding-sash window is the one which is best adapted to the purposes of a hospital ward. These sashes are often surmounted by a third and smaller hinged-sash, fitted with side flaps, so that the air entering from without shall be directed towards the ceiling. The lower frame of each sash-window may also, as in the Berkhamstead rural and the Weymouth port hospitals, be with advantage made with a deep bottom rail so that the sash may be opened to allow of the entrance, in an upward direction, of air between the meeting rails, whilst the window remains closed above and below. With a view of securing a cheerful appearance, the bottom of the windows should not be more than about 3 feet above the floor level, and to ensure adequate movement of air in the upper parts of the ward, it has been found necessary that the top should not be less than some 6 inches, at the most, from the ceiling or the wall-plate, as the case may be. The best arrangement of windows is found to be that which provides for one between every two adjacent beds, and one near the angle of the ward beyond each end bed. Movement of air, and such ample light as tends to secure cleanliness, is thus ensured in those parts of the wards standing most in need of such requirements.

The amount of window surface which it is desirable to ensure for a ward is a subject which has received some attention. Having regard to cheerfulness, to adequate means of lighting and ventilation, as also to the maintenance of an equable and sufficient ward-temperature, it has appeared to me that in a well-constructed and efficiently warmed building the amount of window surface to cubic space should not vary much beyond the limits of 1 square foot to from 60 to 80 cubic feet; a proportion of about 1 square foot to every 70 cubic feet being, as a rule, the most advantageous. The experience obtained in the Children's Hospital at Pendlebury in this connection deserves special consideration, for, due regard being had to ventilation, the failure to maintain the ward air equably warm, and at the same time sweet, was to a great extent due to the excessive window surface, which there amounts to 1 square foot for every 35 cubic feet.

Windows in the opposite side walls, whilst affording the principal means of ward-ventilation, and constituting indeed the only effectual means by which thoroughly and in a short time to change the entire ward air, as, for example, when all the windows are opened on the occasion of cleaning out the wards, do not however suffice for this purpose. The space between the floor and the bottom of the patients' beds is found always to require independent ventilation, as by openings into the outer air situated just above the floor level, and each capable of being closed by means of a small sliding door, on one or other side of the ward, according as the weather may temporarily necessitate. Similar openings near the ceiling level are also, as a rule, provided. "Tobin" tubes have

occasionally been usefully resorted to. One or more vertical enclosed shafts passing from the ceiling through the roof are also, as a rule, requisite to carry off such air as is either too hot or no longer pure. But it must be regarded as certain that the provision of even excessive facilities for the escape of impure air, as by roof-shafts, should in no case be allowed to interfere with the provision of ample means for admitting fresh air into the wards, at a lower level.

Open fireplaces have, under most circumstances, been regarded as best adapted to ward purposes, and the additional means of ventilation they afford may be looked upon as especially useful in the case of wards occupied by patients suffering from infectious diseases. At least one such fireplace is found to be required for every 25 to 30 feet of ward length, and, where this limit is approached, those fireplaces which are provided with an air-chamber behind, by means of which warmed air from outside is passed into the ward, are, as a rule, used, because of the additional facilities they afford for maintaining a sufficient and equable temperature. Where wards exceed 30 feet in length stoves occupying a position in the central line of the ward, and having an open fireplace both in front and behind, or similarly situated closed stoves so made as to throw warmed air into the wards, are mostly used to maintain a fairly equable and a sufficient ward-temperature. Apparatus for combined warming and ventilation was only met with in one instance; it is referred to in connection with the Children's Hospital at Pendlebury, near Manchester.

The ward-space which should be allotted to each patient is a matter of first importance in a hospital where the patients are themselves centres of infection. In the Board's Hospital Memorandum it is stated that the ward-space for each patient should approach, as nearly as circumstances allow, to 2,000 cubic feet and 144 square feet of floor-space. In most of the modern hospitals visited this amount of ward-space was nearly or quite reached; in a few instances it was somewhat exceeded; and, with one exception, I have found no reason to suggest that it should be exceeded. The exception relates to wards containing smallpox patients. In such wards a larger space between the beds seems indicated than is necessary for other patients, especially when many severe cases are under treatment. Under such circumstances it has been found difficult, even when the means of ventilation appeared ample, to keep the air in all parts of the wards quite sweet.

I am disposed to regard a standard of floor-space as necessary to be appointed quite independently of the standard of cubic space, and I should not consider a material excess beyond the required 2,000 cubic feet per bed as compensating for a material shortcoming in the required 144 square feet of floor-space; nor yet should I regard a more ample floor-space as compensating for an insufficient cubic space. In other words, it appears to me that the height ought habitually to be about 14 feet in wards that are intended to have rows of beds on their two opposite sides, or if it be more than 14 feet, the space above that height should not be taken into account in reckoning the cubic space.

The question as to the maximum of beds which should be allowed in any one ward devoted to infectious cases was borne in mind during the inquiry, but where large wards were met with they either lacked the adequate ward-space per patient, or they had not for some considerable time been in full use. Hence no experience on this point was available.

On several occasions the question arose whether children, whilst in a hospital for infectious diseases, needed the same amount of ward-space as is deemed necessary for adults, and it has appeared to me that the subject called for consideration quite apart from the more general one as to the air-space which should be allotted to children in dwelling-houses, or in general hospitals. The circumstances, indeed, are not analogous. Having regard to the general experience acquired, I am of opinion that if any reduction in ward-space is made in the case of children, the reduction should be but small, and that in no case should the space for a child in an infectious hospital be less than three-fourths of that which is deemed necessary for an adult.

In connection with each ward there must be one or more water-closets, or dry-closets, and a ward-sink. In all well-constructed hospitals both these apartments are contained in a building projecting from the main pavilion, being separated from the ward itself by means of a lobby, provided with a door leading into the ward, and having means of cross-ventilation by openings in its two opposite side walls. As a rule, windows made to open are relied on to secure this cross-ventilation, but they are, except in very warm weather, nearly always kept shut, and hence measures should in every hospital be adopted to ensure that this cross-current of air shall not be stopped by any action on the part of patients or nurses. This can be effected in several ways, as by the substitution of a fixed louver, for a part of or for the whole of one of the upper panes of glass. The closets and sinks may conveniently be placed side by side with doors facing the door leading from the lobby into the ward. The partition above the closet and sink doors should rise to the ceiling so as to shut these offices entirely off from the lobby; whereas the partitions separating them from each other should not be more than about 8 feet high, so that, by means of windows placed in the opposite side walls of the projecting building, an independent cross-current of air may be secured through them.

Where water-closets are used both the apparatus known as a "container," as also the "D trap," have in modern hospitals been carefully avoided, as tending to retain infection and to cause nuisance. Wherever any form of dry closet is in use, it is fitted with a movable receptacle, which needs to be emptied and cleansed at least once every day, the removal being effected through a doorway from without; this form of closet also requires to be subjected to frequent inspection, and an ample supply of the dry material used should be available for application. Dry earth and charcoal have both been found to answer this purpose. Ward-sinks require to be provided with means of flushing, and having regard to their use for ward slops, &c., water drawn from the taps with which they are fitted should not be resorted to for domestic or other allied purposes.

A separate bath-room is provided in most hospitals. If the bath be a fixed one, it is found expedient that the head alone should be fitted in contact with any wall, both sides being left free, in order that attendants may have easy access to the patient using it. A movable bath is, however, as a rule, found necessary as well as a fixed one, especially in scarlet-fever wards, where bathing often forms an important part of the treatment adopted. One movable bath at times serves all the requirements of a small pavilion, and in some of the smaller hospitals, where no separate bath-room has been provided, the bath is made to stand in a lobby over a sink, to which hot and cold water are laid on, and over which it can be emptied. Bathing in the wards is, however, not as a rule desirable, except when the circumstances of the patient render it necessary.

In connection with each ward-pavilion an entrance lobby and certain administrative apartments have in nearly all cases been provided. In the one-storeyed pavilions these occupy, as a rule, a central position, and the minimum they consist of is (1) a nurse's room fitted with fixed windows, commanding a view of either ward; (2) a room in which to store such food and other articles as are in constant use; and (3) a linen store. Where no additional rooms are provided, the nurse's room is often fitted as a ward-kitchen, in which articles, such as beef-tea, &c., can be cooked or kept warm, and it is also provided with a scullery sink, an arrangement which is the less objectionable because nurses should not, unless under very occasional and exceptional circumstances, sleep in the rooms adjoining the wards. In the two-storeyed pavilions similar apartments occupy that end of the ward which adjoins the entrance lobby, and in which the staircase is fixed.

## THE BIRKENHEAD TOWN HALL COMPETITION.

A MEETING of the Birkenhead Town Council was held on the 6th inst., the Mayor (Mr. W. Laird) presiding.

A report was read from Mr. Charles Barry, architect, London, who recommended that the author of the designs bearing the motto "Mersey" should receive the appointment of architect to the Corporation for the proposed new town hall. The committee recommended the Council (Mr. Craven dissenting) to select and approve, subject to the conditions of the preliminary and final competitions, the designs submitted under the motto of "Mersey."

It was agreed to take a resolution on the subject of a site for the hall before confirming or otherwise the minutes of the committee.

Mr. Craven then moved as follows:—"That the resolution passed at the meeting of the General Purposes Committee held on the 24th October, 1879, recommending the site in Hamilton Square as suitable for the erection of a town hall and municipal offices, and the resolution passed at the meeting of the Town Council held on October 31, 1879, confirming the same; also so much of the resolution of the General Purposes Committee passed at a meeting held on September 26, 1881, and the resolution passed by the Council on October 12, 1881, confirming the same, and with reference to the Hamilton Square site, be rescinded or varied in order that the following resolution may be passed:—"That as the site previously fixed upon for the town hall is neither suitable nor large enough for a building of such bold and lofty proportions as the design approved of by the General Purposes Committee, and also that, since the site was decided upon, her Majesty has been graciously pleased to grant to the borough a Court of Quarter Session, thereby necessitating the building of a sessions house, the General Purposes Committee be requested to reconsider the question of site, with the view of combining the sessions house with the town hall, and erecting those buildings in the middle of Hamilton Square, provided the owners are willing to permit it free of cost." In supporting the motion, Mr. Craven stated that its adoption did not bind the Council to anything at all; they would be as free after passing it as before. But it would have the effect of bringing the subject before the General Purposes Committee, who could quietly go into the advantages and disadvantages of the different sites, and then report to the Council. The last time the matter was under discussion the only objection he remembered being raised to the Hamilton Square site—which he advocated at that time—was that a building in the middle of the square would be too costly. Since

that time they had got plans, out of which they had chosen a design the carrying out of which would cost 42,000*l*. The question of cost was therefore settled, and now he was prepared to advocate that the design chosen should be built in the centre of the square. With some slight alterations in the plans the building would be an ornament to the square. The design fixed upon was too bold and massive for the site where it was proposed to build the hall, and its general effect would be lost, and, seeing they intended to spend so much money on it, he contended that it should be put where it could be seen. If the town hall proper could be put in the middle of the square, then the site which they had already fixed upon would be at liberty, and they would be able to build upon it a new sessions house and magistrates' court, which they would very soon be compelled to do; whereas, if they had to buy a site for these buildings, it would entail an extra expenditure of 10,000*l*. or 12,000*l*. The town was a prosperous and healthy one, and as they had got money to spend they ought to do it. He had reason to believe that the majority of the owners of property in Hamilton Square would not throw any difficulty in their way in granting the land free of cost.

Mr. Shaw, in seconding the motion, said the necessity for building a sessions house, magistrates' court, &c., had been forced upon them a few months ago, and if they built the town hall on the site fixed upon, they would have to go into Chester Street, bridging over Albion Street, to find room for these additional buildings. That would entail an outlay of 3*l*. per superficial square yard for the extra ground required, which would amount altogether to 10,000*l*. or 12,000*l*. That amount would be saved by erecting the town hall in the middle of Hamilton Square, and leaving the other site for these other buildings.

Mr. Paterson thought the acceptance of the motion would put them in rather a peculiar position with the gentlemen who had sent in designs, as they might have to change them.

Alderman Harris said that to tell the Council that such plans as had been prepared for the original site would be suitable for the middle of Hamilton Square was too much for their credulity. If they were to satisfy the owners of property in the square they must have four frontages to the hall, which would entail an enormous cost. He would like to know if the ratepayers were prepared to spend perhaps 100,000*l*. for a building with four frontages. The question of the sessions house was under consideration the first time the town hall site was before the Council, and on that occasion he himself pointed out to the Council how the rooms in the municipal offices could be utilised. Was a new building really required for the quarter sessions? He had been told that the quarter sessions would sit perhaps two days every quarter, and were they going to spend 10,000*l*. to erect a building to accommodate these? Surely some place could be found in the borough for them. Supposing they decided to build the hall in the centre of the square, he was prepared to say that ten years would not see it finished, they would have so many unlooked-for difficulties to contend with.

Alderman Willmer, in supporting the resolution, contended that it would be foolish to spend 10,000*l*. or 12,000*l*. in purchasing land on which to build a sessions house, if they could build the hall in the centre of the square, and use the site already fixed for it for the sessions house.

The Council divided, when the motion was carried by 21 votes to 9.

On the motion of Alderman Mills, the following resolution was then agreed to:—"That the design for the new town hall submitted under the motto 'Mersey' be approved, subject to the conditions of the preliminary and final competitions, and the terms of the resolution now passed." He further moved, in accordance with the recommendation of the General Purposes Committee, that the sum of 75*l*. be given to each of the five architects who had sent in final designs, and that a vote of thanks be passed to the gentlemen who had taken part in the competition. He announced the names of the five most successful competitors, with the order of merit, to be as follows:—First, "Mersey," Mr. C. O. Ellison, 62 Dale Street, Liverpool; second, "St. Werburgh," Mr. Henry Hall, 90 Doughty Street, Mecklenburgh Square, London, and Mr. John H. Eastwood, 16 Red Lion Square, London; third, "Fide," Mr. E. P. Wright, 26 Well Street, Plymouth, and Mr. G. H. Rawcliffe, 8 Ormerod Street, Burnley; fourth, "Thorough," Mr. John Sullivan, 1 Furnival's Inn, Holborn, London; and fifth, "Fortunio," Mr. Tyson Gooch, 29 Guilford Street, London.

The motion was carried unanimously, after which the proceedings of the General Purposes Committee were confirmed.

**Truro Cathedral.**—At a meeting of the executive committee of the new cathedral at Truro, held at Penzance on Wednesday, it was reported that the subscriptions promised and paid up to the present time amounted to 54,000*l*. The sum spent on the work accomplished and on work ordered is 57,000*l*. Mr. Pearson, the architect, advised that the building of the north transept should be at once proceeded with. This will entail an additional outlay of over 5,000*l*. to complete the first portion of the cathedral, including the north transept and the south porch.

## SCHOOL OF ART WOOD-CARVING.

THE School of Art Wood-carving, which is domiciled at the Royal Albert Hall, South Kensington, and is in connection with the City and Guilds of London Institute for the Advancement of Technical Education, has reopened after the usual summer vacation, and we are requested to state that free studentships in both the day classes and the evening classes are at present vacant. These studentships are maintained out of funds provided by the City and Guilds of London Institute for the Advancement of Technical Education. The school is open to amateurs as well as to those who intend making wood-carving a profession. To those who are unable to attend the classes, information can be given by letter and examples supplied. All necessary information, with forms of application and prospectuses of the school, may be obtained by personal application, or by letter addressed to the Manager, School of Art Wood-carving, Royal Albert Hall, Kensington, S.W.

## THE NORTH AND SOUTH LONDON COMMUNICATIONS PROJECT.

AN exhaustive report upon the communications between the north and south sides of the Thames below London Bridge has been prepared for the Metropolitan Board of Works by the engineer, Sir J. W. Bazalgette, C.B. He informs the Board that London proper extends about six miles, as the crow flies, westwards, and about four miles eastward of London Bridge. About three-fifths of the population live west, and the remaining two-fifths, or above 1½ million, east of that bridge, exclusive of that portion of the City which extends to the east of London Bridge as far as the Tower. Upon the western six miles are twelve road bridges with footpaths and one footbridge, of which nine have since 1877 been rendered free of toll, at an expenditure of 1,341,036*l*. by the Metropolitan Board of Work; but the cost of their construction was about 1½ million. In addition to this an expenditure of about 950,000*l*. will be incurred in rebuilding, strengthening, and improving some of them, and the cost of building London, Southwark, Blackfriars, and Westminster Bridges amounted, as nearly as can be ascertained, to 3¼ millions, making altogether a total expenditure of about 6½ millions for the benefit mainly of the central and western districts of the metropolis. But for the four miles east of London Bridge, and thence to the mouth of the Thames, all vehicular and pedestrian traffic between north and south is completely severed by the river. The east end of London represents its trade and commerce, and its population is greater than the combined population of Liverpool, Manchester, Salford, and Birmingham. Thus the population east of London Bridge on the north side of the river is 894,000, while the combined population of Manchester, Salford, and Birmingham is 918,000; and the population east of London Bridge on the south side is 655,000, that of Liverpool being 552,000. If Liverpool were situated on one side and Manchester and Birmingham on the other side of a river, the importance of forming a direct means of communication between them would not be questioned; and the eastern district of London has, moreover, contributed largely towards the purchase of the toll-bridges of the western district, and has now a very strong claim for consideration.

The necessity for additional means of communication has been generally admitted in all the reports of public authorities, and it remains, therefore, to consider, first, what positions are best suited and are available to meet the requirements of the district to be served. Sir Joseph Bazalgette says that to provide additional means of crossing upon the extreme western limit of the district and close to London Bridge would afford the 'minimum amount of additional accommodation that could be suggested. It would, moreover, perpetuate the existing evil of blocking the thoroughfares of the City by bringing the eastern traffic through them. Little Tower Hill is about 3,000 feet east of London Bridge, the approaches to it are uninterrupted by the docks or their entrances, and the leading lines of thoroughfare converge towards it. The advantages of its position over any higher point of crossing are so obvious that it has been repeatedly selected by the Corporation of London and the Metropolitan Board of Works from time to time when the subject has been under their consideration. The traffic would also be carried over the river here by an independent route, without going through the City. From Little Tower Hill to Nightingale Lane, a distance of three-fourths of a mile below London Bridge, the St. Katharine's Docks prevent the formation of uninterrupted approaches to the river; and the improvement of approaches at Nightingale Lane would seriously interfere with the dock property and be very costly, while they would be less convenient than the approaches to Little Tower Hill. From Nightingale Lane to Shadwell, at a point about two miles below London Bridge, the London Docks similarly intercept the free communication with the river-side. But a tunnel, with suitable approaches, could be formed at Shadwell. From Shadwell to a point six miles below London Bridge the Surrey Commercial Docks, the West India Docks, and the Millwall Docks, in like manner, cut off the free and uninterrupted approaches to the river. A tunnel east of the Isle of Dogs

would connect Greenwich and Woolwich with the extreme north-east of London. Three points of crossing are therefore available for the eastern district—1. Between Little Tower Hill and Bermondsey. 2. Between Shadwell and Rotherhithe. 3. Between Blackwall and Greenwich and Woolwich.

As to the means of crossing, while there are obvious objections to tunnels as compared with bridges, the former are the only practicable means for crossing at Shadwell and Blackwall, having regard to the levels of the approaches, their position with reference to the dock entrances, and to the width of the river. The cost of the Blackwall tunnel, with its approaches, would be about 1,250,000*l.*, and of the Shadwell tunnel about 2,000,000*l.* The mode of crossing at the Tower, however, has been the subject of much discussion. The following methods have been suggested:—1. A low-level bridge, with an uninterrupted roadway. 2. A low-level bridge, with an opening for the passage of vessels through it. 3. A high-level bridge, with inclined road approaches. 4. A high-level bridge, with hydraulic lifts. 5. A tunnel under the river, with inclined approaches. 6. A tunnel, with hydraulic lifts. 7. A ferry. Sir Joseph Bazalgette has prepared designs for each of these suggestions where they had not been previously prepared, and has formed approximate estimates of the cost. After weighing the merits and demerits of each plan, he arrives at the conclusion that a low-level bridge over the river would be the best for the road traffic, but, including compensations, it would cost 3,000,000*l.*, would incur a large amount of opposition, and would involve a change in the character of the business transacted at the wharves. The engineer of the Metropolitan Board of Works is of opinion that the high-level bridge, crossing the river in one span, with a clear headway of 85 feet about Trinity high water, and with straight, inclined approaches, would cost less by about 1,000,000*l.*, and would not interrupt the navigation. It would form a very convenient road communication, and it appears, on the whole, to be best suited to the requirements of the locality, and would, when completed, give the greatest amount of satisfaction. Its cost would be about 2,000,000*l.*, and, after the most careful consideration Sir Joseph Bazalgette recommends its adoption in preference to any of the other projects for crossing the river at this point. Ferries might be established, at comparatively small cost, to accommodate the local traffic at intermediate points where the approaches would not justify the construction of a permanent crossing, although their passage would be frequently interrupted; or they might be established at Shadwell and Blackwall pending the construction of those tunnels. It would, however, be a serious mistake and contrary to all experience to assume that ferries, however well organised, could ever be made an efficient substitute for an uninterrupted line of communication by means of a bridge. The ferry system has reached its highest stage of development in New York, and a vast number of large boats convey the road and rail traffic across the East river and the Hudson river to Brooklyn, Long Island, Jersey City, and Hoboken. Nevertheless, after more than fifty years' experience, it has been found impossible to meet the legitimate demands of public convenience by means of ferries, and at the present time a high-level bridge having double the span of the proposed Tower bridge is on the point of completion across the East river at New York, and another one to Long Island is about to be commenced; while on the other side of the city, a tunnel, offering far greater difficulties than the proposed tunnels at Shadwell and Blackwall, is being carried under the Hudson river. As it is not unfrequently contended that the gradients of a high-level bridge would neutralise the advantages of an uninterrupted roadway, and make ferries preferable, Sir Joseph Bazalgette appends for comparison the total ascents and steepness of the gradients on the proposed bridge, and on the two New York bridges already referred to.

	Ascents.		Mean Gradients.
	North Side.	South Side.	
Tower bridge . . .	57	92	1 in 40
East river bridge . . .	107	83	1 in 31
Long Island bridge . . .	100	132	1 in 25

The East river bridge has one span of 1,600 feet, and two of 930 feet. The Long Island bridge has one span of 734 feet, and one of 618 feet, with long viaduct approaches in both instances. There is nothing exceptional, therefore, in the size of the proposed Tower bridge, while as regards cost, the latter is far cheaper than the New York works.

Assuming that it should be determined to construct the high-level bridge at the Tower and one tunnel at Shadwell and another at Blackwall at an aggregate cost of 5,200,000*l.*, and that this sum could be borrowed at 3½ per cent. and be paid off in sixty years, the annual expenditure would amount to 207,660*l.*, or 570*l.* per diem. This, at the present rateable value, represents a rate of about 1½*d.* in the pound. But there are other sources from which funds in reduction of this rate might fairly be raised. The Coal and Wine Dues, which expire in July 1888, produce 285,000*l.* per annum, or more than the amount required, and no work of greater

utility or benefit to the metropolis could be urged upon Parliament in order to justify the further extension of these dues. Sir Joseph Bazalgette estimated that from a ¼*d.* toll on the foot passengers and 1*d.* on the vehicles 616*l.* per day would be produced; or more than would be required to pay off the capital and interest on 5,200,000*l.*

## ROMAN BATHS AT BATH.

M R. C. E. DAVIS, F.S.A., the city architect of Bath, writes as follows:—

The Roman baths of Bath that have during the last five years been partially exposed to view are the most remarkable relics of the occupation of Britain by the Romans hitherto discovered. The hot springs themselves were found to be protected by an octagonal wall built of massive blocks of stone and cased on the inside with lead of an average weight of 38 lbs. to the foot (exceeding half an inch thick). A great deal of this lead had been broken down by the falling in of the columns and roofs; indeed the whole area of the springs was filled in with Roman tiles and masonry, sand, and organic remains, on which rested the mediæval floor of the bath known as the King's Bath. Excavations have been made beneath the Pump Room opening out the Roman drains, which are now again utilised; these run among masonry of almost Cyclopean character, which circumstances, pecuniary and otherwise, have rendered it impossible to thoroughly explore.

The greatest discovery has been that of a large bath 81 feet in length, by 38 feet 10 inches in width, with steps complete on its four sides, floored with blocks of masonry, on which still remains the original coating of lead. This bath was supplied by the hot mineral water, and had a hatch or sluice of bronze (now deposited in the Pump Room) for conveniently emptying it. The bath is in the centre of a large hall with *scholæ* all round, in length (it is anticipated) 110 feet, by an ascertained width of 68 feet 6 inches. The excavation of this great hall is now in progress. Large buildings have been acquired and removed for the purpose, but unfortunately the offices of the Poor Law Board, which occupy a portion of the site, remain, having been underpinned and arched under. As the floor of the bath is at a depth of 20 feet below the neighbouring streets, the existence of this building does not prevent the opening out of the bath, although it interferes with the view and prevents the completion of the excavations.

Too much of your space would be occupied were I to attempt to particularise the construction of this great hall, but I may be permitted to say that we have excavated more than sufficient to completely restore the buildings, the masonry standing *in situ* of a height exceeding 10 feet from the floor of the bath; indeed, as at Wroxeter, one of the walls has stood exposed to view little less than 1800 years. The hall consists of three aisles, the centre being the width of the bath, vaulted by a barrel-vault. This vault sprang from an arcade of clustered pilasters, giving seven arches on either side. The pilasters, 2 feet in diameter, of solid block, stand on Attic bases and plain pedestals, the side aisles or *scholæ* were arched and groined, with attached pilasters along the walls and three recesses (*exedrae* or *stibadia*) 15 feet wide, on each side the hall, two being semicircular, and the third and central square. In the centre bay of the northern arcade is a defaced piece of sculpture, through which ran the water. Underneath the sculpture is a recess in the steps marking the position of a large sarcophagus (now lost), into which the water was first poured and so overflowed into the bath. The entrance to the great bath is at the western end, by a doorway from a large hall, the precise extent of which is unknown, although I believe I saw its western wall during some excavations I made in 1869. Very fine fragments of architectural sculpture have been obtained, and also pieces of later and more debased character, but the remains generally far surpass anything found in Britain.

In 1754 a large bath, but much smaller than this one, was discovered and destroyed, and were excavations still further pursued there is reason to believe that what has hitherto been discovered is only a fractional portion of what is still buried beneath more modern buildings.

In the progress of the excavations we found a metal mask somewhat similar to those of Dr. Schliemann, several patens and ewers, also of metal, and an engraved tablet, read in one way by Professor Sayce, and in another by Professor Zangemeister of Heidelberg (the greatest European authority on Roman inscriptions); also another tablet in cursive character, not yet satisfactorily deciphered, a large number of coins, bones, and pottery, and last, not least, a teal's egg, evidently in the position laid by the bird against one of the ruined pilasters of the bath in the decayed vegetation that covered the *scholæ*, satisfactorily proving that the city of *Aquæ Solis* (Bath) continued for a lengthened period a deserted ruin after its destruction A.D. 577 by the Saxons.

During the last twelvemonths the Bath Antiquities Committee have been continuing the excavations commenced by the Corporation, liberally assisted by the Society of Antiquaries and private subscribers; but, unless further funds are forthcoming, this truly great and almost national work will have to be discontinued, and the undiscovered buildings remain for a future generation to explore.

## NOTES AND COMMENTS.

MR. HAWKSLEY has prepared a report on an additional water supply for Plymouth. The population of the town is about 80,000, and the consumption is 40 gallons per head per diem. When devising Parliamentary additions to a gravitation work it is usual to ask for powers to provide for a population at least one-half larger than the existing population, and consequently a daily demand of 5,000,000 gallons must be met in the driest and most exigent season of the year. The river Meavy is not equal to the supply of this quantity, and a new reservoir has to be constructed to supplement the daily yield of the river. Mr. HAWKSLEY accordingly proposes the construction of a reservoir at the Weir Head or the Harter. The former is preferred as a site by Mr. HAWKSLEY, but the land is valuable and not easy to acquire. He therefore recommends application to Parliament for power to secure the Harter site. In engineering respects it is a very good one. It admits of the construction of a reservoir of the necessary capacity, without making the embankment of unusual height or unusual strength; and all necessary materials for the earthworks can be obtained on the ground, except clay, of which the valley of the Meavy is extremely deficient. Excellent granite for the masonry works is found on the spot.

It has been announced that the Paris International Exhibition of 1878 was financially a failure. The expenses have exceeded 55 million of francs, a sum which is about 20 millions beyond the original estimate. "Personal expenses," for which 1,713,000 francs were supposed to be sufficient, amount to 3,768,000 francs. The artificial gardens cost two million francs, and the extra works cost nearly six millions instead of one million. The receipts were only about 24 million francs.

THE Prix Jean Leclaire, founded in favour of those young architect students of the Académie des Beaux-Arts who have most distinguished themselves during the year, has been divided between M. QUATESONS, pupil of M. PASCAL, and M. YVON, pupil of M. ANDRÉ. As M. QUATESONS has also carried off the Prix Abel Blouet, awarded to the first pupil of the school, he has commenced his career brilliantly.

It may not be known to all travellers through Milan that the city has acquired in the Museo Poldi in the Via Giardano an addition to its attractions. This museum, established under the will of the late Cavaliere GIAN POLDI-PEZZOLI, is a treasury of works of art in various forms—pictures, carved furniture, tapestry, armour, glass, bronzes, &c.; and in the truthful words of the official account of the museum, "whichever class of objects one examines one finds there nothing which does not possess great value for the intrinsic merit of the work, or for the antiquity or rarity of the objects." Among the 195 choice pictures of great Italian painters—especially of the school of LEONARDO—is LUINI's celebrated picture of the *Betrothal of St. Catherine*, from the Litta Collection.

THE Prefect of the Seine estimates the cost of keeping in good order and repair the streets and sidewalks of Paris during the year 1883 at 10,170,000 francs (406,800*l.*). This sum includes the cost of relaying roads, paving, asphaltting, &c., where required. The total area of streets and sidewalks paved with stone is calculated to amount on January 1 next to 6,234,200 square mètres, the number of persons employed permanently being about 400. The sum entered in the 1883 Municipal Budget on account of stone paving is nearly 5 million francs (200,000*l.*), or about 68½ centimes per square mètre. The repairs are of two kinds—(1) taking up and replacing worn-out paving stones by new ones; (2) taking up, redressing, and relaying the existing stones. The former is done by firms, who contract to maintain a certain area in repair at so much per annum, while the redressing operations are carried out by squads of paviors, comprising a head pavior (*chef de brigade*), a companion ditto, a dresser, and two ordinary labourers for taking up, replacing the stones, &c. The number of these squads is 78, each having its appointed area to look after. In the second category come the macadamised roads and paths, the area of which has of late years greatly diminished. They still, however, cover 1,817,500 square mètres, kept up at a cost of 4,600,000 francs, or 2 francs 54 centimes per square mètre per annum. The repairs on

these roads, &c., are effected by a separate corps of cantonniers, organised in the same way as those employed on all the high roads of the country. The materials used are flints, tufa, and porphyry, from Voutré, in the Department of the Mayenne; the last, which costs no less than 26 francs per mètre, being reserved for those thoroughfares where the traffic is greatest. Asphalte is laid over an area of 316,260 mètres, and the cost of keeping it up is 1 franc 39 centimes per square mètre. The repairs are executed under contract, the contractors being obliged each year to relay entirely one-fifteenth of the surface under their care.

SIR HENRY HUNT, the arbitrator appointed by the Home Secretary, has, after three days' sitting, given his award in the matters in dispute between the Metropolitan Board of Works and the proprietors of Drury Lane Theatre. The principal point involved was the building of a new brick proscenium wall. The arbitrator has confirmed this part of the requisition. The Board were also desirous of continuing the Duke of BEDFORD's private staircase on the north side of the theatre in order to provide an additional means of exit from the upper gallery. This requirement has not been confirmed, but Sir HENRY HUNT has directed a short flight of steps to be constructed leading into the lower gallery staircase, next Russell Street. The other requirements of the Metropolitan Board of Works, relating to the placing of handrails to the staircases and so forth, were agreed to by the proprietors, on the recommendation of their architect, Mr. C. J. PHIPPS, F.S.A. The cost of the award in this case (which has to be paid by the Board) is 136*l.* 4*s.* 10*d.*; the costs of the proprietors of the theatre are stated to be upwards of 500*l.* If to these amounts be added the costs incurred by the Board, the total cost of the inquiry may be assumed to be nearly 1,200*l.*

M. DU SOMMERARD, the Director of the Musée de Cluny, has purchased for his collection the beautiful tapestries *de haute-lisse* which formerly hung in the famous Château de Boussac. The new acquisitions will appear on the walls of a new room, which is to be exclusively devoted to these and cognate specimens of old decorative hangings.

ON Monday next the classes of Ateliers of the Ecole des Beaux-Arts will be re-opened, as well as the magnificent library of the establishment. Strangers to the school are allowed to enter and work in this library without any special permission on the first occasion of presenting themselves; but should they wish to continue their visits, they must procure a regular card of admission, which, however, is readily accorded, especially to foreign art students and amateurs.

MESSRS. WELLS & Co., the old-established ironfounders and art metal workers, of the Commercial Ironworks, Shore-ditch, have in consequence of the great increase of their business in England and the Colonies converted the firm into a limited liability company with a capital of 100,000*l.* It will be seen from the prospectus that exceptional advantages are offered to shareholders. The security of the undertaking is guaranteed by the fact that the vendors leave the whole of their own capital in the concern, and decline to receive profit in any form until a dividend of at least 6 per cent. has been received by the ordinary shareholders.

THE Bank of France began on Monday the issue of its new 100 franc note, the designing and engraving of which have been entrusted to the most eminent artists of the country, and have taken several years in execution. The most striking feature about the new paper is its double "filigrane." That to the left is a head of CERES and that to the right a head of MERCURY; the one being visible only when the note is flat, the other by transparency, and both being so arranged that they cannot be damaged by the folding of the paper. These "filigranes" are covered by no printing, and appear on both sides of the note surrounded by a vignette border. On the face is a design representing draped figures of Agriculture and Navigation, while a group—MINERVA and FORTUNE—occupies the central portion of the back. Below each of the "filigranes" is the upright figure of a *genius* bearing a shield, upon which is inscribed the value of the note. The whole is printed in blue, as in the case of the other notes of the bank. Until further notice the new paper will circulate concurrently with the old.

## ILLUSTRATIONS.

## DESIGN FOR GLASGOW MUNICIPAL BUILDINGS.

THE design published this week was one of the premiated designs selected in the final competition, and is based mainly on the city architect's plan, it being understood that the arrangements and accommodation required had been under his consideration for several years, in conjunction with the other chief officials.

It did not appear desirable to the authors of this design to make the chief entrance from George Square into a carriage-way, it being impossible to preserve it clean and fresh, but there is a good access to the quadrangle from Cochrane Street and exit in George Street, the intention being for visitors in carriages to enter the building on the occasion of public receptions from the courtyard.

The distinguishing feature of this design is the arrangement of the saloons to serve as picture and sculpture galleries; one of the illustrations now given shows how this was proposed to be effected, also the internal appearance of the principal entrance and council chamber. Entrances are provided in John Street for the gas and water departments, and service of banqueting-hall, &c.; in the quadrangle for the office of public works and Dean of Guild, as well as minor entrances to the other departments. Considerable dignity is given to the main entrance by the arrangement adopted of a circular vault, the tower on each floor serving as a means of communication from each side of building, with an open well and balcony looking into the entrance loggia. The warming and ventilation, sanitary arrangements, &c., were all worked out by the authors, without external aid, having had considerable experience in similar matters on other large public buildings; and the lavatories and water-closets were all placed next the external walls, with ample provision for air supply, ventilation, flushing, and disconnection from drains. Separate smoke and ventilating shafts are provided for the various departments, under proper control in the basement, supplemented by hot-water pipes for the larger rooms, corridors, staircases, &c.; and the tower is utilised for extraction of vitiated air, also for storage of water, clock and chimes, alarm bell, and electric light.

Two lifts for passengers are provided for access to the principal rooms and saloons, and smaller hoists for coals and service in convenient positions, with tramways in basement all round; the construction of walls, floors, and roofs being fire-proof throughout.

The authors of this design are Messrs. THOS. WORTHINGTON, F.R.I.B.A., and JOHN G. ELGOOD, A.R.I.B.A., 110 King Street, Manchester.

## TOWER OF ALL SAINTS' CHURCH, WALTON-ON-THE-NAZE.

OUR illustration shows the western feature of the church, recently consecrated by the Bishop of St. Albans, which, when completed, will form a conspicuous landmark on the Eastern coast. At present, for want of funds, only about half the tower is built. The total height will be 80 feet. The style is Early Decorated, and the material brick, faced with Kentish rag, the dressings of Bath and Doulting stone.

Mr. HENRY STONE, of 31 John Street, Bedford Row, is the architect, and Messrs. EVERETT, of Colchester, the builders. The illustration is an ink-photo reproduction of a drawing which was exhibited at the Royal Academy.

## DESIGN FOR FRIEZE FOR BANQUETING-HALL.

THIS illustration is a reproduction by the ink-photo process from a design by Mr. E. PAGE TURNER, of 68 Newman Street, W., which was also exhibited at the Royal Academy. It shows a section of a scheme for the decoration of a public hall. The pictures would be representations of the arts and sciences, and painted in colours; the surrounding network of ornament to be painted in grey blue, including the upright figures, which are emblematical of trades and processes of manufacture. The entire work would be painted on canvas hung between wood mouldings, and 4 feet deep.

**Longsight.**—The memorial stone of a new church has been laid. The building is designed in Early English style, and will be 70 feet long by 36 feet wide, with north and south transepts, giving accommodation for 400 persons. The contractor for the work is Mr. L. C. Webster, of Brook Street, Chorlton-on-Medlock, and the architect, Mr. W. Telford Gunson, of Manchester.

## THE PRESENT CONDITION OF EPHEBUS.

THE remains of Ephesus were visited on September 23 by Mr. J. Russell Endean, who gives the following description of the state of the ruins:—

Emerging from the station we saw immediately on the left hand the standing ruined columns that supported the aqueduct which once supplied the city with water. Unlike the columns in Rome, which may still be seen in many places bearing the aqueduct, these columns have nothing but broken fragments of arches still attached to them. Hence we proceeded over very dusty roads and through maize fields to the Magnesian Gate, passing on the route many excavated and ruined tombs, broken sarcophagi, &c., with a vast amount of *débris* everywhere, covering Mount Prion on our right, the Tomb of Androcles, &c. In the Gymnasium some ruined columns and arches still testify to their former grandeur. Before reaching the Odeum Theatre we saw the tomb reported to be St. Luke's. This is in a greatly more ruinous condition than when last photographed, and, unless quickly protected, the remaining vestiges taken to prove its identity will rapidly disappear. The one sculptured marble slab now perfect is lying half prostrate on the rubbish beneath it, and an unlucky fall of a stone upon it would most probably break this beautiful slab to pieces.

The site of the Odeum is covered with *débris*, with large blocks of white marble, beautifully sculptured, lying scattered over its surface. The Theatre is in a similar state. On the way to the Stadium we passed over the site of the Gymnasium, over a road-way said to have been formerly the covered way of the market-place, fragments of the mosaic pavements lying beneath our feet. The Stadium is an extensive ruin, with parts of broken columns after the style of the Roman Forum still standing.

Now leaving Mount Prion on the right, we proceeded through fields of standing maize to the Temple of Diana, that temple described by Murray as "the most magnificent in the world." Here we had anticipated seeing some noble evidences still standing of its former grandeur, but we found nothing but the most absolute and complete ruin; the whole site was covered with nothing but rubbish and small broken fragments of marble, many pieces being proofs of the exquisite workmanship expended upon the temple; but of the original structure it may truly be said there is not left one stone standing upon another.

The Church of St. John, the Castle on the Hill, and the ruined mosques are gradually falling more and more into decay, and if they are to be preserved the effort to preserve them cannot too soon be made. Taking the site and surroundings of the city, for situation nothing can well be conceived more beautiful; but now the eye must rest upon the scene in order to realise how utter and absolute the ruin is of this once great centre of Asiatic splendour and magnificence. If the Christian world desire to preserve what is yet standing in Ephesus, it is of the first importance that prompt steps should be taken in order to protect what is yet left so worthy of protection, or otherwise the little that remains will sooner or later be removed or destroyed.

## THE LATE MR. JOHN BUNNEY.

IN a letter from Venice, the Rev. T. W. May Lund writes:—  
"Upon my arrival in Venice on Tuesday my boatman told me on the way from the station of the death of Mr. John Bunney, adding this significant comment, 'All Venice is sorry.' Venice has reason to be sorry, not merely because Mr. Bunney took so keen an interest in its art treasures, nor yet because for three years he was a familiar feature in the square of St. Mark, as he sat there daily to paint his exact copy of the façade of the church, which can now only be seen in his faithful reproduction, as its demolition, which he so much feared, has already begun; but because he was a man of noble soul, who made himself the friend of all, and the city of his sojourn the joy and care of his heart. England, too, has reason to be sorry for the loss of this gentle son, little known, perhaps, except to visitors to Venice, but to many of them well known as the artist alive to every tone in nature, the skilful craftsman, the warm and generous friend, the man always busy, yet never too busy to advise, direct, and aid. Many of us will feel that in the loss of that fine white head Venice has lost no small part of her present glory. His great picture has gone to London for exhibition in the Fine Art Gallery. He did what he could to stay the so-called restoration of St. Mark's, and, failing that, he did the next best thing, and gave the world a picture of the great front as we have seen it, but shall never see again. Much excellent work has been left unfinished, especially his proposed book on Ravenna, with illustrations by his own hand, of which place he knew more, I suspect, than any living man. It is to be hoped that at least his drawings of that city may be given to the world, accompanied by such explanatory letterpress as can be culled from his copious notes made on the spot. The body of my dear and lamented friend was fittingly borne to the grave by men of the P. and O. steamer lying here at the time, and was followed by many true mourners, whose one feeling seems to have been that another John Bunney would not soon be found."

## PIPE-FOUNDING IN GLASGOW.

IN the death of Mr. D. Y. Stewart, of St. Rollox Pipe Foundry, says the *Glasgow Herald*, the city has lost another "industrial captain," whose inventive and manufacturing skill, combined with great commercial enterprise and business integrity, contributed in a remarkable degree to make Glasgow the headquarters of a most important branch of the iron trades. The deceased, whose death occurred last week at Barassie, Ayrshire, was born in May 1813, in Lochee, which was then a suburb of Dundee. His father was a linen manufacturer there in the pre-jute period; but when the bad times for that town set in, causing misfortune to many otherwise healthy concerns, young Stewart, at the age of about sixteen years, became an apprentice mechanic, his employer, if we mistake not, being a heckle maker. Some time after finishing his apprenticeship he came to Glasgow, and qualified himself as an expert in general engineering and millwright work in two very famous establishments in those days, one of them being Claud Girdwood's, in the south-east part of the city, and the other being that of Robert Napier, just about the time when that eminent mechanic was engaged on the engines of the first four steamers out of which the great Cunard fleet of Atlantic liners has grown. As was very much the custom with able and ambitious journeyman engineers in those days, D. Y. Stewart did not rest content until he had seen a bit of journeyman experience in some one of the leading engineering shops in England, and in order to gain it he took service for a time in an equally famous establishment in London—that of Ravenhill, we believe. When he was about twenty-nine or thirty years of age, he returned to Scotland, and settled down in Montrose and married a Miss Black, whose brother had an interest in one of the two foundries which then existed in that town, and of which Mr. Stewart became the occupant.

The business which he carried on in that foundry was of a very miscellaneous character, but he persevered in it, and his trade increased in extent and importance. One of his early items of business was a contract for the chairs required in the construction of the railway then in progress between Perth and Aberdeen. At that time the Gorbals Waterworks were "on the cards," as also the works of the City and Suburban Gas Company; and as there was a strike in the foundry trade in Glasgow, that lasted for many months, he was stimulated to turn his attention to the invention of a machine by which the production of cast-iron pipes might be very greatly cheapened, and rendered more or less independent of skilled labour. The stimulus seems to have come from one of his employes, named James Young, who had been paying a holiday visit to Glasgow, and who told Mr. Stewart of the great business in pipe-founding which was then being established here. Mr. Stewart ruminated over the matter a good deal, and eventually on a certain Sunday, when he was attending divine service, he could not help gazing keenly and meditatively upon one of the columns by which the gallery of the church was supported. In a moment of happy inspiration he saw in his "mind's eye" the machine-worked ramming tool of the moulder performing its allotted task upon the sand in the concentric space between the "pattern" and the inner surface of the moulding-box, and in its progress upwards describing a screw-like motion around the column (or pipe, as it were). Soon afterwards he put the idea into practical shape, and in the year 1846 he was in a position to secure his invention by a patent. His first contract after doing so was an order for 200 tons of pipes for the town in which his foundry was then situated, and it was soon followed by one for the town of Fraserburgh.

Having made such a valuable aid to the pipe-founding appliances as his invention was then believed, and subsequently proved, to be, Mr. Stewart could not rest content with remaining in a small provincial town far removed from the iron manufacturing centres, and he at once resolved on finding his way to Glasgow for the prosecution of the new industry in pipe-founding by machinery. A powerful joint-stock company was formed for working the patent process, and Mr. Stewart, as the managing partner, started to build new works at St. Rollox in the month of October 1847—the first casting being made in the month of July of the following year.

We believe that the first contract executed by Mr. Stewart under his patent in this city was one for some 18-inch pipes for the Commercial Gas Company of London; but up to that time (1848) the largest pipes made by machinery were only 6 inches in diameter. It is an interesting fact that in the same year the late Mr. David Napier was making pipes for the Gorbals Waterworks at the famous and somewhat classical Camlachie Foundry. They were 24 inches in diameter, and of course they were hand-made, but the manufacturing facilities of the establishment were of such a character that only seven pipes per day could be turned out. Mr. Stewart experienced many difficulties with his machine at first, but they were eventually overcome, and it became such a great success as to lead to many great pipe contracts being placed in this city. For example, there was the contract for the great Liverpool Waterworks scheme, that known as the Rivington Pike. The contract in all was for 33,000 tons of 44-inch pipes, in 12 feet lengths. It was placed in the year 1848, and 17,000 tons were undertaken by Mr. Stewart's firm, the remaining 16,000 tons being distributed amongst

other three well-known foundry firms—Goldie, of Hayfield Foundry; Neilson, of Hyde Park Foundry; and Gilmour, Wilson & Co., of the London Vulcan Foundry, Port-Dundas. Owing to various causes the contract was not finished till the year 1855; and the result was that Mr. Stewart's firm had to take up the unfulfilled contracts, supplying in all the enormous quantity of 24,000 tons of piping for the Rivington Pike scheme.

For many years pipe-founding contracts have been placed in Glasgow in such numbers and on such a scale as has never been known in any other centre of the iron trades, and the St. Rollox Pipe Foundry has always had its full share of them. That establishment has long been equal in its manufacturing capacity to something like 2,500 tons of pipes per month, a turn-out which has been reached over many months on end. Not only has the machinery in use been on a large scale and of great variety for facilitating the work, but in recent years the number of workmen has also generally ranged between 400 and 500. With such an extraordinary manufacturing power, it is no wonder that the Charles Street firm have almost constantly been working at a succession of large orders, ranging from 4,000, 6,000, 8,000, or 10,000 tons up even to 14,000 and 20,000 tons. For example, the contract in hands at the time of Mr. Stewart's death, and still in progress, is one for 14,000 tons for the Vyrnwy Waterworks scheme of the Liverpool Corporation, the same as his first large contract; and for the Calcutta Waterworks the firm supplied 20,000 tons of piping. A contract for Quebec embraced 8,000 tons, and that quantity was also supplied to the towns of Roubaix and Turcoing, in France, in the year 1861, which was the first large, and almost the only, contract for pipes to any French town or city prior to the signing of the Commercial Treaty with France. The contract in question was taken on the faith that the treaty would be agreed to. The practice in recent years in connection with the pipe-founding firms in Glasgow has been for at least two of the local firms to go as joint venturers; and in that way Messrs. D. Y. Stewart & Co. and Messrs. Edington & Sons took a contract for 30,000 tons for Buenos Ayres (which is still unfinished), one for 24,000 tons for Monte Video, and one for 14,000 tons for the Linstrathen scheme of the Dundee Water Commissioners, while the four leading firms at the time—a few years ago—executed a contract for 90,000 tons for Rio de Janeiro, by far the largest water-pipe contract ever given out. The St. Rollox firm made 22,500 tons of pipes as their share of the contract. One interesting fact which we have further to note in connection with this matter is that from the same works there were supplied to the order of the War Office during the Abyssinian war 16 miles of 4-inch pipes, all of which were turned out in three weeks.

## ANCIENT AND MODERN PAINTING.

AN address was delivered at the annual meeting to the students of the Brighton School of Art by Mr. Herman Merivale. He began by referring to the prevalence of carping and false criticism, with special reference to the *London Times*, which had got into a habit of running down and depreciating everything English, and warning students in every field to learn, in dealing with the work of others, above all things to shun the carping spirit and to cultivate the spirit of generous appreciation; he said what had been done before could and would be done again. It was, he supposed, part of the immutable law that, just when science was pushing so resistlessly forward, the tendencies of painting should be so distinctly retrograde. He was by no means going to take a leaf out of the book of his friend of the *Times*, and say that painting was a lost art, even in England. But the singular superiority of ancient art, as a whole, was too striking and too subtle to escape anybody, and was too patent to allow one to be accused, for maintaining it, either of want of appreciation or the habit of praising the past for the past's sake. It was no exaggeration to appropriate an old saying, and talk of a careful visit to the Italian galleries as a liberal education. The difference of styles was in itself a history. They seem to see the moment when Leonardo da Vinci stepped in to trouble the pre-Raphaelites—beautiful as they themselves were—those Bellini's and others, in their soft colours and gifts of expressing tenderness. He remembered a *Pietà* by Gentile Bellini—only a dead Christ and a weeping mother, old and unattractive of feature; but, oh, so real and so sad!—which held him more at distance than all he saw in the gallery. But the sudden revolution in perspective looked like a miracle, and one tried to realise what it could have been to be alive and looking out for the novelties when Leonardo was still living, and Michael Angelo, Titian, Correggio, and Raphael all at once in the height of their work. They grew to be so completely with one, those painters, that one knew them soon at a sight; if not the individual, certainly the "school"—the school of Lombardy leading up, as it were, in tune and geography to the splendour of the Venetian school, the "school" of Titian and of Benifagio. It was strange that in England we never had a school in this sense—except the Norwich and "Old Crome"—unless we add the pre-Raphaelites, who caused an honest stir and movement in English Art. Unluckily, the analogy of their name breaks down in one respect. They had not yet heralded the birth of another Raphael. Well,

jump on a hundred years, from 1500, and this Italian dawn, and find Rembrandt, after his study of Italian model, bringing into trading Holland his new world of art, and for eight years looking at it through the happy medium of a happy home, and the sweet eyes of the wife and model; and so on from place to place and year to year, to watch the growth of the art which they supposed must have touched perfection, because it had declined. The effect of an Academy Exhibition to him was absolutely depressing, not because the work was so badly done, but because it was done so well, on the whole, up to a certain point, and no further. It was a very carnival of creditable mediocrity, and dreadfully suggestive of the averageness of humanity. Fancy a similar exhibition of a year's MS. novels, and what would the *Times* say? But he was coming round to the bugbear he started with, and he must have done, thanking them for listening to him so kindly and so long. They had great advantages for the students of the day, and he could but say to them—that were art students as to the others—and his best wishes with it—let them strive with all their might to distinguish the false from the true. Choose their own models and examples (for they would live to know that, though the value of a groundwork was inestimable, all the best education was self-education), and, particularly, sit and learn and wait. When the time came to aim, let them aim as high as they could—too high rather than too low. They were very likely to learn what he had learnt, that it might be possible to be very much bored at thirty, when things have not turned out as they meant and hoped, and they felt that the world for them was over, and then to live on till forty and find that it was only beginning, in a very well-spring of new youth. Let them take to heart one of Charles Dickens' maxims, that the main secret of success is ungrudging attention, though he thought he had more to trade on than most men, and whatever their success in productive work or walk of any kind, go on studying to the end, hoping and believing that soon the last day's study would not be lost, and the thread taken up elsewhere. Let them remember Michael Angelo's words when he was past eighty, "I am learning still."

#### THE BISHOP OF DURHAM ON CHURCH RESTORATION.

THE parish church of Aycliffe was reopened lately after restoration, which was directed by Mr. Ewan Christian. At the luncheon after the service Dr. Lightfoot said that the work of church restoration in these days had become more difficult than it had been in any previous epoch. It had been said that the dread of the biographer added another pang to death, and he was sure the dread of the antiquarian critic added a new pang to church restoration. They got a generous donor to put his hand into his pocket, but then up came the critic, and warned him against taking any part in a horrible piece of vandalism. Consequently the man took his hand out of his pocket as if it had been stung, and gave no contribution. But they ought to be grateful to the antiquarian for keeping them straight. Had the ruthless Henry III. had the fear of the antiquary before his eyes he would not have swept away the venerable Abbey of the Confessor, and Westminster Abbey would not have been built. And had that ruthless church restorer, William of Wykeham, been afraid of the antiquarian he would not have meddled with Winchester Cathedral, and grafted on the ancient form of art the style with which his name was associated. Coming nearer home, the same influence would have prevented the ancient Norman apse being destroyed, and the Chapel of the Nine Altars being inflicted on Durham Cathedral. Well, we were happier in these days. Our critics were ready at hand to warn us when we were disposed to lay hands on any historical monument. He was not sure that every historical monument was worth preserving, in spite of all the arguments that had been used on that side of the question. He thought a church was built for the congregation rather than for the cobwebs. He had in his mind the squire's pew of the last century and the early part of this. It was 5 feet square, and was made of good, substantial oak. There were curtains of red silk, and the pew had well-cushioned seats, a table, and sometimes even a stove. The object of a church was congregational worship, but the object of the squire's pew was isolation, and it negated the idea of congregational worship; and, secondly, he did not think it conduced to the worship of God. Still, it might be advisable to preserve such a relic of ancient days. He recollected hearing a story of how one of these pews was preserved. A squire insisted that his pew should be retained, though the vicar, who was having the church altered, wished to have it cut down. As the squire would make no concession, the vicar sent some masons one night and had the pew lowered, so that when the squire next went to church he had to go down two or three steps, and the plebeians looked down upon him just as people looked down into a bear's den. Speaking seriously, he congratulated the parish, and especially Mr. Eade, on the restoration of the church. So far as he had seen, he thought the architect had struck the happy medium. He had preserved what was valuable historically, and at the same time the church was comely in itself and convenient for public worship.

#### MURAL PAINTINGS AT GAWSWORTH.

A PAPER was read on Monday evening at a meeting of the Manchester Literary Club by Mr. Charles Hardwick, "On the Mediæval Mural Paintings and Presumed Tilted Grounds of Gawsworth." He referred to the theory put forth by Mr. Joseph Mayer that the appearance of the ground indicated that there had been there in the middle ages a locality used for the purposes of a *joust à plaisance*, as encounters for amusement were described, in contradistinction to the *joust à l'outrance*. This hypothesis depended entirely upon the shape of the ground, and Mr. Robert Brooke had shown that there was nothing at Gawsworth which could not be easily paralleled at many other places. Gawsworth Church was remarkable for the discovery on its walls in 1850 of three mural paintings, which had probably been covered with whitewash at the Reformation. The most interesting of these was a representation of the *Last Judgment*.

#### WHAT BECOMES OF THE NEW YORK PLUMBERS?

THE following article appears in the *New York Times*:—"People as a rule are not observant. This is singularly illustrated in connection with the migration of plumbers, which goes on year after year and never attracts the attention of anyone except an occasional scientific person. In the winter season plumbers are abundant. We find them on every block, and they almost infest our houses. In the summer they totally disappear, and it would be almost impossible to find a plumber in the city, even were we to want one. Where do the plumbers go in summer? Thoughtless persons will probably suggest that they go to fashionable watering-places, and there spend their ill-gotten wealth in riotous, or at all events extravagant, living. If this were so, our watering-places would be full of plumbers, whereas it is notorious that no one ever meets a plumber at Saratoga, Newport, or any other watering-place. Neither does the plumber go to Europe or sail the ocean in his own private yacht. The gorgeously-dressed men and women of the watering-places, and the tourists who travel in the style of princes, weak-minded enough to know no better, may own silver mines or oil wells or railroads, or they may write for the daily press, but they are never plumbers. The seaside camp meetings would doubtless give a liberal reward for a plumber with whom to experiment, but neither a penitent nor an impenitent plumber ever visits them. The simple truth is that in summer the plumber absolutely disappears, and the average man pays so little attention to anything outside of his business that so strange a phenomenon as the annual disappearance of an entire class of citizens does not awaken his curiosity in the slightest degree. There are, however, scientific persons who have long studied the habits of plumbers and who claim to have discovered that the plumber, like many species of birds, is migratory. The plumber exists only in countries where the snow falls. He is unknown in the tropics. There are slave-hunters and cannibals in Central Africa, but no plumbers. There are tigers and quantities of other beasts of prey in India, but an Indian plumber is unknown. In this climate there are numerous quantities of plumbers in the winter months, but they evidently find it impossible to endure the tropical heat of our summer days. Taking together these two facts—that the plumber flourishes only in cold climates and that he disappears from the United States as soon as the weather grows warm—we can easily frame the hypothesis that he migrates to colder regions, every spring and returns every autumn. There is no lack of facts to support this theory. It is by no means uncommon for a party of bold hunters in the Hudson's Bay district and on the Labrador coast to meet a stray hunter or fisherman who, when asked his address and occupation, will admit that he is a New York or Boston or Philadelphia plumber. No less than five probable plumbers have thus been met at different times within the last five years in the regions just mentioned. These, however, are doubtless only stray plumbers who have fallen behind the main body of plumbers while migrating, and have been unable to reach the high latitudes which are the proper summer *habitat* of their kind. Plumbers have unquestionably been met far to the north of regions frequented by hunters and fishermen. Hendrik Hudson found on the ice near the entrance of Hudson's Bay the frozen body of a man who had a small charcoal stove and a bag of plumbers' tools at his side. Ross, while caught in the Arctic ice, picked up a plumber's bill that was drifting before a strong westerly wind. Dr. Kane was told by the Esquimaux of a large town situated an indefinite distance north-west of the entrance of Smith's Sound, where white people lived who constantly went into each other's houses with pans of burning charcoal and curiously shaped iron tools in their hands; and though Kane disbelieved the story, there can be but little doubt that it referred to the summer settlement of a body of migratory plumbers. Finally, Captain Nares mentions that a man dressed in the Esquimaux style, and whom all the ship's company supposed to be an Esquimaux, once came on board his ship while she was in Smith's Sound. This apparent

Esquimaux carried a small piece of lead pipe in his hand, and when he was asked if he could repair a broken snow-shoe, muttered in plain English, to the astonishment of everybody, 'I'll go back to the shop for my tools,' and thereupon went away and never returned. In the face of this evidence it is impossible to doubt that plumbers are found in the coldest Arctic regions. These can be no others than plumbers who have migrated during the summer from the United States. They spend the warm months in remote regions of ice to which no traveller has yet gained access, and they return in the winter to carry on their destructive trade; and though this has been their habit from time immemorial, no one except a few scientific persons has ever so much as suspected it."

### BUILDINGS IN BRADFORD.

A STATEMENT was presented on Tuesday by the Building and Improvement Committee of the Bradford Town Council, which contained the following statistics relating to new streets and buildings.

The number of plans deposited and approved has been—

	1877.	1878.	1879.	1880.	1881.	1882.
Deposited . . .	523	417	449	441	383	416
Approved . . .	871	350	288	850	321	352

The number of dwelling-houses and other buildings included in the 352 plans approved of during the past year, as compared with the five preceding years, has been—

	1877.	1878.	1879.	1880.	1881.	1882.
Dwelling-houses . . .	1,213	1,701	720	714	577	319
Warehouses and mills . . .	36	28	20	30	19	30
Churches and chapels . . .	7	14	6	11	6	7
Public buildings . . .	2	0	1	1	2	2
Sundry buildings . . .	246	275	409	248	238	383
New streets . . .	31	46	29	36	4	10

The number of new dwelling-houses which has been certified by the Medical Officer of Health during the year as fit for habitation is 473. The number of cases in which such officer has found it necessary to withhold his certificate, on account of dampness and other sanitary defects, is forty-nine. The entire length of sewers completed during the year is 2,972 yards, which, added to the totals of previous years, makes the gross length of public sewers completed since the commencement of the work in 1862, 110,618 lineal yards, or 62 miles 1,493 yards.

### MANCHESTER ACADEMY OF FINE ARTS.

THE life classes of the Manchester Academy were opened for the winter session on Monday evening by an address from the President, Mr. Robert Crozier, who, after adverting to the fact that this was the twenty-third session during which the life classes had been held, said the Academy might be considered fortunate in having assiduous students, who clung to it season after season. He did not know any society of artists that afforded equal privileges to its members. There were no restrictions in regard to their mode of work, each student being free to follow his individual inclination. One thing only he would strongly impress upon the members—it was to bring the spirit of earnestness to bear on all they did, without which nothing could be satisfactorily accomplished. The field of art covered a wide area, and they ought as artists to seek to add to their stock of knowledge in order to be equal to whatever they set themselves to do. A sketch, however slight, might show power and the possession of a cultivated taste. It was only by earnest striving that they could attain to a comprehension of true character in art. In concluding, Mr. Crozier said, as they were all aware, the Royal Institution had been, in a spirit of liberality, handed over to the City Corporation, and they must trust to gaining public esteem by making their Academy worthy of the position to which it aspired, and worthy of the great city of Manchester.

**London.**—Extensive alterations are being made in the Church of St. Saviour, St. George's Square, S.W. In the nave the unsightly galleries have been removed. The caps, label terminations, and bosses supporting the roof have been elaborately carved, the latter forming a very fine angelic choir. A wooden floor has been laid under the seats, and two parish rooms are being constructed in the tower. In the chancel a handsome canopied reredos, with central group of the Last Supper, and two side figures, is being erected; the arcades on the north and south contain bishop's throne, sedilia, and piscina, with credence. The walls and roof are being richly decorated by Messrs. Clayton & Bell, and the floor relaid with polished marble steps and encaustic tiles from the architects' design by Mr. J. C. Edwards, of Ruabon. A fine brass corona is being made by Messrs. T. Potter & Sons, of South Molton Street, W. With the exception of the corona tiles and mural decoration, Mr. Thomas Earp, of Lambeth, has executed the whole. The entire work is from the designs and under the superintendence of Messrs. Romaine-Walker & Tanner, architects, 19 Buckingham Street, Adelphi, W.C.

### THE GLASGOW MUNICIPAL BUILDINGS.

A MEETING of the Glasgow Council was held on the 5th inst., when it was reported that Mr. Wm. Young had accepted the appointment as architect for the new municipal buildings. A letter was submitted from the author of the design "S. Ronan," who was one of those selected to compete in the final competition for the new buildings, stating that his outlays in the preliminary stage of the competition exceeded the premium he received by nearly 150%; and, without pretending that he had any claim for further remuneration, asking the Corporation to consider whether they would not at least reimburse him his outlays. The committee having considered the letter, and being of opinion that it would at least be worthy of consideration by the Town Council whether "S. Ronan's" mode of dealing with one part of the interior of the building might not be advantageously adopted, resolved to recommend that, provided "S. Ronan" agrees to allow the Corporation to adopt such part or parts of his plan of internal arrangements as they may think proper, he should be reimbursed his actual outlays, not exceeding a further sum of 150%. It was also remitted to the master of works and Mr. Young to consider and report what steps they would recommend to be taken with a view to the selection of the stone for the new buildings, and insuring that a good and durable one was got.

The Lord Provost moved the approval of the minutes.

Mr. Scott said he took exception to that part of the minute giving an additional grant to the author of the design "S. Ronan." He did not know why the committee should not make the same concession to all the others who might send in a similar letter. The fact that it was possible to take advantage of some portion of the plan would no doubt apply to other architects' plans as well as that of "S. Ronan." He would like to know if there was any special reason for this recommendation.

The Lord Provost said there was a special reason. There were on that plan some arrangements in the basement different from those proposed by Mr. Young. These when put before the committee received their approval; and so largely did they have the approval of Mr. Carrick and Mr. Barry that it was thought that if the author of the plan was agreeable to allow the committee to make such use of them as they thought proper, the proposed addition would be well spent money. There were two reasons which had weighed with the committee. One was that the author of "S. Ronan" was the only one who had made application; and the other was that if anything had fallen short in the arrangements with Mr. Young, the author of "S. Ronan" would have been the successful competitor. In these circumstances, it was thought that a larger expenditure having been incurred than was covered by the allowance of 150%, it would be a graceful thing on the part of the Council to acknowledge that.

Mr. Gray asked what progress was being made with the general question, as things seemed to be moving very slowly.

The Lord Provost said that the proceedings were being pushed forward as fast as possible consistent with accuracy. Mr. Young was at present in Glasgow, and he believed a great deal of work was being done. In a large building like that before anything could be done much time and thought had to be expended.

Mr. Scott expressed himself satisfied with the explanation given by his lordship.

### LEGAL.

#### Sheerness County Court.

#### BURROWS v. THOMAS AND OTHERS.—AMATEUR ARCHITECTS.

The plaintiff in this case, a working shipwright, claimed for 10*l.* 10*s.* for preparing plans for the erection of seven houses for the Philanthropic Lodge of Oddfellows at Sheerness, of which defendants are trustees. The lodge had a large amount of surplus capital, and, under the provisions of the Friendly Societies' Act, decided to invest it in building houses, which were afterwards to be sold to members upon mortgage. The plaintiff, who was a member of the lodge, was desirous of purchasing one of the houses, and he voluntarily submitted a plan of the kind of house which he thought would be most suitable for a working-man's dwelling. The Building Committee then invited him to assist them, and after drawing plans and making tracings he sent in a bill for 10*l.* 10*s.* The plaintiff was offered 3*l.* 10*s.* on settlement, but he declined to accept that sum, and it was paid into Court.

For the defence, it was maintained that the plans were unskillfully drawn, and had proved to be unworkable. One of the rooms was not provided with a door, the kitchen was not in accordance with the local bye-laws, no back wall was shown, and many other defects and inaccuracies were visible upon the plans. Plaintiff admitted that it was his first essay in drawing plans for the erection of buildings. His Honour said the defects were only what might be expected in an amateur's plan. He thought 10*l.* 10*s.* was an exorbitant charge, and should therefore give a verdict for six guineas, with costs of solicitor and three witnesses.

## CHURCH BUILDING AND RESTORATION.

**Clevedon, Somerset.**—The erection of a new Wesleyan Chapel and manse has been commenced at this growing and healthy watering-place. The memorial-stones were laid on the 28th ult., the interesting ceremony being witnessed by a large assemblage of Wesleyans from the surrounding neighbourhoods, but chiefly from Bristol. The buildings are Early English in design, and comprise a chapel to seat 500 persons, a schoolroom to accommodate 200 children, in addition to which all necessary and suitable classrooms and vestries are provided. The main walls and buttresses are to be of Pennant stone with Bath stone dressings, cills, plinths, and courses. The architect for the works, which are being executed by Mr. W. A. Green, of Clevedon, is Mr. Herbert J. Jones, of Bristol. The total cost, inclusive of lighting, heating, and erection of boundary walls, will be about 4,000*l*.

**Shefford.**—On October 4, the seventh centenary of the birth of St. Francis of Assisi, the foundation-stone of the new church to be dedicated in honour of that saint at Shefford, Bedfordshire, was laid, and the foundations blessed by the Right Rev. Dr. Riddell, Bishop of Northampton. The church is to serve for the ordinary parochial services, as well as the church of the seminary of the diocese for ecclesiastical students, and of St. Francis' Home for Boys. The architect is Mr. S. J. Nicholl, of 1 Caversham Road, N.W.

**Estover.**—A chapel has been opened at Estover, in the parish of Egg Buckland. Sitting accommodation is provided for 150 persons. The building is of local stone with red brick introduced. The internal fittings are of pitch-pine. Mr. Snell, of Courtenay Street, Plymouth, is the architect, and Mr. Foot, of Notte Street, the builder.

**Padbury.**—The parish church of St. Matthew has been reopened after partial restoration of the chancel. The work has been carried out under the superintendence of Mr. J. O. Scott, from the plans of the late Sir Gilbert Scott, by Mr. W. Brown, of Buckingham, at a cost of about 700*l*.

**Mere.**—A mission church newly erected has been opened at Mere. The building has been erected from the plans of Mr. C. E. Ponting, of Marlborough, the contractor being Mr. Hooper, of Mere. The woodwork was executed by Mr. C. Coward, of Mere, and the stonework by Mr. Osborne, of Overton.

**Taunton.**—The memorial-stone of a Congregational church, replacing an old and inconvenient chapel, has been laid. The building will be of limestone with Bath stone dressings, the roof being slated. More accommodation is required in summer than in winter, and the church has been arranged in sections which may be consecutively brought into use; thus the unobstructed ground floor area, seating 276 adults, will be used by the winter congregation only; the next arrangement will be the removal of the curtains to throw the space under the gallery into the general area, giving 78 additional seats. By sliding back the gallery curtains 114 further sittings are added to the church, giving a total of 468. The school will join the chapel in semicircular form, and is to be divided from the chapel by a sliding partition which can be removed, thus converting the school into an aisle which will be used for sittings, so that with 103 seats in the gallery, from 650 to 700 persons can be seated within the building. Mr. John Sulman is the architect, and Messrs. Howell & Son, of Bristol, are the builders.

**Aycliffe.**—The ancient church of St. Andrew, Aycliffe, near Darlington, has been reopened after undergoing alteration and renovation. The work has included the entire rebuilding of the north aisle in the Perpendicular style and the south wall of the chancel, and the putting on of new roof from end to end of the building, the rearrangement of the ancient Jacobean seats of fine oak, the building of the organ chamber and vestry to the north of the chancel, and the restoration of the upper stage of the tower. The works have been carried out, under the direction of Mr. Ewan Christian, of London, by Mr. R. T. Snaith, of Darlington, with Messrs. Allison & Lishman as sub-contractors.

**Bolton.**—The church of Holy Trinity has been reopened after undergoing extensive works of alteration and decoration. The decorative work has been carried out by Mr. Roberts, of Bradshawgate, Bolton, from the designs of Mr. R. Knill Freeman, architect, of Bolton.

**Hoggeston.**—On Tuesday, September 19, within the octave of the usual village festival and of Holy Cross day, was reopened by the Bishop of Oxford the church of SS. Peter and Paul, of Hoggeston, which is said to be a contraction for Holy Cross Town, indicating the supposed original dedication. The building is one of considerable character and interest, and after repeated attempts since the preparation of the first plans eight years ago, and various proposals for reducing the width of the aisles, or for removing one or both of them altogether, or for an entire rebuilding on a smaller scale, on the score of cost and of the church being unnecessarily large for the wants of the parish, the original plans for reinstatement

have been carried out in their entirety. The chancel has been done by the rector, the Rev. C. H. Hole, and the remainder almost wholly through the exertions of two of the principal farmers, Mr. Baylis and Mr. Morris. The building had become latterly insecure for use, and had been closed. The chancel, which had been rebuilt and shortened nearly to half its length, has been restored to its original length, and fitted with stalls in carved oak. The rest of the church has had new roofs, a very few of the old timbers being capable of re-use. The lead covering of the aisles has been recast and replaced. Several new walls and windows and all new pavements were necessary, with the exception of some monumental slabs. The nave has been fitted with solid oak benches on a wood block floor. The old font and pulpit have been replaced. Great effect has been obtained by the use of Northamptonshire orange-brown sandstone, instead of the customary Bath. The work has been carried out by Mr. Green, of Wellingborough, under the direction of Mr. William White, F.S.A.

## NEW BUILDINGS.

**Manchester.**—The Upper Campfield Market, Deansgate, has been opened. The new building has been erected from designs by Messrs. Mangnall and Littlewoods, architects, of Manchester, its total length being 187 feet and 130 feet wide, covering an area of 2,700 square yards. There are three spacious entrances in Liverpool Road, Tonman Street, and Deansgate, the latter being through the centre of the new block of buildings erected by the Manchester Corporation for a free library. The building is principally of iron construction, the sides being enclosed with wood framing glazed with rough plate-glass. Internally the building is divided into three bays, the centre one or main avenue being 50 feet in width between the columns which support wrought-iron elliptical lattice principals and iron purlins. The building is well lighted from the roofs, and ample ventilation is secured by louvres running the entire length of the building in the centre of each bay.

## ART WORKMANSHIP.

**English Tapestry.**—At the Royal Tapestry Factory, Old Windsor, some very beautiful tableaux, designed by Mr. J. E. Hodgson, R.A., and intended for hall and staircase decorations for Mr. Cornelius Vanderbilt's mansion, New York, are being worked by the employes upon the looms of the establishment, which is under the patronage of the Queen and Prince Leopold, Duke of Albany. The series comprises several large pictures—one of which is 22 feet long and six or seven feet high—representing English sports, including deer-stalking, stag and fox hunting, coursing, pheasant and grouse shooting, and salmon, trout, and bottom fishing. As illustrating the progress of the revival of the art of tapestry weaving in this country, it may be mentioned that the English apprentices under instruction at the factory are now engaged upon four *portières* with views of Windsor Castle, Osborne, Buckingham Palace, and Balmoral, and which are being woven in imitation of the old Arras tapestry.

## ENGINEERING WORKS.

**The Cost of Tramways.**—A return has been prepared by the Tramways Committee of the Bradford Corporation showing the cost of the works lately completed. Active operations were commenced on the Manningham Lane section of the Bradford Tramways on September 8, 1881, and the line was completed on January 4 last, but it was not inspected and opened until January 31. The length of this route is 1 mile 1,408 yards, consisting of 1,595 yards of single and 1,573 yards of double line. The rails, points, and crossings have been provided and laid by Messrs. Ridley & Co., of Newcastle-on-Tyne, at a total cost to the Corporation of 5,518*l*, or 2,048*l* per mile of single line. The cost of the concrete foundation and paving has been 6,828*l*, or about 2,530*l* per mile. The annual rental to be paid by the lessees for the first ten years amounts to 781*l* 3*s*. 9*d*., or at the rate of 290*l* per mile. The Leeds Road tramway was commenced on January 19 in this year, and completed on June 7 last. It is 1 mile 1,238 yards in length, and consists of single line with seven passing places, the latter being each 72 yards in length. The system of tramway is the same as adopted in Manningham Lane, but on account of the severe gradients on this route, which average about 1 in 22 for the greater part of the distance, the lessees have thought it desirable to use steam-power. The annual rental to be paid by the lessees amounts to 583*l* 12*s*. 6*d*. The tramway in Sunbribe Road was commenced on April 13 last, and completed on September 9, and certified by Major-General Hutchinson, on behalf of the Board of Trade, on September 20. The length of the route on this section is 1 mile 1,320 yards—including 1,705 yards of double line, and 1,384 yards of single line, with four passing places. The rails, points, and crossings have been provided and laid by Messrs. Ridley & Co., at a total cost to the Corporation of 5,575*l*, or 2,046*l* per mile of single line. The cost of the concrete foundation

and paving has been 6,964*l.*, or about 2,556*l.* per mile. The annual rental to be paid by the lessees during the first ten years of their term is 790*l.* 1*s.* 9*d.* The Tramways Committee, after paying for maintenance of paving, and setting aside a sufficient sum for repairs and renewals of rails, points, and crossings, will be enabled to pay off in thirty years the interest (calculated at the rate of 4 per cent.) and sinking fund on the capital expended, so that at the expiration of that period the tramways will be entirely free from debt.

### ARCHÆOLOGY.

**Roman Remains in London.**—During the construction of the extension of the Metropolitan Railway large quantities of Roman pottery, enriched and plain, have been found, including some elegant specimens of the best description of Samian ware; also mediæval pottery of native and foreign manufacture, together with a miscellaneous collection of iridescent glass, china, stone cannon balls, &c. A fine piece of the old City wall was disclosed at Trinity Square, just below the surface. It was in good order, but a length of about 73 feet had to be removed. It was noted in this locality that the ancient ditch had been diverted away to the eastward from the wall for some especial purpose. In Trinity Square there were also discovered some interesting foundations of Roman buildings; for example, a large area of red tessellated Roman pavement laid on a concrete bed. It was supported by a sub-structure of oak piling, with which in some places were the roots of oak trees, a clearing of vegetation having evidently been made by the early colonists previous to the erection of the building; a wall, a platform, or way on two sides, trough gutter, and some other ducts remained, with which were associated fragments of pottery and unique semi-cylindrical tiles, with diaper enrichments. Mediæval walls were met with near Aldgate as though connected with the foundations of the religious house of the Minorite Order of St. Clare. Contiguous to these was an ancient well with curb and windlass. At the bottom appeared pottery and other objects. Few other remains which could be attributed to the ancient convent were discovered. A Roman cemetery is known to have existed at the Minories. Sepulchral relics were consequently found between Aldgate and Trinity Square, but chiefly nearer the Great Eastern Railway from Church Street southwards. A massive lead coffin was discovered near Church Street. It was ornamented with scallop shells and a beaded pattern of well-known Roman type. Near to John Street a large quantity of remains, with two black urns, were found, also Roman.

**The Rewards of Research.**—Mr. J. E. Cussans, the author of several valuable books on archæology, in a letter respecting his proposed "History of Hertfordshire," writes as follows:—I am constantly receiving letters inquiring when the fourth volume of my History, which is to contain an account of the City of St. Albans, will be issued. I am by no means sure that I shall ever attempt the task. With some exceptions—and I am happy to say that there are exceptions in the county, and very notable ones—the landed proprietors and rich men are listlessly apathetic. I did not undertake my work with any idea of profit. Had I been less scrupulous than I have been, I might perhaps have earned bricklayers' wages: but as it is I find myself, after thirteen years' incessant labour—every year containing 365 days, except the three which had 366—a poorer man by 3,000*l.* than if I had spent the time in teaching white mice to dance. Fishermen are proverbially sanguine, and great allowances must be made for their peculiar temperament; but would that man be deemed sane who continued his futile efforts after fishing the years I have, during which time he had not only caught nothing, but had lost his health by reason of his ill-directed enthusiasm, and expended all his money in ground-bait? Now that is just my case. I have fished during all seasons, and in all weathers, in a Hertfordshire ink-bottle, with a steel pen for hook. I am now very tired. Constant attention to my night lines, often until three o'clock in the morning, has made me feel sleepy. At length, disgusted with the fishes' want of taste, or my own clumsiness, I have put by my tackle. Though my old enthusiasm is certainly blunted, it is not entirely destroyed. I am still anxious to finish my work, if possible. In fact, I am jealous lest another should step in and supplant me; but I cannot afford to make the county a present of another 1,500*l.*, for that would be the approximate loss I should sustain if I essayed my fourth volume on the lines of the former. It would consist of about eight hundred pages of text, and would necessarily contain many and costly illustrations of the Cathedral. I estimate that five hundred subscribers, at six guineas each, would about cover the cost of production. Assuming, then, that I am guaranteed against absolute loss, I purpose relegating certain portions of the work to associates, each of whom will be responsible for his particular contribution. Thus A. B. will write Verulam, and C. D. the Cathedral; while I shall content myself with exercising a general supervision as editor, and contribute a few chapters on St. Albans. I may add that the A. B. and C. D. here foreshadowed are eminently qualified for the departments assigned them. I purpose issuing a prospectus in a few weeks, by which to test the feeling of the county.

### GENERAL.

**M. A. Dumaresq**, the French battle-painter, has presented to the Manchester School of Art an etching executed by him of the portrait of Vasco de Gama in the Lisbon Museum.

**Mr. G. Goldie**, of London, the architect of St. Wilfrid's Catholic Church at York, has designed a memorial and monumental cross to the late Provost Reader, which has now been placed at the head of the tomb in the cemetery, York.

**Mr. John Ross**, of Fearn, Ross-shire, has obtained the contract for the construction of the new line of railway between Keith and Buckie. The contract amount is about 60,000*l.*

**Messrs. Robert Boyle & Son**, the well-known ventilating engineers, of Glasgow and London, have again been successful in carrying off "first honours" for their inventions. They were awarded a silver medal—the highest prize—for their system of ventilation at the International Naval Exhibition at present being held at Tynemouth.

**The Duke of Edinburgh** has agreed to lay the foundation-stone of the old Eddystone tower on Plymouth Hoe on the 20th. Mr. Snell, of Plymouth, is acting as honorary architect.

**Messrs. William Edgumbe Rendle & Co.**, of Westminster, have been selected by the directors of the Great Northern Railway Company of Ireland to glaze the new terminal passenger station in Amiens Street, Dublin, on their "Acme" system of glass roofing. We are informed that this Company have used Rendle's method of glazing solely for the last three years on their new stations and goods-sheds.

**The Bideford Town Council** have decided to call in an architect to adjudicate on the competitive plans for the new bridge buildings.

**The Berlin Museum Authorities** have undertaken the publication in facsimile of all the known drawings of Albert Dürer. The first volume will contain examples from the collections of Mr. Malcolm, of Portlough, and Mr. John Mitchell, of London, as well as the drawings in the Berlin Museum.

**Chiswick Parish Church** is about to be restored, under the direction of Mr. Pearson, R.A., at the cost of Mr. Henry Smith, of the firm of Fuller, Smith & Turner, the brewers.

**The Wakefield Town Council** on Tuesday approved of a tramway scheme for the borough, estimated to cost 15,000*l.*

**Manchester Royal Institution.**—The following nominations have been made for the appointment of seven representatives to serve on the Art Gallery Committee of the Corporation, viz.:—Mr. W. A. Turner, Mr. R. Smith, Mr. T. R. Wilkinson, Mr. S. Barlow, Mr. C. J. Pooley, Mr. G. Faulkner, Mr. C. J. Galloway, Mr. E. Salomons, Mr. T. Ashton, Mr. T. C. Horsfall, Mr. T. Worthington, Mr. C. P. Scott, Mr. J. F. Hutton, Mr. G. Milner, Mr. H. M. Ormerod, and Mr. R. Peacock.

**The Royal Archæological Association.**—The annual excursion to London of the country members of the Association is fixed for the last week of October, extending from Friday the 27th inst., to Tuesday the 31st, inclusive. Among the more interesting places which it is intended to visit will be the Heralds' College; Eton College, Windsor Castle, and St. George's Chapel; the new discoveries at the Tower of London and in the neighbourhood of the Minories; Waltham Abbey Church; and the once Royal Palaces of Greenwich and Eltham.

**The Statue of Louis XIV. at Caen** was, in accordance with a vote of the Municipal Council, set up again on Tuesday last in the Place du Parc, in front of the Lycée and the Palais de Justice.

**The Connaught Theatre, Holborn**, has been sold, subject to the approval of the Court of Chancery, by Messrs. Thurgood & Martin, of Chancery Lane. The premises, after decoration, will be opened under the management of Mr. John Baum.

**The Newbury Town Council**, having received notices from four or five electric light companies of their intention to apply for licenses from the Board of Trade for the supply of the electric light within that borough, have instructed their clerk to take the proper steps to prevent any company obtaining an exclusive footing within the borough, or otherwise interfering with the public lighting to the prejudice of the corporation as owners of the gas undertaking.

**Traffic on Metropolitan Bridges.**—According to an official statement just submitted to the Metropolitan Board of Works, the following was the average traffic over the bridges of the metropolis in twenty-four hours in August:—London Bridge—110,525 pedestrians, 22,242 vehicles; Southwark—25,507 pedestrians, 3,340 vehicles; Blackfriars—79,198 pedestrians, 13,875 vehicles; Waterloo—32,815 pedestrians, 10,370 vehicles; Charing Cross—16,130 pedestrians, no vehicles; Westminster—44,460 pedestrians, 11,750 vehicles; Lambeth—9,800 pedestrians, 810 vehicles; Vauxhall—17,828 pedestrians, 5,453 vehicles; Chelsea—14,500 pedestrians, 2,338 vehicles; Albert—8,134 pedestrians, 725 vehicles; Battersea—10,200 pedestrians, 1,342 vehicles; Wandsworth—1,900 pedestrians, 386 vehicles; Putney—5,245 pedestrians, 1,407 vehicles; Hammersmith—7,740 pedestrians, 1,167 vehicles. The total was therefore 384,042 pedestrians, and 75,235 vehicles per day.

# The Architect.

## THE INSTITUTE OF ARCHITECTS AND ITS WORK.

NEW session of the Institute of Architects opens in the first days of November; and although there may not be so much interest as there might be attaching to the annual recurrence of this event, it is to be hoped there are some members of the body who have public spirit enough to entertain a hope that the coming academical

year may be a fortunate one, or to experience some apprehension lest it should not. Happy is the country, says the adage, which hath no annals; and perhaps there is a certain felicity in the condition of certain of our public institutions also when they transact no business, or nominal business rather than real; but apathy in a prominent learned society, or what professes to be an honoured historical guild, is at any rate not such a characteristic as is likely to meet with general approbation in the active age in which we live, and any one will take it for granted that the bulk of the men of business who constitute the Institute of Architects, and the still greater number of those outside its pale who are concerned in the welfare of a distinguished profession and the progress of an illustrious art, will be found to desire to see the coming session at least inaugurated with some promise of work, and carried forward with some earnest sense of duty.

Recent incidents have demonstrated two things: that our private architectural work in England is still being exceedingly well managed, and that the public influence of our architectural authorities is being just as much mismanaged.

The position of English architects in the year 1882 may perhaps be described thus. The mediævalist revival has practically been brought to a close, as regards all but pure church work, by the completion of Mr. STREET's great Palace of Justice. It is the unavoidable fate of all artistic revivals to yield sooner or later to the necessity for change. The feeling may be very strong indeed, and generally is, that some particular revival in fashion for the moment is based upon transcendent merit in a way that no other fashionable mode has ever been before; but it gives place nevertheless, when the time comes, as inevitably as its predecessors, and restless fancy, in turning over a new leaf, forgets the last as completely as it has forgotten others. It is in pursuance of this law, therefore, that Secular Gothic is now a thing of the past, and that we have to consider with a little anxiety what is to be the style of the immediate future. That it is to be a free rendering of the Renaissance is now apparently settled. A few years ago (to take a good illustration), the Glasgow competition would have displayed in the most approved designs little else than one variety after another of hybrid Romanesque, as the outcome of a hesitating application of so-called Gothic principles to so-called Classic forms, or of Classic principles to Gothic forms; but what we have actually seen—although a good deal of it can scarcely be called so academical as some could wish—is in the main a simple and hearty acceptance of the spirit of the modern European or Italian manner, with no further compromise than a desire to render it a little more piquant or striking than it often is. To criticise the details of some of the designs unfavourably would be easy enough; and indeed to dispose off-hand of the pretensions of two or three of the best of them by simply calling them bad French would be easier still; but it is much more to the purpose to regard the whole experiment most leniently, as a successful demonstration in favour of a fairly refined Classic style, alike free from the quaint whimsicalities of Queen Anne and the harsh severities of monastic Gothic. Other endeavours after novelty on a sufficiently stately scale have also gone in a similar direction, and with similar success; and thus, although no doubt the popular mode of the day for ordinary work has an unquestionably Dutch flavour, we may say that the more healthy examples, and the more dignified, of what may be called the national architecture of England, are just now composed in the style which has customarily prevailed throughout Europe at large during the

last three hundred years, and of which the English Gothic revival, so far as secular art is concerned, is now seen to have been only a local and temporary interruption. And we may even add the opinion that, when English architects are once again fairly started on the line of advance which the French and Germans have continued to follow so ably while we were expending our energies in another direction, it may very probably be found that the peculiar muscularity of design acquired in the practice of the style that is now gone by will contribute to the best English work a national vigour of the utmost merit. But this remains to be seen; and we may for the present be content to look forward to the competition which is spoken of for the new offices of Admiralty and War as the next great opportunity for testing in proper form the capabilities of the rising masters of the profession.

The President of the Institute may therefore congratulate the members upon the progress of architectural art in England without much hesitation: indeed we ought not to omit to observe that even in the everyday Queen Anne work of our commonplace men we may also fairly admit the presence of a great deal that is equally creditable to the ingenuity and adroitness of the designers. But when he comes to speak of that influence of the Institute itself which ought to give public force and shape to such endeavours, what can he say? Doubtless he will try to explain away the misadventure which brought down upon the heads of the Council the contemptuous animadversion of the Minister in Parliament; but we will let that pass. What can he say of such matters of the old renown of the Guild as the exposition of artistic and antiquarian learning in its yearly and daily advance, the interchange of correspondence with foreign guilds, the consolidation and unification of the profession throughout the kingdom itself, and the promotion of fraternal feeling and individual honour? The one incident to which he can point in this direction as an evidence of activity is the recent inauguration of an examination test for membership; and probably this will be made the most of, especially as so little has been revealed of its mysteries that criticism cannot be ventured upon; but in all else it would seem as if the system of reactionary government, from which such great benefits were expected, or at least promised, has resulted in nothing but sheer inaction. Literary matters, scientific matters, artistic matters, both at home and abroad, are all no one knows where. Correspondence with foreign societies, since the death of Mr. COCKERELL, has virtually come to an end. Intercourse with even our own provincial associations has apparently ceased. That kind of material prosperity which is identified with increase of membership in quantity may be satisfactory enough, but what of the quality? And as for the old authoritative influence of the Institute in the days when Professor DONALDSON, Mr. CHARLES NELSON, and Professor LEWIS were secretaries, whether we look to the profession throughout the country, or to public bodies, or to the Government, it is not too much to say that it has disappeared.

If we attribute all this failure to the simple fact that the whole contrivance of the reorganised Council was a mistake, we think we shall be supported in this opinion by all who understand the politics of public societies. It is a maxim which is no longer open to dispute, that the system of administration in such associations ought always to be such as has *grown up* into form and substance with the growth of the body itself, and never a merely theoretical constitution excogitated from first principles by some radical reorganiser. Yet with this principle staring them in the face, the reformers of ten years ago, although no doubt men of age and experience, like the late Mr. WYATT and Mr. WHICHCORD, suffered themselves to become so involved in purely abstract considerations, that they upset all that had *grown up* during forty years of excellent work, and established in its place a system which had the double disadvantage of being both revolutionary and reactionary. In a word, in order to create a new aristocracy (if the reader must laugh, let him laugh) in the form of "Members of Council," and a dignified monarchy in the form of a hereditary presidency, they entirely overthrew what in political parlance is called the liberties of the community, and no one has been allowed to speak his mind in the Institute since that day. The consequences are easily to be guessed. Wherever general freedom prevails, although inconveniences may occasionally attend its exercise in the eyes of the apathetic, the result is life; wherever liberty is sacrificed to mere order and symmetry, the order is lifeless and the symmetry a farce. Above

all things, the official ascendancy and control of those who are selected for past importance and not present activity is entirely fatal to vital management; and when every member of the Council is encouraged to wait in serene repose for his succession to supreme dignity by seniority, it is no wonder that the whole administration is by one stroke brought down to the level of a Lord Mayor's Show or the Court of a Livery Company.

It is apparently for the purpose of overthrowing such a state of things that the provincial members of the Institute are understood to have been engaged in preparing a powerful memorial in favour of the demand that the election of the Council should no longer be left in the hands of the forty or fifty who are able and willing to attend personally at an annual meeting in May. Those who live in London and have nothing better to do have thus the monopoly of voting; indeed there are many of even the London men who are unable to attend so late at night because they live a few miles out of town. What is now suggested is that ballot-papers shall be received from all members who desire to vote, at whatever distance, and that a little ingenuity shall be introduced to make this harmonise with the accidental letter of the law under which alone the present very restricted monopoly unintentionally exists. It is within our knowledge that the reorganised Council has already arbitrarily if not rudely refused to allow such a proposal to be brought before the general body, and we wait with some interest the result of the new application, wishing it, we need not say, more success. It will perhaps be argued by some that the election of the Council is after all but an immaterial side issue; but this is quite at variance with the public experience of this country wherever acquired. Personal, and even petty, as election affairs often become, it cannot be doubted that, if they are fairly conducted, they afford in practice not only the best opportunity for the expression of public opinion, but frequently the only opportunity; and on this ground, if on no other, we do not hesitate to say that the close vestry system which virtually prevails in the Institute is the very worst policy that could be pursued as regards the vitality of the body.

But the most serious of all blunders in the reorganisation is the encouragement it offers to the senior members, for the sake of what at the time was frankly called "ambition" (which can only mean the desire of personal aggrandisement), to wait in masterly inactivity for their turn to take the honour of being president. The late Mr. STREET conferred a great benefit upon the Institute when he came forward to oppose this pernicious principle in his own person, as he did at considerable risk, first by resigning the equivocal position of vice-president, and then by claiming the presidency in opposition to the nominee by succession. On his election it was understood that the rule thus defeated would be abrogated for ever, so soon as the forms of procedure could be satisfied. Mr. STREET died: and we regret to say that the promise, which, if only out of regard for his memory, ought to have been at once carried into effect, has been courageously violated by the persons in accidental authority, not only in defiance of the declared will of the constituency, but—what is more provoking—through the instrumentality of mere forms, over which, it would appear, the members at large have practically no power. It is high time that something were done to promote a revision of such a state of things, and we hope the memorial of the country members may bring on such a movement. The function of a Council of Management is the performance of work and not the enjoyment of dignity, and to make it a question of personal aggrandisement—except in so far as a little ordinary vanity must be conceded to the infirmity of man—is in plain language a perversion of duty, a degradation of office, and an insult to the elementary purpose of an association of learned and accomplished men.

**Birmingham Architectural Association.**—On Saturday last the members, adopting a programme previously arranged by the honorary secretary, Mr. F. W. Franklin Cross, visited Hales Owen. The ruins of the abbey were inspected, and afterwards the church. The latter is an ancient structure, portions having been built prior to the Roman conquest. The west door, the south porch door, the aisle pillars, and the chancel arch are all of very early date; the church, however, presents specimens of Norman Decorated and Perpendicular work, together with a remarkably fine specimen of a Saxon font. The members afterwards visited the chapel of St. Kenelm. After a walk of three miles the members returned by train to Birmingham.

## JEAN BAPTISTE GREUZE.—I.

BY A CORRESPONDENT.

THREE thousand odd guineas were bid for a GREUZE at the sale which dispersed the Duc de MORNAY's collection of pictures a few weeks after the death of that remarkable politician, speculator, and art patron. The experts were startled, for the world had scarcely yet begun to find the charm of GREUZE's works, and REMBRANDT's, VELASQUEZ, and MURILLO's had exhausted the enthusiasm of competitors. The sale took place in 1857. Three years later on, the 4,640 guineas given for *La Pelotonneuse* was distanced at the San Donato sale by the 5,480 guineas paid by the Marquis of HERTFORD for *Ceufs cassés*, followed on the same day by 3,220 guineas for the *Petite fille au carlin*, and 1,250 guineas for *L'Ecouteuse*. Thus it has come to pass that while he who created these portraits of innocent voluptuousness, having a seductive loveliness and a witchery so peculiarly their own as never to have been imitated, died in 1804 a suppliant for bread, forgotten by the world of which he had been the idol, alone in a poor lodging, and to follow whose coffin to the grave there were but DUMONT and BARTHELEMI—a hundred years has not yet elapsed, and we find the happy possessor of a GREUZE can at will convert his smallest canvas into a pile of gold. A letter, the last we possess from GREUZE's pen, addressed to the Home Office, and dated 1801, has a pathos which touches by its earnest simplicity. Translated verbatim, the old man writes thus:—

The picture on which I am at work for Government is half-finished. Absolute want compels me to crave a further advance on its price, which I require to enable me to complete it. I have had the honour of explaining my position to you. I am seventy-five. I have lost fortune, courage, and power. I have not a single commission. Never in my whole life was I in such utter misery. I flatter myself you will take my case into consideration, for it is urgent.—Respectfully,

GREUZE.

This appeal is dated from the lodging in the Palace of the Louvre which was granted to him by the State. Artists of distinction were allowed to occupy small rooms over the picture galleries originally inhabited by the courtiers in attendance on the Valois princes. Certain privileges, besides immunity from rent and taxes, were attached to residence within a royal palace, which enhanced their value to artists. The description given in contemporary memoirs of the condition in which these lodgings were kept is not inviting. If a vivid sense of outward beauty was the distinctive characteristic of their tenants, let us hope that their olfactory organs were dull, and even non-existent.

GREUZE dates from the Galerie du Louvre (the error in orthography is characteristic). He was the son of a tiler, as had been WATTEAU, another of the glories of French art. JEAN BAPTISTE GREUZE sprang from the old *bourgeois* class. Among his ancestors were *prévôts du roy* of the town of Tournus, and of those magnates he was as proud as the seigneur of the neighbouring château of the Crusaders among his forefathers who had crossed swords with SALADIN and his knights. JEAN was born at Tournus in 1725. From his childhood he refused toys and asked for pencils. The tiler, his father, intended him to become an architect, but the boy's vocation was distinct. Mistake was impossible with regard to it; still, the father hesitated, till on one of his birthdays the boy brought him, for a gift what he believed to be an engraving, but which proved to be a pen-and-ink drawing executed during play hours. The tiler apprenticed the lad to a man the good citizens of Tournus considered to be an artist, but who required his students to turn out a given number of drawings per day, at so much the gross. Patient endurance was not the predominant quality of the youth's nature. After a week of forced labour he quitted the workshop, and walked to Paris selling sketches for bread as he went. Of his early days in the capital we have no record, till we hear of his attracting the notice of the sculptor PIGALLE, then engaged on his *Mercurie attachant ses talonnières*, now in the Gallery of Modern Sculpture at the Louvre—rescued, by the bye, but just in time, from the destructive influence of exposure to weather in one of the public gardens. The great man, ignored by his own countrymen and compelled to work for foreign courts, discerned the boy's genius, and foretold his brilliant future. Paris, however, proved a rough school. The lad joined the Academy classes. His provincial garb and bluff manner drew on him the contempt of the under-masters; the worst place in the model-room was invariably assigned to him. To these untoward circumstances was added the jealousy with

which his fellow-students observed that he surpassed them by his freer manner of drawing, and more especially by his happy rendering of expression. His life became unendurable. It, however, must be admitted that the strong sense he possessed of his own power, and a certain self-assertion, which characterised him to the last, probably contributed to his unpopularity. Madded by the sarcasms of the students, he one day rushed out of the classroom, and without introduction presented himself to SILVESTRE, the Academy Professor of Drawing, the same who had instructed the Dauphin in that art. The old man received him kindly, inspected the contents of his portfolio, and, returning with him to the classroom, ordered him to draw a portrait in presence of the students. GREUZE carried off a victory which inaugurated a career of success, interrupted and broken only by the "great Revolution, which swept into oblivion institutions apparently more stable than the reputation of an artist.

GREUZE was elected Associate of the Academy in 1755, through the influence of SILVESTRE. His first picture, *Le Père de Famille* (now in the Louvre), was bought by M. DE LA LIVE DE JULY. No artist of modern times had dared to depict rustic life. Royal personages, statesmen in flowing wigs, generals in cuirass and gold-laced coats, court beauties in brocade and hoops, allegorical subjects, and a few landscapes, had filled the galleries of Versailles as the productions of the painters of the epoch. WATTEAU had, with rare genius and exquisite grace, introduced pastoral subjects, but his shepherds and shepherdesses were attired in silks and satins. Not one of GREUZE's predecessors had ventured to depict a peasant in fustian and wooden shoes, surrounded by his wife and daughters clad in homespun and linen grown on the farm, children, rosy with health, playing with a dog, and the grandmother at a spinning-wheel. M. DE LA LIVE threw open his house and invited the *vertuosi* of the capital to judge this novel production. Connoisseurs, taken by surprise, were seduced by the virginal graces of the young wife; her short-waisted gown, the face set in the shadow of the hair, the rounded cheek in high light against it, and the something voluptuous in the eyes and mouth, which mysterious sensuousness remained the salient characteristic of all GREUZE's subsequent delineations of women. The child's head, its chin resting on the table, with its singular freshness of colour, its childlike expression, and, above all, its angelic smile, had for the critics the charm of novelty. Their verdict prepared the public to echo their enthusiasm when the picture was exhibited at the Salon of 1755.

GREUZE, although elated by his triumph, felt that his artistic education was incomplete. He had not studied the old masters at Rome, and therefore accepted Abbé GEORGE-NOT's generous offer to defray the expense of a journey to Italy. While at Rome a romantic adventure redounds to his credit. Furnished with letters of introduction to a prince of the Holy Roman Empire, he presented them in person to the Duke of P——, who received him with kindness, and requested young GREUZE to give his daughter instruction in drawing. The young princess was an only child, and had recently lost her mother. The girl was beautiful and GREUZE a genius. VENUS's "waspish-headed son" meddled in their affairs. FRAGONARD, then a student at the Villa Medici, drew GREUZE as *Le Cherubin Amoureux*. The cherub, however, had a certain amount of common sense, and resolved to fly from temptation. He accordingly ended his lessons. The prince, meeting him accidentally at St. Peter's, upbraided him for his careless attendance, and, informing him that his daughter was ill, took him to his palace to show a newly-acquired TITIAN, which picture, he added, his daughter intended copying—a task the prince wished GREUZE to assist her to accomplish. Common courtesy thus rendered it incumbent on GREUZE to inquire daily as to the health of the young princess from the traditional nurse in whose charge she was. The nurse, after the pattern of nurses, had scent of the state of things, and, probably as a remedy for the depressed spirits of her young mistress, led GREUZE into her boudoir. GREUZE lost his head; others have done likewise under similar circumstances. He plunged recklessly into a love declaration. "Then," replied the peerless LETITIA, "I may be happy." Here was a revelation for which the "cherubin amoureux" was utterly unprepared. The girl, with the ingenuousness of her age, proceeded to announce her intention of marrying him. "And your father, the prince?" interposed the old nurse, who by no means calculated on so serious a *dénouement*. The prince, it is well to

explain, had arranged her marriage to a man she hated—a fact much in favour of GREUZE. The marriage had only been deferred in consequence of the girl's illness. The princess added to her previous announcement the fact that she was heiress to her mother, and consequently possessor of fabulous wealth. Turning to her nurse, she said, "I bestow it on GREUZE, whom I marry at once. He will take me to Paris; you shall come with us. He will become a second TITIAN, and my father will be proud of his son-in-law." With singular unselfishness, the young artist reflected on the frightful abyss into which such a marriage would plunge her, and resolved to renounce the brilliant prospect love for a moment had conjured. He feigned an illness which speedily became real in the form of brain fever. On recovering from it, in spite of a message from his LETITIA imploring him to fly with her, as her wedding-day to the hated Count PALLIERI was fast approaching, he fled, carrying off a "copy, surreptitiously taken, of her portrait. In the volume of GREUZE's engraved works at the Bibliothèque Nationale is one entitled "*L'Embarras d'une Couronne*." The classical features, the flashing dark eyes, the wealth of raven hair, the magnificent bust, are purely of an Italian type. In his "*Prière à l'Amour*" the same features are reproduced. The latter is dedicated to Princess TIGNATELLI. It is evident the remembrance of his first love remained to him the type of Italian beauty, and it is more than probable the features reproduced are those of the heroine of this adventure.

The series of twenty-four costumes of the peasants of Genoa, Bologna, and Savoy, executed on his way home and engraved by A. MOITTE, were sold at the RAUDON DE BOISELL sale (1777) for 50*l.*, but fell to 10*l.* at VASSAL DE SAINT HUBERT's auction six years later, although 8*l.* was given for a slightly-coloured pastel sketch of a woman's bust, *en chemise*, her hair tied by a ribbon. In truth, the drawings are not interesting. It is singular, however, to remark even in these Italian subjects how thoroughly French is their treatment, and how little influence the study of the old masters had on his style. They were exhibited at the Salon of 1757, to which GREUZE also sent two children's heads, which possess the charm and fascination so peculiar to the subsequent creations of his genius. In his larger works certain faults of colouring are manifest. There is a lack of transparency in the whites, a peculiar grey-ness in the whole scale of colour, a hesitation, or perhaps indecision, in the key-note, and a heaviness in the shadows; but in GREUZE's children and young girls' heads his deficiencies in tone are forgotten. The sunny light of summer turns the hair of his *garçonnet* to gold, and the bloom on her cheek is the freshness of heaven's breeze; the blue eye laughs beneath the sweeping eyelash; the curves of the half-open mouth give as lovely a smile as MURILLO ever painted on an angel's face; the diminutive rounded shoulders have a half-humorous pathos; the whole essence of the work is expression—the passing of a smile over the face of a child. When GREUZE's subject is a young girl, the red gold hair bound by a ribbon is cast back from the face, *belli capelli ricci e innalati*. Truly the tracery of blue veins on the snowy forehead is discernible; in the darkness of the grey blue eye is passion blended with shrinking timidity, rendered by the *noyé du regard* of which GREUZE had the secret. The bloom on the cheek is beneath rather than on the skin; the magic of rose and crimson is on the open nostril and full trembling lips, parted by the unfathomable smile; a transparent gauze veils but does not conceal the bosom; sometimes a ray of sunlight casts the rose tint of the gauze on the snowy bosom, after the manner of RUBENS. The whole picture is realistic, if you will, and seduces by its suggestiveness rather than by what it actually brings before the spectator.

GREUZE's master was RUBENS. He and his friend the engraver WILLE spent hours at the Palace of the Luxembourg, perched on ladders they bribed the gardeners to lend, studying the RUBENS', and striving to penetrate the germinal principles of that master's art, much as WATTEAU fifty years before had done when he lodged at the palace with his friend CLAUDE AUDRAN. His *têtes de jeune filles*, even at the commencement of his career, were eagerly purchased. WILLE boasts of the price he gave for one. WILLE was his *deus ex machina*, and put GREUZE in the way of making money as well as a reputation by sending small pictures of children and young girls to Germany, at that period under the influence of FREDERICK the Great, and therefore enthusiastic on French art and literature. *La Simplicité*, exhibited at the Salon of 1759, having attracted the attention of Madame DE POMPADOUR, was

purchased by her from the lady for whom it was painted. GREUZE immediately reproduced the subject for its original proprietor so happily that the copy surpassed the first picture. *La Simplicité*, shown to the king, at once excited his admiration, and was the cause of an overwhelming number of orders. At the Salon of the same year (1759) GREUZE exhibited *L'Accordée du Village*, since engraved by FLIPART and by ALIX. M. DE MARIGNY, brother of Madame DE POMPADOUR, gave 120*l.* for it; it fetched at his auction in 1781, 768*l.* It was purchased for the king, and is now at the Louvre. At M. DE JULLIENNE'S sale a coloured sketch of it was sold for 17*l.* The head of the bride is a portrait of Mdle. DUCREUX, in whose family a study, taken by GREUZE for *L'Accordée*, of the young lady at fifteen, was preserved till the year 1865, when this study was sold among other pastels belonging to the DUCREUX family. The success of *L'Accordée* was attested by the fact that the picture was reproduced on the stage of the Italian opera in "*Les Noces d'Arlequin*," which brought down the house in a storm of applause. It is true that the painting lacks harmony of tone and is carelessly executed; nevertheless it was the event of the Salon, and GREUZE was considered as the representative of a new order of thought, and the man destined to reform the public taste by the pure tone of his scenes of pastoral life and the moral inculcated by his subjects. In a letter to the *Journal de Paris* GREUZE relates the incident observed by him as he crossed the Pont Neuf which gave rise to the picture entitled *La Belle Mère*. The injustice with which he remarked a stepmother beat a young girl excited his sympathy, and he resolved to paint the subject in order to hold up to public contempt the line of conduct he deplored—whether with success as regards those much-abused persons or not is an open question.

GREUZE was never happier than when describing his own works. In a letter dated December 1786, published by the *Journal*, he gives a lengthy description of his *Veuve et son Curé*, in which he endeavours to convince his readers that he painted chiefly with a view to the improvement of public morals; but, unfortunately for this object, GREUZE threw over these subjects a sensuousness which utterly destroyed the moral effect of the lesson he desired to impart. He sketched the scene as it had been enacted under his eye; but in his successive drawings he insensibly altered the expressions of his actors, and instead of ragged children whom an ill-tempered step-mother has maltreated, we have delicious round-limbed, rosy-cheeked, and blue-eyed boys, whose shoulders only lack wings to convert them into *amorini*. In the *Savonneuses* his washerwomen play with the linen they are supposed to wash, bewitching by their grace. There is an *opéra comique* air about his rustics in the *Père de Famille* and in his *Fils Naturel*, spite his posing as the disciple of DIDEROT and the painter of Virtue. To rival our HOGARTH was his ambition, but HOGARTH had a moral intensity, a penetrating power, a strong truthfulness GREUZE never attained or even understood.

(To be continued.)

## BISHOP BERKELEY ON ARCHITECTURE.

A FEW days ago there was issued an appeal for funds to erect a memorial to Bishop Berkeley in Cloyne Cathedral. It was truly said that "The name of Berkeley has won honour for England among the philosophers of Europe, the philanthropists of America, and among the admirers of genius and virtue in every quarter of the globe." To this it may be added that in an age when national art was neglected Berkeley stood alone in advocating the duty of encouraging architecture, painting, and sculpture in this country, and that in his appreciation of art, no less than in his metaphysics, he was far in advance of his contemporaries. His efforts in this direction have been forgotten. Berkeley's theory of matter will remain a subject for discussion, although not always of a serious kind, for the majority of people will be of Byron's opinion that—

When Bishop Berkeley said there was no matter,  
And proved it, 'twas no matter what he said.

But his writings on subjects which are supposed to be more practical, and which were tested by a varied experience of life, are neglected, and it is not considered necessary to use even a grin to vanish Berkeley the statesman. Now, when a place among English worthies is claimed for him, the opportunity may be

allowed to recall some of those writings which represent one aspect of Berkeley's system.

George Berkeley was born in the county of Kilkenny in Ireland in 1684. His grandfather was an Englishman. In those days the process of amalgamation, by means of which so many strangers became more Irish than the Irish themselves, was no longer potent, and Berkeley considered himself to be a West Briton. He said that the "upper part" of the people of Ireland were truly English by blood, language, religion, manners, inclination, and interest, and that if the children of old Romans born in Britain were still Romans, there was no disputing their claim to be Englishmen. We mention this because it is supposed that there was more or less of the Western wildness about Berkeley's deeds and thoughts. The truth is, that he was more of an Englishman than his friend Swift, and his whole life exemplifies that sense of duty, prudence, and faith in facts which are associated with the English nature. As the late Professor Ferrier wrote, "The fact, the whole fact, and nothing but the fact, was the clamorous and incessant demand of Berkeley's intellect. No man ever delighted less to expatiate in the regions of the occult, the abstract, the impalpable, the fanciful, and the unknown."

In 1709 Berkeley startled scholars with his "Essays towards a New Theory of Vision," in which he maintained that the perception of distance or size was the result of an act of reasoning rather than of the sense of sight. It was followed by "The Principles of Human Knowledge" and the "Dialogues between Philonous and Hylas," in which he opposed the theory that was as old as philosophy of a substratum of matter which was common to all things. Through these publications he was brought into notice, and he was appointed chaplain to that modern Don Quixote, the erratic Earl of Peterborough, who was then Ambassador in Sicily. Afterwards he acted as companion to a young gentleman who was making the "grand tour." When he returned to England he found everybody crazy about South Sea and other projects for attaining wealth in a short time. Berkeley believed that prosperity was only to be secured by industry and frugality, and that the remedy for the evils of the time was to be found in the fostering of public spirit. One of the means towards that end was, according to Berkeley, the employment of art—and in his "Essay towards Preventing the Ruin of Great Britain" we find the following passages:—

It would be a very useful policy, and warranted by the example of the wisest governments to make the natural love of fame and reputation subservient to promoting that noble principle, a sense of public spirit. Triumphal arches, columns, statues, inscriptions, and the like monuments of public services have in former times been found great incentives to virtue and magnanimity, and would probably have the same effects on Englishmen which they have had on Greeks and Romans. And perhaps a pillar of infamy would be found a proper and exemplary punishment in cases of signal public villainy, where the loss of fortune, liberty, or life are not proportioned to the crime, or where the skill of the offender or the nature of his offence may screen him from the letter of the law.

Those noble arts of Architecture, Sculpture, and Painting do not only adorn the public, but have also an influence on the minds and manners of men, filling them with great ideas and spiring them up to an emulation of worthy actions. For this cause they were cultivated and encouraged by the Greek cities, who vied with each other in building and adorning their temples, theatres, porticoes, and the like public works, at the same time that they discouraged private luxury: the very reverse of our conduct. To propose the building a parliament house, courts of justice, royal palace, and other public edifices suitable to the dignity of the nation, and adorning them with paintings and statues which may transmit memorable things and persons to posterity, would probably be laughed at as a vain affair, of great expense, and little use to the public; and, it must be owned, we have reduced ourselves to such straits that any proposition of expense suiteth ill with our present circumstances. But how proper soever this proposal may be for the times, yet it comes so properly into a discourse of public spirit, that I could not but say something of it. And at another time it will not seem unreasonable if we consider that it is no more than the wisest nations have done before us, that it would spirit up new arts, employ many hands, keep the money circulating at home, and lastly, that it would be a notable instance of public spirit as well as a motive to it.

We have only to imagine a clergyman during the railway mania suggesting the construction of splendid public buildings as a means of restoring the national sanity, and we shall understand the courage which inspired Berkeley in 1721. The Deanery of Derry was accepted by him in 1724, but he thought he might be more useful if he conducted a college in Bermuda for the instruc-

tion of Indians. "His heart will break," said Swift, when describing the scheme, "if his deanery be not taken from him." The Indian college was not a success, owing to the Government endowments being withheld, but his residence in Rhode Island gave Berkeley the opportunity to compose the Dialogues, which were afterwards published with the title of "The Minute Philosopher." The object of this work, which was an imitation of the Platonic Dialogues, was to refute the fashionable scepticism; eighteenth-century free-thinkers, according to Berkeley, being "the very same with those Cicero called minute philosophers." The best thing about them was that they were supposed to be ravished with the abstract beauty of virtue. The endeavour of Berkeley was therefore to utilise the sentiment by explaining to them that, as without thought there can be no end or design, and without an end there can be no use, and without use there is no aptness or fitness of proportion from whence beauty springs, it will follow that beauty is not to be found in a system formed, connected, and governed by chance, fate, or other blind unthinking principle. To demonstrate the truth of this theory by something concrete, nothing could be better fitted, he believed, than an exposition of what constituted beauty in architecture, and the following extracts will give a notion of the Berkeleian system of aesthetics:—

Those who have considered the theory of architecture tell us the proportions of the three Grecian orders were taken from the human body as the most beautiful and perfect production of nature. Hence were derived those graceful ideas of columns which had a character of strength without clumsiness or of delicacy without weakness. Those beautiful proportions were, I say, taken originally from nature, which in her creatures referreth them to some end, use, or design. The *gonfiezza* also, or swelling, and the diminution of a pillar, is it not in such proportion as to make it appear strong and light at the same time? In the same manner, must not the whole entablature, with its projections, be so proportioned as to seem great but not heavy, light but not little, inasmuch as a deviation into either extreme would thwart that reason and use of things wherein their beauty is founded, and to which it is subordinate? The entablature and all its parts and ornaments—architrave, frieze, cornice, triglyphs, metopes, modillions, and the rest, have each an use, or appearance of use, in giving firmness and union to the building, in protecting it from the weather and casting off the rain, in representing the ends of beams with their intervals, the production of rafters, and so forth. And if we consider the graceful angles in frontispieces, the spaces between the columns or the ornaments of their capitals, shall we not find that their beauty riseth from the appearance of use, or the imitation of natural things whose beauty is originally founded on the same principle, which is indeed the grand distinction between Grecian and Gothic architecture, the latter being fantastical, and for the most part founded neither in Nature nor in reason, in necessity nor use, the appearance of which accounts for all the beauty, grace, and ornament of the other.

One of the friends then remarks that the Greeks were able, without any sacrifice of the principle of beauty, to vary the proportions of their buildings to suit the requirements of distance or position, and in that respect they differed from the architects of the age:—

This latitude or license, he says, might not perhaps be safely trusted with most modern architects, who in their bold sallies seem to act without aim or design, and to be governed by no idea, no reason, or principle of art, but pure caprice, joined with a thorough contempt of that noble simplicity of the ancients without which there can be no unity, gracefulness, or grandeur in their works; which of consequence must serve only to disfigure and dishonour the nation, being so many monuments to future ages of the opulence and ill-taste of the present.

It is not difficult to imagine how incredulous Berkeley would have been if some prophet informed him that the debased buildings of his age were to be accepted as models for imitation at the close of the nineteenth century. As a firm believer in progress he could hardly suppose that in the noblest of the arts there was to be retrogression. A Greek did not regard architecture more highly than Berkeley. To his mind there was something divine in the qualities which give character to one of the temples, and he suggests that in architecture alone we can find the key to the mystery of beauty:—

Architecture, the noble offspring of judgment and fancy, was gradually formed in the most polite and knowing countries of Asia, Egypt, Greece, and Italy: It was cherished and esteemed by the most flourishing states and most renowned princes, who with vast expense improved and brought it to perfection. It seems above all other arts peculiarly conversant about order, proportion, and symmetry. May it not therefore be supposed on

all accounts most likely to help us to some rational notion of the *Je ne sais quoi* in beauty?

According to Berkeley the beautiful in dress and furniture, as well as in building, sculpture, and painting, is something real and well-grounded. But having before his eyes imitations of Dutch vagaries, in churches and houses, full-bottomed wigs, hoops and other structures of whalebone and buckram, he was of opinion that the English and other Northern peoples were not competent to create the beautiful if they were directed by their natural taste. It was only from ancient, that is, Greek and Italian models, that the genuine τὸ καλόν was to be drawn.

The "Minute Philosopher" gained for Berkeley (through the influence of Queen Caroline) the bishopric of Cloyne. A year after his appointment he published "The Querist," a tract containing nearly six hundred questions, and which in the opinion of Sir James Macintosh contains "more hints still unapplied on legislation and political economy than are to be found in any equal space." From "The Querist" we can infer the condition of Ireland in days when gentlemen were rakes and ladies were gamblers and extravagant, while idleness and beggary abounded. Berkeley's remedy for Irish evils might be said to consist in self-reliance and industry. He inquires whether, if there was a wall of brass a thousand cubits high round the island, Irishmen might not live cleanly and comfortably, till the land, and reap the fruits of it. Once more he introduces his favourite arts, but this time he does not meddle with theory. In the first place he suggests the necessity of a general diffusion of art, in order that it might be applicable to the staple manufactures of the country. Here are some of the queries which are readily converted into axioms:—

Whether those same manufactures which England imports from other countries may not be admitted from Ireland? And, if so, whether lace, carpets, and tapestry—three considerable articles of English importation—might not find encouragement in Ireland? And whether an academy for design might not greatly conduce to the perfecting those manufactures among us? Whether France and Flanders could have drawn so much money from England for figured silks, lace, and tapestry if they had not had academies for designing? Whether when a room was once prepared and models made in plaster of Paris, the annual expense of such an academy need stand the public in above 200*l.* a year? Whether our linen manufacture would not find the benefit of this institution, and whether there be anything that makes us fall short of the Dutch in damasks, diapers, and printed linen but our ignorance in design? Whether those who may slight this affair as national have sufficiently considered the extensive use of the art of design, and its influence in most trades and manufactures wherein the forms of things are often more regarded than the materials? Whether there be any art sooner learned than that of making carpets? And whether our women, with little time and pains, may not make more beautiful carpets than those imported from Turkey? And whether this branch of the woollen manufacture be not open to us? Whether human industry can produce, from such cheap materials, a manufacture of so great value by any other art as by those of sculpture and painting? Whether pictures and statues are not, in fact, so much treasure? And whether Rome and Florence would not be poor towns without them? Whether they do not bring ready money as well as jewels? Whether in Italy debts are not paid and children portioned with them as with gold and silver?

Berkeley's advice was neglected by the Irish manufacturers, and in consequence they have lost their position in the markets of the world. The trade of poplin-weaving survived to our time, but owing to the absence of good patterns it is gradually decaying. Another subject that is repeatedly introduced into "The Querist" is building. In no country are there fewer old mansions worth the notice of the traveller than in Ireland, and the reason is that the money which in other countries is expended on building was in Ireland lavished on objects of a less worthy kind. In the following queries it will be seen that the duty of building is suggested by many considerations; and here again Berkeley was in advance of his time, for he was the advocate of what is now known as fire-proof construction:—

Whether, if the arts of sculpture and painting were encouraged among us, we might not furnish our houses in a much nobler manner with our own manufactures? Whether we have not, or may not have, all the necessary materials for building at home? Whether tiles and plaster may not supply the place of Norway fir for flooring and wainscot? Whether plaster be not warmer as well as more secure than deal? And whether a modern fashionable house, lined with fir, daubed over with oil and paint, be not, like a fire-ship, ready to be lighted up by all accidents? Whether anything is a nobler ornament in the eye of the world than an Italian palace—that is, stone and mortar skilfully put together and

adorned with sculpture and painting, and whether this may not be compassed without foreign trade?

What would be the consequence if our gentry affected to distinguish themselves by fine houses rather than by fine clothes? Whether any people in Europe are so meanly provided with houses and furniture in proportion to their incomes as the men of estates in Ireland? Whether building would not peculiarly encourage all other arts in this kingdom? Whether smiths, masons, bricklayers, plasterers, carpenters, joiners, tilers, plumbers and glaziers, would not all find employment if the humour of building prevailed? Whether the ornaments and furniture of a good house do not employ a number of all sorts of artificers in iron, wood, marble, brass, pewter, copper, wool, flax, and divers other materials? Whether in buildings and gardens a great number of day labourers do not find employment? Whether by these means much of that sustenance and wealth of this nation which now goes to foreigners would not be kept at home, and nourish and circulate among our own people? Whether our expense in building and improvements doth not remain at home, pass to the heir and adorn the public? And whether any of those things can be said of claret? Whether in proportion as Ireland was improved and beautified by fine seats the number of absentees would not decrease? Whether he who employs men in buildings and manufactures doth not put life in the country, and whether the neighbourhood round him be not observed to thrive? Whether every squire that hath made his domain swarm with busy hands, like a beehive or anthill, would not serve his own interest as well as that of his country? Whether a gentleman who hath seen a little of the world, and observed how men live elsewhere, can contentedly sit down in a cold, damp, sordid habitation in the midst of a bleak country inhabited by thieves and beggars? Whether, on the other hand, a handsome seat amidst well-improved lands, fair villages, and a thriving neighbourhood, may not invite a man to dwell on his own estate, and quit the life of an insignificant saunterer about town for that of an useful country gentleman? Whether it would not be of use and ornament if the towns throughout this kingdom were provided with decent churches, town houses, workhouses, market-places, and paved streets, with some order taken for cleanliness?

A century and a half have elapsed since the foregoing suggestions were made public, and as few improvements have been introduced during that period, Dr. Berkeley's words are as applicable as ever. We should like to hear that a memorial in his honour will be raised, but the best tribute to his memory would be the improvement of the country which claims him for a native.

### EARLY BOOK ILLUSTRATION.\*

IN considering what are the principles that should determine book illustration, it is impossible not to be struck with the constant neglect of those finer qualities of taste which are so clearly established in the very earliest specimens of the art. By this I do not mean, of course, that the block-books are the earliest extant examples of wood-engraving. The block-books belong to the middle of the fifteenth century, but wood-engraving had already been known and produced for some considerable period; it was used, as we are told, in attesting documents so early as the thirteenth century; but its first important development is found in connection with the production of playing cards by the German cardmakers in the beginning of the fifteenth century.

The Germans were the first to practise card-making as a trade, and they largely exported their wares, produced at Augsburg, into the cities of North Italy; nor was it until the year 1441 that the cardmakers of Venice obtained an order from the magistrates, directing that no foreign manufacture of printed cards should be any longer imported. These printed cards were usually coloured with a stencil placed over the block. It was only natural that this mode of reproducing impressions of a design should speedily be adopted by the Church for the purpose of circulating among the people figures of the saints. Possibly the cardmakers were themselves employed in the service of the Church; and it is, at any rate, certain that the earliest sacred subject engraved on wood, the celebrated block representing the St. Christopher, in the possession of the Earl Spencer, and which bears the date 1418, was found in the convent within fifty miles of the city of Augsburg. This print, like the early cards, is coloured by means of a stencil-plate; the design is of considerable size, measuring  $11\frac{1}{4}$  inches in height, and 8 inches in breadth, and shows a quality of art superior to that which enters into the illustration of the earliest printed books.

There are several other early wood blocks which rank with the St. Christopher in point of time and style. One of these is the design of the Annunciation, preserved in the same volume which contains St. Christopher; another represents the Martyrdom of St. Sebastian, and a third, St. Bernardin, is preserved in the National Library at Paris. There is one characteristic which belongs to wood engravings of this period, and which is dependent

upon the process by which they are afterwards coloured. In the original block it is not uncommon to find that certain parts are left untouched, or partly indicated, with the view of being afterwards filled up by means of the stencil-plate.

It would not serve our purpose to-night to enter into a detailed examination of these early woodcuts, although they possess the highest interest in connection with the development of an art which was destined to be permanently associated with the production of printed books. Our special concern just now is to follow the progress of pictorial illustration in its relation to literature, and here, as I have already stated, the next step in advance is marked by the production of what are known as block-books, which date from about the middle of the fifteenth century. The block-book forms an important connecting-link between the illuminated manuscript and the later achievements of the printing-press. It has this in common with the illuminated manuscript, that it is the harmonious and coherent result of a single artistic process, and the finest block-books possess for this reason a certain completeness of effect which could never be secured even by the most elaborate and beautiful specimens of mechanical typography. The great charm of the illuminated manuscript consists in the fact that the spirit of the artist seems to enter as much into the transcription of the text as into the invention of the ornament or design which accompanies it. The whole bears the stamp of human handiwork and of human individuality; a quality that, from this point of view of art, is of higher value than the utmost perfection of mechanical skill. Something of the same peculiar fascination belongs to the block-books, although many of them are of comparatively little value in point of artistic refinement and skill. The block-book, as its name implies, is a book printed, text and illustration together, from a carved block. Before the invention of movable type the demand for the general circulation of popular religious works doubtless led to the employment of the wood-engraver's art, which had already found exercise in multiplying the figures of the saints. The exact date and place to which the origin of these block-books is to be ascribed is somewhat uncertain, but it seems probable that the earliest specimens were produced in Holland some years before the middle of the fifteenth century. I have said that these books have an intimate connection with the illuminated manuscripts which they superseded, and this is clearly shown by the fact that, in many instances, original manuscripts are still in existence, from which the engravers of the block-books obviously derived their inspiration. The works most freely circulated by this means are the "Apocalypse," the "Biblia Pauperum," and the "Ars Moriendi"; and in several instances the manuscript prototype is still in existence. But although these early engravers were clearly dependent upon the illustrators of the illuminated manuscripts for the material of their work, it would be misleading to assume that the results they achieved are in any sense comparable to the models from which they are taken. Mr. Quaritch, to whom I am indebted for much valuable suggestion in connection with this subject, has pointed out that the labour of engraving these books must, in many instances, have been entrusted to workmen with little art or skill in the management of their material; and certainly there are several considerations which go far to support this theory. In the first place, the engravings in the block-books are in many instances not up to the level of the art of the time. Mr. Chatto has pointed out that the block of the St. Christopher, of which mention has already been made, and which is, undoubtedly, to be ascribed to an earlier date, is artistically of much finer quality than most of the illustrations to the works issued from the printing-press; and there are instances of blocks inserted in manuscripts produced before the year 1440, which prove that the cuts in the block-books do not, as a rule, afford a fair index of the resources of the art at the time. A superb manuscript of the Apocalypse, secured by Mr. Quaritch at the Didot sale, containing designs of the highest artistic beauty and excellence, goes further to prove that the block-books, as a rule, were rough and rude imitations of the originals, executed by journeymen rather than by trained artists. But there are brilliant exceptions to this general rule, and the British Museum is fortunate in possessing one of the very finest of these block-books, which has recently been reproduced by the Holbein Society. This is the "Ars Moriendi," acquired in 1872 from the Weigel collection at Leipsic for the sum of 1,072*l.* 10*s.*, the highest price ever paid by the trustees for any printed book. But this precious possession, whatever its cost, must be reckoned of inestimable value as an early and admirable specimen of book illustration. Unlike most of the other block-books of the period, it is a genuine and admirable work of art, and it is only necessary to compare the cuts with those contained in other versions of the work in order to realise the superior claims possessed by the author of the original edition. Mr. Bullen, in a most interesting essay, prefixed to the Holbein Society publication, fixes a later date for the "Ars Moriendi" than for most of the other block-books with which we are familiar. "The manufacture of block-books," he writes, "commenced in Holland, and afterwards practised in Belgium, appears to have travelled about in the middle of the fifteenth century into Germany, and fixed itself at Cologne, where this edition was in all probability executed;" and it is certainly true, as he proceeds to point out, that the illustrations betray the influence of the lower Rhenish school.

\* From a report of a Cantor lecture, by Mr. J. Comyns Carr, published in the *Journal of the Society of Arts*.

HARRINGTON GARDENS  
for W.R. CASSELS ESQ.  
ERNEST GEORGE & PETO ARCHTS

DESIGN FOR DECORATION OF VESTIBULE, SHERWOOD, TUNBRIDGE WELLS.  
BY LEWIS P. CRACE

Sprague & Co. 22, North Street, London, E.C.

Design by: Royal Masonic Institution for Boys' Work

Oct 21<sup>st</sup> 1882.

Green · London · N. Preparatory · School · Cross, Wells & Cross  
Architects

THE UPPER NORWOOD DISTRICT COTTAGE HOSPITAL.  
MESS<sup>RS</sup> JOHN & JOHN BELCHER, F.R.I.B.A., ARCHITECTS.

It may be taken as a capital illustration of the skill and resource possessed by the earliest wood-engravers, and it seems to settle once for all the principles which determine all manner of decoration for printed books. Of course the general qualities of art displayed in these designs are those which might only be expected in the period in which it was produced; but what we have now to remark is the fine tact and taste with which the execution is adapted to the purposes of book illustration. The lines, though few, are admirably chosen to give effect to the artist's purpose, and throughout his work he would seem to have been constantly mindful of the relation which his picture should bear to the cut letters of the text. It may, of course, be said that the style which I am here holding up for admiration was imposed upon the artist by the imperfect resources at his command, and that he would have come nearer to the modern view of the wood-engraver's craft had he possessed the necessary knowledge and experience of what can be accomplished. But this, even if true, cannot be held to affect the question we are discussing. The world of art is not an arena for the exercise of feats of manual dexterity, and the greatest artist is not he who encounters and conquers the greatest difficulties, but who most willingly submits himself to the obvious conditions which the particular style of design imposes. To my mind, the most elaborate and intricate specimen of wood engraving which our modern times have produced compare but poorly with the simple and abstract qualities displayed by the engraver of the "Ars Moriendi"; and I believe that many of the failures which have overtaken modern art are due as much to the temptation which is afforded by increased facilities in technical practice as to any other cause.

There are many other of the block-books which, if time allowed, would be worth description and study; but their use to us on this occasion lies in the fact that they mark a particular epoch in the development of book illustration. The last of them, which is also to be seen in the British Museum, was produced in Venice in the year 1510, and is the work of Giovanni Andrea Vavassore. It is more elaborate in character than the "Ars Moriendi," and in the picture design there is a more ambitious attempt to secure fuller effects of light and shade. It anticipates, in a measure, the next revolution in the art of publication, consequent upon the invention of movable type. This invention at first seems to have exercised a depressing influence upon the practice of wood-engraving.

The cutting from the letters for the text had no doubt formed an important part of his business, and the introduction of typography of necessity deprived him of a valuable means of subsistence, but the decline was but temporary. Under the protecting influence of the printing-press, the wood-block rapidly acquired increased prominence, for it became the means of circulating engraved designs throughout every part of civilised Europe.

To follow the subsequent fortunes of engraving in wood would require a separate consideration of the art of Italy and the North; but it may be said, generally, that as Germany had been the first to encourage the engraver's art, so also it produced, in a more mature period of its development, the finest and most interesting specimens. It has been sometimes doubted whether Albert Dürer was himself an engraver on wood, but it is certain his great genius must have powerfully influenced the practice of this branch of art. No man ever possessed a finer instinct for the varying conditions under which his designs were to be reproduced; his mode of technical execution for engraving on copper has been a model to all the world since his time, and in like manner he exhibited an equal judgment in the management of designs destined for reproduction on wood.

Many of the wood-blocks executed at this time far exceeded the limits of book illustration. Such, for example, are the series of designs by Dürer for the triumph of Maximilian, who was himself a constant patron of this branch of art. At the same time wood-engraving received a new development by the invention of the system known as *chiaroscuro*, of which the earliest example is found in the reprint of the "Repose in Egypt," by Lucas Cranach. This mode of engraving, which consists in the use of two or more blocks, so printed as to imitate the effect of a washed drawing, may be taken as indicating a new departure in the wood-engraver's art. It marked the first attempt to make wood engravings a means of reproducing pictorial effect, and although in itself sufficiently simple, it may be reckoned as the source and origin of the many modern efforts in the same direction. In fact, in its modern application, wood-engraving has almost ceased to possess distinct claims of its own. It is employed as a means of reproducing drawings in wash or colour, or to imitate the free and careless handling of a pen-and-ink sketch. The result has been that the wood-block has lost its distinctive character of fitness for its place in a printed volume. It is true that the earliest wood-blocks were *fac-simile* reproductions of an artist's design; but then the artist laboured with a definite view of the process by which his work was to be translated, and of the place it was destined to fill. He preserved in his design something of the abstract character that belongs to printed type; the lines by which he expressed his thought were few, simple, and severe; he sought for no suggestion of colour, nor did he strive for great depth or variety of light and shade. It is a characteristic of all early engravers, a characteristic specially marked in the early wood-blocks, that they are founded

rather upon the principles of sculpture than of painting. The light and shade are evenly balanced over the whole composition, subtleties of local colour are neglected in favour of a clear, sharp definition of broad effect, and the result appeals more by beauty and balance of form, and by truth and simplicity of character, than by laboured difficulty of executive skill. It may perhaps be said that wood-engraving of this earlier and nobler kind reached its highest perfection within ten years of the time of Dürer's death.

The "Dance of Death," which may be taken, all things considered, as the very finest specimen of the art in existence, was published at Lyons in the year 1538; and Holbein's designs to the volume may be taken to sum up in a form of supreme excellence those principles in the engraver's art that had been gradually developing themselves in the previous hundred years.

In the mass of work now produced there is very little trace left of the principles upon which Holbein laboured. Instead of proceeding by the simplest means, our modern artist seems rather by preference to take the most difficult and complex way of expressing himself. A wood engraving, it is not unjust to say, has become scarcely distinguishable from the steel engraving, save by its inferiority. It strives after equal complexity of colour and tone, although the resources at the command of the artist are by no means fit for the attempt. When it appears in a printed volume the modern woodcut looks for the most part like an unsightly stain upon the page. It bears no relation to the text which surrounds it, and which it is assumed to illustrate. The heavy mass of deep tone seems to make a hole in the page, and however we may admire the quality of the work judged apart and on its own merits, we are bound to confess that it has been produced without consideration of the conditions under which it is to appear.

The original cause of this decline in the art has been already indicated. Envy of the effects proper to another mode of expression is the death of every art. Literature cannot reproduce the beauties proper to painting or design. Sculpture, whatever claims of its own it may possess, is powerless to give us the glow and colour of a Titian; and in like manner the wood-engraver, so far as he sought to place himself in competition with the engraver on copper, found that he was parting with the beauties peculiar to his own craft without securing those that belong to another. During the latter part of the seventeenth century the art may be said to have reached its lowest point, and the only book illustration of the eighteenth century that deserves much consideration consists of delicate copper-plate engravings produced by the French artists of the time.

These steel plates, it must be confessed, are often most skilfully introduced into the text, so as almost to produce the impression that they belong to the same process of printing; but I do not propose, whatever their merits, to discuss this class of illustrated books this evening.

Book-illustration as an art, as I have already said, is founded upon wood-engraving, and it is to wood-engraving we must look if we are to have any real revival of the kind of beauty which the early-printed books possess.

If we look back, then, upon the condition of wood-engraving during the period of its prosperity, we shall find certain clearly-marked characteristics which specially fit it for association with printed books. We find, in the first place, that the artist, partly perhaps from limited resources, but much more from innate and trained sense of the requirement of his task, constantly preserved such a simplicity in his workmanship that the result found happy companionship with the printed page. With the example of the illuminated manuscript still fresh in memory, he treated the page of a printed book as an entire composition into which the picture was not to overbalance or oppress the remainder.

#### RUBENS' "DANIEL IN THE LIONS' DEN."

THE high price given for the painting of *Daniel in the Lions' Den* at the sale of the Hamilton Collection has been the means of attracting attention to two similar works in Godshill Church, Isle of Wight, and in the Archers' Hall, Edinburgh, both of which are claimed to have been painted by Rubens. Mr. J. C. Robinson has examined the two pictures, and he is convinced that they are only simple copies from the Hamilton picture, and not *repliche* by Rubens or by pupils working under his direction.

"It is on record," says Mr. Robinson, "that Rubens himself stated to Sir Dudley Carleton, the English Minister in Flanders, that the *Daniel in the Lions' Den* was executed entirely by his own hand. Doubtless it was so, and all appearances lead me to the belief that the Hamilton picture is the one so produced. Carleton's testimony is very significant, and it is especially indicative of the early date of the picture, for ultimately Rubens, in his more important works, nearly always largely availed himself of the assistance of pupils. The picture in Godshill Church, in the Isle of Wight, is obviously the earlier in date of the two copies. From sundry indications I infer that it is an old English copy, made not long after the importation of the original, in the time of Charles I. The example in Edinburgh, on the other hand, which seems to have been given to the Archers' Company in 1788, bears the impress of that period, and it was probably made from the picture at Hamilton some time during the second half of the eighteenth century."

## NOTES AND COMMENTS.

THE Improved Wood Pavement Company was authorised about a year ago to lay down, as an experiment and at its own expense, a pavement of wood blocks in the Rue Montmartre and the Boulevard Poissonnière, two of the most crowded thoroughfares in Paris. The city engineers have reported so favourably respecting the new pavement that the municipal authorities have just given an order to the same company for the paving of the entire length of the roadway of the Champs-Élysées, from the Place de la Concorde to the Rond Point. The preliminary works necessitated by the change have already been commenced, and the laying down the blocks will begin next month. It is expected to be entirely finished by March 1, and will be executed in longitudinal sections, so as to interfere as little as possible with the traffic of the finest roadway in Europe.

M. BONNAT is now working on his picture of the *Martyrdom of Saint-Denis*, which has been ordered by the Government, at the price of 20,000 francs, for the Panthéon. It will be probably exhibited in next year's Salon. Among other commissions given for the adornment of the same building may be mentioned that to M. GALLAND, Professor of Decoration at the Ecole des Beaux-Arts, for a picture of *Saint-Denis Preaching*—20,000 francs; a statue of *The Virgin*, to M. PAUL DUBOIS—15,000 francs; and a statue of *Sainte-Genève*, to M. GUILLAUME, at same price. M. MEISSONIER some years ago received a commission from the State to paint the *Last Moments of Sainte-Genève* for 50,000 francs; but he has not commenced it, so that, as a matter of fact, the work may be considered abandoned.

WHILE speaking of orders given by public bodies, we may mention those received by M. MOROT for the Academy Palace, the Hôtel de Ville, where he is to execute a *Dance of the Nymphs* on the ceiling of the large Salle des Fêtes, and for the Musée Lorrain at Nancy. For these works the artist is to receive 90,000 francs, two-thirds of which is found by the State and one-third by the town.

THE authorities of the City and Guilds of London Technical Institute have acted wisely in instituting a series of forty lectures upon the Art of Furniture. Up to the present science appears to have monopolised the attention of the Institute. The lectures will be delivered by the Head-master of the department, Mr. ANDREW F. BROPHY, and will deal with the most interesting styles. Unlike many other teachers on similar subjects, Mr. BROPHY possesses a practical knowledge of the subject. His designs have been sought after by many of the principal firms in London, and his remarkable success at South Kensington is evidence of his mastery of the theory of industrial art. The lectures will be most useful to men who are engaged in the different furniture trades, and it may be added that they cannot fail to be attractive to the general public.

AMONG MESSRS. CROSBY LOCKWOOD & Co.'s forthcoming books will be a new edition, re-written and enlarged, of Mr. LOWIS D'A. JACKSON'S "Hydraulic Manual," consisting of Working Tables and Explanatory Text; a new and enlarged edition of Mr. MICHAEL REYNOLDS' "Stationary-Engine Driving," a Practical Manual for Engineers in charge of Stationary Engines; and the following scientific and technical works in their popular "WEALE'S Rudimentary Series":—"Land Drainage," its Theory and Practice, by Professor SCOTT; "The Smithy and Forge," including Coach Smithing, Farriers' Work, &c., by W. J. E. CRANE; "Details of Machinery," comprising Instructions for the Execution of Various Works in Iron, in the Fitting Shop, Foundry, and Boiler Yard, by FRANCIS CAMPIN, C.E.; "The Metallurgy of Iron," containing Outlines of the History of Iron Manufacture, Methods of Assay and Analyses of Iron Ores, Processes of Manufacture of Iron and Steel, &c. &c., by H. BAUERMAN, F.G.S.; "Plumbing," a Text-book to the Practice of the Art or Craft of the Plumber, with chapters on House Drainage, embodying the latest improvements, by W. P. BUCHAN; "Quantities and Measurements," with Rules for Abstracting, Hints for preparing a Bill of Quantities, and Prices for all work in the Building Trade, by ALFRED CHARLES BEATON, with prices revised to the present date.

THE classes and ateliers of the Ecole des Beaux-Arts have been reopened during the past week. The number of students entered on the books of the establishment exceeds that of any previous year, being 1,130 in all—viz., 661 in the architectural section, 285 for painting, and 184 for sculpture.

A LONG-NEEDED improvement is about to be introduced at the Louvre. A few of the rooms bear their denomination on medallions over the door of entry, and it is now proposed to extend this system throughout, so that visitors will no longer be obliged to wander about in fruitless search of a particular collection. In the block known as the Colonnade the rooms that are to be added to the old Musée des Souverains are now being decorated and repaired. A large number of statuettes, articles of pottery, &c., found recently by the various foreign expeditions sent out by the French Government, are already provisionally installed in this part of the building, and are open to the public during certain hours of the day. The most noteworthy articles are those illustrative of the Chaldeans.

SIR G. B. AIRY, who has but lately resigned the office of Astronomer Royal, which he held for more than a generation, has raised objections against the design for the proposed Forth Bridge. In the first place, he doubts the stability of the cantilevers, which are 675 feet in length, and project over the Forth without any support. These form the support of 350 feet of railway, which rests on the tips of the brackets. There are no precedents for such cantilevers. According to a calculation of Sir GEORGE AIRY'S, the tension on both the upper and lower booms increases from 1,004 tons near the extremities to 3,674 tons near the piers. He apprehends danger from so great a force acting endways, as it does. The effect is likely to lead to buckling, which has before now proved fatal to several structures. Lastly, it is said that the liability of the bridge to ruinous disturbance from the force of the wind acting with the leverage of the long brackets is alarmingly great. Both Mr. FOWLER and Mr. B. BAKER, the engineers of the bridge, have had much to do with iron structures, and they will no doubt be able to make out a case for their design; but the censures of so eminent a mathematician as Sir GEORGE AIRY demand attention from the directors and the public.

NICOLAS LORIN, the celebrated painter on glass, died last week at Chartres, his native town. A list of even his principal works would be too long for publication here, but we may mention the following places where specimens of his remarkable work may be seen:—Chartres, Bourges, Paris, Saint-Denis, Vincennes, Rouen, Sens, Lyons, Auch, Troyes, Dijon, Nevers, Rheims, Amiens, Canterbury (England), Heligenkreuz (Austria), Brussels, New York, and finally Monaco, where the great palace window, representing the *Jugement de Sainte-Devote*, is considered a masterpiece of glass-painting. Just previous to his decease M. LORIN had been chosen by the special committee appointed for the purpose to execute from his own designs the *Jeanne d'Arc* windows destined for the Orleans Cathedral.

MR. J. T. WOOD says that in spite of the desolation of Ephesus much remains on the site of the temple to interest a visitor. He mentions the several courses of beautiful marble masonry of the south and west walls of the cells of an earlier temple, which were made to serve for the foundations of the last temple; also the foundation piers of the great columns, and the whole of the marble pavement of an earlier temple, which was probably built in the time of CRÆSUS, who contributed largely to its cost. A portion of this pavement on the south side has been uplifted by an earthquake with a large mass of the mortar, which was in use at the time for building a church or some other large building within the cella of the temple. There is also to be seen on the north side of the site and at the east end 100 feet of the lowest step of the platform upon which the temple was raised. Then there are countless drums of fluted columns, altogether making a most interesting though not an imposing ruin. Mr. WOOD'S excavations have hitherto extended to the inner side of a colonnade which surrounded the temple. He is now endeavouring to raise funds by private subscription to extend the exploration beyond the portico, when it is reasonable to expect that much of the beautiful sculptured frieze and superstructure of the temple will be found.

## ILLUSTRATIONS.

## HARRINGTON GARDENS.

THE mansions shown in the illustration are the latest additions to Harrington Gardens, South Kensington. They are of red brick with red tiled roofs. The houses are set back from the path to obtain a drive, so that a carriage may be entered without the usual walk across the public footway. A small court open on one side is formed between the houses, lighting the staircases. The court will be brick paved, and will hold myrtles, &c., in tubs. On the ground-floor of the larger house is an arcaded porch beside the open court. A dining-room, which is oak pannelled to the ceiling (the ceiling showing the moulded joists); and the drawing-room, which is 40 by 18, with three bay windows; a library of the same size being above it, also with three bays. These rooms look towards the gardens. The billiard-room occupies the north side of the first floor. The drawing-room is to be panelled up to the top of the doors, and will have a hooded stone chimney-piece in the Early Renaissance manner. A fine carved oak staircase occupies one end of the entrance hall. With the smaller house, the dining-room and morning-room occupy the garden front, while a smoking-room and a panelled hall, low of pitch, occupy the north side of the house. Above this hall is the drawing-room, square on plan and lofty, as shown by the long mullioned windows. This room has a balcony upon the court. The architects of the buildings are MESSRS. ERNEST GEORGE & PETO. The contract was taken by MESSRS. STEPHENS & BASTOW at 13,272*l*.

## NORWOOD COTTAGE HOSPITAL.

THE above hospital, situated in the Hermitage Road, is to be opened by the Lord Mayor, Sir JOHN WHITTAKER ELLIS, to-day (Saturday), under the presidency of Mr. GRANTHAM, Q.C., M.P.

It has been erected to accommodate fifteen patients, having four wards of three beds each and three separate rooms. On the ground floor is a spacious dayroom, from which the wards and offices open out. The position of the matron's and nurses' rooms enables them to overlook two wards each.

Each ward is provided with bathroom, hot and cold water, w.c., sink, &c. The sanitary arrangements have received special attention, and are in accordance with the latest improvements.

Electric bells with proper indicators have been fitted up throughout by Mr. GEORGE PORTER, of Fenchurch Street; a flexible cord with push at end being placed for the use of each patient. The ward doors have Messrs. KAYE's locks, by which they are opened and shut noiselessly.

The general appearance of a public building has been avoided as far as possible, and homelike comforts and snugness considered.

The works have been well carried out by Messrs. GARNHAM & SONS, builders, of Westow Street, Norwood, from the designs and under the superintendence of Messrs. J. & J. BELCHER, of 5 Adelaide Place, E.C.

## NEW VESTIBULE, SHERWOOD, TUNBRIDGE WELLS.

THIS illustration has been reproduced from a coloured drawing exhibited at the Royal Academy this year. The architectural features of the interior are of various coloured marbles, and the work, together with other additions to the house, was recently executed for Dr. SIEMENS, F.R.S., by Messrs. WILLICOMBE & OAKLEY, builders, of Tunbridge Wells. The drawing, which shows a scheme for the colour decoration, was executed by Mr. LEWIS P. CRACE, A.R.I.B.A., of 71 George Street, W., from whose designs the work was carried out.

## DESIGN FOR PREPARATORY SCHOOL FOR BOYS, WOOD GREEN, N.

THIS design was prepared in accordance with conditions recently issued by the chairman and members of the House and Building Committee of the Royal Masonic Institution for Boys.

The drawings provide accommodation for 150 boys, and include, on the ground-floor, a central entrance hall and staircase, communicating on either side (by a wide corridor running the entire length of the building) with class-rooms, teachers' rooms, dining-room, matron's, sitting and store rooms, visitors' room, &c., and a dining-hall. The boys' dormitories, &c., are placed on the first floor, and the second floor of the central block contains sleeping accommodation for the servants.

The fronts are intended to be faced with Fareham red bricks, with dressings, &c., of Tisbury stone, and the roofs covered with Bangor slates; the internal joiners' work to be in pitch-pine.

The cost of the building and outbuildings, including enclosing fence, play-sheds, gymnasium, &c., is estimated at 20,000*l*.

MESSRS. CROSS, WELLS & CROSS, of No. 70 Chancery Lane W.C., are the authors of the design.

## SCOTTISH ARCHÆOLOGY.

ON Monday the annual Rhind Lectures on Archæology were resumed in Edinburgh. The subject selected is "Scotland in Pagan times—the Bronze and Stone Ages," and Dr. Joseph Anderson is again the lecturer.

In the opening lecture Dr. Anderson referred to the remains which had been discovered of the burials in Scotland during the bronze period. During two seasons—August 1876 and 1877—he had been present at the excavation of a large cairn in a field near Collessie. It was a mass of gathered stones covering an area of about 120 feet in diameter, and rising in the centre to a height of about 14 feet above the natural level. Commencing on the south-east side, a width of about 8 yards, extending all through the cairn from side to side, was excavated and cleared out down to the sub-soil. The bulk of the cairn was then found to consist of rolled stones apparently gathered from the surface of the surrounding area. The mass of the cairn was simply agglomerated, not built, or placed with any visible arrangement except in one feature. That feature, however, distinctly indicated arrangement with a purpose. A few feet within the exterior of the cairn there was a ring of sandstone slabs, set on edge, close to each other. The ring was traced for fully one-third round the base of the cairn. These slabs were from 3 to 4 feet high. The level space within the incomplete circle from which the mass of the cairn had been removed presented a remarkable appearance. It was covered with a layer of fire-clay varying in thickness from 1 to 3 inches. The surface of this clay bed was mottled over with marks of fire at separate spaces. In these spaces the ashes and charcoal of wood could be gathered in handfuls, and the whole surface of the side of the cairn, so far as it was laid bare, was more or less strewn with ashes and minute particles of charcoal. These appearances were to some extent explained by the fact that there were cremated burials in the soil underneath the cairn, which in all probability were placed there previous to the construction, or at least prior to the completion, of the cairn. In the cairn itself was found but one burial. It was enclosed in a cist of slabs placed on the natural surface of the ground, a little beyond the centre of the cairn to the south-west. The cist was of four-sided stones set on edge. The space it enclosed was 4 feet 6 inches long, and 3 feet wide in the centre. The appearance of the bottom of the cavity was peculiar—a layer of perfectly clean-washed angular gravel, nearly all of a size, with no admixture of clay, sand, or earth. Below it was the sandy gravel of the subsoil, in and on which a few small portions of the unburnt bones of a human skeleton were found in a condition of extreme decay. Near the west end of the cist, and therefore placed either behind the shoulder or before the face of the corpse, a tall, handsomely-shaped and finely-made urn of clay lay on its side. It stood 9 inches high and 6 inches across the mouth. It was graceful in shape, narrowing slightly below the brim; and, swelling to its greatest width at about half its height, it narrowed again to a diameter at the bottom of about 4 inches. Although made without the aid of a wheel, it was almost regular in its outlines, with band ornamentation produced by the impressions of a tool with closely-set teeth like those of a comb. This one burial was all that was discovered in the cairn, and was apparently the burial for which the cairn was constructed. It was an unburnt burial, and no relics were associated with it except the urn. But the cairn presented the singular feature, which, so far as his experience went, was unique in Scotland, of having been erected over a site in which there were burials underground. Beneath the cairn was a pit about 4 feet by 3 feet, and 6 feet deep, in the bottom of which were found the broken fragments of an urn of the same form as that found in the cist, but smaller; of the same texture, and similar ornamentation. In another pit, which had been excavated to a depth of 4 feet under the natural level, there appeared a layer of burnt bones about an inch in thickness, spread over a space of 3 or 4 square feet. Among them he recognised portions of a human skull and vertebral column. There was no appearance of an urn, but among the bones lay a finely-made, thin, and tapering blade of bronze, still bearing on its broad end the holes through which it had been riveted to the handle. Close by it was found the gold mounting of the butt end of its handle. He described this cairn and its associated burials thus minutely because it was the only cairn of the bronze age which he had seen excavated. Many others had doubtless been met with, but the instances in which the phenomena of the burials and the features

of the structure had been specially investigated and placed on record were exceedingly few, and the details were of the most meagre and unsatisfactory description.

Dr. Anderson next compared similar cairns found at Cairn Greg, Linlathen, at Cleigh, Argyshire, and at Glenforsa, Mull, in each of which the central burial had been accompanied by a bronze dagger, the last-named cairn containing, besides the dagger, two urns and a "bracer" of polished stone. This polished stone was thin and rectangular in form, with slightly rounded corners, and pierced by a small hole in the middle of its breadth, close to each end. The association in other quarters of this peculiarly-formed stone object with arrow-heads of flint was suggestive of its connection with the use of the bow, and the fact that the braces of bone, which in mediæval and modern times were strapped on the left wrist to protect it from the recoil of the bow-string, were curiously like these stone objects, had given force to the suggestion. All these interments, the lecturer pointed out, differed in a marked manner from those described in the previous course of lectures. These were characterised by the presence of weapons and implements of iron and ornaments of silver, bronze, or brass. In the interments now under consideration the deposits of grave goods were much more limited in quantity and much less varied in character. No metal usually appeared but bronze, and that only in a single form—a flat triangularly-shaped blade, remarkable for its thinness, and peculiar not only in its form but in the manner in which it was attached to the handle by rivets. Instead of stone urns, which were associated with the iron age interments, they had urns of clay, of a special form and peculiar ornamentation. They were therefore dealing with a typical form of burial. It separated the burials in which it occurred from the typical burials of the iron age on the one hand and the typical burials of the stone age on the other. It separated them from the burials of the iron age, because it had never been found either with implements of iron or with objects exhibiting special forms, or bearing the special ornamentation of the iron age. It separated them from the burials of the stone age, because it was itself of bronze; and though it was associated with implements of stone, it brought these stone implements and the burials with which they were associated into the category of bronze age types. Dr. Anderson proceeded to notice a series of burials still characterised by the presence of a thin blade of bronze, the blade presenting certain differences of form and character, and being associated with a typical form of urn which indicated the practice of cremation. These included burials discovered at Lockerbie, Balblair, and Rogart, in Sutherlandshire; Penicuik; and Burreldales, Aberdeenshire. Occasionally, he said, such burials as these were found associated in groups, implying the use of the site as a family or tribal burying-ground. The deposits they contained were totally destitute of iron, and the only cutting implements they contained were made of bronze, this being their most peculiar feature. They had thus passed a phase of culture familiar with the use of iron and silver to a phase of culture familiar only with the use of bronze and gold. He also described a series of cemeteries disclosing urn burials after cremation found at various times at Lawpark, St. Andrews; Magdalen Bridge, Joppa; Alloa, and other places, in which implements or ornaments of bronze were found among the burnt bones; the Alloa cemetery, from which twenty-two urns were obtained, also contained in the cist which enclosed the skeleton two penannular armlets of gold, together weighing five ounces. In one cist in Forfarshire were found a small triangular flint knife, a bronze pin, and a curious necklace of jet or cannel coal. In the whole series of these burials they marked the presence of a set of phenomena that were unlike the phenomena of any other series of burials within the same area. They were characterised by the absence of iron and silver, and the presence of bronze and gold. The bronze was present in these deposits in the same character as iron was present in the deposits of the iron age as the only material for cutting instruments. It was not abundant; the only objects met with were small, and presented but little variety of form and character. Yet they were neither rude nor unshapely implements. On the contrary, they exhibited a remarkable fineness of form and delicacy of finish, implying extremely skilful and careful workmanship in every step of the complicated processes of their manufacture. These thin, triangular blades of bronze were as beautifully cast and finished as any modern founder could wish. They were neatly fitted to their handles of wood, and solidly fastened by rivets. The handles were sometimes decorated with mountings of gold, ornamented in *repoussé* work. The oval blades were even more skilfully made and more delicately finished. Their edge rivalled in its keenness the edge of a razor, and some of the forms of the blade had been found capable of shaving, and this purpose attributed to them. The urns themselves presented a wonderful variety of graceful forms and appropriately simple but effective ornamentation. They were not wheel-made, but many of them were so regularly symmetrical in their outlines that it was difficult to suppose they had not been moulded on the wheel. With these finely-ornamented urns there were associated armlets of gold and necklaces of jet, and beads of amber and variegated glass. The gold armlets were massive and well made, and could not fairly be called rude or inelegant. The jet necklaces of beads

and plates were elaborately constructed and carefully ornamented with punctuated patterns, which contrasted fitly with the polished surface of the material. Intrinsically all these variously fabricated objects were evidences of the capacity and culture of the men who made them. But as they found them all in associations which showed that they were grave goods devoted to the dead, they saw that they were also evidences of the piety and affection which thus expressed itself in the manner of its time.

## ALTERATIONS AT OXFORD.

ACCORDING to custom, the *Oxford Chronicle* publishes a list of the alterations and improvements that have taken place in Oxford during the past year, from which we take the following.

### The Old Schools.

This fine pile of buildings—including Bodley's Library—has been undergoing thorough restoration during the last five or six years, at a cost defrayed by the Curators of the University Chest, under the direction of Mr. T. G. Jackson, architect, Devereux Court, Temple, London. The Library, round which the Schools are grouped, was finished by the donor in 1598, and formally opened by the donor in 1602. Bodley himself died ten years afterwards, and was buried in Merton Chapel. About this time the Schools were begun, Thomas Holt, a native of York, being the architect, and he was at his death interred in Holywell Cemetery, where so many notable men connected with the University have been buried. To Holt belongs the honour—if honour it may be called—of having introduced the Classical orders of architecture in a series over each other in the same building. The central tower of the Schools is the most famous—if not a unique—specimen of this kind of work in England, and this prominent object has just been restored in a very complete and careful manner. The tower from the pavement to the top of the angle pinnacle is 110 feet high, or to the top of the octagon turret, 117 feet. Its width from east to west is 31 feet, and from north to south six inches less, so that it is nearly square. The west front is most important, composed as it is of the five orders of architecture, with Elizabethan ornamentation, the columns rising above each other in pairs on either side. This has now been completely repaired, and as Clipsham stone has been used for the purpose, it is hoped that the weather will have little effect upon the new work. Every detail of the old structure has been minutely copied stone for stone, and wherever it was possible the work of the former restorer has been retained. This has been rendered still more easy from the fact that Bath stone was used in those portions of the work which have been allowed to stand. The parts untouched consist of six columns on the south side of the west front, a portion of the cornice of the upper order, the parapet, and pinnacles. The masonry is solidly laid in Portland cement.

The new Examination Schools, which have been erected from the designs of Mr. Jackson, were completed in May. They were described shortly afterwards in the *Architect*.

### The Indian Institute.

The work of pulling down the six old houses, excavating the ground, and laying the foundations of the future Indian Institute, at the east end of Broad Street, has been successfully accomplished by Messrs. G. Wyatt & Son, and the contract for the erection of the building has been undertaken by Messrs. J. R. Symm & Co., who have already commenced operations.

The architect is Mr. Basil Champneys, and the style of the building will be that commonly known as Jacobean. The angle formed by the junction of Holywell with Broad Street will be occupied by a turret surmounted by a lantern, which will contain the principal staircase leading to the basement below and to the library and museum above. On one side of this turret, facing Broad Street, will be the main entrance. The whole of the first and second floors towards Broad Street will be occupied by the library, which will, when completed, have a series of five oriel windows, while the upper floor will have the same number of smaller windows lighting the galleries. The front towards Holywell Street will be necessarily of irregular shape, and will be broken up into parts by two projecting features, which are intended to obviate the awkwardness of the site. The material throughout will be of Milton stone.

### New College.

Extensive alterations have been in progress at this college in remodelling and reorganising the kitchen wing, and its various offices. The original kitchen of William de Wykeham's foundation must have been a lofty and spacious apartment, but subsequent alterations and clumsy fittings, which may perhaps have been convenient in their day, sadly marred its fine proportions. These have been removed, and the kitchen restored to its probable former size. An entirely new system of cooking apparatus, with steam and hot water services, has been fitted up by Messrs. Jeakes & Co. The old larders and other offices have been replaced by substantial new buildings. The builder's work was executed by Mr. Holland, of Hurst Street, under the superintendence of Messrs. Wilkinson & Moore.

**Brasenose College.**

The buildings in course of erection at this College will take the place of two slightly-built and not well-planned constructions now standing in the kitchen or cloister quadrangle. By their removal, and that of some cottages and outbuildings, a spacious quadrangle, bounded on the east by the ante-chapel and cloisters, and on the west by the new wing, which is set a good way back, will be formed in the place of the present confined and irregular space. To the south, the new quadrangle is only separated from High Street by the houses and shops facing that street, and the buildings now being erected form part of a scheme for the quadrangle which will extend the whole distance from the old Brasenose buildings to High Street, and add one more to the series of collegiate and academical buildings with which that street is lined. The building will contain twenty-two sets of rooms for undergraduates, two large lecture-rooms, and a spacious set of rooms for a fellow. The old collegiate plan of disposing the rooms on separate staircases has been followed, but various conveniences in the way of sculleries and servants' offices are provided, which were unknown or disregarded when the older college buildings were designed. The foundations are laid at a depth varying from 14 to 20 feet, that being the depth of the "made" or artificial earth for the most part within the ancient limits of the city. In order to gain space enough for the new building it was necessary to demolish the greater part of Amsterdam Court, which occupied the site, and preserved the name of Amsterdam or Broadgates Hall, one of the numerous academical halls with which Oxford abounded during the Middle Ages, and especially before the existence of colleges. The walling of the new buildings is of Headington rubble, faced with Gibraltar rag stone, with dressings of Clipsham stone for strings, cills, weatherings, and mullions, and hard Doulting for the rest. The durable flagstone of Castlehill, near Thurso, will be used for the landings, and the stairs will be of hard Portland. The foundations and the walls, to the height of about 3 feet above ground, were put in by workmen under Mr. Mockford, the clerk of the works. The contract for the building above this level has been let to Messrs. Simm & Co., of Oxford, who have carried the buildings almost to the roof.

**Lincoln College.**

The new buildings from the north side of the space of ground known as "The Grove," at Lincoln College, bounded on the west by the older quadrangle of that College, and on the east by the back of Brasenose College, replace the old "Grove buildings," which contained eleven sets of small and inconvenient rooms, and which, although only built in 1759, had suffered so much from the action of the weather on the perishable local stone of which they were constructed as to have become dilapidated. The new building, now approaching completion, is designed by Mr. T. G. Jackson, and contains fifteen sets of rooms for undergraduates, and one set for a Fellow, besides making provision for some of the servants' offices. The depth to which it was necessary to go in order to secure a sound foundation has given opportunity for an extensive basement, which serves partly for cellage and partly for sculleries and servants' offices, a convenience unknown to the economy of older collegiate buildings. The basement contains also a new larder, reached by a subway from the college kitchen. The south front is faced with Handborough stone, and the north is of red brick, coursed with ashlar, the dressings throughout being of Clipsham stone. The stairs are of Portland, with landings of the extremely hard Castlehill flags from Caithness. The depth to which it was necessary to go for foundation, varying from 17 feet to 20 feet, affords a remarkable instance of the accumulation of earth within old towns. But it is still more remarkable that this accumulation of made earth seems to have been as great as at present in the fifteenth century. In joining the new building to the College Hall it was necessary to open one of the hall windows which had been blocked on the outside with masonry, and concealed on the inside by the panelling erected by Lord Crewe in 1701, at which time, probably, the other hall windows were converted into the present plain square-sashed openings. On opening this blocked window the original tracery was found behind it so complete that the whole of the design could be accurately recovered, a discovery of which, it is much to be desired, use may be made hereafter in restoring these beautiful windows to their original condition. The design of the tracery is very unusual and effective. The foundations and basement up to the ground-level were put in by workmen under Mr. Mockford, the clerk of the works. The contractor for the superstructure is Mr. Estcourt, of Gloucester.

**University College.**

At this college Messrs. Simm & Co. have restored several of the stone gables in the Radcliffe Quadrangle, which were found to be in a very dilapidated state. Taynton stone has been used. The same builders have also carried out extensive improvements in the drainage at Balliol, Merton, and Corpus Colleges, and the Radcliffe Observatory, from the plans of Mr. Griffith.

**Keble College.**

Further works of extension have been carried out at this college, and they are in a style corresponding with the rest of the

buildings, namely, red brick with Bath stone dressings. The additions comprise a bursary, steward's office, over both of which is a lecture-room 39 feet in length by 26 feet in width, and twenty sets of rooms for undergraduates, together with the necessary offices. The new buildings extend 131 feet in length by 30 feet in depth, and the lecture room is approached by a flight of Derbyshire marble steps. Messrs. Parnell & Son, of Rugby, who have been entrusted with the construction of the rest of the college, are the builders, Mr. Butterfield being the architect.

**Magdalen College.**

Considerable progress has been made with the new wing at Magdalen College, and the whole of the interior mason work has now been completed. The roof rafters are in position, and will be covered in almost immediately. The architectural features of the building are the oriel windows in the tower and those at the east and west ends of the High Street façade. It is proposed ultimately to erect three sides of a square, the fourth being occupied by buildings at present in existence, supplemented by a wall surmounted by an ornamental iron railing. However, only half the work is now in hand, and this comprises the whole of the frontage to the High Street in a line with the college buildings. This addition will provide thirty sets, lecture-rooms, and Fellows' chambers. At the south angle of the new buildings a tower will be erected, harmonising with that of the founder in the centre of the west side of the cloisters, which will rise to some 80 feet, beside decorated pinnacles. The chief entrance to the new quadrangle will be at the base of the tower, the archway and groining of the roof being in harmony with those in the founder's tower. The front extends about 200 feet from east to west, and the west wing will extend about 114 feet northwards. When completed the buildings will form a handsome addition to the present structure. Mr. McCulloch has carried out the carving most efficiently. Messrs. Franklin & Son, builders, Deddington, have been entrusted with the work. It is stated that the remainder of the extension scheme is likely to be taken in hand at once. The architects are Messrs. Bodley & Garner.

**A MÆDIEVAL VIGNETTE.**

AT the annual meeting of the Cumberland and Westmoreland Archæological Society, Mr. R. S. Ferguson, Mayor of Carlisle, read a paper on a "Vignette to a Charter to Carlisle." He said that in looking over the Royal Charters in possession of the Corporation of Carlisle, he fell in with a charming little vignette representing the siege of a walled town. It was mainly framed in the initial letter, the capital Chancery E of a charter of 9 Edward II., but two groups of figures were outside the frame. His pleasure in this trifling discovery was much enhanced on noticing that the chief of the defenders, a knightly figure in complete armour, bore on his shield the well-known arms of Sir Andrew de Harcla, thus proving that the scene depicted was his gallant defence of Carlisle in 1315 against Robert Bruce and the Scottish army. As the vignette itself and not De Harcla was the subject of the paper, he should only give a very brief account of that gallant and ill-fated soldier. He was Sheriff of Cumberland from 1 to 16 Edward II.; Warden of the Marches 8 Edward II.; created Earl of Carlisle 1321; and executed on a charge of high treason in 1325. The story of his arrest in Carlisle Castle by Sir Antony de Lucy, and of his subsequent execution on Harraby Hill, near Carlisle, was told in the Chronicle of Lanercost, and from that authority he quoted an account of the siege of Carlisle by Bruce, appending the translation in Jefferson's "History of Carlisle" as follows:—

"Very shortly afterwards in the same year, on the Feast of St. Mary Magdalene (July 22, 1315), the King of Scotland, having gathered together all his force, came as far as Carlisle, and surrounding the city besieged it for ten days, treading down the corn-fields and laying waste the suburbs and everything around, and burning the whole country; and collected for his army all the cattle they could steal from Allerdale, Coupland, and Westmoreland. On every day they made an attack on some one of the three gates of the city, and sometimes on all three together; but not with impunity, for darts, arrows, and stones, as well then as at other times, were cast down upon them from the walls in so great an abundance, that they questioned among themselves whether the stones did not increase and multiply within the walls. But on the fifth day of the siege they erected an engine for casting stones near the church of the Holy Trinity (the cathedral), where their king had placed himself, and continually threw great stones towards the Caldew gate, and at the wall, but did no injury, or but little to those within, except that they killed one man. There were, indeed, within the city seven or eight similar engines, with other warlike instruments, called springalds, for throwing long darts; and slings in sticks for casting stones, which greatly terrified and annoyed those who were without the city. In the meanwhile the Scots erected a great belfrey, in the manner of a tower, the height of which considerably exceeded that of the walls, which being observed, the carpenters of the city erected a wooden tower, which exceeded the height of the other, upon one of the towers of the wall, towards which that engine must have approached the

wall; but it never drew near to the wall, for when it was drawn upon wheels over moist and clayey ground, there it stuck by reason of its weight, nor could it be drawn any further, or occasion any inconvenience. But the Scots applied many long ladders which they had brought with them for the purpose of ascending the wall in the same manner in different places, and a sow for undermining the wall of the city, if they found it practicable, but neither the sow nor the ladders availed them anything. They also made bundles of straw and grass in great abundance to fill up the moat without the wall, on the east side, in order to pass over it dry; they also made long wooden bridges running on wheels, that being drawn forcibly and rapidly with cords, they might be carried across the ditch; but neither would the bundles, during the whole stay of the Scots there, fill up the moat, nor those bridges pass the ditch, but fell by their weight to the bottom. 'On the ninth day of the siege, when all the engines were ready, they made a general assault on all the gates of the town, and attacked valiantly throughout the whole circuit of the walls, and the citizens defended themselves as valiantly; and in the like manner on the following days. Moreover, the Scots employed a stratagem similar to that by which they took the Castle of Edinburgh—they caused the greater part of their army to make an assault on the eastern part of the city, against the place of the friars minors (the Grey Friars), that they might draw thither the party within, but the Lord James Douglas, a valiant and wary soldier, with certain of the more bold and alert of the army, posted themselves on the western side, over against the place of canons and preaching friars (the Black Friars), where, on account of the height (of the walls) and difficulty, an attack was not apprehended, and there erected long ladders, which they ascended, and they had archers in great numbers, who discharged their arrows thickly lest any one should raise his head above the wall; but, blessed be the Lord, they found such a resistance there, that they were thrown to the ground with their ladders, and there and elsewhere about the walls some were taken, some were slain, and others wounded. Yet no Englishman was killed during the whole siege, except one man struck with an arrow, and the one above mentioned, but a few were wounded. Thereupon, on the eleventh day, that is to say, on the Feast of St. Peter ad Vincula, the Scots, either because they heard of the approach of the English to raise the siege, or because they despaired of making any further progress, early in the morning returned into their own lands in confusion, leaving behind them all their warlike engines above mentioned. Certain English pursuing them took John de Moray, who in the before-mentioned battle at Strivellan had for his share twenty-three English knights besides esquires and others of lower rank, and received a great sum for their ransom. They took also, with the aforesaid John, the Lord Robert Bardolf, a man certainly of the very worst disposition towards the English, and brought them both to the Castle of Carlisle.'

Turning to the vignette, Mr. Ferguson said the artist had represented within the frame of the initial letter a walled town, Carlisle, and over the wall could be seen the roof and east window of the cathedral. Various turrets or towers rose from the wall, and one lofty one rose above the frame of the initial letter; this probably was intended to represent the castle. In the left hand corner outside the letter was a "*machina ad lapides jaciendos*." This must be the one the Scots erected on the fifth day of the siege "*juxta Ecclesiam Sanctæ Trinitatis*," that was the cathedral. It was clear to one having local knowledge that the scene depicted was the assault on the ninth day, "*contra locum canonicorum et fratrum prædicatorum*," that was the vicinity of the Sallyport, where the wall would be at least 30 feet high. He drew attention to some of the details of the drawing. The principal figure in the loftiest tower is Andrew de Harcla himself; he has already sent one spear through a Scot below; and is depicted in the act of hurling another. He described the arms and armour of De Harcla. But the spears have loops at about one-third of their length from the butt end; and Harcla, in the act of throwing the spear, grasps it in his hand, having his forefinger inserted in the loop. The Romans used a strap or thong tied to their spears; so did the Greeks. De Harcla wears a huge visored, conical-topped helm, much resembling No. 75 in the Institute's "*Catalogue of Helms*." It is surmounted by a panache or plume of upright feathers. Mr. Planché, in his "*Cyclopædia of Costume*" (*sub voce* "*Panache*"), said that prior to the reign of Henry V. panaches only appeared as heraldic crests. This was an earlier instance of a panache than those given in the works on heraldry, and it might either be a crest or a mere decoration. De Harcla also wears a 'sleeveless surcoat over a hauberk of banded mail. His sword, which has plain, straight quillons, hangs at his left side, the surcoat hanging over the waist-belt in most natural folds. On his left arm De Harcla carries his shield, which displays a plain cross containing in the dexter chief point a martlet. The martlet in this drawing is peculiar; it is not like those on the enamelled shield of William de Valence in Westminster Abbey (1296), but is sitting on a small twig. Next to De Harcla is a figure in surcoat and hauberk of banded mail. He is winding up one of the "*springaldes*," which seemed to have been a large alabaster or cross-bow, worked as usual with a windlass. Three other defenders are on towers or turrets of less altitude than that occupied by De Harcla and the "*springalde*" man. One is lifting

a stone of great weight; a second, with a coolness and imperturbability that made him think him the town clerk, thrusts a long spear through a Scot who has climbed up a ladder; while a third with his left hand clutches the Scot by the throat, and with his right, in which is an enormous falchion, endeavours to decapitate him. All these three are alike clad in hauberks of banded mail and surcoats, but their head-gear is varied; the third wears a plain steel or iron skull-cap; the second a coif of mail; while the first wears some sort of hood. The besiegers are represented by six individuals: one of them, "*the forlorn hope*," they might suppose, had already been mentioned as on the top of the ladder. He has met with a warm reception, is falling, and apparently about to give up the ghost, but still brandishes in his right hand a huge battle-axe; his left arm hangs relaxed, but the shield has not yet fallen to the ground, but is suspended from the arm by the enarmes at the back of the shield. Three more of the besiegers are at the foot of the walls; one is an archer, and is discharging an arrow at the men on the battlements; another, with a spear in his hand, watches the man falling from the ladder; while a third, in the act of vigorously plying his pick, is felled to the ground by a stone which takes him about the nape of the neck. Two besiegers and the "*machina ad lapides jaciendos*" form a separate group. The machine is a *trébuchet*; one of the men has laid aside his battle-axe, and with a mallet is wedging a stone into the loop of the sling. The other man is transfixd by a spear hurled by De Harcla, and falls off the frame of the machine on which he has been standing. He has an arrow in his right hand and a bow in his left. The besiegers are all dressed alike, in most wretched habiliments; they wear cloaks with hoods, some sort of clothes covering the loins, and apparently nothing else, save that their feet are encased in brogues. The whole drawing is full of life, truth, and vigour, and its fidelity to the account of the siege given in the Chronicle of Lanercost is most remarkable.

### INGESTRE HALL.

ON the 12th inst. Ingestre Hall, Staffordshire, one of the mansions of the Shrewsbury family, was destroyed by fire, which is supposed to have originated in an old beam under the hearth of the state-room having become ignited from the continuous fire. The hall was erected in 1676, and in it were stored many heirlooms, valuable ancient portraits, and the majority of the old Talbot family paintings. Among the burning *débris* in the state-room and grand dining-hill, all the contents of which were consumed, were the paintings of the old Talbot family, a valuable portrait of George IV., and a much-prized life-sized painting of the Earl's great-grandfather, once a popular Lord-Lieutenant of Ireland, known as "*old Lord Talbot*." Some ancestral tokens of family connections with royalty have also perished.

Mr. Loftus Brock, in a letter to the *Times*, says the destruction of the Hall is not an isolated instance of the great danger to which ancient buildings are exposed from the vast amount of wood used in their construction, as vast numbers of old mansions have been burnt to the ground one after another, in a more or less unexplained way. Of these, the environs of London alone testify to the loss of many a priceless work of ancient art.

Mr. Brock describes one case in his own practice as follows:—Several years ago a fortunate alarm of fire in a grand old Jacobean house in one of the midland counties led to a searching examination. I accomplished this by having the hearthstones taken up throughout the house, or nearly so, and some of the elaborate chimneypieces as well. In something like one half of these cases huge oak beams, so common in the construction of ancient floorings, were found beneath the hearths, which in some positions were so close that they rested upon the oak, there being in none either intervening trimmer-arch or concrete. It was therefore not to be wondered at that the ends of these beams were found either charred or so dry as to cause matter of surprise that fire had not actually taken place. This process of preparation for burning had evidently been going on slowly for years. At all hazards I had the ends of the beams either cut away entirely, or the thickness so greatly reduced as to admit of an air space around and over them, and a heat-proof foundation provided for the hearthstones before they were relaid. The bearings of the beams thus weakened were made good by wrought-iron plates inserted beneath them, or by other corbels, rendered necessary by the presence of some elaborate cornices in the rooms below, which could hardly be disturbed. The result of these very simple and comparatively cheap precautions, thus applied in time, is to save the building from fear of destruction, and what was accomplished in it can be applied with equal facility to any other. Another vulnerable point of our old buildings is the course of the flues. It is not unfrequently the case that several of the chimneys are added works, carried up close to or even beside the older beams of construction. The course, therefore, of the flues should be carefully traced. Oak is a material that does not burn easily, and is not to be lighted by any mere spark. The recurrence of such losses as these may therefore be fairly classed under the description, if not of preventible disasters, at least of those which can be very materially reduced in number.

## THE LONDON SCHOOL BOARD.

AT the first meeting of the London School Board after the holidays the Chairman, Mr. E. N. Buxton, reviewed the work of the Board. In the course of his address he said:—The Act of 1870 requires that schools should be provided for all the children for whose elementary education efficient and suitable provision is not otherwise made. We cannot be said to have yet reached this state of things. While the number of schools that have been built, together with those we found in existence, would more than suffice for the children of London as it was in 1870, London in 1882 has increased to such an extent that we still find ourselves in arrear. But though the stern chase which is imposed upon us is proverbially a long one, we have distinctly diminished the distance between the schools that exist and those that are needed. Thus, while the school population has increased since 1871 from 574,693 to 733,060, the accommodation in efficient schools has grown from 262,259, or 45·6 per cent. of the children of school age at that time, to 531,427, or 72·4 per cent. of the children now in existence. During the past three years the school population has increased by 34,720, and we have provided during that period new schools for 70,589. During the twelve years we have provided in 260 schools accommodation for 256,360 children, while the accommodation in voluntary schools, which in 1871 was for 262,259, is now for 261,868. If we now strike a balance of the net results, we find that the number of school places required, after making all necessary deductions for reasonable causes of absence, amounts to 641,428; while the total number of school places in efficient elementary schools will amount at the end of our term of office to 539,044 only. One practical proof of this deficiency is found in the number of children who are still refused admission in the growing districts. If these figures are not sufficient to convince persons who contend that we have overbuilt, we can appeal to the official statement in the House of Commons by successive Vice-Presidents of the Council, who, while giving us credit for a vigorous attempt to overtake the deficiency, have from time to time reminded us that we cannot yet claim to have accomplished this our primary and most necessary task. Owing to street improvements and new railways, to the establishment of large warehouses, and, perhaps, to an ever-increasing tendency to live away from their work, there is a constant migration of the artisan classes from the central districts of London to the outer zone. This, added to the absolute increase of population, has caused in some divisions a growth which may be almost described as appalling, and it raises the question whether we might not, in the interests of economy, look further ahead than we have hitherto done in the purchase of sites, so as to secure them where they will inevitably be wanted before the pressure of population has caused a rise to extreme prices. Thus, I find that the average price per square yard of the whole of the sites purchased by us has been 2*l.* 6*s.* 3*d.*; that of the sites within the one mile radius, 10*l.* 16*s.* 9*d.*; while that of the sites purchased in new districts has been under 1*l.* Neither should we leave out of account the importance, in building our schools, of antedating the arrival of the population; otherwise, while the walls are building, the children look on from the streets. It is, moreover, very shortsighted policy to build our schools in the growing districts only for the existing children. Enlargements are constantly necessary to schools the accommodation in which has been cut down to the bare needs of the present, and experience has repeatedly shown that this involves a far heavier charge than if the school had been built of the full size in the first instance. With reference to this, one of our superintendents writes:—"Unless we are to be in a chronic state of want of school places, steps must be taken three years in advance in neighbourhoods where the population is rapidly increasing." And again—"Pending the enlargement of Buckingham Terrace Schools, a number of boys are 'about the street' growing up in ignorance themselves, and becoming a fruitful source of truancy to others." Although we cannot, in view of these facts, take credit for having completed our school provision, an enormous amount of good work has been accomplished, and the results are beginning to be apparent. As the deficiency of accommodation is provided for, the desire for education extends. This is well shown by the fact that whereas in 1871, when the school places numbered 262,259, or half what they now are, there were only 222,518 on the rolls, now that the total accommodation, including voluntary schools, has been increased to 531,427, the number on the rolls is 525,999. In other words, though the supply has doubled, the demand has more than overtaken it. Writing of this part of our work, Mr. Bailey, one of her Majesty's Inspectors, and therefore an independent authority, in his report to the Education Department remarks:—"I must now conclude, but can hardly do so without testifying to the immeasurable benefit which the School Board has conferred on the East of London. Clergymen have told me that they hardly know their own parishes, so great has been the change for the better." The statistics which we collect for our bylaws purpose show that the voluntary schools have fairly maintained their position during the last few years. Notwithstanding the fact that since 1870 accommodation for 256,360 children has been provided in Board schools, the attendance in voluntary schools has not diminished, a

higher standard of efficiency is maintained than was previously thought necessary, and a diminishing number apply to be taken over by the Board. Thus while in 1877, 10 schools accommodating 3,655 children, and in 1878, 14 schools, accommodating 7,028 children, were transferred to us, during the past three years only eight schools, accommodating 3,682 children, have been transferred. Since 1870, 133 schools in all, with accommodation for 44,678 children, have been transferred to us; yet the number of children in average attendance in voluntary schools is somewhat larger now than it was at that time. A few of the weaker schools have always, and will always, from time to time, cease to exist, quite irrespective of any action on the part of the School Board. Thus I find that of those schools which have received a building grant—the only schools of which I am able to get a return—exactly the same number were closed on an average of years previous to 1871 as since that year. While some improvements in detail have been introduced into the construction of our schools, there has not been much departure from the general design which was determined upon some years ago; but in a few cases a large central hall has been introduced, or, where space was a secondary object, schools have been built entirely on the ground-floor. The cost of our permanent Architect's Department, which has been sometimes criticised, is really far less than if we adopted an open system of competition. It amounts to less than 3·5 per cent. on the cost of the schools, and has the further advantage that experience of all suggestions of proved value is accumulated and applied in future designs.

## ARCHITECTS AND ENGINEERS IN INDIA.

SIR GEORGE BIRDWOOD has called public attention to the proposed deformation of Muir College, Allahabad. The college is, he says, one of the finest modern public buildings in India. So much of it as has been completed forms two sides of a quadrangle, built in an intelligent and cultivated rendering of Mahomedan architecture, with tile-covered domes, one 120 feet high, and a bell tower rising to 190 feet. The hall and library are magnificently proportioned rooms, elaborately decorated; and altogether the building, in the opinion of those who have seen it, or the designs for it, which were exhibited some years ago in the Royal Academy, is one of the most successful efforts of its architect, Mr. William Emerson, who is well known in India by the Crawford Markets and sundry churches built by him in Bombay, and the fine hospital at Bhaunagar.

Some time ago it was proposed to add an observatory and a new classroom to the college, and that these additions to it should, in order to save the architect's fees, be made by the Public Works Department, and not by Mr. Emerson. The architect, and others interested in the college, strongly objected to this; and their objections have been successful to the extent that it has now been resolved that the new buildings shall not be added to the college, in completion of Mr. Emerson's quadrangle, but be placed as a separate block, at some distance from it, on its least public side, and as much as possible out of view from it.

Unfortunately, the college authorities still adhere to their first proposal for employing the Public Works Department on the new buildings, and not Mr. Emerson. The very fact that they have determined that the additions to the college shall not be connected with it, but be hid away out of sight of it, so far as is possible, is a sufficient proof that they recognise the grave and wilful offence against art in what they contemplate doing, while pleading in justification the typical English economy which would spoil a coat for the sake of skimping a little cloth.

The Government of India has of late years recognised the duty of conserving the architectural remains of the bygone religions and ruling dynasties of India; and surely their reverent care should be extended also to the protection of beautiful modern buildings in India from wanton deformation. The Government of India is also now taking a direct interest in cherishing the artistic instincts of the people of India, and this is to be done not only by bringing together costly collections of art objects, which, after all, are seen by comparatively few, but still more by giving the things which must be seen by everybody, such as public buildings, the highest possible expression of beauty. The true economy, indeed, in making the necessary additions to Muir College would be for the college authorities to recognise at once that architecture is the work of architects, and that nothing but failure, discredit, and the worst waste in the end, can result from the misjudged proposal to complete an architectural work of such magnitude and artistic importance, without reference to the original designs, or under the direction of men who, although excellent engineers, are emphatically not architects.

Mr. R. Aitken, C.E., follows up this letter by some personal experiences. In England, he says, a man may be a civil engineer or a military one; he may be an architect or he may be a mining or a mechanical engineer; but no sooner does he land in India than he is supposed to be able to undertake works which necessitate experience in all the foregoing professions. What wonder, then, that India is studded with ghastly buildings, tumble-down barracks, and engineering failures of every kind and description?

His own experience in India was a series of struggles against ignorance and prejudice of the most provoking and obstinate kind. When Mr. Aitken pointed out that docks were required for the steam sea-going trade of Bombay, he was told by the Department that he knew nothing about it, although he had been in the offices of two of the most eminent harbour engineers in England. They delayed the construction of these docks for years, and if they could have had their own way, they would not even now have been built. If there had been no docks in Bombay harbour the Indian contingent would not have arrived at Suez in time to take part in the Egyptian war. The Public Works Department determined to stop the works at Kurrachee harbour, saying it was useless to attempt any improvement. It was useless for civil engineers to point out that they were mistaken. The works were stopped, and, as a captain of a steamer said, "an old General of Engineers was trying to cure Kurrachee bar by throwing bottles into the Indus." Many other instances could be given where great injury has been done to the country by the Public Works Department being the master of the public and not its servant.

### LILLESHELL ABBEY.

A PARTY of members of the North Staffordshire Archaeological Society lately visited Lilleshall Abbey, when an address was delivered by Mr. Charles Lynam, architect. The present remains, he said, indicate that the abbey consisted of a cruciform church, running east and west, with a cloister garth to the south, on the east side of which were the chapter-house and dormitory. On the south side were the day-room and refectory. On the west side very little more than the lines of foundations of former buildings now remain. There are also some remnants of the boundary walls enclosing the abbey grounds. Up to the date of the foundation of the abbey (A.D. 1145) the semicircular arch had been almost exclusively used in all arcuated buildings, and it is also the prevailing form in these buildings, but it is here used with a richness and refinement that almost shrouds its simple form and transports it, as it were, into the much-yearned-after Pointed form. Indeed, before the completion of the buildings this new form is adopted in all its beauty and strength. Thus in these buildings the precise transition between the old and the new world of architecture is most perfectly exhibited. It is remarkable that the whole of the buildings seem to have been carried on and completed within a few years, probably within the rule of the first abbot (1148 to 1174), and that very slight alteration was ever made in them, so that they present as perfect an example of the transition from the semicircular to the pointed arch—that is, from the Romanesque to the Gothic style—as can be seen anywhere. At the time of their commencement the round arch alone was used, but before their completion the pointed arch was fully adopted. The church consisted of a nave, north and south transepts, chancel, with a chapel on each side of it, and a chapel west of the north transept. It was entirely without aisles. There was also a second chapel to the east of each of the transepts. The church was divided by a screen wall at about one-third of its length from the west end. The eastern portion formed the church of the monastery, and the western that for public use. At a later date another screen wall was erected eastward of the first division, and formed a central chapel. The remains of three steps at the eastern end of the western division seem to indicate that there was a high altar there for the use of the public church, and that in the chapel east of it were two altars; the remains of the one on the south side still exist, and also the piscina. In the portion of the church used by the monks there appear to have been no less than eight altars. That part of the church used by the monastery was entered by the processional doorway from the east walk of the cloister and by a doorway in the gable of the south transept, and the central chapel, with two altars, was entered by a doorway in its eastern wall. The western part of the church was entered by the great western doorway. It had also a doorway to the north and a priests' doorway to the south from the west walk of the cloister. On its north side is also a doorway to a stair turret which led to the roofs. There are still remains of altars in the chapel against the south side of the chancel, in that of the south transept, and in the central chapel. In the first-named the piscina and aumbry also remain, and in the latter the piscina. The proportions of the church are very remarkable, its length being more than seven times its width; but its height was in good relative proportion. It was spanned by a semicircular barrel vault strengthened by diagonal and cross ribs. Its walls were no less than 6 feet in thickness, and may be said to have been without buttresses; yet the abutting walls were skillfully arranged so as to assist the strength of the main walls. Excepting the large traceried window of the east gable of the chancel, no alteration was made in the original work of this church; and its exterior, with its noble western doorway, its great height of wall, pierced by large yet simple round-arched windows; its interior, with a length of more than 220 feet and proportionate height, covered with simple vaulting, must both alike have been truly majestic. The buildings to the east of the cloister square consist of the chapter-house, a passage on the north side of it leading to the abbey grounds to the east, and another passage against the gable

of the south transept which led to the church and the monks' dormitory, which was over these two passages, and the stairs to which still remain. The vaults of these two passages are the only ones now existing, and afford a clear indication of the vaulting which covered the church and the other buildings. The lavatory and aumbry adjoining it are on this side of the cloister. In the chapter-house is a coffin lid with a cross upon it, indicating no doubt the burial place of one of the abbots, as this was the usual place for their interment. The buildings on the south side of the cloister square consist of a passage at the east end which led to the gardens on the south, a small portion of the walls of the day-room, the refectory, and kitchen, which had a cellar beneath it. The refectory was entered from the south walk of the cloister, opposite to which is the recess used as a pulpit. It was lighted by windows in the south wall. The kitchen appears to have been at the west end of the refectory, with its fireplace against the wall of the refectory, and a doorway between the two. The buildings to the west of the cloisters were probably the guest-house and abbot's house, but their foundations now alone remain. The kitchen communicates with these buildings. There is clear evidence that all the buildings were vaulted except the cloister walk, which seems to have had a lean-to roof of timber. The walls to the buildings other than the church were 4 feet in thickness, and these, as well as those to the church, were built of coursed rubble work with ashlar quoins at the angles, and for the dressings. The principal dimensions of the buildings are as follows:—Length of the church, 223 feet; width, 30 feet 6 inches. Transepts, including the crossing of the nave, 100 feet by 32 feet 6 inches. The chapter-house is 23 feet 6 inches wide. The day-room has a length of 33 feet, and the refectory is 43 feet 6 inches long by 24 feet 6 inches wide. The cloister square from east to west measures 129 feet, and from north to south 107 feet. In the refectory two monumental effigies are placed in recesses in the north and south walls. No one can visit this abbey and not be impressed with the skill shown in the arrangement of its plan, with the deep scientific knowledge exhibited in its construction, and with the exquisite beauty of its design, all of which, however, may have emanated from a French rather than an English origin. Not the least remarkable feature about the work is that its stone should have lasted so long with scarcely a trace of decay in many parts. Numbers of the ancient masons' marks are now as visible as when first made on the outer faces of the stone. It ought to be an interesting question for the geologists to determine from what quarry this stone was procured.

### THE GLASGOW INSTITUTE OF ARCHITECTS.

THE annual general meeting of the Glasgow Institute was held on Tuesday, Mr. John Honeyman, F.R.I.B.A., the president, in the chair. Among the members present were Messrs. James Sellars, jun., vice-president; Wm. Landless, honorary treasurer; Wm. MacLean, writer, secretary; John Baird, H. K. Bromhead, Campbell Douglas, Thomas Halket, jun., William Leiper, J. A. Morris (Ayr), Alexander Petrie, A. G. Thomson, David Thomson, James Thomson, Robert Turnbull, and T. L. Watson. The annual report, which was read by Mr. MacLean, stated that the total number of members now upon the roll is 49; and while some further accession is desirable, the council consider it to be a fair subject for congratulation that, considering the necessary qualifications, so large a proportion of the profession in Scotland has joined the Institute. The first subject which occupied the attention of the council during the year was the revision of the regulations for the measurement of mason-work. As a result of numerous committee meetings and meetings of council, the rules as revised were printed and circulated among the members. They were then considered at two meetings of the Institute, and, with various consequent modifications, again printed. The Glasgow Institute of Measurers was then invited to confer with the council on the subject, but the Measurers' Institute being otherwise engaged, this conference did not take place, and the revised rules were sent to the Master Masons' Association, from whom the proposal to amend the existing rules originally came. The council has received no further communication from them or from the measurers on the subject. They think it desirable that before any decision is come to, the matter should be brought under the notice of the Edinburgh Architectural Association and the Edinburgh Measurers, with the view of introducing one uniform system of measuring mason-work in all parts of Scotland. The New Municipal Buildings Competition again occupied the attention of the council. Since last report the architect for the proposed building has been appointed by the Town Council, which has in this and all other respects honourably adhered to the conditions of the competition and implicitly followed the advice of the professional assessors. It is, however, to be regretted that the Town Council did not take a broader and more liberal view of its duty in the matter of exhibiting the successful and the unsuccessful designs after the final award had been made. The letter of the conditions was barely fulfilled by the exhibition of the ten designs submitted in the final stage for six days only in most unsuitable

rooms, and the representations of the council of the Institute as to the general desire of competitors and others that as many of the designs as could be obtained should be publicly exhibited were entirely unavailing. The Town Council unanimously refused to have anything to do with such an exhibition. In these circumstances, and having ascertained that it was generally desired by the competitors and by many members of the profession, the Institute decided to undertake the management and pecuniary responsibilities of the exhibition. The exhibition was accordingly held in the upper rooms of the Corporation Galleries (the use of which was kindly granted by the Town Council for the occasion), and was open to the public free of charge from September 2 to September 14. It proved both interesting and instructive, and was visited by over 4,000 persons. Fifty-six designs were exhibited, and these were illustrated by about 400 drawings. A sum of 100*l.* was voted by the Institute to meet the expenses of the exhibition, and it is gratifying to know that the expenses did not exceed one half of this sum. The committee charged with the arrangements connected with this exhibition so satisfactorily carried out were—Messrs. John Honeyman, the president; James Sellars, the vice-president; John Baird, William Landless, and T. L. Watson; Mr. Sellars, convener. The council recently made application for a copy of the new Police Bill, which, however, they have not yet received. The council are of opinion that such a measure, in so far as it deals with matters affecting heritable property and hygiene, deserves the most careful consideration of all members of the Institute, and they would strongly deprecate any undue haste on the part of the authorities in legislating on such subjects by pushing forward the new Bill before all classes of the community have had ample leisure to consider how they are to be affected by it. The abstract of accounts of Mr. William Landless, honorary treasurer, shows the funds of the Institute to be in a very satisfactory state.

The President, in moving the adoption of the report, said the minutes of the past session, and of every preceding session, would show that they had devoted very little time indeed to matters immediately bearing on their own advantages. The greater part of their time had been spent in dealing with such subjects as modes of contracting and methods of measuring, building regulations, sanitary matters, and others, all of much more importance to their employers than to themselves. He thought this was exactly as it should be. Their first duty as a society was exactly the same as their first duty as individuals, and that was certainly not to look after number one. There were abuses to eradicate and reforms to accomplish, in dealing with which individual efforts would be quite unavailing, but where union would prove to be strength; and, unfortunately, he must also add that there were new dangers to be apprehended and mischievous innovations to be resisted. It would, he thought, be entirely wrong for their Institute to allow such a measure as the new Police Bill, for example, to pass without careful consideration and criticism. Their fellow-citizens, indeed, had a right to expect their advice in such a matter. The doubt at present seemed to be whether or not they and their fellow-citizens were to have any chance of considering that Bill at all. He hoped that doubt would soon be satisfactorily resolved, and their representatives would refuse to allow any further step to be taken till they had at least thoroughly mastered every detail, and weighed its consequences. He believed that in that case they would be able to consider the clauses relating to land and building regulations at their leisure. But there was another matter in which they were deeply interested both as citizens and advisers—he referred to the proposal of the Gas Committee to debar all and sundry from supplying electricity, in order that they might secure a monopoly of that production themselves. Many of them must know that they were already reaping the fruits of this short-sighted reactionary policy, and that there was more difficulty in getting work of the kind done in Glasgow than in any large city in the kingdom; but then while five firms wish to commence work the Town Clerk has been instructed to inform them that the committee “cannot consent to any licenses or Provisional Orders being granted to any parties empowering them to provide or supply electric light within the city.” He could not say more on the subject then, but he would express his own personal conviction, that if the citizens allowed the Corporation to act on the recommendation of the Gas Committee, they would ere long heartily repent of it. It seemed to him a monstrous thing that at this time of the day they should, without a word of protest, allow themselves quietly to be fixed down under the incubus of a monopoly which must inevitably paralyse local enterprise and drive an important industry from the city.

Mr. John Baird, in seconding the adoption of the report, said that he thought one of the best things the Institute had ever done was getting up the exhibition of designs for the Municipal Buildings, which had excited a great deal of interest among the citizens, and given them some idea of what had been done by competitors. He also thought that the Institute showed gratifying signs of vitality and progress, and especially during the presidency of Mr. Honeyman, and hoped the members would continue to give their best attention to the interests of their employers and of their fellow-citizens.

The Council of Management for the year was, on the motion

of Mr. Campbell Douglas, seconded by Mr. Petrie, chosen; consisting of Messrs. John Honeyman, James Sellars, jun., William Landless, Hugh Barclay, John Gordon, John Murdoch (Ayr), Robert Turnbull, T. L. Watson, David Thomson, James Thomson, and William Leiper.

On the motion of Mr. James Sellars, jun., a hearty vote of thanks was given to Mr. John Honeyman, the retiring president.

A meeting of the newly-elected Council took place immediately after the general meeting of the Institute. Mr. James Thomson was elected president; Mr. David Thomson, vice-president; Mr. John Burnet, auditor; Mr. William Landless, treasurer; Mr. William MacLean, secretary.

## CHURCH BUILDING AND RESTORATION.

**Exeter.**—The completed portion of the new church of St. Matthew was opened on Thursday last week. It comprises the nave, aisles, transepts, and the base of the tower. The style is Early First Pointed, which, while less costly than others, admits of simple yet dignified treatment. Externally the building is of local red brick, relieved by string-courses and bands of Box-ground Bath stone and deep red moulded brick, while the dressings of the windows are of Bath stone. Outwardly the chief ornamentation is on the west front, which faces the roadway. There are double western doors, composed of oak. Above them is a traceried tympanum, glazed with coloured glass, and small windows on each side of the doors to light the entrance lobby under the gallery. The arch of the dome over the doors is composed of Bath, Pocombe, and lias stone; while in the head of the gable over the door is a Bath stone niche, in which at some future date it is intended to place a figure of the patron saint of the new parish. In the tower above the doors are two two-light windows with traceried heads, flanking the niche before mentioned. Above and between the heads of these windows is a sex-foil circular window with coloured glass, and above the whole rises a deeply moulded arch. At present the tower is only carried up to about the level of the nave roof, and to complete it 1,000*l.* more will be required. Interiorly the shafts of the columns in the nave are of grey granite, with handsomely carved bases and caps of Hamhill stone. From these pillars spring graceful Pointed arches. The voussiors of the arches are alternately of Pocombe and Corsehill (Dumfries) stone, the former a variegated kind, and the latter of a rich reddish-brown. The responds against the walls of the tower and transept are of Pocombe stone. The spandrels in the nave are at present faced with buff brick from Chudleigh. The chancel is backed with a temporary alcove, until the chancel, the foundation of which has already been laid, is completed. Above the arches in the nave light is admitted by means of small Pointed windows, fitted with cathedral glass, with coloured heads. The transept arches are of Hamhill stone, with Hampshire brick moulding, and a Hamhill label outside. The roofs of the nave and transepts are barrel ones of pitch-pine, and the same material is used for the lean-to roofs of the side aisles, around the walls of which a dado of coloured tiles is to be fixed. The clerestory windows, six on each side, are two-light ones, with small quatrefoil and trefoil lights above. In the western tower, immediately over the entrance lobby, is a gallery approached by a newell staircase. The front screen of gallery is of carved Hamhill stone, supported by Corsehill stone columns on Hamhill bases. On the west side of the tower is the baptistry. The bowl of font is of Caen stone and the die of Corsehill, surrounded by six columns of Devonshire marble. The altar is of oak, carved. The builder, Mr. Luscombe, has had all the carving executed by his own workmen. A small quatrefoil window in the baptistry, filled with coloured glass, is the gift of the architect, who also presents a handsome brass altar-cross. The whole of the glazing has been done by Mr. F. Drake, of the Cathedral Yard; while the lighting and warming have been entrusted to Mr. F. M. Rice. The wrought-iron hinges of the doors have also been executed by Mr. Rice. Mr. R. Medley Fulford, of Exeter, is the architect.

**Taunton.**—The work of beautifying and restoring the church of Holy Trinity, Taunton, has been completed, and the edifice reopened. The choir and sanctuary have been raised from the level of the nave, the former by two and the latter by four steps, thus displaying to greater advantage the reredos and altar. The old choir has been removed and new open pitch-pine stalls have been substituted, while the whole of the floor of the chancel and choir, together with the nave and aisles, has been laid with Minton encaustic tiles. A new pulpit of Beer stone and a handsome altar screen have been added. The church has been re-seated, pitch-pine open stalls with ornamental ends taking the place of the unsightly high-backed pews. A new font of Beer stone, of a chaste design, has been given by the members of the Band of Hope connected with the church. The chief amount of attention has been bestowed upon the chancel, the walls of which have been painted and decorated in chaste stencil patterns in various colours; also the pillars and panels of the gallery. Two cathedral glass windows have been inserted in the chancel. The plant and drawings have been prepared by Mr. G. C. Strawbridge, architect, of

Taunton, under whose direction and superintendence the works have been carried out. Mr. H. J. Spiller was the builder, and Mr. T. J. Serle has carried out the decorations.

**Glasgow.**—The Mure memorial church at Baillieston has been opened; the buildings comprising hall, session-house, vestry, classroom, &c. The church is seated for about 430 persons. There is a large vestibule at the entrance door communicating with the area and the stair to the gallery. The interior of the church, which is spanned by semicircular bound couples supported on stone corbels, is divided by two passages into three divisions of seats. The style of the building is the thirteenth-century Gothic. Messrs. J. M'Kissack and W. G. Rowan, of Glasgow, were the architects.

**Edinburgh.**—The foundation-stone of a new church at Loanhead has been laid. The estimated cost of the building, the style of which will be thirteenth-century Gothic, with hall, is estimated at 2,200/. Accommodation will be provided for 600 persons. Mr. Hardy is the architect.

**Glasgow.**—A new church is about to be erected in Crown Street, Gorbals, from the designs of Mr. James Ritchie. The style of architecture is Anglo-Romanesque. The church will be roofed under one span, but internally supported by columns and semicircular arches over the side galleries, thus forming nave and aisles. The ceiling will be plastered up to the under side of the ridge, the timber work of the couples being exposed. The window openings are all round-headed or circular, with tracery in the church and front of the offices. Over the deeply-splayed and pedimented doorway will be a triple-arched recess, in the lower part of which is a series of six lights for the back part of the area, and in the upper part three single lights for lighting the end or centre gallery. At the street corner the tower rises plain over one of the exit doorways, up to the belfry stage, which is at a level over the roofs of the adjoining four-storey tenements. This stage will be pedimented on the four sides, and pierced with openings having mullions and traceried tops. The steeple will be completed by an elongated dome or spire with four sides, capped with a crown-shaped iron terminal about 110 feet above the ground.

**Evans Memorial Chapel.**—A chapel has been recently erected from the designs and under the superintendence of Messrs. Charles J. & C. Herbert Shoppee, on a site forming part of the exercising grounds of the Home and Colonial Training College, Gray's Inn Road. It is approached from an arched covered way, serving as a cloister, and is intended as a memorial to the late Rev. J. J. Evans, M.A., for many years Principal of the College. The style is Romanesque, and the dimensions of the chapel are 53 feet in length, by 22 feet in width, with an aisle on the north side, 27 feet by 9 feet. Externally the chapel is partly faced with glazed white bricks and Box stone dressings, relieved with blue bricks in courses, and covered with green slates and red ridge tiles. On the stone tympanum over the entrance doors the words "Holiness unto the Lord" are incised, and the letters gilt. The interior of the chapel is faced with white Suffolk bricks and string-courses and cornice of dark purple Luton bricks, with Box stone quoins, jambs, and arches to the windows. The windows are glazed with tinted glass in geometrical patterns, in lead lights by Messrs. Odell. The arcade separating the aisle from the chapel is semicircular, and has moulded stone voussoirs and labels. The shafts are of polished red Aberdeen granite, with moulded stone bases and stone capitals, carved by Mr. Bradford, of Albert Street, Kennington Road. The roofs are of pitch pine, with moulded principals resting on Box stone corbels, and with moulded ribs and cornices. A pitch pine dado, 5 feet high, is fixed to the walls. At the west end is a gallery with ornamental pitch pine front, and with a separate access by stone staircase from the cloister. The reading-desk, entrance doors, lobby, and seats are of pitch pine. The chapel is paved with Craven, Dunnill & Co.'s geometrical tiles, with encaustic tiles at intervals. The gas-fittings are of wrought iron, of Messrs. Gardner's manufacture. The chapel will be heated by hot water. A brass memorial plate, engraved by Mr. Gawthorp, is fixed against the south wall. Ample provision has been made for ventilation and the admission of fresh air. The works have been well carried out by Mr. Henry Burman, builder.

### GENERAL.

**Mr. G. G. Hoskins, F.R.I.B.A.,** has completed additions and alterations at Oakwood Croft, near Darlington, the residence of Mr. C. G. Johnson, J.P.

**Mr. M. Carr,** architect, of Queen's Square, Middlesborough, has prepared plans for a new Roman Catholic cemetery and chapel at North Ormesby, which have now been formally approved by Dr. Lacey, Bishop of Middlesborough.

**Mr. J. V. Edwards,** assistant surveyor, has been appointed West Riding surveyor in place of Mr. B. Hartley, resigned.

**The Decoration Committee** of the Lerwick Town Hall have received an intimation from Mr. G. H. B. Hay, of Hayfield, of his intention to present a stained-glass window in commemoration of his late father, the subject to be illustrated being the reign of James III. of Scotland.

**The St. Gothard Tunnel** has been selected as the subject of the prize poem for the Chancellor's gold medal at Oxford for 1883.

**The Rev. Canon Pearson** has presented four enamel mosaics to Canterbury Cathedral, which have been placed in the open spaces of the altar. The subjects are four angels, taken from the celebrated paintings of Fra Angelico, the originals of which are now treasured at Venice. The background of each is of rich gold, on which the delicately and artistically traced figures present a striking picture when seen in a favourable light. The work has been carried out by the Venice and Murano Glass and Mosaic Company.

**National Portrait Gallery.**—A complete re-arrangement of the pictures and sculpture in the National Portrait Gallery has been resolved on, and will be commenced forthwith. The portraits formerly in the British Museum and Hall of Serjeants' Inn will no longer be kept apart, but incorporated chronologically in the general series. Every picture will have, according to rule, a distinct statement on the frame of the donor's name. It is not intended to close the whole of the gallery during the alterations, but one portion or another will always be open to the public.

**Mr. James Matcham,** builder, of Plymouth, was killed on the 12th inst., through a fall from a scaffold at the Naval Barracks, Keyham. Some of the largest works in the West of England have been carried out by him, including the Devonport Public Hall, the Rougemont Hotel, Exeter, Mr. Singer's mansion at Paignton, the Imperial Hotel and St. John's Church, Torquay, and the Militia Barracks, Mutley.

**The Matlock Grounds Competition.**—Fourteen designs were submitted in open competition for laying out the grounds of the Matlock Bath, Pavilion, and Gardens Co. (Limited). The first premium of 25/ was awarded to Messrs. Barron & Son, Borrowash, Derby; the second premium of 15/ to Messrs. Brockbank, Wilson & Mulliner, Albert Square, Manchester; and a supplementary premium of 5/ to Mr. F. S. Smith, 14 St. Anne's Square, Manchester.

**The Vestry of St. George's, Hanover Square,** have, it is said, acquired a site opposite the Royal Mews entrance to Buckingham Palace for the purpose of erecting a workhouse and casual ward.

**Mr. Tomlinson,** Engineer to the Canadian Government, is at present in England superintending the construction of an iron bridge for the Canadian Pacific Railway Company by Messrs. Hawks, Crawshay & Sons, Gateshead. The bridge is intended to cross the Frazer River, the Rocky Mountains, British Columbia. The total length of the bridge will be 525 feet, with a clear span of 315 feet.

**The Plymouth Pier Company** have, it is stated, disposed of the rights of the Plymouth Pier by private contract, and the work will now be proceeded by Mr. Daniell, who has been engaged in carrying out some important contracts at Portishead.

**Benwell Tower,** the residence of the Bishop of Newcastle-on-Tyne, is undergoing internal renovation, under the supervision of Mr. Robert Johnson, architect, New Bridge Street, Newcastle. The principal contractors for the work are Messrs. J. & W. Lowry, of Corporation Street.

**An English Church** is to be erected at San Remo from the designs of Mr. Norman Shaw, R.A. The cost will be about 3,800/. inclusive of site.

**Mrs. Normand** has offered to build a public hall for Dysart, Fifeshire, as a memorial of her late husband, for many years provost of the burgh.

**The Parks Committee** of the Manchester City Council recommend the taking down of the old museum building and replacing it by a new structure in Queen's Park from the designs of Mr. Allison, the city surveyor.

**The Vicar of Ashford Parish Church** has decided on the erection of suitable Sunday-school buildings on a site adjoining the church.

**The French Academy of Inscriptions and Belles Lettres** invite competitions for the prize of 2,000 francs, which they will award in 1884 to the author or authors of the best essay upon the history of art prior to the era of Pericles. The founder of the prize is M. Louis Fould. The competition will be open to all savants, foreign and French alike, with the exception of the members of the Institute of France.

**The Worcester Art Exhibition** closed on Wednesday. The receipts up to Tuesday night had been 9,794/ 16s., besides 250/ for items not yet ascertained. The expenditure was 8,500/, so that a balance of over 1,500/ is at the disposal of the Committee for the Promotion of Art and Industrial Purposes in Worcester and Worcestershire.

**Manchester Royal Institution.**—The voting for representatives to serve on the Art Gallery Committee of the Corporation took place on Wednesday as follows:—Mr. W. A. Turner, 38; Mr. C. J. Pooley, 37; Mr. T. Ashton, 34; Mr. T. R. Wilkinson, 30; Mr. R. Smith, 29; Mr. C. J. Galloway, 27; Mr. C. P. Scott, 26 (the above seven were elected); Mr. G. Milner, 22; Mr. T. Worthington, 19; Mr. E. Salomons, 19; Mr. T. C. Horsfall, 19; Mr. S. Barlow, 17; Mr. G. Falkner, 17, and Mr. H. M. Ormerod, 16.

**Mr. A. B. Brady, C.E.,** has been elected surveyor to the sanitary authority of the Maldon Union, Essex. There were sixty candidates.

# The Architect.

## ART IN NATURE, AND NATURE IN ART.

SOME critics of Art who are at a loss to explain themselves have a felicitous way of taking refuge in the obscurity of a well-known mystical proposition which is expressed in the phrase that we ought to go to Nature. What it is to go to Nature is always left open; indeed, if this were a little more clearly explained the doctrine would lose its force for want of vagueness. But there is one way of putting the question, if only in connection with constructive art and decoration, wherein a man may venture to hope that intelligible argument is within his reach, if he will insist upon the adoption of plain language. That is to say, when it is urged upon us, as it often is, that Nature avoids regularity, and therefore that Art ought to do the same, here we have something definite which can be argued out. If to go to Nature is *inter alia* to avoid the ordinary symmetries of Art, and in a manner to deny that two and two make four, this at least can be disputed with every hope of success.

An eminent amateur, speaking two or three weeks ago to the students of a provincial School of Science and Art,\* set forth the well-worn doctrine thus:—That there is no unquestionable standard of beauty except Nature; that Nature never copies herself; that art workmen ought, like Nature, not to be too exact, but to use freedom; that the artists of the olden time did so; for “the old builders’ workmen were really artists, they did as Nature does”—they made two parts of a design “tolerably alike and symmetrical,” but not exactly so. This may recall to mind the more celebrated and more forcible instance in which Mr. RUSKIN, the very high-priest of such transcendentalism, came across an ingenious observer who had taken the trouble to count the dentil-blocks on the two sides of a certain pediment, and had thereupon published to the world his discovery that one side had one more dentil than the other. Upon the head of this too-accurate explorer the “Oxford Graduate” poured forth in generous but relentless rage all the most scornful language of his vocabulary. Not that he himself would advocate the express cultivation of irregularity in that particular form; but for any one to take measure of the artistic fire with so mean a thermometer as the counting of dentils he took to be the very extremity of prosaic dulness, while the act of positively publishing to the world the discovery of a majority of one tooth was the uttermost folly of priggishness.

Now, it is perfectly true that Nature does not make the two eyes in a fine lady’s face so perfectly similar as she thinks they are, or place a gentleman’s nose always so faultlessly on the central axis of his countenance as he is accustomed to believe. No two hands are quite alike; no pair of feet; no two leaves in a forest of leaves. Art, on the contrary, at least of the common kind, is apt to feel dissatisfied if the rules of uniformity are noticeably violated. In architecture especially the designer and the workman are equally solicitous about the unimpeachable accuracy of all regularities; and if the President of the Institute, for example, were to discover now at Smithfield Market that one of his pediments had such a thing as a dentil more on one side than on the other, it may be reasonably supposed that he would condemn the faulty handiwork to be instantly taken down. How then is it, if Art is to go to Nature, and Nature never makes two halves of anything alike, that architecture must make her symmetries so unswerving?

The best answer to this puzzling question is the boldest.—If Nature never makes two things alike, it is because she *tries and fails*, whereas Art in just the same way *tries and succeeds*. The paradox here is not very profound; the facts of the case, indeed, lie on the surface. The artist’s manipulation of his work is comparatively simple, but that of the agencies called Nature is complicated beyond our calculation; so much so that while the workmen on a building turn out a thousand ornaments as much alike as so many peas in a pod are proverbially said to be, those very peas in fact, although all set

a-growing on the self-same model, are every one of them by some accident or other marred in the making; so that it is by reason of a thousand different combinations of accidental imperfection only, and not by the meritorious intention of Nature in any way, that no two of them all are mathematically alike.

Imperfection is therefore excusable and allowable in Nature where it is not so in Art, and the philosophy which would present this imperfection in the light of a variation of purpose to be taken as a divine law is illogical and illusory. No doubt the cultivated imagination accepts such natural irregularity to a certain extent as constituting in itself a grace—“a grace beyond the reach of art”; but for the artist to attempt to imitate this irregularity is not a grace, or, if it sometimes may be so dealt with as to please a specially educated mind, it must always be strictly kept within the limits of that intelligent design or foreseeing intention which is quite a different thing from the *abandon* of Nature. In other words, to teach *careless* or slipshod Art is a mistake of first principles, just as much so, for instance, as to inculcate Bohemian manners—which the admirers of such slipshod art, by the way, very generally do.

What, then, of that mechanical or metallic regularity which in certain modes of architectural workmanship becomes, no doubt, so frigid and spiritless? There is no reason why anyone should not acknowledge the fact that such cold clean-cut symmetry is sometimes so odious that the critic who is possessed of “feeling” is only prompted to wish that by the touch of some enchanter’s wand he could upset the whole into confusion anyhow. But what is the “feeling” that produces this impulse? Some will say it is a secret artistic conscience, the exercise of which is as much beyond our control as its laws are beyond our knowledge. But, on the other hand, some will prefer to think it is only “a wild kind of justice” which resents, not all symmetry, but a specific kind of symmetry overdone. In fact, the case is in a great measure one of artistic style, and of the consequent difference, in our age at least, of artistic training. To the keen-witted and elegant Greek of antiquity nothing architectural could be too symmetrically refined, or too finely polished, whether in design or in workmanship; this was the ideal of his style. To the blunt and rude Churchman of the Middle Ages, with a fighting noble on one hand and a stubborn churl on the other, both equally untaught and unteachable—even if he had been able and willing to teach them, which he was not—it would have seemed quite out of character that any building work, or any other work of the artistic kind, should be so daintily and delicately finished; his most intricate traceries, therefore, and most shapely mouldings, were, like himself, developed with a palpable rudeness which—there being good in all things—became a quaint masterly freedom: again a grace beyond the reach of art. It is not too much to say, indeed, that one of the weakest points in our ordinary revived Gothic has ever been the uncharacteristic precision of its workmanship. The authentic old work is always a little rough and ready in its handling, and often a good deal; and so far the critic who calls this going to Nature would be perfectly right if he were not calling it by a wrong name. But this kind of carelessness is not Nature’s kind of carelessness; unless we consent to state the case as we have done—that Nature seeks perfection and misses it by the interference of accident, whereas mediæval art sought it not and missed it not, but only fell short of it for want of delicacy in the handling.

There is a kind of symmetry, however, which in the modern European vernacular or Renaissance style seems to throw off an infinity of similarities, like the castings of the iron-founder or the plasterer, of which it may be truly said that, for want of that thoughtful finish, now mental rather than manual, which the old Greeks always manifested, the whole scheme of ornament seems to be as dead as a row of ninepins. This cannot be helped in such a country as England now is. Classical work, which ought to be instinct with the spirit of refinement, is too often so coarse and meaningless with us that precision is out of place, and the eye desires to see crude workmanship to support the crude design. If an antique Greek temple had been cut in crystal or in steel, as it was in marble of the best that could be found, the perfection of precision would have been still equally appropriate. There are many modern works in France, and some in England too, of which we might say the same. But just as in the case of the whole mass of the mediæval work the classic finesse was wanting, so also in the generality of the modern classic it is wanting no

\* See page 218 *ante*; October 7.

less. The management of terra-cotta—preferably a rough-and-ready management of a rough-and-ready material—is an excellent illustration of this principle. The production of ornamentation in red brick is another instance where polish is a profanation of Art. But it is a perversion of language to say this is “going to Nature”; it is only Art of one kind and not another, corresponding with conditions of one kind and not another. No doubt it is well worthy of study, and especially on the part of those whose temperament is not equal to the patient development of more delicate work; but this is all, as indeed this is enough.

## JEAN BAPTISTE GREUZE.—II.

BY A CORRESPONDENT.

(Concluded from page 246.)

GREUZE in 1767 had been ten years Associate of the Academy, and yet had not complied with its rules, which enjoin on each Associate to send a picture for approval within six months of election. This being considered as “contempt of court,” he was forbidden to exhibit at future Salons by a decree communicated with infinite precaution to GREUZE by COCHIN the engraver, then perpetual secretary to the Academy. To this mandate he replied in a letter DIDEROT characterises as an epitome of vanity and of impertinence. Unwilling, however, to forfeit the honours of the Salon, he set to work in earnest on a classical subject, utterly foreign to his style, and which proved a failure. The story he selected for his painting was an episode in the career of SEPTIMUS SEVERUS. On the reception-day GREUZE awaited in a room adjoining the council chamber the verdict of the Academicians. Suddenly the folding-doors of the *salle* were thrown open. GREUZE entered without the slightest trepidation. “Sir,” said the President, addressing him, “you are received as Academician.” The usual formalities accomplished, the President proceeded to make the following unpleasant remark:—“Sir, the Academy receives you as *genre* painter; your former works have won this distinction for you. This picture,” pointing to it, “is neither worthy of you, nor of the Academy.” Here was a blow, fatal to the vision GREUZE had conjured of obtaining a professor’s chair, as well as other official distinctions. With singular want of tact he attempted to defend the merits of the painting, which was literally out of drawing. DIDEROT himself dared not utter a word in favour of his friend. The scene was painful, and was succeeded by an ill-judged letter published in the form of a pamphlet, which the public carefully abstained from reading.

DIDEROT attributes the failure to the fact of his unfortunate domestic arrangements, and the consequent pre-occupation of his mind. Before his journey to Italy GREUZE had seen a woman of striking beauty at a *bouquiniste’s* shop. On his return he passed the same bookseller’s shop, and there again saw the type he afterwards frequently painted in the person of Mdlle. BABUTY. The lady made advances which GREUZE was too weak-minded to resist, and he unfortunately married the original of *La Voluptueuse* and of *La Mère bien-aimée* in 1773. In 1785 he appeared before the Commissary of Police as JEAN BAPTISTE GREUZE, peintre de l’Académie Royale, residing Rue Basse Porte, St. Denis, to complain that, although two children had been born to them, his wife had not only dishonoured his name, but likewise sold engravings of his pictures to the value of 2,000*l.* and subtracted drawings and even pictures from his studio, which she had bestowed on her various admirers, who thus undersold his finished works. GREUZE further states that in his utter misery he had moved from the Rue Thibotode to the Rue Notre Dame des Victoires, where he had been on the point of death, in consequence of the attempt Madame GREUZE had made to poison him by means of broth in which verdigris had been mixed. Scarcely recovered, he had seen his wife rise in the dead of night and approach his bed armed with a *vaso da notte*. He had but time to escape the destined blow. JEAN BAPTISTE next morning quitted the house, and invoked the aid of the police-commissary.

This state of things was certainly not conducive to the progress of art; but having obtained a divorce, he painted *La Pleureuse*, a *chef-d’œuvre* which attracted the encomiums of the Marquis DE MARIGNY, Surintendant des Beaux-Arts, to whom GREUZE remarked, with his usual self-assertion, that he knew the merit of his work, but yet was in want of orders. CARL

VERNET, his neighbour, replied by the truth, “It is because you have many enemies, and especially one, to whom you seem singularly attached, and who will prove your ruin.” “Who is he?” inquired GREUZE. “Yourself.” His pride was inordinate, but accompanied by so much ingenuousness that people were disposed rather to smile at its folly than feel anger at its manifestation.

The brevet conferring on GREUZE the lodging at the Louvre, vacant by the death of LA ROCHE, is dated March 6, 1769; it enjoins on its recipient to occupy the said lodging himself, and on no pretext to allow others to do so. The following year the King bestowed on him a sum of 1,500 livres to repair the lodging, which he, however, appears to have occupied but a short time at that period.

In his rage and mortification at the manner in which his *tableau de réception* had been received at the Academy, GREUZE quitted Paris and established himself for a time in Anjou, where he painted the portrait of Madame DE PORRIN, now in the Angers Museum. It was at this period that one of the best known of his works, *La Cruche cassée*, now at the Louvre, was produced. It is always a matter of difficulty to obtain a good view of it, so many are the easels which daily surround it. A young girl clad in white has gathered roses in the folds of her frock, on her right arm is a broken pitcher, a rose is nestled in her dark hair, she gazes at you with a tender, wistful expression. The deep blue eyes are veiled by unfallen tears, which are surrounded by shadow. Rose pink is the only tone of bright colour in the whole, and is repeated in the flowers in her white gown, in the bloom on her cheek, and in the ribbon in her hair. Madame DU BARRI possessed a reduction by GREUZE of the original, which was sold at the Marquis DE VERT’s sale in 1777 for 120*l.* At the MARIETTE sale a drawing of the girl’s head went for 80*l.*; but in March 1792, during the whirlwind of revolution, a pastel of the picture sold for 15*l.*, whereas in 1869 a mere pencil outline by GREUZE, at the Marquis MAISON’s auction, was eagerly secured for 92 guineas.

The death of LOUIS XV. by no means deprived GREUZE of the popularity which Court favour had obtained for him. His *atelier* continued to be the resort of all the rank and fashion of the capital, as well as of the distinguished personages who visited Paris. Among the latter was BENJAMIN FRANKLIN, who went there for the purpose of enlisting the sympathies of the young nobles of France in the cause of American independence, and also of obtaining the sanction of LOUIS XVI. to their armed co-operation with it. GREUZE painted his portrait at the same time as *La Malédiction paternelle*, now at the Louvre. GUSTAVUS VASA, the romantic young King of Sweden, who travelled as Comte DE FALKENSTEIN, was among the number of his visitors, and bestowed on GREUZE the rank of baron, and, what was perhaps more useful, a gift of 4,000 ducats. Madame ROLAND, the beautiful and gifted martyr of liberty, describes a visit she paid the studio in September 1777. *La Malédiction paternelle* was then on the easel, as also the *Cruche cassée*. Of the latter she writes, “On ne peut rien voir de plus piquant et de plus joli.” She said to GREUZE, “The only fault I find with it is, that the little girl does not appear sufficiently sorry for her misfortune. I fear she may return to the spring.” Emperor JOSEPH II., on his first visit to his sister, Queen MARIE ANTOINETTE, likewise was among those whom love of art attracted to the studio. He asked GREUZE whether he had been in Italy. On the artist replying in the affirmative, the Emperor said, “You did not find your style there; it belongs exclusively to you. *Vous êtes le poète de vos tableaux.*” A double meaning may be given to the imperial compliment. Madame ROLAND, in the letter in which she relates this anecdote, admits that she was sufficiently malicious to emphasise it by saying, “It is true that if anything can add to the charm of your work it is the description *you* give of them.” She adds, “I was three-quarters of an hour in the studio. I took MIGNONNE with me. There were several visitors, but GREUZE spoke chiefly to me.”

M. DE GONCOURT’s lucid comments on the causes which contributed to GREUZE’s style are worth translating verbatim. He writes as follows:—“Charity in the latter end of the eighteenth century had become a romance of the imagination. Society caressed the image of Virtue, which it tricked out as though it were a doll. Dukes on their estates bestowed crowns of roses on village virgins, which the ‘impures’ of Paris applauded. Trianon, a little opéra comique village, was built next to the Palace of Versailles. It only suggested a decoration for SEDAINÉ’s theatre. The King had the good-heartedness of

a farmer. He turned up his lace ruffles to help a carter to drag his waggon through a muddy road. The queen herself was drawn in the *Traits d'humanité*. GREUZE is the unconscious exponent of this sentimentalism, so soon engulfed in the sea of trouble of 1789. GREUZE personifies *La Dame de Charité* in the features of his own wife, and that picture may be said to embody the spirit of the period. *La Paix du ménage*, *Le Paralytique servi par ses Enfants* (now in the Imperial Gallery of St. Petersburg), *La Grand' Maman*, *Le gâteau des Rois*, and *La Maman* are all inspired by the same false sentiment. Rustic felicity he further attempted to render attractive in *Les Sévères* and *Le Retour de la Nourrice*. CHARDIN's pictures of rural life produce a totally opposite impression to similar subjects painted by GREUZE. There is a wholesome tone, a robust life, a truth to Nature in CHARDIN, which does not exist in GREUZE, in whose works there is something sensual in form, colour, and even a certain *coquetterie friponne*, rather suggestive of the CLAIRONS and CHAMPMESLÉS of the day than of the hardworking peasant mother honestly gaining bread for her children by the labour of her hands, which these pictures are supposed to bring before the public. The innocence depicted is that of Paris at the close of the eighteenth century. The type GREUZE paints of the *ingénue* is decidedly the one which was his greatest success.

GREUZE, after his separation from his wife, had formed an association with MASSARD, GAILLARD, LEVASSEUR, and FLIPART for the engraving and selling of his works. For many years his pictures fetched high prices both in France and abroad. BAUDOUINS' and LAWREINIES' licentious engravings were replaced on the walls of old manor-houses by GREUZE's *soi-disant* pictures of Virtue in humble life. The prints were issued in every variety of form, proofs *avant lettre*, without the royal escutcheon and with it, without the title of *peintre du roi* and with it, with GREUZE's signature at the back and without.

Even as late as July 1792 an annual pension of 1,537 livres 10 sols was conferred on GREUZE by LOUIS XVI. as a reward for his talent in painting. Six months later the head of him whose last acts thus testify to the kindly nature of the man fell to the plaudits of the champions of the liberty whose first year of power was cited in the grant. GREUZE survived his reputation; he endured the extremest want, and suffered yet more from the utter oblivion which swept over his name, to a nature such as his more agonising than cold and hunger.

GREUZE executed one etching. It is the reproduction of a little girl, whose head leans on her left shoulder; a slight handkerchief is carelessly thrown over her head. It is signed with a G and two points. "J. B. GREUZE del. et sculp." on a proof sold by DEFER, proves its authenticity. GREUZE executed the portraits of PIGALLE in 1757, of the Dauphin (afterwards LOUIS XVI.) in 1761, of the Duc de CHARTRES (Egalité) and of his sister in 1763, of CAFFIERI and of WEILLE, 1765, as well as of Madame GREUZE. His portrait of CATHERINE II. was etched by GAUCHER, that of DIDEROT was engraved by A. DE ST.-AUBIN and of Miss HERVEY by CHATELET. Among the most fascinating of his portraits is one which was exhibited at the Exposition Alsace et Lorraine, where the art treasures of France were collected. It was of the beautiful Marquise de CHAMPCENETZ, and represented a young woman of the world, whose loveliness had the charm of sweetness. She was *coiffée à la Lamballe*, which fashion set off the exquisite chiselling of her features. The portrait now belongs to the Comte de GRIFFULHE, and has never been engraved. The Comte de LA BORDE possesses a portrait of his ancestress, Madame d'ESCARS, by GREUZE, and the Comte de BELLEVAL one of Madame de VIETTE, with a letter from GREUZE, in which he acknowledges the sum of 25 louis for the portrait, which he takes care to add he painted for friendship rather than money.

Religious subjects were as little in GREUZE's line as hymns in TOM MOORE's, but of those he attempted *Mary the Egyptian* is the best known. Prince LUCIEN BONAPARTE commissioned GREUZE, then in his old age, to make him a replica of this subject. In 1869 either the original or this replica was purchased at the Marquis de MAISON's sale for 800 guineas. An allegorical subject, *L'offrande à l'amour*, has been made popular through its engraving. The original was purchased from GREUZE by the Duc de CHOISEUL in 1772. It was sold in London in 1793 for 33*l.*, and resold at the Cardinal FESCH's sale at Rome, 1844, for 6,160 scudi Romain. *Le triomphe de l'Hymen* was painted for the Comte d'ARTOIS, and

a replica of it was sold to Russia by the Comte d'ESPAGNAC. Two of the heads in this *Triumph of Hymen*, PSYCHE and LOVE, were separately reproduced by GREUZE. The one cost the Marquis of HERTFORD 1,800 guineas, and the other was purchased by NAPOLEON III. for 1,200 guineas for a birthday present for the Empress EUGÉNIE, who presented it to the Grand Duchess MARY of Russia. It was exhibited at the Exposition Rétrospectif by permission of the Grand Duchess in 1866. Forty-five of his scenes of rustic life have been engraved, as have sixty-eight of his heads of children and young girls. The latter are certainly the most popular of GREUZE's works. Among these the best known are *La Cruche cassée*, *La Petite Fille au chien*, *La Belle Boudeuse*, *la Bacchante*, *La Modestie*, *Le Petit Frère*, and *Le tendre Désir*. The latter, engraved by MASSARD, was sold (1785) at the Marquis de VERI's auction. A reduction of it, once the property of the Marquis de MONTCALM, is now in the possession of Vice-Admiral OLIVER. Fuller details with regard to the biography of GREUZE will be found in the writings of that erudite art critic, M. ED. DE GONCOURT, to whose works on art we are so largely indebted.

#### METROPOLITAN BUILDING ACTS.\*

THAT the Acts relating to building in the metropolis are not popular is seen from the first sentence in the preface to Mr. FLETCHER's edition of them. It is many years, he says, since any edition of them has been published containing notes, diagrams, plans of chimneys, and the like. The reason for this is plain. To every one except the gentlemen concerned in their administration the Building Acts are a necessary evil, and one which presses heavily upon honest people. An architect or a builder having the least pride in his work would, if there were no Acts, produce buildings quite as substantial and as free from risk as those which are supposed to be rendered secure by the observance of prescribed formalities. But since the Legislature was not competent to devise a better means of checking dishonest and dangerous work than by the assumption that it was general, the Acts must be accepted. Mr. FLETCHER is sanguine if he supposes that diagrams or reports of cases, however numerous, will make a copy of the Building Act to be "well received by those who most use the Act," unless, indeed, by the users he means district surveyors. The Act can never be expected to be well received by London architects and builders. The most that can be said is that when reports of cases are introduced, the necessity of carefulness in complying with the letter as much as the spirit of the law becomes more apparent. Looked at in this light, Mr. FLETCHER's book will be found to have great utility, and a study of it may save architects and builders from many annoyances. There is an abstract of the sections of the Acts which might advantageously be also printed separately in a more portable form; the diagrams are clear and accurate, and there are copies of bylaws, notices, and other documents. It is also convenient to have parts of different Acts which are related brought together, as is done in this book. But the printing of the volume might have been improved by the use of a greater variety of type so as to indicate subjects, by keeping the clauses further apart, and by giving wider margins. No one cares to spend much time in a study of the contents of a work of this kind, and every mechanical means should be adopted to facilitate reference.

The Building Acts, although important enough in their way, form part of a class of law with which lawyers of repute do not care to meddle. Like the old Roman *jus gentium*, which was administered by the prætors, the Acts are not attractive to nobles of the robe. Cases under those Acts are seldom discussed in the Superior Courts, and when they are the judges seem to be indisposed to reverse the decisions of the magistrates. There is so much that is petty and trumpery about the generality of the cases as to make the police-court the fittest place in which to hear them. It is a mockery of law to put in motion the elaborate machinery of one of the Superior Courts in order to determine how many varieties of fees can be claimed by a district surveyor for a single inspection of a builder's work.

\* "The Metropolitan Building Acts: a Text-Book for Architects, Surveyors, Builders, &c." By Banister Fletcher. Published by B. T. Batsford. "The Metropolitan Management and Building Acts Amendment Act, 1882." By Alfred Emden. Published by Stevens & Haynes.

The cases which have been selected by Mr. FLETCHER form a very curious collection. In one, with which he himself was concerned, it was laid down that a wooden structure on wheels was a building. Although the owner cut it in two and removed one half, he was not able to escape his liabilities, and he was fined. In 1874 it was decided that a wooden fowl-house was a building, and on another occasion it was demonstrated successfully by a district surveyor that the existence of a roof was not necessary to constitute a building out of a wooden enclosure. It would be difficult to say how little in the way of sides is sufficient to form a "building" in the eyes of magistrates and surveyors. Even an advertisement hoarding comes under that category if a few strips of wood are attached to it to enable the canvas to resist buckling. We have heard of a case in which a zealous assistant endeavoured to raise a claim against a man who threw a tarpaulin across an open passage on a wet day, and the enclosure thus formed might with more justice be interpreted to be a "building" than many of those things which have given occasion to the imposition of fines. That obnoxious phrase "combustible structure" is so universally applicable, the public ought indeed to congratulate themselves upon the forbearance of the district surveyors. If we may conclude from the reported decisions, the only things which appear to be beyond the Acts are a wig-box and a bird-cage; but, according to Mr. Justice BYLES, the latter must have a handle for lifting it from the ground.

It is needless to say that many of the cases in Mr. FLETCHER'S book relate to fees, for the peculiar character associated with the Acts in the metropolis is mainly owing to the arrangements which have been framed for the payment of the surveyors. Some restriction on claims was introduced by a judgment of Lord BLACKBURN, in which it was laid down that fees are payable when they become due by the person who at that time answers the descriptions of builder, owner, or occupier. In other words, fees cannot be claimed from a stranger several years after they were incurred, although he may have received "a proper bill" from the district surveyor. But if the successors of the owners of a building are not held to be responsible for their predecessor's debts, the workmen and labourers who may have been employed on the building are less fortunate. It is recorded in Mr. FLETCHER'S book how a journeyman carpenter, who was very civil to the district surveyor, was summoned because his employer failed to comply with the requirements of the Act. He was fined, and in default was ordered to be imprisoned for ten days. The defendant, it appears, said he had no money, and accordingly he was removed in custody. The unhappy scapegoat was, we suppose, unable to appeal; but he has gained notoriety, for henceforth he becomes an example to all metropolitan workmen. Mr. FLETCHER warns them that "the Court will severely punish those who endeavour to evade the Act," or, as it is better expressed in the same sentence, those who "evade payment." It must be satisfactory to the district surveyors to be assured that the definition of builder in the Acts is "most comprehensive." "It includes," says Mr. FLETCHER, "not merely master builders, but every journeyman of every trade who shall do any work where there is no master builder." But if subcontractors are not bound to give notices, it is hardly equitable to insist on every journeyman of every trade sending them to the district surveyor. The importance attached to the Acts as a source of fees is suggested by the number of cases which are given by Mr. FLETCHER to throw light on this part of the subject.

The builders whose names appear in the reports of the cases in Mr. FLETCHER'S book do not represent the average standard of morality of the trade in the metropolis. They belong rather to the class for whom bylaws have been specially formulated, and they seem to be proud of outwitting the district surveyor. In one of the earliest cases given, where the builder says he will adopt a more economical plan, it is evident that the reason is that by means of the alteration the Metropolitan Board of Works and the district surveyor will be rendered powerless. The use of improper materials in jerry-built houses in the outlying districts of the metropolis has often given occasion for the Acts to be exercised, but it is noteworthy that no cases are cited which can be said to refer to ordinary buildings. No respectable builder is likely to be punished for building walls that are not properly bonded and solidly put together. It is therefore hard when a firm of builders or contractors, who may have sustained a reputation for excellent work, are summoned to a police office on account of some

trifling matter, or in order to test a new reading of the Acts by the surveyor. And this suggests another of the peculiarities of the administration under the Building Acts. How does it happen that cases are perpetually cropping up in certain districts while they seem to be unknown elsewhere? There are many district surveyors whose names are never heard of in the newspapers. Are we to conclude that the builders in their districts are exceptionally moral? or might not another reason be given to explain the phenomenon? There are some men who are born litigants, and woe to the parish in which one of them succeeds in gaining an appointment as a district surveyor. But the difference in the amount of litigation between districts is so remarkable that we are surprised the Board of Works do not issue a map (like those adopted for infectious diseases) in which red dots might be made to indicate the relative disregard of the Acts by the public, and the energy of the surveyors in having culprits mulcted.

Mr. EMDEN has supplemented his valuable book on building law by an edition of the Amendment Act of 1882, which is printed in a convenient form. Notes explanatory of the clauses and of procedure under the Act are appended, in which the pith of the matter is given in a few words.

### MR. MORRIS ON DECORATIVE ART IN ENGLAND.

A FINE-ART and industrial exhibition was opened on Friday last week, in St. James's Hall, Manchester, by the Earl of Wilton. At the luncheon which followed the chairman, Earl Wilton, proposed a toast to the success of the exhibition. Mr. William Morris subsequently responded to the toast, "English Decorative Art," proposed by Mr. Woodall, M.P., as follows:—

I think we may without rashness congratulate ourselves on the progress made in decorative art of late years. I should be loth to speak slightly of any of the brotherhood to which I belong, past or present. But the plain fact is, that some twenty-five years ago the arts of mere decoration were in such a state that one is bound to say that they looked as if they were coming to an end; of the traditional part of them there was, in England at least, scarce any more left than there is now, *i.e.* nothing. On the more obvious and self-conscious side there was nothing stirring. What individual talent was left could only show itself in eccentricities that most often deserved to be called by any other name rather than decoration. The public was as blankly ignorant of the history of the art as the designers were of its first principles. The contempt with which the whole subject was treated in those days is shown pretty clearly by the law which relates to the copyright in industrial designs, which, strange to say, is to this day all the protection accorded to them. The framers of that law doubtless wished to secure to manufacturers all reasonable advantages for those designs which they had paid for or invented; yet to this day it is only possible to protect such designs for three years; three years seemed at the time when that law was made ample time for a manufacturer to reap all reasonable advantages from any design he might produce. I don't think I need make much comment on that. Well, really, I must say that twenty-five years ago it did not much matter whose design you got hold of. They were all much the same, and did little but spoil the materials out of which they were made.

I well remember when I was first setting up house, twenty-three years ago, and two or three other friends of mine were in the same plight, what a rummage there used to be for anything tolerable in the way of hangings, for instance, and what shouts of joy would be raised if we had the luck to dig up some cheapish commonplace manufacture, which, being outside the range of fancy goods, had escaped the general influence of the vacuity of the times. On the whole, I remember that we had to fall back upon turkey-red cotton and dark blue serge; since even the very self colours of fancy goods had grown to be impossible, which is the more inexcusable as at that time the beneficent march of science and commerce had not yet destroyed the ancient and worthy traditions of the craft of dyeing as it has since done. My lord, this last sentence shows itself to me like the skeleton at the Egyptian feast, and reminds me that I have something else to say than self-satisfied triumph over our advance on the blank nothingness of the first half of the century. Yet certainly that advance has been made—a reaction from ugliness to beauty has touched at least some part of the people who live among civilisation; and in what we technically call the decorative arts this new Renaissance has been helped in this country by many agencies, not least among which has been the steady endeavour on the part of the Department for Science and Art to spread artistic education among the public in general. Some of the results of this new Renaissance are now before the people of this great city, and I think I may say that they very fairly represent what has been done in the arts of decoration since the change I have been speaking of took place. Nor am I

ashamed, in the name of my brethren in the craft, in the first place, to beg some tenderness from the public for our shortcomings, considering the difficulties we have had to fight against; and in the second place, to remind them that things have changed—that no young housekeeper need now take so much pains for such a scanty result as I had to do in 1859; that anyone can now find in shops all over the country goods at commonplace prices, which both intend to be and are beautiful, and more or less marked by artistic individuality; that, in short, anyone who chooses can make the interior of his house comely and pleasant without an unreasonable expenditure of time and trouble. Now I will not ask my craft-brethren to be content with my using no greater words in praise of our noble selves than these, which after all do seem to me to imply great encouragement to us all, for something more I have to say before I sit down. I am always asking myself, Is this apparent success real, is this seeming advance of a quarter of a century going somewhere or nowhere? That is a serious question, to which it is impossible to answer aye or no. But after all to us as practical people it does not matter much whether it can be answered directly always, so long as we see clearly what are the conditions of the health or disease, the life or death of our art. In short, so long as we can see what work is immediately ahead of us to maintain our art in a hopeful state. Now, to my mind, it is not so very difficult to see this. Firstly, we have, to put the matter in its simplest form, to interest the whole public in the work. Firstly and indeed lastly, there is nothing else for us to do. That once done, the whole public will see to this matter. Well, that is easy to say and very hard to do; short to say and very long to do; and yet we must set to work about it, unless we æsthetic upholsterers are content to be what I am afraid many people think us—contemptible waiters-on, or mere pleasure-seekers and triflers with life. For in truth these decorative arts, when they are genuine, real from the root up, have one claim to be considered serious matters which even the greater arts do in a way lack, and this claim is that they are the direct expression of the thoughts and aspirations of the mass of the people, and I assert that the higher class of artist, the individual artist, he whose work is, as it were, a world in itself, cannot live healthily and happily without the lower kind of art—if we must call it lower—the kind which we may think of as co-operative art, and which when it is genuine gives your great man, be he never so great, the peaceful and beautiful surroundings, and the sympathetic audience which he justly thinks he has a right to. If you compel a Michael Angelo to live in a world of dullards and blunderers, what can happen to him but to waste his life in ceaseless indignant protest, till his art fades out in sour despondency and his whole career has turned out a useless martyrdom? Great minds need no slaves to rule over, but rather fellow-workmen whom they can help and be helped by. So I say that the decorative arts are as necessary to our life as civilised men, nay as men, as the more strictly intellectual arts are, and that that which has become our end and aim, to wit, the new birth of popular art, as on the one hand it is a most arduous, so on the other it is a most worthy undertaking. Such great works both make the utmost courage necessary and inspire us with the necessary courage for carrying them out. Striving to arm myself with that courage, I will venture still to try to tell you what seem to me the chief difficulties that we have to face in our undertaking, and will beg you also to be courageous in listening to my few last words; since courage, as you well know, is the very mother of kindness and good nature.

Well, once for all, I am afraid I must admit that the public in general are not touched at all by any interest for decorative art; a few of the upper and middle classes only have as much as heard that there is such a thing as decorative, which should be popular art. How could it be otherwise? Consider. That lapse of all the arts of decoration that I began by speaking of, and which got to such a pitch at last that it became unbearable to some of the cultivated part of our population, that paralysis of the art was brought about by commerce (so called) forbidding the exercise of art as an essential part of manufactured wares. Time was when all manufactured wares had some claim to beauty, and, other things being equal, the most beautiful thing was the most marketable. I fear we cannot say that this is the case now. Pray excuse me for drawing an illustration from a very interesting and useful class of goods to which we are none of us strangers—printed cottons. If you turn over the pattern books of this or that cotton printer in this city, you will find many patterns which are exceedingly pretty, while some of them are exceedingly—well, ugly, as I am sure the gentlemen who print them will admit. Now, having the honour of the acquaintance of a cotton printer in this city, I am able to say that, so far as I could understand, the ugly patterns sell quite as well as the pretty ones. Now, you know, if the decorative arts were in a healthy condition, instinctive good taste would refuse the ugly patterns and demand the pretty ones, and so prevent what I must consider a degrading waste of money, time, and intelligence; for what in its way can be more wasteful than using all the accumulated knowledge and skill of centuries in spoiling the fair white surface of a piece of cloth by putting a pattern on it which you know to be ugly?

And in like manner it fares with all the other industrial arts. If a manufacturer determines to be also somewhat of an artist (as

he most certainly should be), and to turn out nothing but what may do credit to his own reason and intellect, he must also make up his mind to give up a great part, probably the greatest part, of his business; and I will say at once, before I go further, that if a good few of our makers of common wares were so much touched by the importance of the decorative arts of England as to do this, it would make a new era in that advance of the art which I have been speaking of; and if we could add to such a sacrifice of apparent welfare an obvious and lively interest on the part of the public in the processes and methods of the art, I do think we should be nearing our goal. For at present the divorce of commercial manufacture from art has made the public bad marketiers; too often they don't know what they are buying. Often I have had it said to me when I have been showing my friends some process of designing or making a piece of goods, "Dear me, I had no idea that all that trouble was necessary." In short, it seems to be generally believed by a people, to my mind, somewhat overdone by machinery, that works of minor art can be and are turned out like the sausages in the mythical Yankee machine—live pig at one end, sausages at the other. Whereas in truth every work of art, however humble, as on the one hand there has gone to make it real human pleasure of body and mind, so on the other every stage of its making has been attended by painful care, anxiety, and chance of failure. And this it is, this play of hope and fear, joy and sorrow over it, which makes it what we call a work of art; indeed, we may well call it a work of nature also.

That word "nature" reminds me that I have still something to say to you, if I do not weary you overmuch. The divorce of commerce from art has been wasteful of more than the works of man's industry, and in many places, and I must say nowhere more than in South Lancashire, has made the advice which we must always give to all students of art to go to nature somewhat of a mockery. Believe me, I do not speak of this or any other evil wantonly, but with the hope of, in my small way, encouraging those who are fighting against it; and indeed fight against this evil we must, if we are to have decorative or any other art for long. The choice lies before us, which will you have, art or dirt? In the long run I believe you will find art the cheaper of the two commodities; for if we choose dirt we shall make England, all of it sooner or later, what it was not meant to be, an uncomfortable country, and discomfort breeds discontent, and discontent—what will that bring forth in this land of stout-hearted men?

This is far from being beside the question; it is English decorative art I am speaking of, and can we forget what the country is like which bred that art as it once was, which has made an ancient English house, for all its simplicity and rudeness, the loveliest of the habitations of man? Surely my voice is speaking the thoughts of many people when I plead with the mighty and overwhelming commerce of England to spare the source from which all English art has sprung, what is left us of the land of England, with all its growth of familiar beauty, sweetened every acre of it with the memories of the men that made us. When that plea is listened to, and we make up our minds, first, to keep all we have left us of fair and unspoiled country and dwellings, and, second, to replace what we have lost by a reasonable and living art which shall really express our lives and their aspirations—I say when we have made up our minds to do this, then is all gained. Nature, which has covered with her kind hand the battle-fields of the Edwards and Henries and Charleses, will in one way or other, when we call upon her, do no less for the battle-fields of commerce. Our scientific men, who to me, an outsider, seem able to do anything they care to do, will have shown us the right use of carbon and sulphuric acid, and the sun will shine as brightly through the boughs outside the factory windows in Lancashire as it does through the Kentish hop-garden. I think those days will come, wild as the prophecy seems. We shall not see them. Who cares, since we amongst others shall have worked to bring them about? Nor will anybody in those days need to talk about English decorative art, for everyone will have it ready to his hand; like the company of a friend with whom one can talk if one wills, or be silent with if one pleases, so restful, so familiar shall it be.

---

**The Tower.**—The large block of buildings situated within the Tower of London, which for nearly two centuries past have been used as the Ordnance Office and Stores, was on Monday sold by Messrs. Horne, Eversfield & Co. by order of the Commissioners of Her Majesty's Works and Public Buildings, preparatory to their being taken down to clear the site for the restoration of the Lantern Tower, which formerly stood on a portion of the site occupied by the buildings about to be demolished. The Ordnance Office, now so shortly to disappear, is a spacious block about 150 feet in length and 90 feet in depth, and is carried to a height of upwards of 70 feet, consisting of a basement and five lofty floors. The materials were divided into 129 lots, most of which fetched little more than nominal prices. The original cost of the building, which is of unusual strength, is said to have been upwards of 60,000*l.* The site is to be entirely cleared in six weeks, when the Office of Works will proceed with the work of restoration.

## BEWICK AND MODERN WOOD ENGRAVING.\*

I THINK it will not be disputed that the modern impetus which the practice of wood-engraving has undoubtedly received is due in great measure to the efforts of Thomas Bewick. In a certain sense Bewick may be said to be the inventor of wood engraving as a separate art, for he was the first to adapt himself with readiness and complete submission to the peculiar technical conditions which the wood-block suggests.

It may seem at first sight that this statement is in contradiction to what has already been said as to the excellence of the earlier engravers; and it is therefore important that I should define clearly what is meant in thus ascribing to Bewick a position of such importance. The praise which has been bestowed upon the earlier engravings is due to them in virtue of the completeness with which they fit themselves with printed books; but of course it would be unfair to allege that wood engraving must be altogether confined to the duty of illustration. It has a right, if it can prove its efficiency, to exist as a separate and independent art and it is from this point of view that Bewick's influence is to be considered.

To my thinking, not even the best and most skilful of Bewick's cuts can be compared for beauty to the broad simple manner displayed in the *Ars Moriendi* or the *Dream of Poliphilo*; but when Bewick applied himself to the art it had already passed far beyond the point at which it had arrived when these books were produced. A greater demand for completeness of pictorial effect had introduced a more elaborate system of workmanship, a system based, as I have already explained, not upon the peculiar conditions of the wood-cutter's craft, but upon the more or less slavish imitation of the processes proper to engraving on metal. It was Bewick's triumph to discover a means by which this greater elaboration can be more simply and more appropriately secured; and in order to understand the nature of this triumph we must remind ourselves again of the means by which a picture is produced upon an engraved block.

All earlier work, it must be repeated, was founded upon a direct imitation of an original drawing. Bewick's practice, on the other hand, consists in a direct use of the block itself; he was not in any sense a *fac-simile* engraver. In order to explain his position in regard to his art, I may quote the words of a writer who has offered an enthusiastic vindication of Bewick's powers.

"Through the three centuries and a half," says Mr. Holliday in an interesting series of articles contributed to the *Magazine of Art*, "which elapsed between the 'St. Christopher' and the time when Bewick began his artistic career, there is no sign that any artist who dealt with wood-engraving recognised that the process consisted in cutting out lights, and that by confining it to the imitation of black-line drawings they weighted it hopelessly in its competition with other arts."

"If the view already expressed," continues Mr. Holliday, "be correct, wood-engraving proper commenced only with Thomas Bewick, the work of this remarkable artist being in no sense a development of that of his predecessors, to which it is throughout opposed. Accepting as the obvious and unquestionably characteristic peculiarity of the wood-block, its unequalled power of giving clearly-drawn whites on a dark ground, as contrasted with engraving on copper, which proceeds by engraving black lines on a white ground, we find first that the earlier engravers ignored this capacity, but attempted such simple work only that it was always easy to execute, though quite uninteresting when done. When they had such designs as those of Dürer or Holbein to cut, the result was highly valuable; but, inasmuch as the engraver's work was purely mechanical, and left the resources of his material wholly undeveloped, his craft cannot be called an art. Instead of cultivating an art proper, he was imitating another art, that of pen-and-ink drawing on a material indifferently adapted to the purpose, his sole object being the production of many copies. It is quite clear that it never occurred to either artists or engravers that wood was capable of more than this. Secondly, we find that Bewick discovered the true powers of the wood-block, and gives us for the first time engraving in which white is cut out of black, and where we find no attempt made to force the material into the unnatural imitation of scratching, cross-hatching, or any other mode for which it is unfitted; and thirdly, we find that a great number of modern artists who draw for wood, and engravers who cut the drawings, pass over Bewick's work, and, recurring to the old, false, and hopeless principle of imitating other and antagonistic arts, aim exclusively at qualities in which wood is infinitely surpassed by etching, and leave untouched those in which etching would be as completely outstripped by wood-engraving."

According to Mr. Holliday's contention, Bewick's perception of the capabilities of the wood-block is based upon an essential principle in the rendering of nature. "A little reflection," he says, "or, what is better, a little observation, will show us that nature, as a rule, exhibits objects light on a dark ground;" and he therefore proceeds to contend that that process will have the advantage

in which lines are taken out with the greatest ease, in which the objects are drawn with light instead of being drawn with darkness. I am not disposed to contest Mr. Holliday's generous estimate of Bewick's genius. Assuming that wood engraving is to exist as an independent art, he is, I think, unquestionably right in asserting that Bewick was the first to perceive the true means by which the block might be utilised for this purpose. In so far, then, as it may be regarded as a direct means of artistic expression, the conclusion we should seek to establish may be said to be incontrovertible, for it is obvious that the distinction so often insisted upon between the processes of wood engraving, or the processes of etching or engraving on copper, suggests a very important difference in the manner of working.

It is this fact which leads Mr. Linton, the eminent living professor of the art, to declare that all true wood engraving is produced by the use of what he terms the white line. If, therefore, we suppose the case of an artist working directly from Nature upon wood, we may readily acknowledge the method described by Mr. Linton and Mr. Holliday to be the most appropriate to the means at his disposal; but, as a matter of fact, wood engraving has very rarely been used as a means of independent expression. The causes which have determined the use of this particular process are of a practical rather than of a purely artistic character. The wood-block offers the readiest and the most economical mode of multiplying copies of a design, and it is for this reason that it has been so constantly employed for the illustration of printed books. If the larger principle for which Mr. Holliday contends were true at all, it would hold good as well for the draughtsman as for the engraver, and we might therefore expect that drawings would, as a general rule, be executed with a white pencil upon black paper. It is obvious, I think, that to accept this logical inference would be to place the pretensions of the wood-engraver upon too high a pedestal. The practice originated by Bewick must be taken as indicating a convention necessary to the art, as he understood it, but having no basis in a deeper principle.

It was a happy inspiration which led Bewick to perceive that a harmonious and consistent result might be produced at an expenditure of less labour than earlier engravers had been forced to bestow. His art, as he practised it, is not an art of reproduction or imitation; it is essentially a means of expression, and in his blocks we get the first independent experiment to give to wood engraving, by means strictly appropriate to the material, the force and variety of tone that we find differently expressed in a painting or an engraving on copper.

Bewick's blocks are, within their limits, complete as pieces of pictorial illustration; they do not suggest the existence of any drawing in another material from which they have been copied, nor, on the other hand, do they convey the idea that the artist has been attempting to reproduce the effects of a work in colour. Since his time wood engraving may be divided into three distinct categories. There is first a style developed from that which he originated, and which depends upon a wholly independent treatment of the wood-block. Secondly, there has been, as I pointed out in my last lecture, a developed style of *fac-simile* engraving, not different in principle from the earlier manner, but admitting greater variety of effect, and simulating with more adroitness the individual manner of an artist's sketch. Thirdly, we have a great mass of modern wood engraving which applies itself to the task of imitating the appearances and results of other arts, either in painting, drawing with the brush, or in sculpture.

Let us now consider these different styles in their order. Bewick's method, in the most familiar and celebrated examples of his work, consist not in the use of lines at all, but in the cutting away of irregular spaces. He works from the black surface of the block, with a desire to retain as much of it as possible; and he therefore expresses himself less by definition of line than by contrasted masses of light and shade. In fact, to quote again the words of Mr. Holliday, "the picture is drawn in white upon a black ground, and his blocks are executed in such a way as to suggest that he had previously made a drawing in this manner."

This mode of work has its counterpart among the processes employed by the engraver on metal in what is known as mezzotint engraving. Here, as you are aware, the whole surface of the plate is ploughed up, so that when filled with ink it produces a uniform impression of the deepest tone. Upon this dark background the engraver then proceeds to register his picture by scraping away the lights. In proportion as he restores the even surface of the plate he secures the highest light, and by graduated strength of execution he is able to represent with the utmost subtlety all the most delicate refinements of light and shade. The same subtlety and refinement are not possible to the wood-engraver, but it is possible to work upon the same principle; and it was this principle which Bewick's genius enabled him to apprehend. In the representation of objects in nature an artist may proceed either by mass or by line. He may first define the forms, and then afterwards add by successive lines the sense of contour and solidity; and in work so produced it will always be easy to perceive that the bounding lines of the picture have been established first, and that the truths of tone, which give roundness and reality to the picture have subsequently been added. Or he may, if he chooses, proceed at once to translate the appearances of Nature by careful

\* From a report of a Cantor lecture by Mr. J. Comyns Carr, published in the *Journal of the Society of Arts*.

disposition of masses of light and shade, and then, according to this system, the outline will come unsought as the result of contrasted strength of different depths of tone. It was in the use of this particular method that Bewick's originality is most clearly displayed. He cannot be said to have absolutely discovered the idea of working in white on black, for some of the initial letters in the earlier-printed books of Italy are executed upon the same plan; and in the print-room of the British Museum there are one or two large wood engravings of the human figure which display a like perception of the facilities which the wood-block offers for such a mode of work. But Bewick, if he did not absolutely originate the style, nevertheless uses it with the happiest effect in his careful and elaborate engravings of animals and birds. Nothing could be more admirable than the skill with which he conveys the sense of delicate tone and texture of a bird's plumage; and it is remarkable that the realism which attaches to this part of his work is often strangely in contrast with the crudely-executed details of background.

But there is another class of engravings by Bewick in which a different method is pursued. In treating landscapes he proceeds really upon a totally distinct principle to that which guides him in his more careful and elaborate rendering of animals. Here his endeavour is not merely to register form, or even to simulate effects of texture, but to indicate the impression of a tint, and this he does with superb skill by the use of what Mr. Linton has called a white line. By varying the thickness of the lines that he cuts away, and therefore conversely of the line that he leaves, he succeeds in giving every variety and delicacy of tone.

This is the phase of Bewick's art which may be said to have been most fruitful by way of example to more modern engravers. The originality of Bewick's achievement is the more remarkable seeing that there is nothing in the circumstances of his education which could in any way have assisted his progress. Having at an early age exhibited a certain taste for drawing, he was apprenticed by his father to Mr. Ralph Beilby, an engraver, to whom he was bound for a term of seven years; but Beilby was an engraver on copper, and for some time the young Bewick was employed in the rougher sorts of copper-plate work, even including the execution of brass plates for street doors, and of crests and initials on watch-seals and silver plate. At the expiration of his apprenticeship he seems to have formed a resolution to apply himself altogether to wood engraving; and it is noticeable that his earliest essays prove that he had not yet abandoned the traditions which belonged to his practice as an engraver on copper. But it was not long before he struck out a new path of his own, in which he showed that he had reflected for himself upon the resources of his art, and that he brought to its practice not merely manual skill and dexterity, but individual artistic power and an individual technical style.

I shall not dwell at length upon that particular manner employed by Bewick, which consisted, as I have said, less in the use of lines than of masses of light and shade. It has not yet been fruitful in any remarkable development among later engravers, though it is clear that in the hands of a man of distinct gift it might be made to yield new and interesting results. That it could ever take a foremost place as a means of interpreting Nature is not to be said, for it would always be necessary to acknowledge and accept a distinct convention upon which it is founded.

A far more important influence on wood engraving may be traced to Bewick's use of line. Here also his practice shows a due regard for the limitations of wood engraving, and it has been found capable in other hands of producing work of singular excellence and refinement. In its essence this style of engraving may be said to be the converse of that which was employed by the earliest artists; they laboured with a view to producing effect by the use of well-defined black lines in rendering the impressions of an original drawing. Here, on the other hand, the picture is traced by means of cutting away regular white lines of varying thickness, so managed as to show that the artist has worked with the peculiarities of a wood-block constantly in view. It is among the modern engravers of France that this system has been adopted and pursued with the greatest measure of success. An artistic result always gains in effect of dignity and charm when a certain degree of scientific system and precision are seen to be employed in its production. No device, however cunning, will give a picture that peculiar fascination which comes from the perception of a style firmly held and deliberately put in practice; and it would be hard to match, even amongst the most perfect *fac-simile* engravings, the beauty of certain wood-blocks produced by some of the modern masters of the French school. As a favourable example of this method, I may take a reproduction of an early Florentine picture by Pannemaker, a copy of which I have brought with me to-night. Here it may be observed that the engraver has been, in the first place, careful of the qualities of the work that he has been called upon to translate. There is something in the simple and restrained style of the engraving which accords with the naive manner of the painter. Assuming that it is fair to attempt in black and white to make a version of a work in colour, it would be difficult to conceive of any better spirit in which to approach the task than Pannemaker has here displayed. In the next place it may be said that the engraving has a special charm, inasmuch as it appeals to us confessedly as a work executed on wood.

There is no merit in art in any concealment of the means by which a good effect is produced. If we are looking at steel engraving we like to feel that the engraver has made full use of all the delicate resources at his command, and that he has denied himself no refinement or subtlety of tone which the material places within his reach. In like manner a wood-block should give us a pleasurable sensation by reminding us of the peculiar advantages which it offers to the artist.

We like to feel not merely that the work is admirable in result, but that it has been a pleasure to the workman, and that he has enjoyed the task of accommodating his subject to the particular means at his disposal. We like to feel also, and we do feel always in the presence of any piece of masterly art, that the artist has had no unequal struggle with difficulties hard to overcome, but that he has been able, by his knowledge and practice in the craft, to bring a definite system to the treatment of the whole. In looking at a fresco, one element of fascination depends upon the fact that the texture of the wet plaster partly overpowers the surface of the colour and hinders any impression of vulgar illusion by reminding us that it is a picture painted on a wall. In the same way it is pleasant in a wood engraving to feel that it is a wood engraving, and that the lines are traced by one who is familiar with the processes, and who is not afraid to adapt his subject to his material. Nor is it to be said, because there is no attempt at any striking imitative effects in texture or colour, that the work is wanting in subtlety or skill. It is easy to perceive that these lines of varying thickness, through which the face of this maiden reveals itself, are cut by the hand of a master; every part of the picture has an equal degree of realism, an equal suggestion of colour, and yet there is over all a prevailing sense of style and system which gives the result its peculiar charm. It would be easy to multiply examples of the modern French school, which show to what a high point of development this scientific manner of wood-cutting has been carried, and we must acknowledge, when we look to the work of the past, that this mode of wood-cutting is a new discovery, and that it undoubtedly has its origin in the work of Bewick.

#### LABOURERS' DWELLINGS.

A PAPER was read at the Annual Conference of the Diocese of Nottingham by Sir Charles H. J. Anderson on "Labourers' Dwellings." The old thatched habitations, so picturesque and comfortable, were, he said, fast disappearing on account of straw becoming more valuable, and the destruction of the cultivation of reeds, which made such beautiful thatch, being effected by the draining of the fens where they once grew. In the place of these dwellings they found springing up the ugliest of brick buildings. Where they were even built with a view to ornament they found little to admire, except in those parts where stone was plentiful and good, where custom had produced, both in chimneys, gables, and mullioned window, what might be called a style of its own. He considered, however, that under any circumstances it was impossible to build a really picturesque cottage at a moderate price which could be adopted as a model. For country cottages he knew no better plan than those which might be found in reports of the Diocesan Architectural Society for 1861. These were twin cottages, and much like what they saw dotted about landowners' estates, and attached as adjuncts to the farm intended for the married labourer. The dimensions were as follows for each cottage, which had a porch and doors at each end to keep the families from interfering with each other:—Living-room, 14 feet by 12; scullery, 12 feet by 8, and a pantry; above stairs there should be three bedrooms, 12 feet by 19; 8 feet by 11; and 9 feet by 12. No cottage should have walls less than a brick and a half thick, and slate or some asphalte should be laid between the bricks a little above the ground to prevent the damp from rising. In these places there was an outer porch and an inner passage, allowing independent communication with the stairs, kitchen, scullery, and pantry, with a landing upstairs admitting separate entrances to the three bedrooms; and this was important for decency and convenience, which things the labourer cared little for. There would always be the lodger difficulty in connection with such buildings as he was speaking of, but he could not see how it could be done away with except by the introduction of stringent measures, which in these days would be termed tyrannical. In conclusion, the speaker referred to town houses, and said that more attention should be given to their construction, as the tendency was to build on "spec," and so disregard the most essential things for health and comfort. In conclusion he moved "That in the construction of labourers' dwellings, both in town and country, the health, morality, and comfort of the inmates should be the main object."

**Berkeley Castle.**—The fifteenth-century roof of the chapel of Berkeley Castle has been repaired under the direction of Messrs. Middleton & Son, architects, of Cheltenham. The ends of the oak beams supporting the roof having become decayed, the lead was stripped off the exterior, and strong beams, strengthened with boiler plates, fixed above the roof, and the roof itself suspended with wrought-iron stirrups.

## NOTES AND COMMENTS.

THE death is announced of M. HORSIN-DÉON, the French picture-restorer. During half-a-century an immense number of works of every epoch and school have passed through his hands. M. DÉON was entrusted with the formation or sale of several of the finest collections of old paintings. He was also a prolific writer on art topics, the most noteworthy of his contributions to literature being his sketches of the lives and works of French artists, and *A Treatise on the Preservation and Restoration of Paintings*, which is probably the best book on the subject.

LANCASHIRE is likely to supply profitable cases to Parliamentary counsel during the next session. The Manchester ship canal project will be supported by a fund of 100,000*l.*, and it may be assumed that at least an equal sum will be forthcoming on the part of those who will oppose the Bill. Then there is the new project for laying down over 130 miles of metal plateway for the conveyance of goods through the principal manufacturing districts of Lancashire, at a cost of about four and a half millions of money. Two main routes have been selected: one starting from the south end of Liverpool and running to Oldham *viâ* Warrington, touching the south side of Manchester, and taking in Ashton and Staley-bridge; the other route starts from the north end of Liverpool, touching St. Helens, Ashton-in-Makerfield, Bolton, Bury, Heywood, and Rochdale, and, like the other line, terminating in Oldham. There will also be subsidiary lines, leaving the main road at convenient points, and branching off to Burnley in one direction and Preston in another. It is proposed to use ordinary waggons or lorries, with wheels adapted to the gauge of the line. In fact, the plateway is a return to the primitive tramway of the North of England collieries. The promoters of the scheme believe that they will be able to monopolise the greater part of the goods traffic of the railways, owing to the simplicity of the arrangements, by means of which cotton can be conveyed directly from the ship's hold to the mill and *vice versa*. The preliminary expenses are estimated at 75,000*l.* The opposition in this case will be powerful, as the principal railway companies are concerned in it. If the two schemes come before Parliament, it is therefore not unlikely that half a million will be expended in the contest.

M. CHARLES BONNEGRÂCE, the French historical and portrait painter, has just died at Montmirail in his 60th year. He was formerly a pupil of Baron GROS, and was represented in nearly all the Salons since 1834. He obtained a third medal in 1839, a second in 1842, and was made a Knight of the Legion of Honour in 1867. Among his chief works are—*Christ au Tombeau*, *Le Baptême de Jésus-Christ par St. Jean*, *St. Laurent Martyr*, *Jésus Enfant parmi les Docteurs*, *Antiope*, *Daphnis et Chloé*, and *La Pudeur Vaincue par l'Amour*. He also executed a number of portraits, and had great success. The Paris Municipality entrusted him with the decoration of the Chapelle St.-Denis in the church of La Chapelle, and a large mural painting for the church of St.-Louis-en-l'Île.

M. CLESINGER, who has already executed two fine statues of the Generals KLEBER and MARCEAU for the great square in front of the Ecole Militaire, Paris, has received a further commission from the Government for one of CARNOT. The fourth statue will be of HOCHÉ. One will be placed at each corner of the square.

THE members of the National Society of Amalgamated Brass Workers have sent a circular to their employers in Birmingham asking for a new scale of payment to be adopted. It appears that it has been the custom in the brass trades for casters to receive one price for their work, which has been regulated by weight. For many years past different prices have been paid at various firms for the same class of work. Manufacturers who employ casters on light work have in some cases paid less than other firms who manufacture heavier goods. For the last twenty-five years patterns have also been considerably reduced in weight by the coring of work which was previously cast solid, also by the patterns being reduced to meet manufacturers in competing with each other, or to conform to the fashion in the more artistic branches of the trade. This lightening of patterns has diminished the wages of the

casters. The increased number of cores has also had the same effect. The following are the prices proposed by the society to be paid for the casting of chandelier, common gas, and general cock work:—Common fine, 22*s.* per cwt.; best common, 15*s.* per cwt., including pulley frames, ball joints, back plates, and glass holders when not done fine; common gas work, 10*s.* per cwt.; cock work, 10*s.* per cwt.; old moulds, 4*d.* each, and weight; pin pattern work, 4*d.* per lb.; false cored, 1*s.* per lb.; odd moulds, 4*d.* each; running down dust, 2*s.* 6*d.* per cwt. to be paid on the weight taken out; metal mixing, 1*s.* The 10 per cent. bonus to be paid on these prices and added the same way as at present.

A SMALL painting by M. MEISSONIER, called *La Polichinelle*, which had been for many years at Vienna, is about to return to France, having been purchased by a Parisian collector for 40,000 francs. The work measures about 6½ inches in height.

M. FALGUIÈRE has been elected Professor of Sculpture at the Ecole des Beaux-Arts. The other candidates proposed to the Minister by the Superior Council of Fine Arts were MM. AIMÉ, MILET, and MERCIÉ. M. FALGUIÈRE's group of *Triomphe de la Révolution*, on the top of the Arc de Triomphe in the Champs Elysées, is now being uncovered. The figure representing France, with the flag and altar of the Rights of Man, may already be seen above the scaffolding, while the groups Military Duty and Civic Duty will shortly be visible.

A CASE is now before the Scottish Law Courts in which important issues are involved. In 1877 Messrs. A. & T. ADAMS, of Callander, contracted to erect a bridge at Ayr for the sum of 13,000*l.*, according to plans which were prepared by Messrs. BLYTH & CUNNINGHAM, of Edinburgh. The work was completed in 1879. Soon afterwards the bridge was found to be insecure, and it was necessary to have other works carried out. The Road Trustees have accordingly taken an action against the engineers for neglect of duty in superintending the erection of the bridge, and against the contractors for breach of contract, and no less than 8,750*l.* damages are claimed. The contractors maintain that the bridge was stably and substantially built according to the plans and specifications furnished to them by the engineers. They further state that when the bridge was finished in 1879 it was examined by the Road Trustees, tested, inspected, then taken over, the whole price paid, and the contract terminated. The engineers state that they performed the whole of the duties incumbent upon them, and they deny that the bridge was in any way defectively constructed or insufficiently tested. At present the case is in a preliminary stage, as the statements of claim have not been fully specified.

THE Fine Art Industrial Exhibition which has been opened in Manchester is of great interest. There are, of course, no pictures, statues, engravings, drawings, and examples of ancient art that can equal those seen in the famous exhibition that was held in the city more than twenty years ago. But as showing the application of art to furniture and house fittings, it may safely be said no English exhibition has surpassed that in the St. James's Hall. In it the latest developments of industrial art are to be studied. Messrs. GILLOW show their competence to produce most excellent examples in the styles now in vogue—such as Flemish, Italian, Queen Anne, or "Adams." On no other occasion has such an opportunity been given to study the work of Messrs. MORRIS & Co. Several large specimens of the tapestries which have been woven at the Windsor Works have been lent, including those designed by Mr. HODGSON, R.A. No art exhibition would be complete without some of the pottery of Messrs. DOULTON, and at Manchester types are to be seen of the different kinds of their work, which may be said to constitute a new industry. The arrangements for the exhibition have been under the control of Mr. DARBISHIRE.

THE jury of the Rouen Fine Arts Exhibition have awarded a gold medal to Madame MURATON for two pictures of still life. This lady has already received medals at the great Exhibitions of Paris, Vienna, and London. M. LÉON GLAISE carried off the Government prize—a Sèvres vase. The Exhibition has been a marked success, and the exhibits and public attendance show a marked advance on former years.

DESIGNS FOR THE TOWN HALL, BIRKENHEAD.

WE publish this week three of the competitive designs for the proposed Birkenhead Town Hall.

One is by Mr. HENRY WALKER, F.R.I.B.A., of Leeds, and it was prepared after a personal examination of the site. The style adopted would be in accord with the surrounding buildings, and the author's aim was to secure a dignified appearance for the Town Hall from whatever point it was viewed. A tower was incorporated in the design, out of deference to the opinion of those who consider that a building of this class should have some distinct terminal feature. Besides being useful as a clock and bell tower, it would add to the appearance of the town when seen from the river.

The restricted nature of the site and the large amount of floor space needed for the great hall and the principal departments have increased the difficulties of the competitors; but the author endeavoured to secure simplicity and convenience in the arrangements. A grand double staircase was provided for access to council-chamber and mayor's reception-rooms, two other stairs being placed at the back of the building for approaching the offices. It will be seen that five public entrances were provided.

It was proposed to construct the whole of the substructure and the internal walls of stock-bricks, the outside walls being faced with stone from the Stourton quarries. There would be a base of Tranmere stone, and all flags, steps, and landings would be of hard Yorkshire stone. The columns in the hall would be of polished Hopton wood-stone or of iron cased with Scagliola marble. The staircases, corridors, passages, muniment-rooms, and strong-rooms were to be fireproof. It was intended to encase all the structural ironwork in plaster as a protection against fire. Provision would also be made for the effective treatment of the heating and ventilation arrangements. The roofs would be covered with green Westmoreland slates, and the dome of the tower with copper.

Upon cubing the design (allowing 2 feet 6 inches for foundations below basement floor and measuring to half-way up the roofs) it was found to contain 1,112,000 cubic feet, which, at 9d. per foot, amounts to 42,000l., which may be taken approximately as the cost of the building.

## II.

We also reproduce the perspective view and plans of the design submitted in the preliminary competition by Mr. A. H. TILTMAN, M.R.I.B.A., architect, of 7 John Street, Bedford Row, and Guildford. The plans sufficiently explain the arrangement and purpose of the several parts. The front of the building faces the Hamilton Square. The greatest difficulty the competitors had to contend with in this competition was the unusual one of cost, the sum being limited for the whole of the work to 42,000l. This design somewhat exceeded this amount. It was proposed to face the whole of the exterior in stone.

## III.

The particulars relating to the design which was submitted in competition by Mr. JAMES N. CROFTS, architect, 5 Harrington Street, Liverpool, are as follows:—

The council-chamber, being the most important room, is placed in the front on the first floor, and is loftier than the adjoining apartments. A gallery is also arranged for the public. The mayor's apartments are *en suite* with this on the south side, and the town clerk occupies the whole of the north side on this floor.

There is a large public hall, 100 feet by 40 feet, at the back on this floor, capable of holding nearly 1,000 persons, and is arranged near service, so that it can be used as a banqueting-room on extra occasions, and is also arranged so that it can be emptied in a few minutes.

The surveyor's offices are on the ground-floor on one side, and treasurer's department on the other, with the rates offices in the centre, under quadrangle, thereby ensuring good light and economy of space. The gas and water offices are at back. The committee-rooms are placed easy of access on ground-floor, and the medical officer and water engineer are also on this floor. The school inspector, remainder of surveyor's department, inspector of nuisances, gas and water inspectors, and some spare offices, are placed in the basement: this floor however, being only some 3 or 4 feet below ground, with windows above, is thoroughly well lighted. The centre of

this floor, under quadrangle, is vaulted, and is made for stores and records. There is a gas-fitting store at back connected with the gas office above.

The second floor is devoted to spare rooms and the kitchen department. The keeper's house is placed at top, over council-chamber.

All the corridors are well lighted, and there is abundance of egress and ingress to all parts of the building. The strong rooms, staircases, and corridors are all fireproof.

The dome has a large exhaust at top to be utilised for ventilating the building, inlets by air tubes, heating by hot water and open fires.

The design is made to harmonise with the houses in Hamilton Square. The sculpture groups represent the sciences, arts, commerce, and kindred subjects. The stone would be from Cefn, North Wales, with granite for the entrances and plinth. The woodwork would be chiefly in oak, and the dome constructed of iron covered with zinc. The architect's estimate for the whole, including dome and carriage porch, &c., complete, was 44,300l., or at the rate of 9d. per cubic foot all through.

The author believes that the arrangements shown in his design would have been in accordance with the views of the officials, and would have met with the approval of the Corporation.

## SCOTTISH ARCHÆOLOGY.

THE subject of the second of the Rhind lectures on "Scotland in Pagan Times: the Bronze and Stone Ages," which are now in course of delivery in Edinburgh, was "Burial-places which were marked by Circles of Standing Stones." Dr. Anderson said that in 1860 a group was discovered at Manchrie Moor in Arran, containing urns and implements or ornaments of bronze and flint among the fragments of human bones. In these burials the phenomena were of the same special character as those described in the first lecture. They were associated with implements of bronze or urns decorated with that ornamentation of straight zigzag lines which was characteristic of the age of bronze. But they differed from those previously described in respect that they were marked by the presence of a ring of standing stones encompassing the area in which the interments had been made. The objects associated with the burials in the character of grave goods were small pins of bronze, portions of thin bronze blades, chips of flint, bracers of polished stone, and the head of a perforated stone hammer or battle-axe. These were not associated with all the burials; but urns, or fragments of urns, with forms and ornamentation characteristic of interments of the bronze age, were found in all the sites. From the frequency with which these burial circles were found to contain a plurality of interments, it was obvious that they were not the monuments of single individuals, but family or tribal burying-grounds. From the fact that they contained interments burnt and unburnt, it was obvious that they were in use when both these customs were practised, while the occurrence of bronze in association with the burnt interments assigned them to the age of bronze. In all these instances the circular stone-setting, whatever might be the precise form which it assumed, had been found to be the external sign by which the burial ground was distinguished from the surrounding area. Like the cairn, it was the visible mark of the spot of earth to which the remains of the dead had been consigned, though of course it was impossible to say, and it was not necessary that it should be affirmed, that in every stone circle the evidences of interment would be found. The colossal size of their pillar stones, the magnitude of the area enclosed, the care and labour expended entrenching and fencing it, were features which gave to these singular constructions a peculiarly impressive character. This impressiveness was specially characteristic of such a circle as that of Stennis, in Orkney, which encloses an area of two and a half acres. Dr. Anderson noticed the standing stones of Callernish, in Lewis, a type of structure which was associated with a chambered cairn. The cairn appeared in a subordinate character, for it was plainly the great stone setting and not the small cairn which was the principal object. The cairn had given way to the circle, and the circle had risen to the dignity of the principal member of the composite structure. It thus became clear that the circular stone setting, which first appeared as an adjunct to the stone-age cairns, acquired its dignity and importance through the degradation of the cairn structure which it encircled, and came at last to stand alone as the characteristic mark of bronze-age burial. No other conclusion, the lecturer thought, could be come to than that these stone circles were the customary enclosures of bronze-age burying places. It was not possible, in the present state of our knowledge, to proceed further than this with certainty. But, looking at the obvious fact that most of the relics which had been described were objects constructed for definite purposes in every-day life, and that they had all been devoted to the grave by the feeling which was of old

termed "pious," it seemed impossible to doubt that it was culture and that it was civilisation that were thus manifested by unfamiliar phenomena. Such devotion in honour of the dead implied an attitude of mind which was inconceivable apart from the existence of culture. They saw here a moral feeling prevailing over the greed of gold, placing the most massive and costly ornaments on the slab that covered the grave chest, and leaving them there undisturbed with but a few inches of earth to protect them. They perceived that the cairn, the circle of erect stones, the broad, deep trench marking off the grave-ground, were costly memorials, whether they were the products of filial piety and family affection, or of public sympathy and appreciation of worth. In some cases the magnitude of the work, and in others the hugeness of the masses of the individual stones of which they were composed, implied more than mere costliness, and indicated the consciousness of power and the ability to overcome the forces of nature, while it also gave evidence of the existence of organisation and co-operation which were the necessary concomitants of civilisation. And when to this indirect testimony they added the direct evidence of technical skill and artistic taste supplied by the presence of the various objects of use or ornament, in stone and bone, bronze and gold, amber and jet, which accompanied the remains interred in these constructions, they might well ask to what they would attribute these various manifestations if it was not culture in the individual that produced the skill and developed the taste, and if it was not civilisation in the society in which he lived and moved that furnished the means and the leisure that make culture possible.

Dr. Anderson in his third lecture treated of "The Culture and Cultivation of the Bronze Age." As there was, he said, no example of a dwelling or a stronghold which could be assigned to the bronze age in Scotland, the materials remaining from which to draw conclusions regarding its culture and civilisation consisted chiefly of the arms, implements, and ornaments of the people which have been preserved in the soil, though not associated with burials. These remains were found in hoards or deposits of greater or less numbers of articles, often of different varieties of form of character, and in single examples found casually in the soil. The first of the principal deposits which had been found in Scotland the lecturer spoke of was a large portion of a hoard of bronze objects which was presented to the Museum of the Society of Antiquaries in 1781, and which had been dredged up from the bottom of Duddingston Loch, Edinburgh. Sir Alexander Dick, who had established a system of marl dredging, in describing the circumstances of the "find," said that his men when dredging in deeper places than usual brought up a very weighty bag, which, on examination, proved to be a "heap of swords, spears, and other lumps of brass." The spear-heads, the lecturer stated, were mostly large leaf-shaped, with a cylindrical socket for the shaft prolonged into a tapering midrib extending to the point of the blade. The fragments of the swords showed that they had also leaf-shaped blades, with a flat handle-plate pierced by rivets. When the Queen's Drive, Edinburgh, was being formed in 1846, two swords of bronze similar to those found in the loch were found on the side of the hill overlooking the loch. They were both entire, and showed the perfect form of the swords found in the loch. One measured 26½ inches in length, and the other 24¾ inches. The form was peculiar, very different from anything that is seen in the iron age. The implements were short, and unfurnished with a guard; they were neither inelegant nor unpurpose-like, but, on the contrary, remarkably graceful in form and fitness of purpose. The blade was leaf-shaped, and widest at about two-thirds of its length from the handle-plate. Such a form of sword was not Roman, and it had not been in use since the period of the Roman invasion—the swords used at that time being of iron, the bronze swords, therefore, belonging to an earlier period, of which there was no historic record. He then referred to a number of bronze weapons and ornaments which were found in 1869 in excavations that were being carried on in Grosvenor Crescent. After minutely describing the formation of the swords, &c., he went on to speak of bronze implements and weapons, &c., found at Gogar, Brechin, Skye, Gospartrie (Fife), Achtertyre (Elgin), Killin, Highfield (Dingwall), Kingarth (Bute), Corsbie Moss (Berwickshire), Glenbervie, Shuna, Beith, and Yetholm. The total number of bronze objects discovered in different parts of Scotland was estimated at 61 bronze swords, 4 scabbard tips, 39 spear-heads, 3 broad, heavy, halbard-like blades; 4 shields, representing 111 weapons or implements of war; 31 socketed axe-heads, 8 plain circular rings, 3 penannular armlets, 4 pins, 2 annular discs, 1 gouge, 1 caldron, and 1 golden ornament, representing 51 articles of common use or ornament. The characteristics of the hoards in which these objects were found were (1) that they were not associated with human sepulture, and (2) that they all contained warlike weapons. He then proceeded to describe a series of deposits which contained no warlike weapons found at Premnay (Aberdeenshire), Bell's Mills (Water of Leith, Edinburgh), Poolewe (Ross-shire), Colleonard (Banffshire), and Tonderghie (Wigtownshire). The objects of the articles were the same as the warlike weapons. After referring to hoards of massive ornaments of gold found in various parts of the country, including Stirlingshire, Arran, Islay (where 36 gold armlets were found), Argyle, Lanark, Galloway,

Dumfriesshire, Slateford, near Edinburgh, &c., Dr. Anderson said that the examples he had given would suffice to show the prevalence of the use of gold in Scotland at a period when iron and silver did not appear among the industrial products of the people, and that bronze was the only metal employed in the fabrication of their cutting-tools and weapons. The prevalent use of gold in the age of bronze being a prominent and characteristic phenomenon, the question arose—How did the bronze-age people of Scotland become possessed of such a supply of what was now the representative of material wealth? There was no direct answer to such a question. The fact which was of importance was that they had the gold, and had it apparently in abundance. One thing he was sure of was that, from whatever source their supply of gold was obtained, it could not be obtained without its relative equivalent in labour or produce being given in return. If they imported these metals (copper, tin, and gold), the fact that a traffic so complex and costly was maintained and provided for implied the existence of the conditions of culture and systems of social and commercial and political organisation which could not be held to indicate a low condition of civilisation.

In summing up the characteristics of the peculiar phase of culture and civilisation as it was found manifesting itself in Scotland at this time, the lecturer said it was apparent the objects were manufactured within the country—first, because in many cases they exhibited special varieties of form peculiar to Scotland, and, second, because the moulds themselves were found in the soil in which the objects were found. Some of the works of which he had spoken were very fine, and the hammer-made articles had never been equalled in beautiful workmanship in more modern times. The people of that age also used gold in the mounting of their weapons, and most lavishly in personal adornment. Although nothing was known of their household life and manners, yet there was evidence of an indirect nature to indicate that they could not have been wholly destitute of the comforts and conveniences of life. The people were known now to the people of the present day, not from the circumstances in which they maintained themselves in life, but from the circumstances which were the direct result of their attitude of mind towards their dead. If life with them was a struggle for existence, they looked in vain for its memorials; but there was no wide district of country in which the memorials of their dead were not prominent, picturesque, and familiar features. In this, as in the preparation of the funeral pile, the fabrication of the finely ornamented urns, and the costly dedication of articles of use or adornment, freely renounced by the survivors, and set apart from the inheritance of the living as grave goods for the dead, was realised the intensity of their devotion to filial memories and family ties, to hereditary honour and ancestral tradition. The realisation of this was only attained by patient investigation, and after a long course of sustained and laborious effort to gather and preserve the mutilated relics and memorials of the piety and industry, the culture and cultivation of the bronze-age ancestors. The iron-shod progress of the present day tramples out the foot-marks of those who travelled in days gone past—their monuments were demolished, their graves ploughed, their bones scattered, liberty for their bones to lie undisturbed in the soil that was theirs before it belonged to the present generation, and which belongs to the people of the present day as it belonged to them, was refused them. This was done, and was called civilisation, and done also by the present age with the less compunction because they were called savages.

The remarkable horned cairns of Caithness formed the subject of Dr. Anderson's fourth lecture. On the crest of an eminence overlooking the south end of Yarhouse Loch were two of great magnitude, and within a short distance from each other—not circular but elongated in form, lying along the crest of the hill from east to west, diminishing in breadth and height from east to west, and with curved, horn-like projections at both ends of their structure. The larger of these cairns when excavated was found to be 240 feet long; and the breadth at the spring of the horn at the eastern end 66 feet, and at the western end 36 feet. The horns expanded in their curvature so as to make the line across their tops at the eastern end 92 feet and at the western end 53 feet. The extreme height of the cairn at the east end did not exceed 12 feet, and it sloped gradually to less than 5 feet at the west end. The removal of the loose stones from the upper part of the east or high end of the cairn disclosed a chamber with a passage leading into it. The chamber to which the passage gave access was excessively small as compared with the gigantic size of the cairn—being scarcely 12 feet in length and about 6 feet broad. The side walls were still entire to a height of 7 feet. The substance of the floor was a compacted mass, about 5 inches thick, of earthy clay plentifully intermixed with ashes, charcoal of wood, and calcined bones, in a condition of extreme comminution. Although the amount of bone ash which entered into the composition of this mass was very large, no single fragment of bone was discovered exceeding an inch in length; but the few fragments that did afford definite indications were unmistakably human in character. About a dozen chips of flint and two fragments of pottery—of a well-made, hard-baked, thin, black paste—were all the manufactured relics obtained. It was, in fact, the non-success of the search for relics that

suggested the direction of the investigation to other results. The best defined of the two projecting horns in front of the chamber was selected for examination. It was then discovered that this great cairn was a cairn only in external appearance, and for the same reason that the broch is a cairn, *i.e.* because it is a ruin. Originally, then, this great cairn, which by the dilapidation of ages had assumed the appearance of an oblong mass of loose stones, had been built upon a definite ground plan—240 feet long, 92 feet broad at one end, and 53 at the other—with a double wall defining its external outlines. It had been a construction in an architectural sense, with an external elevation, of which portions remained to the height of 4 feet. It was also a structure in the architectural sense by having an internal elevation—an interior chamber, covered by a roof partitioned off into compartments, and provided with accesses by a lintelled passage and an external doorway. It was not built with mortar or cement of any kind. Its stones were unsquared, and bore no mark of any tool. Its roof was partly flat and partly arched by the overlapping of the stones. In these respects its constructional features were not different from those of the dry-built structures of the early Christian period, or of the iron age of Pagan times. But its singularity of form, and the absolute individuality of its architectural conception, precluded the possibility of assigning to it any relationship with them. In fact they had hitherto met with no form of structure to which it was comparable. About 200 yards distant from this cairn, another closely resembling it was examined. Its extreme length was 190 feet, its greatest breadth 45 feet, and its least breadth 25 feet. From the inspection made, it also appeared to be a cairn through dilapidation, but not in reality. This was the most significant fact disclosed by these investigations. Its significance was partially seen when they remembered that all the sepulchres of the bronze and iron ages with which they had become familiar were absolutely structureless—were heaps of stones and earth piled over the cists or graves. Even the stone circles or boundary rings of standing stones, though possessing some features of construction, had none of the essential characteristics of a structure like this, with exterior and interior elevations, external walls and internal chambers, rough floored, and partitioned and furnished with doorways and passages. As yet they had met with nothing in the contents of these examples of this superior type of sepulchral structure which enabled them to associate the type with any one of the three stages of culture and civilisation characterised as the ages of iron, bronze, and stone. As the result of excavations of other and similar Caithness cairns, Dr. Anderson pointed out that they differed widely from the structureless cairns of the bronze age, and that their typical characteristics were:—(1) The presence of a definite external form which was structural, and (2) the presence of an interior chamber accessible by a passage and doorway. It was also apparent that in this small area of investigation there were two well-marked varieties of this typical form. One of these resembled the bronze age cairns in the circularity of its external form, while differing from them in its internal construction. The other differed from the bronze age cairns both in external configuration and internal construction. The inference was that the circular form passed on into the bronze age, while the other form did not; and that the form which was most unlike the bronze age form was the earlier of the two. But in their essential characteristics they were easily recognisable as outlying examples of a general type whose area was not confined to Scotland, although it was not known to extend beyond the bounds of Britain. A considerable number of examples had been more or less completely investigated in England, chiefly in Yorkshire, Wiltshire, and Gloucestershire. One of these, most recently excavated, measured 149 feet in length, 76 feet wide at the one end, 41 feet at the other, and 10 feet high. It was slightly horned at the one end, but it shared the English peculiarity of having no projecting horn at the narrow end. Entering from one side of the structure was a passage leading into the chamber, in which the remains of many burials were found. In singular agreement with the character of the Caithness burials, no implements, or ornaments, or pottery were found, with the single exception of a well-formed, leaf-shaped arrow-head of flint, which was found in the passage leading to the chamber. Other and similar examples were found in the same district. In view of the excessively pronounced peculiarities of this character, there was no escape from the inference that they were all the work of one race of men. In the words of the late Professor Rolleston, the peculiarities of a horned cairn were such that it was impossible to imagine that they did not indicate to us that one race of men, and one only, must have combined them as they are combined. And their geographical distribution showed, with equal conclusiveness, that of whatever stock that race might have been, they were a homogeneous people, spread over the whole area of Britain.

**Kelsale.**—The parish church of Kelsale has been restored from the plans of Mr. Norman Shaw. The work has been done in sections, and the last section of the work has now been completed. The contractors for the work were Messrs. Ludkin & Son, Benham, the architect being Mr. E. Prior.

## FRENCH ART SCHOOLS.

THE annual meeting of the Burslem School of Art was held on the 19th inst., when Professor Roscoe, a member of the Commission on Technical Instruction, distributed the prizes. After describing the progress of science teaching, he continued:—If in evening science instruction we in England excel, it is in art evening classes that we find the French pre-eminent. It is often said that the French have a natural taste for art, and that it is hopeless for England to compete with her in this department of industry. This I do not believe. England has produced artists of every grade and kind equal to any which France can boast, and therefore the capability of the Englishman to receive and to excel in art work is, I believe, certain. But he needs training, and that he has not yet had, either in pure or in applied art, to anything approaching the extent to which it is supplied to the French student. A well-known French artist has expressed his opinion respecting the highest walks of English art teaching, and with some degree of truth, that "your artists are not teachers, and your teachers are not artists"; and so we have not got the idea of the necessity for art teaching into our marrow as the French have, and our art teaching—whether from faults of the system or otherwise I am not competent to judge—does not do for the nation and the industries dependent upon art what the French and German schools do for their art industries. In this respect, I take it, we have much to learn and much to do before we are up to the level of Continental nations. To take one single example. When the Commissioners were in Paris, your excellent member and my valued friend Mr. Woodall, together with Mr. Swire Smith and myself, visited many of the night art schools. In one of these schools of design, situated in the Tenth Arrondissement, we found no less than 300 adult pupils, all of whom, you will please to remember, had been hard at work at their various trades for twelve hours before they entered the school, for there is no Fifty-six Hours Bill in Paris. There we saw engravers, stuff-designers, stone-masons, carpenters, decorators, and other tradesmen, to the number of forty or fifty, all drawing from the living model. In another room was a large mechanical drawing-class, where I saw an ordinary stonemason making a scale drawing of a skew bridge—a task which, I will undertake to say, very few working masons in England could do.

In a third room was a class of thirty men engaged in modelling in clay from a classic figure, and three or four other rooms were crammed full of artisans working hard at their art studies, and these same men came every night in the week. Then when I tell you that there are no less than thirty or forty such schools in Paris, all filled with anxious and diligent students, and when you compare this with our too sparsely attended schools of design, you will see that after all teaching has something to do with the prominence into which French taste and French fashion has forced itself throughout the markets of the world. But it may be replied that this demand for high art teaching, even amongst the artisan class, and the want of such a demand in England, proves that the French have a natural aptitude which fails in the Englishmen. Again, I feel certain that this is not so. The demand for further art training amongst the blouses is great because they have been taught whilst boys in school what drawing is, and they understand how important a part it plays in their future careers. The whole matter is summed up in two words. Our system, or I want of system, of teaching drawing in primary schools is execrably bad; the French system is excellently good. In the one case the boys learn nothing except to detest the whole business; in the other, children soon find that they benefit from the teaching. They then take an intelligent interest in the subject, and this expands into a decided taste, which grows with their growth and strengthens with their strength. In my opinion no subject whatever can be taught to young children which can exceed, if even it can compare, in importance with drawing. But then, of course, it must be properly taught. If properly taught it not only trains the hand and eye, but may be made the most excellent means of exercising the child's observing faculties, of teaching it accuracy and patience, and of rewarding it when the difficulties are successfully surmounted in a tangible definite form by the drawing which it takes home. Moreover, this teaching of drawing is the proper commencement of technical instruction for every trade and for every class of industry, and for every position in those trades and industries. From highest to lowest the power of representing correctly on paper what has to be worked out in reality, is a power which cannot be too highly prized, and yet it is one which, even amongst what are termed our educated classes, is rare enough. Now I maintain that our old-fashioned system of drawing from the flat leads to none of the above advantages; on the other hand, the time of the children is wasted, and not only so, but either their interest is never awakened or, what is worse, they are disgusted with the subject. The working of the continental system has exactly the opposite effect. In place of drawing pictures of old tubs and besoms, broken down cottages or equally valueless objects, the French boy begins almost at once to draw from the round—a simple cast of a leaf, for example. He then has some tool or simple piece of machinery placed on his desk. This he has first to sketch, then he accurately measures all the parts, and, noting

these, he afterwards has to construct a sectional drawing to scale of the object. Problems of constantly increasing complexity are thus placed before him, and the objects which he has to draw are such as are of everyday use, and of practical value, and the result is that the little French or German boy out of the street is able to draw, and draw accurately in a way which is absolutely astounding to an Englishman conversant only with the work of the ordinary primary English school. I am perfectly well aware that we have in England schools where drawing is well taught, as well perhaps as anywhere else. But the exception only proves the rule, and I am convinced that if the Education Department and the school boards, and the public generally, were to insist upon and carry out through the length and breadth of the country the foundation of a rational system of drawing-teaching, such as that I have briefly described, and such as is to be seen at work in almost every elementary school on the Continent, more would thus be done towards the solution of the question of our technical instruction than many might at first sight suppose.

### DECORATIVE ART.

THE first of a course of six lectures on "Decorative Art, Ornament, and Design," was delivered by Mr. J. H. Chamberlain, at the Midland Institute, Birmingham, on Tuesday evening. The notion of speaking upon the whole subject of decoration in six lectures was, he said, almost as absurd as a proposal made to him by a person whom he once met to teach him the French language in two lessons. With the permission, therefore, of his hearers, he would call his course of lectures simply an introduction to the study of decorative art, ornament, and design. The study of art might be either very wide or very narrow, and in this case the narrow way was not the safe one. They might, if they liked, study art in a narrow manner, and learn something about it. They might get hold of what was called the practical side of the question; they might learn maxims and get receipts; they might get to understand some of the outward characteristics of style, and attain a good deal of what was commonly called "art knowledge," so as to practise for themselves, doubtless with a considerable degree of success; but if they had no more knowledge than that, he ventured to say that they would be, as far as regarded art itself, entirely uneducated persons, and their practice would be merely empiricism, or what the world called quackery, and they would not have any real insight into the business to which they affected to belong. To understand any single phase of art required very prolonged and very wide study. Even if they said they would confine themselves to one particular style, they would find that it was impossible to understand that style without going back for hundreds, perhaps thousands, of years. They would find themselves obliged to look at what the rest of the nations of the world were doing at the same time, they must understand kindred styles, and they must go on even to some examination of the subsequent career of the particular style they were studying. This was true if they wanted simply to learn such a comparatively easy matter as the history of the style; but if they wanted to get at what was, really, after all, the only kind of art knowledge that was thoroughly worth knowing, they needed to understand not only the outward characteristics of the style, but its inner life—not only its history, but the reasons of its course—and so they would find their study gradually widening until the task became a gigantic one. In fact, none of them need be ashamed to acknowledge the truth, that however much they might work at that ever-widening subject, they would be ignorant of a very large portion of it. Art having to do with the mind, with the heart and soul, being guided by feeling and passion, being the product of joy and hope and love, and a great many other mental matters, it was quite impossible to understand the art of any past era and of any past nation unless they knew more than its outward signs, and unless they were able to understand something of that nation's joy. Owing to the ignorance which prevailed there were many persons who held that in the differences of opinion which prevailed as regarded art it was "no use disputing about taste," that taste had no special value, and that in art there was no standard of right or wrong. He hoped that those to whom he was speaking would not take that as the correct verdict, and it would be his effort to show in these lectures that there was some attainable standard of right and wrong in art. So little was the true nature of art understood by most people that they would find solemn treatises and solemn people ready to say that art was simply a sign of national decay; that it had never flourished in any age when that age had been at its best; that it was the offspring of luxury and effeminacy; a toy and plaything to please the idle moments of voluptuaries and fools. Such false ideas would be dispelled if people knew what art really was, and if they examined it by its only true key. Art was only another history of man's humanity. It was a history of man's wants and of his efforts to satisfy them—a history of man's soul, written in a language which was, perhaps, difficult to read and easy to misinterpret, but still the most permanent language the world had known. Had the true nature of art been known it would, the lecturer pointed out, have saved them from many mis-

takes, and especially from futile endeavours to restore or bring back some art that had perished, or that which had outlived its uses. Such knowledge would have shown them that if they must revive things they could only revive them, as Shakespere said, "with a difference"; and even revival of that kind was only possible where something at least of the same state of civilisation and the same state of society as that which made the art remained until the present hour. We were rough enough and rude enough in some things; but our roughness and rudeness was not like that which found expression in the Gothic art. They asked a stonemason to make them a Gothic quatrefoil, and he forthwith took his compass and struck four accurate circles. If they ordered him to do it with the irregularity of the antique, he would not do so; or, if he attempted it, he would give them a regularity of irregularity. It was impossible to revive archaic art, or to imitate that of another nation in which the conditions of civilisation were different. The lecturer illustrated this from the experience of the last few years in the imitation of Japanese art, and from the attempted revivals of the Greek, Roman, and Egyptian, Gothic, and other ancient forms of art. It was a curious thing that we should be always digging up the dead, and reviving ghosts. We went through some sort of art incantation, expecting to see life, and all that we achieved was to call up some miserable shade of it. There was, he thought, still hope for us if we would only try to learn what art was. We had been collecting stores of material and widening our idea of art. We saw that it had not been confined to one or two kingdoms only, but that it had been the heritage of all kinds and conditions of men—that there had been no nation which had not had some kind of art of its own by which it was able to communicate its feelings and thoughts to its fellows, and to hand down the record to the races succeeding. Mr. Chamberlain concluded by showing how art was the result of man's faculty of admiration, influenced by his physical wants, and urged his hearers to the cultivation of that faculty, stating that our future in art would be determined, first, by the warmth, truth, and sincerity of our admiration or the reverse; and in the second place by our skill in making plain the nature of that admiration, and revealing it to our fellow-men.

### LIVERPOOL ARCHITECTURAL SOCIETY.

AN address was delivered at the opening meeting of the session of the Liverpool Architectural Society by the president, Mr. William Parslow, F.R.I.B.A.

He said it was pleasing to observe the number of buildings in progress which gave evidence of skill and development in artistic power among the architects of Liverpool. A distinguished Town Councillor once exclaimed, "Architects in Liverpool! Why there are no architects in Liverpool." There was sufficient in those days to rebut such a doubt, but now there is a great deal more. They were pleased to have buildings by the privileged architects of London and elsewhere, but buildings by their townsmen show that the necessity does not exist to go out of Liverpool for architects. The cases where an outside architect has been appointed without competition, however, indicate that the Town Councillor's notion still prevails. Mr. Parslow said that as architects they could hardly condemn the Government for declining to erect a new post office in Liverpool. The position for a half-century of an important centre like a post office gives value to the property around, and many properties are acquired with the knowledge of the advantages consequent upon the position of such a building, the removal of which would be an injury to them. Owing to a similar cause, he knew of a case where property in one place sank in value 75 per cent., while sites, as in Victoria Street, went up 75 per cent. Recently a property for which a gentleman declined to give 400l. five years ago has been sold for over 30,000l., this increase in value being due to improvements in the vicinity. If they turned from the consideration of large structures to ordinary building, they saw a curious prospect before them. A contractor said recently that nobody will now build for investment, and to obtain reasonable interest on buildings is out of the question. It was well known that in the suburbs of Liverpool houses were offered to occupiers free for many months and afterwards at a nominal rent. Building societies lend money too freely to speculating builders. Then the mortgages are compelled to seize the properties and let them for a nominal sum in order to bring a return; and so general in all parts of the country has this experience become that all good property duly paid for in suburban districts has had to come down in rental value to compete with this class. The original purpose of the building societies was to enable prudent people to acquire their own houses at a moderate cost. Now they are employed for a different end, and in consequence building societies are succumbing to evils of their own creation. One society recently wrote off 8,000l. at a sweep in order to be rid of responsibilities.

They must all be pleased by seeing the action of the Government in controlling the manufacture of white lead in order to diminish the dangers to the workmen; the manufacture of oxide of zinc, which produces no such effects, might become a substitute. The

trouble that exists in grinding zinc when oxidised might, by due attention, be diminished. At present we keep to the old practice of using white lead. People are obstinately conservative in this particular who would abjure the name in politics. If we turn to the zinc in preference to lead, this article would doubtless soon compete favourably in price. Certainly it retains a purer whiteness than lead. Oxide of zinc is now used more in naval architecture than in buildings, and it is said to prove much more enduring when used for the painting of bulwarks, exposed to alternations of wet and dry, than oxide of lead.

Mr. Parslow afterwards referred to the expedients for the abatement of smoke in towns, the settlement of light and air cases, professional evidence in law courts, the Liverpool water supply, open spaces in towns, the St. George's Hall sculpture competition, the Mersey Tunnel, the Channel Tunnel, &c., and concluded with some advice to students.

### THE BIRMINGHAM CORPORATION AND ELECTRIC LIGHTING.

A REPORT has been prepared by the Gas Committee of the Birmingham Town Council, who have been engaged in considering whether the electric lighting of the town should be undertaken by the Council, or whether consent should be given to one or more of the applications for power of which notice has been given by electric lighting companies. It is recommended that the latter course should be adopted. The report explains that under the Electric Lighting Act certain powers are reserved to a local authority, when a licence has been granted a private company, to supply the light. It is supposed, for example, that the Board of Trade has the power to make provision in the licence or order that the local authority may control the breaking up of streets, may make contracts with an electric lighting company for the performance of this work, and themselves undertake the control and breaking up of the streets. No loss would therefore arise to the town if the Corporation declined to have a monopoly of the lighting. As regards the profits which might accrue to the town from such a monopoly, the committee say there are no reliable data on which an estimate can be formed of the prospect of a profitable supply of electricity being undertaken. So far as it is known there has been no instance of a profit having been derived from such a supply, but it has been replied that this is a presumption only, as no electric company has yet separated in its accounts the profit and loss on manufacture and supply. It must not, however, be lost sight of that some at least of the scientific witnesses examined before the Parliamentary Committee on the Electric Lighting Bill believed that such a profit is attainable; while others, and those perhaps with the best practical acquaintance with the subject, were more cautious, and stated that this had to be proved by experiment on a sufficient scale. One of them, Mr. Crompton, stated that no remunerative return was to be expected during the first seven years at least of the experiment. Mr. Gainsford, a member of the Town Council of Sheffield, who has been using electric lighting in collieries with which he is connected, is reported to have said in a recent debate in the Council of that town, that his experience had been that electricity cannot be provided at the price of gas, even when the motive power is provided free. The committee have calculated the cost of lighting the Market Hall Ward, containing about 1,000 yards square. There are in the ward 3,570 consumers, who are using at a moderate computation from 100,000 to 120,000 lights. The length of mains in the ward is nineteen and a half miles, and their value 13,500*l*. The capital account for gas, including mains and services, is 170,000*l*. It may, however, be noted that the cost of new gasworks, specially erected for lighting such an area, including distributive plant and meters, ought not now to exceed 100,000*l*. The cost of electric plant, dynamo, conductors, and services for 100,000 lights is estimated at 423,500*l*, exclusive of buildings, lands, &c. The minimum amount of capital that will be required must therefore considerably exceed 4*l*. per lamp. The only power to be obtained under the Electric Lighting Act is for the supply of electricity, and the Act expressly prohibits any arrangement by which profit on any particular form of lamp can be made an integral part of the system of supply. It follows, therefore, that the question of profit to be made by undertakers, whether local authorities or electric-lighting companies, must be considered as solely appertaining to the supply. It cannot be doubted that when conductors have been laid in any area, each of the owners of lamps and apparatus which are protected by patent will urge the employment of a particular lamp, and that while a profit on the manufacture and supply of lamps would thus be secured to them, the undertakers would be left with what has been shown to be an inevitably costly portion of the business.

The committee do not think it can be said that electricity is at present a public necessity. Dr. Siemens has said that electricity is the light of luxury, and that gas is, and will be, the poor man's friend. The committee, not differing with Dr. Siemens, quote his authority in support of their opinion, and are unable, so far as regards this reason, to recommend the expenditure of any portion of the corporate funds in an experiment for the advantage of a

portion only of the community. They do not believe that the rate-payers will be in any way prejudiced by the establishment of one or more companies in limited areas of supply. They are of opinion that the competition with gas at local prices will impose a sufficient limit to the price of electricity, that it will be possible to make due provision under such a concession for the retention by the Council of full control over the public streets, and to secure immediate progress with the installation, and that it will not be difficult to arrange that the concession shall be made for a moderate term.

The result of an undertaking to supply electricity would almost certainly impose an immediate burden on the ratepayers, with the ultimate prospect of a considerable loss. It is known that the principal difficulties of the proposed system lie in the distribution of electricity. Apart from cost, the difficulties of the generation of electricity and the construction of lamps may be said to have been overcome. A local authority undertaking the supply of electricity under the most favourable circumstances would have on its hands the costly and difficult part of the supply. It would, however, be serving the interests of companies whose profits are made by royalties on or the manufacture of dynamos, plant, and lamps, who would be able to attribute all the imperfections and failures of the system to the source of supply, and to whose interest it would be to foster a continual agitation for cheaper electricity. The committee believe that no sufficient reason can be shown to induce the Corporation to enter on a work which cannot fail to bring it anxieties, difficulties, and arduous labours, without the recompense of contributing to the welfare of the community as a whole, and which would involve financial responsibilities, with the uncertainty of adequate, if any, return. If, on the other hand, the companies are allowed to take the management of the supply, they will undertake also the responsibilities and difficulties appertaining to it. At the end of the term which is agreed upon, or which Parliament determines, as sufficient compensation to the company, the Corporation will have the same opportunity, but on more favourable terms, of acquiring the property, and will, if it has become profitable, have the same inducement in the saving of interest on capital employed as it had when it purchased the gas undertaking.

### LEWES PRIORY.

A MEETING of the Sussex Archaeological Society was held on the 19th inst. at Lewes. The remains of the Castle were visited. Afterwards Mr. Somers Clarke gave an explanation of the recent excavations at the Priory. He said he would presume that they were acquainted with the general history of the foundation of the Priory, and should only mention a few dates in reference to it. They all knew that the reception accorded to William de Warrenne and his wife Gundrada at the great monastery of Cluny, in Burgundy, decided them to place the religious house they proposed to form at Lewes under the Cluniac Order. They therefore arranged with Hugh, Abbot of Cluny, to send over three or four monks to England, and Lanzo and three others came over in 1077. They might presume that before the arrival of the monks the plan of the monastery had been laid out and the works commenced. It did not appear that William de Warrenne intended to found a house of great size. The somewhat modest dimensions of the church, as well as the small number of monks asked for, led to that conclusion. He wished to explain in passing what he meant by the modest dimensions of the church. They were all acquainted with the cathedral at Chichester, and knew it to be one of the smallest English cathedrals. The dimensions of this church are in almost every respect less than those of Chichester Cathedral, certainly the original dimensions were rather smaller, and therefore he was justified in saying that the scheme was not a very great one. The consecration took place between 1091 and 1097. He hoped they would be able to get at the date more accurately after further investigation. Mr. Clarke here proceeded to explain the plan of the building as he thought it existed up to the time of the first dedication, pointing out that the church was only 54 feet in extreme width, internal measure, and remarked that for this fact, together with all other information concerning the church, they were indebted to Mr. Parsons' plan. Allowing for the substantial piers always used by the Norman architects, he said it was evident the scheme of the building must have been a small one. He pointed out on the plan the position of the high altar, choir, cloister, dormitory, refectory, and where the kitchen and abbot's house probably stood, remarking that of the kitchen and abbot's house, there are no remains. He had no doubt the remains of an infirmary would be found, as this was a very important part of a monastic establishment, the aged monks being permitted relaxation from the somewhat severe discipline of the rules of the order. In the time of the third Earl de Warrenne, a second dedication took place, probably between 1136 and 1147. He supposed that the new church had a double transept, and that the accommodation of the brethren was very much increased. A comparison with other monastic buildings made the conclusion inevitable that the new church had double transepts, and the fact that the mother church at Cluny had them was in favour of that supposition. That building was of surpassing magnitude, and was

reconstructed in 1089. As the church in Lewes was begun about 1077, it must have been laid out earlier, and it was not, therefore, likely that it would have been affected by the plan of what was proposed to be done at Cluny. The great monastery at Cluny was already of long standing, and had become very wealthy. Its church had double aisles, double transepts, and besides these a building at the west end practically as large as many a large church. They had no account of the number of monks in residence at the Priory, but they must presume that the whole brotherhood had increased since the first foundation, and that they would require a larger dormitory. He could hardly account for the dormitory being carried so far south, and concluded that it must also have been re-erected. It was exceedingly probable that when they built the chapter-house, they increased the dormitory with it. He had abstracted several dates from a book that he had seen in the British Museum, which went to show that in 1218 the great infirmary was built, and two houses of the infirmary erected in 1219. In 1229 the first mass was celebrated in the new Lady Chapel, and a bequest of two hundred marks was made in 1268 towards completing the towers of the front of the church. In 1243 it is stated that on the anniversary day Earl Warrenne laid the foundation of "the new work at our church," but they were not quite sure about the application of this entry to Lewes. Before the suppression the Priory must have presented a magnificent appearance, more particularly as there were such a great number of persons of distinction buried in it. Mr. Clarke then referred to the work that had been done recently, and said that they had chiefly been engaged in clearing the place and taking much of the earth away from the dormitory, revealing the great enlargement that was made after the first foundation. They had not, however, up to the present time found any objects that seemed to be of great importance. A circular staircase was found in the north-east angle of the refectory similar to the one known before to exist.

Mr. Somers Clarke then referred to the courtesy of the London and Brighton Railway Company. A representative had been sent by the engineer to inform him of their willingness to place a fence round a portion of the ruins abutting upon the line, and to remove certain obstructions, so that visitors to the grounds might have free access to every part of the existing remains of the Priory. Mr. Clarke said he had to thank the members of the Sussex Archaeological Society for the help some of them had given him, but, in reply to some 600 notices sent out, he had only received seventeen contributions. He wished especially to thank Mr. Evelyn Blaker, who had not only given a handsome subscription, but had announced that he would pay any balance there might be on the wrong side, and he must also express his indebtedness to Mr. St. John Hope for having so opportunely come to his assistance, and superintended the excavations. He could only regret that that gentleman was not present to describe the ruins.

### THE SITE OF TROY.

A GENERAL meeting of the Society for the Promotion of Hellenic Studies was held on the 19th inst., when Professor Jebb read some notes on the site of Troy, based on a recent visit to the Troad in company with Professor W. W. Goodwin, Mr. Frank Calvert, Mr. J. T. Clarke, and a Prussian architect. The result of his observations had been to convince Professor Jebb in the first place that the extant remains did not warrant Dr. Schliemann's well-known theory of seven successive cities on the same site. These five observers could find no such number of distinct layers of *débris*. The remains of building, whether of brick or stone, were not, in their opinion, of such a character as to justify any positive assumption of period; and though, undoubtedly, brick buildings existed showing traces of fire, these were not sufficient in quantity to prove the existence of a city built entirely of brick, but only the co-existence of brick and stone. The evidence of pottery, on which Dr. Schliemann and others had laid stress, was not, Professor Jebb contended, by any means conclusive as to any period or succession of periods, so good an authority as M. Dumont having stated his conviction that it was impossible to say exactly to which period each kind of pottery belonged. On the general question of the comparative claims of Hissarlik, Bunarbashi, and other places in the Troad to be regarded as the site of Homer's Troy, Professor Jebb maintained that no one site in the Troad fulfilled all the conditions, and that it was unreasonable to suppose that Homer intended to draw an accurate picture of any given city. It was far more likely that he composed his Troy out of several places that were before his mind. Thus, though the main events of the poem might most appropriately be grouped around such a site as Hissarlik, it was impossible that so slight an eminence should be described as "windy" or "craggy," epithets which, however, were strictly applicable to Bunarbashi. In short, Professor Jebb regarded the search for the Troy of the "Iliad" as hopeless, because unreasonable. After some remarks upon the Greek tradition as to the site of Troy, Professor Jebb concluded by expressing his sense of the great services Dr. Schliemann has rendered to

archæology by his discoveries, adding that in his opinion the gratitude of scholars for these discoveries was better shown by a careful examination, and, if necessary, refutation, than by a hasty and ill-considered acceptance, of the theories Dr. Schliemann had based upon them. Mr. L. P. Farnell read a paper on the Gigantomachia as treated in the altar frieze lately discovered at Pergamon, and now at Berlin. After dealing with its relation to previous literature and tradition, the writer proceeded to discuss in detail the relation which the work bore to other known treatments of the same subject.

### ANCIENT CONVEYANCING.

THE opening lecture of the Law Classes of the Edinburgh University was delivered on Tuesday by Professor Tytler. The subject of the lecture was "A Sketch of the Early History of Conveyancing." Conveyancing, he said, was coeval with the idea of property itself. Even in the rudest form of civilisation there existed certain forms and ceremonies by which all transactions or covenants dealing with property were ratified. The possession of movables was *prima facie* evidence that they were the property of the possessor; but actual occupancy of land was not necessarily a test of property. After a reference to the early methods of land transfer in the East mentioned in the Bible, both before and after writing was made use of in the transaction, two Persian instances recently discovered were also given, relating to the reigns of Nebuchadnezzar and Darius. In these cases the deeds were recorded on terra-cotta plates, one side of which had a carefully-executed plan of the land sold, and the names of the adjoining proprietors. Conveyancing in the early days of Rome was next referred to, certain recognised forms and ceremonies being then deemed of more importance for the transfer than any writing, which was only the evidence of their due performance. At an early period Rome had a public register for such deeds. In many of these transactions they could trace the germs of their own form. The Royal Charters of Rome were the models for subsequent documents of the same description in this country, some of which were almost in the same words. The ceremony of transmission of land under the feudal system was, he showed, copied in some of its particulars from the Romans. The barbarians who invaded the Empire disposed of the land they conquered according to the fundamental principle of the feudal system, which was a disposition of the soil by the prince or leader of free grants to his followers, under the condition and obligation that they, for their part, should render to him military service. These grants were at first only for a time or for life, and it was not until the time of Charlemagne that they became, properly speaking, hereditary. Speaking of early methods in this country, he said the Britons never took kindly to the Roman system, and that was superseded when the Saxon invasion took place. A reference to the early Saxon deeds as being brief and simple was by the students greeted with loud applause. In England the form of charter which was used until a few years ago was fixed about the time of Edward. The early Scotch charters were very much the same as those of England; but latterly they differed very much. How that came about he could not there examine; but it was likely to be attributed to their legal institutions having been founded so much more on the Roman law than those of England—a circumstance which might be explained by their early and close connection with France.

### THE THAMES COMMUNICATION QUESTION.

THE Committee of the Metropolitan Board of Works, to whom the schemes of Sir J. W. Bazalgette for new means of communication between the north and south sides of the Thames had been referred, have arrived at the conclusion that immediate steps should be taken to furnish at least three additional means of communication between the two sides of the river at the points indicated by the engineer upon his plans—viz., the Tower, Shadwell, and Blackwall. They are not prepared, however, to express any opinion as to the form or mode of communication to be provided. This, they urge, is a question which will require much more consideration, and upon which it is not necessary for the Board to come to a decision at present. What has first to be determined upon is whether additional means of communication shall be provided, having regard both to the public needs and to the financial considerations involved. It is unnecessary to point out that the cost of the undertakings, whatever form they may assume, will be very great, and the Board, before determining on them, will doubtless wish to ascertain whether anything can be done to reduce the prospective charge on the rates which will follow on their being carried out. The indirect taxation which now exists in the shape of the coal and wine duties at once suggests itself as the most simple and equitable method of affording the relief required. The duties are now leviable until July 1889. Representations have from time to time been made to the Government in recent years as to the expediency of extending the time during which the duties are

authorised to be levied, and the answer of the Government has hitherto been to the effect that it would be well to wait until nearer the time when the duties will expire before asking the Legislature to prolong them. This time is approaching, and the Committee of the Metropolitan Board of Works are of opinion that next session will not be too early for Parliament to be asked to prolong the time within which the duties may be levied. The Committee recommend that the Government be informed that in the Board's opinion three additional means of communication are required between the two sides of the Thames, and that the Government be asked to introduce into Parliament in the next session a Bill to prolong the period for levying the coal and wine duties.

## LEGAL.

### Hanley County Court.

**KELLY v. EARL GRANVILLE.—EMPLOYERS' LIABILITY ACT.**

Judgment has been given by Mr. Holroyd, County Court Judge, in an action brought under the Employers' Liability Act by the plaintiff, as the widow of Thomas Kelly, who was killed whilst working upon the premises of the defendant. It was alleged that the death resulted from a defect in the condition of the plant used in the business of the defendant, "such defect being the deficiency of ropes and pulleys or other proper appliances for safely lowering the beams of timber of an engine-house"; secondly, from the negligence of Wallace, a person in the service of the defendant, who had superintendence entrusted to him; and thirdly, from the negligence of Wallace, to whose orders or directions the deceased was bound to conform and did conform, the injury having resulted from his having so conformed. At the time of the accident the deceased and some other workmen were engaged in demolishing an engine-house at the Shelton Bar Ironworks. The building was composed of three floors. The whole of the operations were under the direction of William Rees; Wallace was the foreman bricklayer under Rees. He was a working foreman, and worked himself. On the ground-floor, where the deceased was removing tiles from a box, was a crossbeam. The mode of taking down the timbers of the roof was by sawing through the beams and letting them fall to the floor below. Under ordinary circumstances there was no danger in this operation, for it was not disputed that the floor was sufficient to resist the fall of the beams. In the floor, however, was a hole. By some unfortunate mischance one of the beams, in falling from above, instead of resting on the floor, went through the hole, and, striking on the crossbeam, which was about six feet from the ground-floor, bounded off and struck Kelly, inflicting injuries which resulted in his death.

In giving judgment Mr. Holroyd said—The first head of claim mentioned in the particulars cannot in my opinion be sustained, for it alleges that there was "defect in the condition of the plant." I do not think that the word "defect," as used in the Act, means that the best method has not been used for attaining the desired object; but that there was some imperfection or fault existing in the plant or machinery itself. For instance, to take the present case, if ropes and pulleys which were rotten had been employed for lowering the beams, it perhaps might be said that the plant was defective, but here what the plaintiff really complains of is that an improper mode was used in the lowering of the timber from the roof—that is, by letting it fall; and it seems to me that an improper scheme or mode of operation does not fall within the first subsection. The second head complains of the negligence of Wallace, a person in the service of the defendant who has superintendence entrusted to him. The plaintiff cannot maintain the cause of action here relied upon, for on turning to the interpretation clause (section 8) it will be found that the expression "person who has superintendence entrusted to him" means one who is not ordinarily employed in manual labour; and here the evidence is that Wallace was a bricklayer, although a foreman, and worked himself. The third head is that the death resulted from the negligence of Wallace, to whose orders the deceased was bound to conform and did conform. This head of claim requires greater consideration than the two former, for the deceased was bound to obey the orders of Wallace, and Wallace sent him to work at the spot where he met his death. He therefore did conform to the directions of Wallace, and from so doing he met with the injuries which resulted in his death. The question then resolves itself into this—Was there any negligence on the part of Wallace? Or, in other words, was the place where Kelly was working unsafe? For it must be taken that if the place was unsafe, Wallace must have been aware of the nature of the operations and of the danger if any existed. The alleged negligence of Wallace consisted in this—that he sent the deceased to unload the box of tiles, although he knew that to work on the ground floor was unsafe whilst beams of timber were allowed to fall from the roof. But it must be recollected that the beams were intended to fall upon the floor of an upper storey. If they had so fallen they would have rested there and have been lowered afterwards; and in that event no injury could have befallen any person on the ground-floor, but unfortunately there was the hole, and through this hole a beam unexpectedly fell, which, striking upon a cross-beam and bounding off, struck Kelly, ultimately causing his death.

It seems to me that this result could not have been anticipated by any human foresight. The deceased was not put to work under the hole, but at a little distance on one side. It was a singular accident, and one which happened contrary to all reasonable expectation and without the default of any person. I therefore find myself compelled to give my judgment for the defendant.

On application a case was granted.

## SCHOOL BUILDINGS.

**Rawtenstall.**—New schools, to provide for Sunday-school as well as day-school purposes, are to be erected in Henry Street. A large room will also be provided for public assemblies, to seat 2,000. The architect is Mr. Lawrence Booth, of 88 King Street, Manchester.

**Kirkheaton.**—The corner-stone of a new Infant school has lately been laid, the site of the building comprising a plot of 2,000 square yards at Fields, Kirkheaton. Accommodation is to be provided for 200 children at an estimated cost of 1,300*l.*, which is at the rate of 6*l.* 10*s.* per head. The architect is Mr. J. W. Cocking, of Huddersfield.

**Leytonstone.**—A new Sunday-school and lecture hall connected with the Baptist chapel at Leytonstone was opened on Thursday the 19th. The cost was about 2,000*l.*, and the works have been carried out by Mr. J. Marsland, builder, of Walworth, under the direction of Mr. John E. Sears, A.R.I.B.A., architect.

**Bath.**—A Board school has been opened in Dover Street. A free treatment of Tudor style has been adopted for the building, which is of rubble stone faced with Bath freestone. Mr. C. B. Oliver, of London and Bath, is the architect, and Mr. Edward Gay, of Bath, the builder. The heating arrangement is by hot water on the high-pressure principle, by Messrs. Bacon & Son, London. Messrs. Kaye & Co., of London, supplied the patent door-locks.

## NEW BUILDINGS.

**Manchester.**—A nurses' home has been erected in the grounds of the Infirmary, and will shortly be ready for occupation. The building is of white-faced bricks, the interior fittings throughout being of pitch-pine. It is three storeys in height, twenty-eight bedrooms being on each floor, with special sitting-rooms for superintendents. Messrs. Pennington & Bridgen, of Manchester, are the architects; and the contractors, Messrs. W. Southern & Sons.

**Reformatory, Glasgow.**—A reformatory for girls at East Chapelon was formally opened on Saturday. The reformatory is two storeys in height. It has a frontage measuring 78 feet in length, while the wings on either side extend backwards for a distance of 82 feet 6 inches. On the lower flat the schoolroom, workrooms, dining-room, kitchen, and the matron's apartments are situated, while the upper storey is occupied with two large dormitories, sick-room, lavatory, and other accommodation. The rooms are large, lofty, and thoroughly ventilated. In the adjoining premises the washing-house, laundry, and dairy are conveniently situated. The building, which is intended to accommodate sixty girls, has been erected from designs prepared by Mr John Honeyman, architect, Glasgow.

## CHURCH BUILDING AND RESTORATION.

**Blochairn, N.B.**—The memorial-stone of a Free church has been laid. The church, which is designed by Mr. Malcolm Stark, jun., 167 St. Vincent Street, Glasgow, is of the fourteenth-century type of pointed architecture, and is being erected to accommodate about 800. A clock tower rises to a height of 135 feet. The cost will be about 2,900*l.*

**Latchley.**—The foundation-stone of a chapel of ease has been laid for the parish of Calstock in an out-of-the-way part of the parish. Mr. J. P. St. Aubyn is the architect, and the work will be carried out by Mr. Roskelly, of Albaston. The chapel is being built by the inhabitants mainly, those who cannot subscribe contributing labour, &c.

**Bickleigh.**—The parish church has been reopened after undergoing works of restoration and renovation. The works have been carried out under the direction of Mr. Sedding, by Mr. Cowling, of Bickleigh, builder.

**Tidcombe.**—The church at Tidcombe has been reopened after restoration. The work of restoration has been carried out under the direction of Mr. Walter Money, architect, of Newbury.

**Seaforth.**—A Congregational church has been opened. The building is of grey brick, with Stourton stone dressings; to accommodate 400 persons. Mr. Thomas Cook, of Liverpool, is the architect; and Mr. J. Holmes, of Seaforth, the contractor.

**Pelynt.**—The parish church has been reopened, after being closed for about a year for works of restoration. The restoration has been carried out from the designs of Mr. J. P. St. Aubyn. The works were executed by Mr. J. Slade, sen., joiner; Mr. P. Lean, jun., mason; and the glazing has been done by Messrs. Watson & Fouracre, of Plymouth.

**Bolam.**—The parish church has been re-seated and the building re-roofed, the chancel roof raised to its original position, and other improvements effected, under the direction of Mr. F. R. Wilson, of Alnwick.

**South Wrexall.**—The church of St. James has been reopened on the completion of works of restoration. Messrs. Weaver & Adye, of Devizes and Bradford-on-Avon, are the architects; the contractor being Mr. James Burgess, of Westbury.

**Marlow.**—Various alterations and improvements have been carried out at the parish church, which has lately been reopened. The work has been done by Mr. Y. J. Lovell, under the direction of Mr. J. J. Oldrid Scott.

**Glasbury.**—A new church, dedicated to All Saints, has been opened in the neighbourhood of Glasbury. The church has been erected from the designs of Mr. G. C. Haddon, of Hereford, selected in competition. The building is of stone from the Maesllwch estate.

**Stonehouse.**—The parish church of Stonehouse has been reopened after alteration and renovation, carried out from the plans of Mr. H. J. Snell, of Plymouth. A new chancel, organ-chamber, and vestry have been added, and the former vestry converted into a baptistery. Messrs. Palk & Partridge, of Plymouth, were the contractors.

### SANITARY WORKS.

**Cost of Sanitary Works.**—According to the report of the Local Government Board, the loans of urban and rural sanitary authorities sanctioned since 1871 amount to 24,283,257*l.*, in addition to about ten millions previously borrowed. In the last nine years urban authorities have borrowed for sanitary improvements 19,890,674*l.*, and rural authorities 1,619,396*l.* In addition, in 1876–81, loans authorised under the Artisans' and Labourers' Dwellings Improvement Act have amounted to 1,903,353*l.*; and joint boards have been empowered to borrow 689,635*l.*, mainly for sewerage. In 1879–80–81, loans for water supply have amounted to 293,880*l.*, 420,932*l.*, and 305,187*l.* in urban districts, and in rural districts to 75,473*l.*, 53,191*l.*, and 67,593*l.* For sewerage and sewage disposal they have amounted to 1,088,819*l.*, 947,540*l.*, and 593,903*l.* in urban districts, and 191,097*l.*, 98,731*l.*, and 160,267*l.* in rural districts. In some instances irregularities have been detected on the part of the authorities in relation to the liquidation of outstanding loans. They have been urged to put their financial affairs in a more satisfactory position, and in several instances arrears have been discharged and more regularity observed in the setting aside and proper investment of sinking funds. But borrowing powers exercisable without the sanction of the Board are conferred by Parliament. In ten years, exclusive of annuities and unascertained amounts, Parliament has authorised the borrowing of 33,381,517*l.*, against 24,283,257*l.* sanctioned by the Board. But in 1881 the Parliamentary sanction covered only 1,548,025*l.*, against 2,526,190*l.* requiring the sanction of the Board. Under the Artisans' and Labourers' Dwellings Improvement Act the Board have authorised the borrowing of 1,878,374*l.*, and have recommended the advance of all except 57,374*l.* by the Commissioners at a low rate of interest. The borrowers were—Birmingham, 1,500,000*l.*; Liverpool, 50,000*l.*; Norwich, 10,000*l.*; Swansea, 121,000*l.*; Walsall, 15,000*l.*; and Wolverhampton, 182,374*l.*

### GENERAL.

**M. Maspero**, the Curator of the Boulak Museum, returned to Cairo on October 6. He has made an examination of the contents of the museum, and has announced that he finds everything absolutely as it was left by him.

**Mr. Woolner, R.A.**, has completed a bust of Mr. Gladstone for the Corporation of London. A bust of Lord Beaconsfield, by Mr. Belt, is also to be added to the Guildhall collection.

**Mr. C. J. Heywood**, of Chaseley, has undertaken the cost of restoring a bay in the nave of Manchester Cathedral.

**Mr. George Fuller**, who for many years assisted his father, the late Mr. George Fuller, has commenced business as a land agent and surveyor at 35 Bucklersbury, E.C.

**Mr. J. Sant, R.A.**, has painted a portrait of Lady Bolsover, which has been presented to the Baroness by the tradespeople of the district.

**Miss Ascough**, member of the Birmingham Society of Artists, has painted a picture of the well-known St. Bernard "Hermit," owned by Mr. Goodwin, Dudley.

**Mr. J. Thomas**, City Surveyor of Bristol, has visited Bideford this week to inspect and adjudicate on the plans for the new market.

**Mr. W. E. Glasier and Mr. W. E. M. Glasier** have retired from the firm of Messrs. Glasier & Sons, surveyors and land agents, of Charing Cross, and Mr. G. H. Brougham Glasier has taken into partnership Mr. Henry J. Dowden, who for many years past has been with Messrs. Driver & Co., of Whitehall. The style of the firm will still be Glasier & Sons.

**The Building Works** belonging to Messrs. Bull & Sons at Southampton have been destroyed by fire. In addition to Messrs. Bull & Sons' valuable plant, machinery, stock of seasoned wood, &c., a large quantity of prepared carving and other works for the completion of the Law Courts and for the new Houses of Parliament, which the firm are now erecting at Cape Town, was destroyed.

**An Art Exhibition** was opened at Stafford on Tuesday. It contains a collection of paintings by ancient and modern masters, which have been lent from private galleries in the county, pottery from most of the leading manufacturers of North Staffordshire, art metal work, &c.

**An Arcade** of fourteen shops and four houses, roofed with glass, is to be erected at Ilfracombe. Messrs. Robbins & Co., of Ilfracombe, are the architects. The estimated cost of the work is about 3,000*l.* Mr. J. L. Brooks is the contractor.

**Hardwick Church**, in the county of Norfolk, has been restored. Sir Peter Gleane, a supporter of Charles I. and a frequent benefactor to the parish, was the donor of the seventeenth-century carved woodwork. His pew in the chancel was so large that it acquired the nickname of the "bedstead pew"; this has now been removed to the west end of the church, and does duty as a vestry.

**A Mural Monument**, executed by Mr. T. King, of Hereford, from the designs of Mr. Lewis Powell, architect, of Hereford, has been erected in Weobley parish church, in memory of Mrs. Moore, of Chadnor.

**A Large Highway Bridge** over the River Dee at Newbridge, Ruabon, has been condemned by the county surveyor and traffic stopped. The reconstruction will take about six months to effect.

**Six Bronze Statuettes**, of good workmanship, in excellent preservation, have been recently excavated at Pompeii, representing Apollo with his lyre, Mercury, Esculapius, Hercules, and two Lares. They were found, together with a bronze lamp, in a little shrine, on the walls of which is painted a figure of Fortune.

**The Liverpool Art Club** have arranged to hold a loan exhibition of works by the late Hablot K. Browne ("Phiz").

**The Tunnel under the Elbe**, between the town of Hamburg and the island of Steinwärder, has been opened. It is 800 metres in length, and cost about 1,000,000*l.*

**The Public Monuments Admission Fees** in Edinburgh have, after paying all expenses connected with the care of monuments, left a profit for the year of 286*l.* 2*s.* 3*d.* From the accumulation of the balances the Town Council have been able to expend 1,418*l.* 4*s.* 10*d.* on statues and statuettes, which have been placed during the year in the niches of the Scott Monument, while there still remains a balance of money in hand amounting to 1,442*l.* 17*s.* 6*d.*

**The Theatre Royal, Glasgow**, was on Wednesday offered for sale at the reduced upset price of 12,000*l.*, being 6,000*l.* under the sum at which the building was first exposed on August 2 last. The Glasgow Theatre and Opera House Company, Limited, were the purchasers at the upset price.

**The Manchester City Council** have approved of a resolution that application should be made to the Board of Trade for powers to supply electricity for public and private purposes within the city.

**The Walker Art Gallery**, Liverpool, has been enriched with the following donations:—A portrait of Mr. D. MacIver, M.P., by Hubert Herkomer; *Venus beseeching Vulcan to forge a Suit of Armour for Aeneas*, by Rubens (from the collection of the late Don Miguel, of Spain); *The Holy Family*, artist unknown, but supposed to be of the Bolognese school; landscape, by Francesco Casanova Romanelli; *The Rape of Europa* (from the collection of the late Alexander Nowell, of Underly Park, Westmoreland); landscape, by Gaspard Poussin (from the collection of the late A. Nowell); *A German Birthday in 1575*, by C. Napier Hemy. *An Incident of Isandula*, by Mr. Woodville, is to be purchased for the permanent collection.

**The New Municipal Buildings, Ayr.**—A meeting of the Town Council of Ayr was held on Monday, when abstracts of the accounts for the new municipal buildings were presented. The Provost said the total cost amounted to 38,917*l.* 15*s.* 2*d.* This sum included the cost of site, also of the portion of the old buildings which had been connected with the new. It might appear very much in excess of the original estimate, but it was never expected that the buildings would be completed without large additions to the estimates, as no account was taken of the cost of repairs and alterations of the old buildings, although moderate schedule rates were fixed for the work; and during the course of construction another property was purchased, and a large addition made to the back portion of the building.

# The Architect.

## THE PROGRESS OF FURNITURE EXHIBITIONS.

AMONGST the various forms which have been assumed by the enterprise of collecting for public exhibition the productions of current invention, there has been none, as we presume to think, and can be none, of more direct and substantial interest to the English people than the display in this manner of the goods which the rival manufacturers of furniture—

taking the phrase in a wide sense—are presenting from day to day for their purchase. It matters not for the purpose of our argument whether the style, taste, feeling, and so forth, prevalent at the moment may be regarded as good or bad, worthy or unworthy, hopeful or not; the proposition we venture to lay down (and we are proud to say it has been long ago dwelt upon in this journal) is no less than this—that of all artistic work whatever, that kind which in the greatest measure promotes the enjoyment of all, and calls for the sympathy of all, from the highest to the lowest in the land, is the unpretentious work of everyday ornament and decoration in connection with the household goods which are indeed our household gods. There are many millions of us to whom the periodical exhibitions of paintings and sculpture at the west end of London are unknown; to whom the historical collections at South Kensington are unintelligible; to whom a Hamilton sale is but a stroke of business in the empyrean; to whom the National Gallery and the British Museum are no more than the Arabian Nights' Entertainments and the Lord Mayor's Show, all standing on the same unpractical level as wonders of the world not wholly beyond the suspicion of necromancy; millions of the supercilious well-to-do whose god, when not their belly, is their breeches-pocket, and whose opinion of "boets and bainters" is no better than King GEORGE II.'s; millions of aspiring shopkeepers, whose emotions reach never higher than the level of the parish vestry; millions of hard-working operatives whose excursions into dreamland are only of the type of a bean-feast at Gravesend or a Bank Holiday in Epping Forest; and, alas! millions upon millions still whose lives are passed in the squalor and grime of abject toil and the soul's dirt of too degrading recreations; and yet there shall be found amongst all these millions only exceptions sufficient to prove the rule that none are so lowly and despicable as to be without that sense of (let us call it) finery which seeks pleasure and secures it in the little graces of household stuff, and none so exalted in dignity or in intellect as to rise superior to the self-same cheap delight.

The Fine Art Industrial Exhibition now open at Manchester seems to be an exceedingly satisfactory illustration of the great progress which England is making in the direction of extending and expanding this enjoyment of household art. If we compare it with such exhibitions of furniture, for instance, as those which have been held in the hall at Islington only recently, we cannot help perceiving that there is a motive at work which is beginning at last to assert itself more boldly in the right direction. That is to say, the merits of mere workmanship and price are giving place to those of artistic design, and there is growing up a recognition of the fact that Art is All Art, and not two or three select provinces of Art. And thus there is spreading abroad every day that practical liberality of artistic principle which, already identified with the unexpected admission of a decorative specialist into the Royal Academy, may before many more years have passed lead to the acceptance in that supreme representative body, without any misgiving, of not one but many specialists of the same class, and those not nominally and academically architects, but actually and confessedly manufacturing tradesmen. The collection now in question no longer concerns itself materially with what are called the higher arts. In other words, the promoters of such an enterprise no longer waste their energies in the affectation of a belief in the exclusive traditions of the old Italian Academies, in which the *credo*, dignified but crude, went to maintain that "the Arts" had always been in number

exactly three, and three must always remain. This short-sighted and narrow view of things may remind us of the time when astronomers were taught to observe in the space between Mars and Jupiter four stars, into which it had pleased the powers of Nature to subdivide, as it was thought, by some explosive force the proper planet of the system once revolving there. Ceres, Pallas, Juno, and Vesta, they were called, and there was an end of them. But in process of time there came into the field of inquiry explorers who discovered a fifth, a sixth, at length a twentieth, a fiftieth, a hundred and twentieth, a hundred and fiftieth, and ten or a dozen in a single year, and six or seven brought in one after another by those audacious discoverers of the futility of traditions, the Anglo-Americans, men bearing homely names like PETERS and WATSON, and wielding the weapons of discovery at places with names as homely, such as Clinton and Ann Arbor. So also of the three arts which constituted in our youth "the circle of the Arts" formative and constructive—leaving poetry and music, that is to say, apart, and keeping to architecture, sculpture, and painting—all alike are now being multiplied day by day by the recognition, not of new and strange arts, but of old arts well known and well worn, and more or less widely practised from time immemorial, but for some reason hitherto held in a vague kind of subjection or bondage, or relegated to an unexplained inferiority, and chiefly because their practitioners were "tradesmen" and "manufacturers," and therefore not "artists," painting and carving and designing and constructing in "workshops" and not "studios"; the whole distinction, however, beginning to vanish, and gradually vanishing more and more, into thin air, or something thinner than air, as common sense is applied to the true state of the case. An exhibition, therefore, now and then, of the works of these artistic tradesmen and their workshops, is all that is wanted to complete the dissipation of the clouds of priggish prejudice which have hitherto obscured the true application of the great artistic doctrine of the day—the unity of art in all its many-sidedness, and the "égalité" of artists in all their variety of pursuits.

Professed poetry is proverbially akin to madness; and it is part of the price which Mr. MORRIS must continue to pay for having acquired a poetical reputation that his more prosaic utterances will be taken for ever by the multitude with a large grain of salt. To be plain with him, it is doubtful whether one Englishman in a hundred to whom the author of *The Earthly Paradise* might in the way of honest trade communicate the price of a piece of wall hanging, would find himself at all able to believe what he had been told in the ordinary sense of the language, unless it were confirmed by the untainted testimony of some more sober-minded member of his commercial staff. Accordingly, when he makes his speech at Manchester—and a very able speech it is—upon the Progress of Decorative Art in England,\* the great "aesthetic upholsterer" must not expect the average reader to receive it in precisely the way that is intended; and if for this very reason it comes to pass that he himself is led to use language not "understood of the people," this is but a natural reaction which, if it increases mutual embarrassment, fortunately does not now decrease, as once it might have done, mutual honour and confidence. But at any rate, figurative as his phraseology may sometimes appear to be in the eyes of such as the Manchester cotton printers—and perhaps particularly so when he invites those shrewd votaries of commerce pure and simple to regard themselves as such functionaries of the aesthetic that every one of them "most certainly should be somewhat of an artist," so that he may "turn out nothing but what may do credit to his own reason and intellect," thereby "making up his mind to give up a great part, probably the greatest part, of his business," and thereby "make a new era in the advance of the art"—figurative as such language may seem to be, no doubt need be entertained, even by the most prosaic dealer in the driest of dry goods, that there is here expressed a great principle of trade. That principle is, no more, but no less, than this—that if Manchester cottons, as a typical manufacture, are to retain their place in the markets of the world, it is greatly by the aid of artistic design that this must be done. So also with many other things—if English workpeople are to keep their hold upon even the English public, it is greatly by the artistic touch that this must be done. No exhibitions, therefore, of those miscellaneous things of personal and household use to which we are indebted for so much everyday pleasure, ought nowadays to be other-

\* See p. 262 ante; October 28.

wise than exhibitions of things artistic. We need not disparage the manipulative excellence of high-class workmanship ; but the time is coming when, without artistic feeling, the best of this will be driven out of the field—we do not say by inferior work, but by work equally good *plus* superior design. For this superior design, be it remembered, costs very little in money, and not necessarily very much in brains ; and if, as Mr. MORRIS hints, the manufacturer will but take the trouble to cultivate what artistic power may happen to be in himself, the profit may cost him nothing at all but the pleasure of intellectual exercise.

#### NOTES ON WINTER EXHIBITIONS.

THE winter season is heralded as usual by the opening of numberless picture exhibitions, passing from one to the other of which the visitor is fain to wonder at the exhaustless supply of art—good, bad, and indifferent—which pours through the London market. The supplies become increasingly “international” in character, so that it might almost be supposed that as many foreign works found purchasers as do the native products. The Haymarket galleries, the French Gallery, the various Bond Street exhibitions, all set forth Continental art for that London public which may well repudiate any accusation of “insular prejudice” in art matters.

The Dudley Gallery, almost alone of open exhibitions, is true to the national colours. But even here the place of honour is assigned, and worthily filled, by a painter who in style at least is a foreigner, Mr. CLAUSEN. *A Peasant Girl* (166) is a life-scale study to the knees of such a grave-faced maid of the fields as JULES BRETON has loved to paint, save that this girl, while rough with toil, looks out on the world with a cheerful content rather than with the sorrowful endurance of the French master's homely models. This is strong, fresh work, more precise in modelling of form than is Mr. CLAUSEN's wont, and distinct in character, as are also his other minor contributions in the gallery. The figure subjects generally are not remarkable. Miss KATE THOMPSON's head of *Olivia* (75) is the best she has shown, and indicates the influence of Mr. TADEMA in the solid painting. Mrs. CARR HASTINGS' *Helen* (68) is as flower-like in tint and as ill-drawn as usual. A study of a man in his library, arrested in writing for want of *Words to Express his Thoughts* (131), shows Mr. THOMAS DAVIDSON to have a clean, direct way of working, and considerable artist-like knack in the putting together of his material. Among rustic studies, the *Cornish Lad* (79) of P. J. JANSEN strikes one as possessing genuine character, while the light and shade is capital. There is humour in the situation and much luminosity in HAMILTON MACALLUM's picture of boys spending a *Summer Half-Holiday* (80) by baths in a very blue sea, taken in detachments, half the party sporting in the water, half on shore, ranged in watchful rows, eager for their turn. This is a showy and amusing picture, but it has unveracities enough ; as for example, the representation of boys floating on to the beach, where there is obviously no room for their bodies in the shallow water, and yet nothing but heads and shoulders are visible. Mr. HEMY sends a couple of very strong studies of fishing-boats and rough waves (161, 176) ; Mr. HENRY MOORE contributes from his store of subjects gathered this year *A Summer Afternoon, Coast of Jersey* (229), vigorous, true in character of rock and ripple, brilliant, but too *painty*, as of late this artist's work has inclined to be. Indeed, this is the fault of much work here as elsewhere ; the crude streaking and loading of pigment becomes a libel on the painter's art ; the material is thrust offensively forward, and the standpoint for observation of such effect as a picture may be intended to produce becomes a matter of intricate calculation ; in which a pace out is fatal.

The amount of pleasant landscape is always considerable in the Dudley Gallery. Out of the average level rise certain bits by Mr. E. WATERLOW, especially *Evening in the Marshes* (214) ; an unpretending but excellent study of detail, *The Pool in the Glen* (198), by THOMAS IRELAND ; the pictures of ALFRED and of GUSTAVE DE BREANSKI (the poetic *Marsh at Wargrave* (37) by the first being only rather spoilt by “plastering” in the sky) ; and lastly, one or two clever sketches by CLEM LAMBERT, hung on the door screen (408 and 425). These are perhaps as artistic work as any in the room, delicious in tone, and having a finesse in execution that would indicate the practice of one who can work with delicate tools.

In flower-painting M. FANTIN leads off ; Miss H. THORNEY-CROFT is supreme for colour and outline ; and Miss LETITIA PARSONS shows faithful study and a better eye for tint than for arrangement.

A chief attraction of the French Gallery is the well-known picture by Mdle. HENRIETTE BROWN—*Alsace*, 1870—in the broad and well-considered style of the painter, though as to the serious face of the Alsatian woman who is here painted asking alms for her country, the painting is more flimsy than should have been. The best example Mr. WALLIS has yet brought forward of the Austrian Professor MÜLLER is *The Guardian of the Sacred Well*, wherein the skill is consummate which renders, even to illusion, the blinding white sunshine that searches out every crevice and cranny of crumbling wall, and darkens by emphasis the swarthy skins and Oriental draperies of the Arab guard and the child who drinks at the well. Among the multiplicity of little cabinet *genre* pictures, those by C. SEILER have a mastery of manner and largeness of style that make them independent of mere scale. *A Freischütz Bargain*, wherein marksmen, Tyrolese by costume, examine the rifles of an old dealer in various wares, whose shop is in a picturesque sort of vault, is simply first-rate work within its limited purpose ; the capacity of the artist appears to stretch far beyond the accident of his subject. One or two pictures by Mr. W. H. BARTLETT still indicate rather promise than performance. *Mussel-Gatherers, Venice*, and the studies of sandy sea-coast and a perspective of French highroad, *Gortheen Bay*, and *The Heat and Burthen of the Day*, all show the same power of giving interest to simple, even rather bald, pictorial material by broad atmospheric effect and a certain originality of manner. But there seems no reason why Mr. BARTLETT should not aim at grace as well as character in his figures, or why he should not concentrate his compositions into something which looks less like accident and more like artistic intention. One or two of Mr. JOHN VARLEY's clever Egyptian studies have found their way hither. This artist should be coming to the front by-and-by. The name of a Spanish artist, R. SANTORO, is affixed to some dashing bits of Venetian waterway and buildings : the painter seems to do a good deal with a sort of thumb-nail touch, which becomes a mannerism, if not a trick. Other work worth noting is, of course, to be found in the room, but it must be confessed that the exhibition as a whole is far below the mark, and contains much of what in literary slang is called “padding.”

At Mr. McLEAN's gallery a charming collection of water-colour drawings is gathered, new and old, foreign and English. We have especially marked the effective sketches of L. HARPIGNIES : imaginative pieces of effect, done for the most part on rough absorbent paper, with a gummy medium, and relying much on contrast of pale or flushed sky with dark masses of foliage or rock. They are strongly reminiscent of some of the late JOHN VARLEY's things, and are often very beautiful. A gallant show of CLARA MONTALBA's drawings show her at her best : the *London Bridge* and *A Thames Wharf* are capital examples of her clever draughtsmanship ; *The Choir of St. Mark's* gives the wondrous golden glories and solemn shadows of that unique interior as they have rarely been felt or expressed. The clean completeness of J. LEWIS BROWNE's horses and their riders comes out well in several pieces, and for like quality, with less breadth and more delicacy, should be noted a little drawing of girls riding on the sea-sands, called *The Amazons*, by J. MAX CLAUDE. If our young Academician, Mr. A. C. Gow, is going to paint a big picture from the exceedingly clever study called *A Highland Raid*—an interior with a *mêlée* of fighting men—we hope he will alter the scheme of colour, that now mars the aim of the vivacious composition and capital drawing. A large Welsh subject, *The Land of Antique Slate*, by ALFRED HUNT, has the peculiar radiance of the artist's sunny scenes, and very finely felt mountain form, but it inclines too much to a general yellowness of tone. Leading men must have their followers, but we have seldom seen a closer reflection than is a picture of *Haymaking on the Thames*, by G. S. WALTON, of like subjects by GEORGE FRIPP.

Curiosity, when not admiration, will bring visitors to Mr. TOOTH's showrooms to see the famous picture by BASTIEN LEPAGE, *Le Père Jacques* ; and very diverse will be the impressions that singularly clever and singularly disagreeable piece of work will produce. Père JACQUES is a type, and his labour is typical ; he is a toothless, ruddy-faced, hard-eyed man, old before his time with rough toil, meagre of body, probably

rheumatic, certainly weak-kneed, and sour-blooded. He has gathered a prodigious bundle of sticks, and stands among the fluttering autumn leaves and bare stems of the copse fronting the spectator, his shoulders bent beneath the burden, his head projecting forward out of the canvas, and his body and legs retiring into it. The observation points to an oddity, an incongruity, in the realism of M. LEPAGE. The man's head is real to painful illusion: it seems to start out of the frame and swear sullenly at the onlooker; the fagots on his back threaten to fall at the spectator's feet. Why, then, are his legs merged after the fashion of a "spirit photograph." The same peculiarity attends the appearance of the little girl in a blue blouse, who stoops among the tangle to gather a flower; her body also is evanescent, and altogether she looks farther off than the head of PÈRE JACQUES, who stands behind her. The power of the painter is undeniable; his handling, his artistry, is even magnificent; but his art, taken as a whole, within that range of rustic life to which another French artist, J. F. MILLET, gave dignity and pathos while he no less emphasised the toil and suffering, is to us simply abhorrent. This collection contains many foreign works of high class; among them *Market-day at Tangiers* is the best picture by G. SIMONI we have seen—true to the life in the Arab crowd, redolent of African atmosphere, and composed with admirable spirit.

The American artist, D. RIDGWAY KNIGHT, is represented by a characteristic work, a picture of *Gossips*—a group of women of the people having coffee on a terrace overlooking a green country and distant town. Probably the scene may be laid at one of the popular resorts in the environs of Paris. The study of character and manners in the various figures is close and marked by a refined humour, and the picture is well painted. As is usual with this artist we see no exaggeration, and in this respect he differs from many painted in France who select similar subjects.

Among French works that draw a certain class of public favour are the female heads by G. JACQUET, with their fresh, luscious prettiness, so exquisitely manipulated. The touch of the artist is a marvel of delicate skill, which one may admire quite apart from the general style of the art to which he devotes it.

By a man of the rising English school Mr. S. E. WALLER is *Flown*, an incident in Jacobite times, when the officers of the Crown, sent down to a lone country mansion to catch conspirators, find before them an empty house. Horses are Mr. WALLER's forte, but the men are well enough, and the story is graphically set forth. The handling of the painter seems to have gained in vigour. In the sorrowful vein of JOSEF ISRAËLS is *No Tidings*, by F. HOLL, A.R.A., a picture of striking chiaroscuro, full of character in the group of the fisherman's wife, dignified in her sad expectation, and the listless lads gathered about the ingle nook. Mr. Gow, A.R.A., has a couple of blue-jacketed jockeys adjusting their favours on the wedding morn, which has the humour of STACY MARKS, though not his pleasant quaintness. A large study of sea, by W. J. SHAW, *Crossing the Bar*, is marked by the unpleasant contrast of slaty purple sky and chill green water which the painter affects; and surely these fine curves of cold water, even in the trouble of a sandbank, would not churn up such woolly foam. Over the way hangs a dashing sea-piece by E. BERTHELOU, *Rough Weather off Tréport*.

### THE SHEFFIELD MUSEUM.

A FEW months ago Mr. Ruskin asked to be entrusted with funds with which to enable him to purchase several of the illuminated manuscripts of the Hamilton collection. It was his intention to have placed his purchases in the St. George's Museum at Walkley, Sheffield. Mr. Ruskin, having carefully examined these manuscripts, knew their value, and was anxious to secure a number of them. In a letter to Mr. Swan, the Curator, he expresses his regret that no funds whatever have been sent in response to his appeal, and he has been unable to make any purchases at the sale, although he would have laid out the money to greater advantage than any one else. Mr. Ruskin is now abroad superintending the work of three artists he has engaged making copies of works by eminent masters, in both painting and sculpture, for the Walkley Museum, where works of art have recently accumulated to such an extent that an additional temporary store-room 40 feet in length has had to be built. The erection of a suitable building by the people of Sheffield is now under consideration, and the site suggested is at Endcliffe, near the residence of Sir John Brown.

### THE ARCHITECTURAL ASSOCIATION.

THE annual conversazione of this Society took place on Friday evening, the 27th ult. The prizes were distributed by the President, Mr. E. G. Hayes, to the successful students in the past session, as follows:—

*Association Travelling Studentship*.—Mr. W. A. Pite (medal and studentship); 2nd prize, Mr. F. H. Tulloch; hon. mention, Mr. A. S. Haynes.

*Association Medal*.—Mr. G. W. Ward (medal and prize).

*The Architectural Union Company's Prize*.—Mr. J. S. Newberry.

*Class of Design*.—1st and 2nd prizes divided between Mr. G. W. Miller and Mr. J. G. Sankey (bracketed equal); hon. mention, Mr. T. E. Pryce and Mr. C. W. Wilson.

*Elementary Class of Design*.—1st prize, Mr. G. G. Woodward; 2nd prize, Mr. A. C. Houston; hon. mention, Mr. W. A. Webb and Mr. G. A. Oatley.

*Class of Colour Decoration*.—1st prize, Mr. S. R. J. Smith; hon. mention, Mr. C. T. Coggin.

*Class of Construction*.—1st prize, Mr. A. H. Gausden; 2nd prize, Mr. A. C. Houston; hon. mention, Mr. L. Hunt.

*Study of Planning and Specification*.—1st prize, Mr. A. Gover. 2nd prize, Mr. C. G. Killmister and Mr. W. J. Landor (bracketed equal).

In connection with the course of lectures given by Mr. Tarver a prize and certificate were awarded to Mr. R. L. Cole. Certificates were also awarded to Messrs. F. Webb, E. H. Selby, T. H. Roberts, and T. E. Newberry.

In connection with the series given by Mr. Blashill a prize and certificate were awarded to Mr. H. T. Nixon; and certificates to Messrs. C. H. Brodie, R. E. Crossland, J. H. Buckeridge, and E. P. Tucker.

#### The Inaugural Address.

The President then delivered his address, in the course of which he said:—

There have been several events of importance which have taken place during the past year in the architectural world to which I must briefly allude. This time last year my predecessor in this chair was called upon to deplore the loss the profession had sustained by the death of William Burges; it is now my sad duty to add my small tribute of praise to the memory of George Edmund Street, who died in December of last year. Mr. Street was so well known, and his talents so universally admired, that it is quite unnecessary for me to dilate upon them. Any one who examines carefully his last and greatest work, the new Royal Courts of Justice, which he was not permitted to see completed, can but be struck with the infinite variety in design and beauty in detail which meet the eye in every part of that vast building; it is so evidently the work of a master mind and hand, and one upon which that mind and hand have lavished a wealth of thought and care.

Another event of considerable importance to the profession is the institution of an examination for all those who may now desire to enter the ranks of the Royal Institute of British Architects. It is hoped that in the course of time this examination will be firmly established, and that it will be considered a necessary qualification for all who may wish to practise in this country as architects. Hitherto, unfortunately, nothing of the kind has been necessary; the principal qualification being a brass plate and a certain amount of confidence. The result of this has been that the profession has frequently suffered severely in being misrepresented by untrained and unsuitable practitioners. If we consider the importance of the interests frequently involved in an architect's practice, and the extent of the knowledge required to produce at all satisfactory results, it cannot be doubted that the step the Institute has taken is a most important one and in the right direction. It is satisfactory for me to remark that out of nineteen passed candidates this year ten are members of the Association.

The subject of architectural competitions is one which has received a large amount of consideration during the past session, but no satisfactory conclusions have been arrived at, and the discussion is to be resumed in the next session. The objects to be attained are—to frame such rules and regulations for the conduct of competitions as will obtain the approval and approbation of the profession generally, and to persuade the public in all cases to adopt such rules. Architects do not want to discourage competitions; but what they do want is to have the instructions clearly framed by an expert, to be satisfied that the requirements laid down will be strictly adhered to in every respect, and that the final selection, if possible—or, if not, the selection of some small number—shall be made by a professional assessor, whose position and qualification shall be such as to command respect. Another great object that architects have in view in discussing the question is to reduce as far as possible the amount of work to be done. In these days, when the promoters of nearly every building enterprise, small or large, must have a competition, and when so many architects are found to send in designs for anything upon almost any terms, it behoves those who have the interests of the profession at heart to make a decided stand. The matter really is in our own hands,

if architects can only be got to agree as to the terms and conditions upon which competitions should be conducted, and to agree further not to compete unless upon such conditions. The Committees and Boards, who desire in most cases to act fairly and honourably, would, I doubt not, be generally ready to adopt any such leading principles as have been suggested for their guidance.

I have referred at some length in the earlier portions of my remarks to the assistance which is given by the Association in training the young architect, and have pointed out some of the immediate results of that training. Perhaps I may be allowed to trespass upon your time for a few minutes more, and to look at the state of our art generally. I think the Association may justly claim to have exercised considerable influence in guiding the taste and supplying the wants of the public in this great city, and in many other parts of the country. We are often told by our critics that we have no style of our own in this nineteenth century, and that we are mere copyists. The first part of the statement is no doubt true, but I am rather disposed to adopt the opinion of those who think that a new and distinct style of architecture is an impossibility. For what we call style is, as you are well aware, a combination in the masses and voids, and in the details and ornament, of certain well-known and distinctive forms: and if it is a fact, as most of us believe, that these forms have in past ages been well-nigh exhausted, the best thing we can do is what we are doing now, to adopt such a period of work as we or our clients may consider best suited for the purpose, and to design our buildings in accordance therewith. If some of our critics would kindly supply us with a few brand new forms, such as would be suitable, say, for window openings, and a few combinations of new forms which we can use for mouldings, architects will be glad to take the matter in hand; and there is no doubt that upon such a basis an entirely new style of architecture would soon be evolved. As to the statement that in reviving old work we are mere copyists, I do not think we need allow that to trouble us, because we know that in designing a building in any style we have to arrange new combinations suited to its requirements and situation, and that as much, or more, knowledge, ingenuity, and originality is required to do this, as would be the case if we were living at the period when that particular style was in vogue.

This century has seen a revival of the taste for Gothic architecture, and the old work has been studied, measured, and sketched, until its spirit has been thoroughly acquired, and buildings of all kinds have been erected which have carried on the tradition and feeling of the style in a most perfect manner, and in a manner which can no more be said to be a copying of old work than one building of the twelfth century can be said to be copied from another of the same date. The Gothic work of different periods, thus revived, still continues, and probably will continue to be used for all ecclesiastical work, and it would almost seem to have been developed in new ways, in consequence of the introduction of new materials. But it is a question if this century will see many more secular buildings of importance erected in the style.

Then we have had a revival of a kind of work which is now commonly known as Queen Anne, but which includes a great variety of features, both English and foreign, which were in use before and after that time. The work has given scope to great originality of idea, and it has been found suitable for all kinds of secular building, and seems likely to hold its own for some time to come.

We have also seen erected recently some few buildings in which late Gothic features with Classic details are used, and it is still open to us to adopt, more largely than has hitherto been done, mixtures in the art of architecture. I may refer to one well-known extreme example, to illustrate my meaning—the entrance gateway to the old schools at Oxford. Here we may see the five orders of Classic architecture, one above another, on the face of a building which has Gothic windows, and is crowned with a battlemented parapet and pinnacles. The combination in this particular case is more curious than beautiful; but there are many other buildings which were erected in the sixteenth or seventeenth centuries, in which Gothic and Classic forms are combined with happy results. You will find in the library an interesting series of photographs which were taken by one of our members on the recent excursion, some of which are from buildings of this character and well worthy of your inspection. The tendency at the present time would rather seem to be towards work of this description. It is well suited to modern requirements in secular building, and it gives scope for great originality in treatment.

Thus it is clear that the current of thought in the architectural world flows along; at times it has been somewhat slow and sluggish, but now again it appears full of life and energy. We on our part are doing our best to maintain that life; to breathe into our designs that nameless spirit of beauty which should pervade every architectural work, and which is necessary to raise it above the sphere of mere building. We are stimulated in our exertions by the consciousness that we are devoting our energies to a noble study; that we are following one of the few callings in life which are worth doing for their own sake alone, and by the recollection of the enduring character of our work. And with all these thoughts before us, we look for kindly appreciation from the public, for thoughtful and discerning criticism, so that we may be rewarded

by pleasure in our own work, and enabled, as far as possible, in everything we do, to leave behind us a memorial which may be regarded as a thing of beauty and a joy for ever.

Mr. T. M. RICKMAN said it was some twenty-eight years since he occupied the presidential chair, and he was pleased to find the same spirit animating the society as formerly. They always felt, and the Association still felt, that the business of the society was that of students of architecture, while the business of the elder society was the practice of architecture. He was pleased to find that the class of men coming forward as students were likely to do much honour to the practice of architecture.

Mr. J. B. FRASER (President of the Leeds Architectural Society) said he had great pleasure in being present and hearing of the valuable work done by the society. In the provinces they looked on the Association as taking the lead in all matters connected with the profession, and they gave them all credit in an educational point of view.

Mr. WILLIAM WHITE, F.S.A., proposed a vote of thanks to the President for the address he had given. Among the several points of interest the President had sketched out in his address one especially related to the sad loss sustained in the death of Mr. Street, one of his oldest and dearest friends. It was some thirty years ago that he was associated with Mr. Street alone in making some suggestions which would be most appropriately carried out now, if that could be; but he thought that the Architectural Association had to a great extent taken up the project they then were considering, viz. the formation of an architectural college. They wrote to three persons, distinguished men at that time, and had most kind and cordial replies from them, but the time had not then arrived for carrying the project into execution. Mr. White then remarked that no new style could be developed without a scrupulous adhesion to some definite principles and line of design, and that especial line he thought had been taken up by the Association with the greatest benefit to the profession and public at large. He had always deprecated a mere adoption of eclecticism, for, having the choice of the world before them, architecture did not consist in the incongruous grouping together of a lot of collected material without order or system.

Mr. JOHN NORTON, in seconding the vote of thanks, expressed his hopes that the new session would be successful.

The PRESIDENT acknowledged the vote in a short reply, and the formal part of the proceedings concluded.

The conversazione was well attended, notwithstanding the inclemency of the weather, about 270 of the members being present, independently of their friends. The pictures in the Institute Library were lent for exhibition by the artists and owners for the occasion, and the drawings of the various classes were hung in the rooms of the Royal Institute of British Architects, which had been kindly placed by the Council at the disposal of the Architectural Association. Among these were the drawings executed by Mr. Pite, the holder of the Travelling Studentship. Mr. Phené Spiers contributed a collection of water-colour drawings and specimens of Japanese hanging drawings. The photographs taken during the excursion of the Association have already been alluded to in the President's address.

## MODERN PROCESSES IN BOOK ILLUSTRATION.\*

PREVIOUS to the invention of the different modes of photographic engraving, lithography offered the only means of reproducing an original drawing in absolute facsimile. Wood and metal both alike demanded the aid of the engraver to carry out and interpret the artist's design, but in lithography the artist could work directly upon the stone, or, if the drawing were on paper, it would be mechanically transferred to the stone. Lithography has not in England attracted any very serious artistic notice, nor has it been carried to any great degree of perfection. But in France its peculiar resources have been more highly esteemed, and many admirable lithographs have been produced, in which the draughtsman has adapted himself with tact and skill to the special conditions of the art. It may be worth while to say a word about the actual process of lithography, for the reason that it has an important bearing upon the different modes of photographic engraving which I am about to describe. The principle of lithography, it should be understood, is not purely mechanical. The impressions from the stone are taken in a press, but the ink is not delivered from a raised surface as in the case of a wood-block, or from an incised line as in the case of a metal plate. The picture is neither cut into the surface of the stone nor elevated in relief upon it, and therefore the means by which successive impressions are obtained may be said to be chemical rather than mechanical. The stone used in lithography is a sort of calcareous slate which is found in Bavaria. It is carefully prepared, either by graining or

\* From a report of a Cantor lecture by Mr. J. Comyns Carr, published in the *Journal of the Society of Arts*.

polishing, according to the character of the drawing that is to be reproduced. In either case, the ink or chalk employed by the draughtsman is of special composition, being, in fact, a mixture of grease and soap coloured with lamp-black. When the drawing has been made in this material, a weak solution of nitrous acid is poured over it, in order to render the ink or chalk insoluble in water. The necessity for this precaution arises from the fact that the stone has to be wetted with a sponge before each impression is taken. The water so applied to the surface is repelled by those parts which are covered with the greasy chalk, and is absorbed into the untouched portions of the stone; and, conversely, when the roller, covered with printing-ink, is now passed over the surface, the ink, which is combined with oil, unites readily with the greasy surface of the drawing, and is repelled by the wet surface of the stone where the water has been imbibed. The stone is now ready for printing, and the same process is repeated for every impression. Lithographic printing therefore depends, it will be observed, upon the antipathy of oil and water. The greasy nature of the material employed by the draughtsman unites with the grease of the ink, and enables the printer to multiply impressions without loss of any of the qualities of his original design. But lithographs are not always drawn directly on the stone. They can be transferred from paper specially prepared for the purpose; and it is the power of transferring the original design which enables lithography to make use of the resources of the photographer.

I have described the process of lithography, because it will enable you the better to understand the means by which a photo-engraving in relief is usually obtained. These relief blocks have now been in use for some years, but it is only recently that they have shown signs of sufficient excellence to render them worthy rivals of wood engraving. Their great merit, where they are successful, is that they give us the absolute autograph of the artist. The photographer here takes the place of the wood engraver, and allows the original draughtsman to speak for himself. Or, at least, it should rather be said that this is so in principle; in practice it must be acknowledged that photography cannot always claim the absolute veracity which is sometimes attributed to it. It inevitably coarsens, to some extent, even the simple lines of a pen-and-ink drawing, and it takes no account of varying depth or strength of colour. The photographic engraver can distinguish between a broad line and a thin line, though he is apt to exaggerate both; but he is wholly powerless to effect any distinction between a dark line and a light line. In this respect it must be admitted that all these processes are still inferior in effect to the wood-block, in the treatment of which the engraver has at his command numerous devices for giving varieties and refinements of tone. But it must be allowed, nevertheless, that in dispensing with the services of the engraver there is an important gain of another kind. It is something to have the actual touch of the original artist, even though the interpretation is somewhat rough and clumsy; and when the artist has learned to adapt his work to the conditions of the process, results will be obtained such as could not be secured even by the most painstaking and conscientious engraver. For it is to be observed that the process itself is capable of a vast amount of improvement, and the results now obtained already compare very favourably with the earlier and cruder experiments. Apart from the lack of variety in tone, which was a patent defect of those earlier essays, there was another and more serious disadvantage, arising from a certain rottenness and insecurity in the lines themselves. This arose partly from the employment of paper unfitted for the purpose, and partly from an uneven biting of the metal. Photography not only exaggerates the actual work of the draughtsman, but it caricatures the surface of the paper, and if this surface be rough and uneven, the lines, when they are transferred to the metal, lose sharpness and consistency. Mr. Dawson sought to overcome these defects by a process which he has described as typographic etching. Here the drawing was actually made upon a prepared plate in a manner partly corresponding to real etching, and the black in relief was afterwards obtained by a cast. But this process had not, after all, the advantage of rendering in facsimile an original drawing; and I now therefore pass to the consideration of the various modes now adopted for obtaining relief-blocks through the intervention of photography.

As the conductor of two artistic magazines, one of which is produced in France, I have had the opportunity of scrutinising very closely the results produced by the different professors of this kind of engraving both in England and abroad. The principal firms in France at the present time are the Messrs. Gillot, Messrs. Yves and Barret, and M. Petit, and very favourable examples of their skill are to be seen in the pages of *L'Art* and the *Gazette des Beaux-Arts*. The point in which they seem to me to surpass most of their rivals in this country lies in the ability to interpret drawings in charcoal and chalk, as well as drawings in pen and ink. It certainly appears, at first sight, a very remarkable gain to the resources of illustration to be able to print from a relief-block in such a way as to imitate the crumbling touch of a chalk drawing, and this has in some instances been very successfully accomplished. Very much, of course, depends upon the skill of the printer in handling these photographic blocks, as they undoubtedly demand more adroit handling than is bestowed upon the ordinary wood-block. The art of printing illustrated works is unquestion-

ably more widely understood in France than with ourselves, and to this cause we must attribute some part of the superiority which the French processes would seem to possess. In London there are, by comparison, only a limited number of printing firms which devote special attention to this class of work, and although the results obtained in these isolated cases are highly satisfactory, the production is, as a general rule, far more costly. But even the best of these French processes, aided and supported as they are by the greater skill and resource of the French printer, are scarcely superior to a process to which I shall specially draw your attention to-night. This process is the invention of a German gentleman, Mr. Henschel, who is a resident in this country, and who has kindly afforded me every facility for explaining to you the peculiar methods of his work. There are many others of the same kind, and based mainly upon the same principles; but as there are considerable differences in detail, I have thought it best to-night to confine myself to the description of a single example. The faults common to nearly all the processes to which I have referred are, as I have said, of two kinds. In the first place, the line which was firm and steady in the original drawing is apt to exhibit a certain rottenness when it reappears upon the block, and further, the block commonly fails to distinguish successfully between lines of varying strength. It may even be said that where the original drawing has passages of delicate execution, even though expressed in line, these delicate parts disappear altogether, and the printed impression from the block is, by comparison, crude and coarse in effect. In order to understand why this should be so, it will be necessary to explain the different stages in the production of one of these blocks. The first requisite, common to every process, consists in a good clear negative from the drawing which has to be reproduced; but the real difficulty begins when it is sought to transfer this negative on to the metal. Now, this has usually been accomplished by means of transfer paper, such as has long been used by lithographers. This transfer paper is so treated as to be sensitive to the action of light, and an ordinary photographic print is then taken upon it, which is afterwards treated with lithographic printing ink and transferred to the smooth surface of the zinc plate. But the conditions which make it necessary to employ this transfer paper are unfavourable to the photographer. In order to secure detail, the light must act through the transfer substance, and fix the image to the paper itself, but unfortunately the exposure required to effect this result intensifies the darker parts of the picture to an exaggerated degree. The engraver has therefore to choose between two evils. Either the black parts of the picture will be too strong, or the lighter and more delicate portions will be lost altogether; for unless the light has penetrated the transfer substance and fixed the image to the paper, these delicate features will inevitably be washed away with the transfer material and never reach the metal at all. And this, in fact, is what usually happens. If an ordinary process block is compared with an ordinary drawing of any subtlety or refinement, it will be found not merely that the lines are rotten, but that many finer lines which gave beauty to the drawing have no existence in the block at all. And there is yet a further disadvantage incidental to the usual mode of procedure. The transfer to the metal can only be effected by pressure, and the pressure has the inevitable result of destroying the delicate work, and rendering the lines indistinguishable. When the image, with whatever loss it has suffered by the way, has been transferred to the metal plate, it is treated very much in the manner already described in connection with lithography. The surface is covered with gum, so as to resist and repel the printer's ink, which is now applied by the lithographic roller, and which only adheres to those parts where the transfer ink has been impressed. The plate so inked and prepared is now ready for the acid bath. It might, if we chose, be treated as a lithograph, and impressions might be taken from it just as they are taken from the surface of the stone. But our object now is to produce a block in relief which shall be adapted for printing in an ordinary press with movable type, and with this purpose in view, the next thing to be done is to bite away all those portions of the plate which are not occupied by the lines of the drawing. The zinc plate is therefore placed in the acid bath in the same manner as an etching, only that here the process is reversed, and instead of eating into the lines of the drawing, the acid eats away all those portions which surround these lines, which are themselves protected from chemical action by the ink which covers them. As the biting gets deeper, care is needed in order to protect the sides as well as the upper surface of these lines, otherwise they would be undermined, and would then fall away; and for this purpose the ink has to be applied again and again during successive stages of the biting.

The method I have been describing is the ordinary method of producing a process block. It may differ in detail, or according to the varying systems of different inventors, but the principle is the same in all, and it is subject in all to the peculiar disadvantages I have pointed out. By way of removing some of these disadvantages, Mr. Henschel, and others who have worked in the same direction, have found a means of doing away altogether with the ordinary transfer process, and of therefore avoiding the grave defects which it involves. Instead of taking a print from the negative upon transfer paper, he takes it upon a composition of his own

preparation, which retains all the most delicate features of the photograph. The print so obtained, which resembles a carbon print, and has the same quality of relief, is then laid with its face downwards upon the metal plate, and is then developed; and when this development is complete the paper to which the composition is attached is removed and the composition itself is washed away, save only in those places where the action of the light has taken place and which remain attached to the plate. No pressure is needed in this mode of registering the picture upon the plate, and therefore none of the finer work is filled up or destroyed. And again it may be remarked, that when he has once got the picture impressed upon the plate, it is at once in a condition to be treated by the acid. The composition itself, in the earlier stages of the biting, suffices to protect the drawing from the action of the acid. Though it is not greasy, like the printer's ink, it has chemical properties which serve equally for the purpose, and the strong printer's ink is only applied at a later stage.

In the presence of improvements like these it would be rash to declare that photographic processes have even yet reached the point of full development. Every day brings some new element of refinement, and if the progress in the future is to be measured by that which has been achieved in the past, it is more than probable that the craft of the engraver will be almost entirely superseded. Nor even if this should be the ultimate result of the alliance between science and art, would there be any great cause for regret. As to wood engraving, it has been made sufficiently clear, by our brief examination of its history, that it has never ranked higher than art of reproduction. With one single exception, it has never been used as a means of independent expression, and as the efforts of all the best engravers have been directed to the faithful reproduction of an original drawing, art will suffer no real loss should this same result be achieved by purely mechanical means. But it will then more than ever become the duty of the original artist to fit his work to its destination, and to consider, when he is engaged upon the illustration of a printed volume, what is the style of execution that will give the happiest expression to his ideas. With no intermediate craft between himself and the printer, he will have no excuse for employing inappropriate material, or for cumbering the printed page with work that displays an excess of elaboration.

### SCOTTISH ARCHÆOLOGY.

THE fifth of Dr. Anderson's course of lectures on "Scotland in Pagan Times" treated of chambered cairns in Argyre, Orkney, and Inverness. It was said that in 1871 Dr. R. Angus Smith, Manchester, explored a large chambered cairn at Achnacree, near Loch Etive, Argyshire. In form it was approximately circular, 75 feet in diameter, and rising to a height of 15 feet in the centre. There were traces of an outer ring formed by a trench and embankment round it, about 135 feet in diameter. The entrance passage was about 28 feet long, 3½ feet high, and 2 feet wide. The chambered interior to which it led resembled that of the Caithness cairns in being triply divided, but differed in the manner of the division, each of the three parts forming a separately roofed and walled chamber, the second entering by a doorway with a raised sill in the back of the first, and the third entering similarly from the back of the second. The floors of the chambers were covered with stones strewed loosely about, and in the loose soil of the floor were found fragments of several urns of peculiar form. One of these—the most entire—measured 7 inches in diameter and 4 in depth. It was bowl-shaped and rounded at the base to a globular form, the upper part showing a broad flattened rim slightly bevelled outwardly and recurved below. It was formed of a fine dark-coloured paste, close in texture, and hard-baked. It thus differed entirely in form, texture, colour, and quality from the urns of the bronze age, which were of a reddish paste, loose in texture, coarse-grained, and slightly baked. It differed from them also in being destitute of surface ornamentation. But the most striking difference lay in its difference of form—its globular bottom and broadened rim recurving below. Portions of another urn of similar form and character were found. There were no indications of cremation, and though no remains of unburnt bodies were discovered, the presumption was that the interments were unburnt, both on account of the form of the urns and the absence of burnt bones, which were almost indestructible. Dr. Anderson then described the cairns at Largie, near Kilmartin, and at Kilchean, also in Argyshire, and showed that in this group of Argyshire cairns they recognised the same features that gave character to the Caithness group, but with certain differences. They were chambered cairns, the chamber was subdivided into compartments, the roof was partly formed by vaulting and partly by flat slabs, and in one case it was wholly flat. The contents were burials after cremation, and in two of the three cases they were accompanied by urns of a dark-coloured paste, differing in form and character from those of the bronze age. In the third case the urn was of red paste, and the chamber exhibited a transitional form, inasmuch as it did not possess the vaulted roof which was characteristic of the typical group, but exhibited

a cist-like form, which was the form characteristic of the bronze-age cairns in Scotland. No trace of bronze, however, was present in any of them, and when implements were found with the interments they were merely of chipped flint. Another group of cairns of a singularly interesting character was found in the north of Caithness. The best known of the group was the chambered mound of Maeshow, nearly a mile east from the great stone circle of Stennis, on the opposite side of the Loch of Stennis. After describing the character of this structure and the interior dimensions, Dr. Anderson said that there were indications in the chamber which led to the conclusion that it had been broken into, probably in the hope of finding treasure, in the twelfth century. Within the range of from 3 feet to 11 feet from the floor the walls were thickly covered with runic inscriptions, comprising in the aggregate more than 900 letters. The forms of the letters of which the inscriptions were composed were those of the later variety of Scandinavian runes, which Professor Munch states are never older than A.D. 1100. The majority of the inscriptions were such as men seeking the shelter or concealment of the broken chamber might scribble from mere idleness. One stated that "Thatie the Viking came here to weary." Others consisted simply of a man's name with the formula carved, as "Hernend Hardane carved these runes." But one of the longer inscriptions told what was thought of the origin of the mound in the twelfth century by its Scandinavian visitors. Their tradition was that it was Lodbrok's sorcery hall. Ragnar Lodbrok was a well-known hero of the mythical poetry and romantic legends of Scandinavia. The people therefore who gave it this fabulous origin could have known nothing of its history. But there was another inscription of greater value, because it supplied the information of the breaking open of the mound. It stated that the larsalafarer broke open the Orkahang in the lifetime of the blessed Earl (Roguvald, who died in 1158), and that there was much treasure hidden in it; while another inscription stated that the treasure had been carried away before the Jerusalem men broke the mound open. Having described the structural peculiarities of the chambered cairn on the Holm of Papa Westray, Dr. Anderson said that in this Orkney group of chambered cairns we had the same essential characteristics as were exhibited by the groups which had been described on the mainland of Scotland. There was a typical relationship with strong local differentiation in each of the groups, so that while the essential characteristics remained the same, the Orkney group, the Caithness group, and the Argyshire group had each a special character of its own. Another group of cairn structures of a very remarkable character was situated in the little plain of Clova, on the edge of Culoden Moor, within a few miles of Inverness. Like all the others, they possess a definite internal outline and a regularly constructed interior chamber and passage; but, unlike any of the others, there was no subdivision of the internal chamber, and they presented an external feature which was not present among the groups of similar structures peculiar to Orkney, Caithness, and Argyre—namely, the addition of a ring of standing stones erected outside the periphery of the cairn. They had thus, again, reached the point in the investigation at which we found the stone circle and the chambered cairn united as a composite structure. But here the ring of standing stones was obviously an adjunct to the cairn which contained the burials within its chamber. From the descriptions that had been given in this and the previous lecture, it was clear that all these cairns, however much they might differ from each other in their structural details, belonged to one type of sepulchral structure, differing from all other types that were present in the same area—(1) in the possession of an interior chamber accessible by a passage; and (2) in the possession of a definite external form, which was structurally defined. In speaking of them he had called them cairns with respect to their present appearance, but with respect to their essential characteristics it had been demonstrated that they were in reality the ruins of buildings that were distinctly structural and architectural in character and conception. The system of their structure and design was a system that produced a building with outside and inside, with roofs and floors, external and internal doorways, partitions, and passages. A just conception of these features of their character and of their significance was only attained with difficulty, and after investigation, comparison, and reflection. But their enormous magnitude was a feature of their character which gave an instantaneous impression of energy and power, and the obvious fact that they were houses of the dead instinctively challenged our respect for their builders. They were men who were in their stone age, but it was plain that they were not on that account inferior in capacity and culture to the men of the bronze or iron ages, in so far as capacity might be indicated by the construction of cairns, or culture signified by an attitude of mind which regarded the perpetuation of the memory and honour of their ancestral dead.

The subject of the sixth and concluding lecture of the course was "The Culture and Civilisation of the Stone Age in Scotland." Dr. Anderson said that, as he had before had occasion to remark of the bronze age, there was no vestige of a dwelling or of a defensive structure known in Scotland which could be proved by evidence to have been the work of the men of the stone age. It was to their burial-places that we must therefore look as the chief sources of the materials which might disclose the quality of the

culture and the pattern of the civilisation existing among them. These materials were not abundant, but there were others which were more abundant, and whose testimony, though less direct and circumstantial, was not the less relevant to the purpose of their investigation. They were rarely found in hoards or groups. By far the larger number had been found casually in ploughing, in draining, or in excavations in peat mosses, in the beds of rivers, and the margins of lochs, or in sandy wastes by the sea-shore. He pointed out that stone axes and moulds for casting spear-heads of bronze had been found together at Campbeistown, Argyshire; and that instances of stone implements occurring in groups had been found in Aberdeenshire; at Dunmore, Glenshee; at Daviot, Inverness-shire; at Tingwall, in Shetland; and at Fochabers. These weapons served the double purpose of tools and weapons. Speaking of the method of hafting and the form of the typical stone axe, the lecturer said that its specialty of form and fineness of finish were indications of culture, while the perforated battle-axes of stone were characterised by a fineness of finish and decoration which exhibited special skill and taste in their manufacture, and afforded evidence of the capacity and culture of their makers.

The lecturer next described the implements and weapons which were not polished but finished by chipping, and also the spear and arrow heads, remarking that some of the processes of their manufacture were still a mystery to modern science, the production of ripple-flaking, for example, being pronounced by all who had tried it as simply impossible. Reviewing the whole phenomena of the stone age, as these were manifested in Scotland, we found them affording evidences of capacity and culture in the individual associated with evidences of civilisation in the community. We found their weapons and ornaments fashioned in forms that combined beauty of outline with symmetry and grace of proportion. We found the workmanship of the best examples faultless, the polish perfect, and the edge as regular and finely drawn from the face of the instrument as it was possible to make it with the aid of machinery and scientific appliances. The application of intellect and energy to the perfection of the art of working in stone was effected in directions that were different from those adopted by workers in metals, and therefore the culture of the lapidary was a culture which was not the same as the culture of the founder or the smith. But it would be manifestly absurd to say that the application of intellect and handicraft to the perfection of an art was culture when it was directed to one material, and was not culture when it was directed to another—that culture might be manifested in bronze, iron, and silver and gold, but none in bone or ivory, or jet or stone. In point of fact, we found that in the stone age there were certain varieties of implements and weapons which were roughly made, and certain other varieties which were finely made and carefully finished, and that the same thing was also true of certain examples of the same variety. This differentiation was in itself evidence of an activity of intellect which discriminated between what was needful and what was ornamental, and, having accomplished what was needful, was not content with that, but proceeded to the knowledge of conditions and the achievement of results which lay beyond the limits of utilitarian application in the region of æsthetic culture. It would be equally absurd to say that the application of intellect and experience to the perfection of an art was culture when it was directed to one method of operation, and was not culture when it was directed to another method—in other words, that it was culture which was manifested in the working of stone by grinding, and that it was not culture which was manifested in the working of the same material by chipping. In the finer forms of these chipped implements it was manifest that their rudeness was the result of processes carefully adapted to the properties of the material, and performed with a dexterity and a precision only to be acquired by practice and experience. That their surfaces were always unsmoothed, while other implements in the same material were finely polished, was evidence that the absence of polish in them was the result of intention and not the result of incapacity. And that this abstention from all effort to produce a finer finish of surface and outline than that which resulted from the merely constructional process ought rather to be recommended as a merit than censured as a defect in the workman's culture seemed plain from the fact that, whether practically or æsthetically considered, the form thus finished possessed a character of fitness and beauty which was universally acknowledged as most admirable. This character was the result of a single process perfected to a pitch of delicacy and refinement which is now unattainable. The process which they thus invented and perfected was the very process which scientific investigation had found to be the most suitable to the qualities of the material which they employed. In all these manifestations of special knowledge and skill it was impossible to hold that there was not evidence of culture. It might be a culture which differed from the culture of the bronze age, as the bronze age culture differed from that of the iron age; but whatever might be the amount of its difference from these or from existing varieties of culture, it was impossible to conclude that such manifestations as these did not constitute evidence which was relevant and sufficient to imply the existence of culture among individual members of stone age communities. Again, when we considered the aggregate of individuals in whom this culture existed, we found them, whether

as families, clans, or tribal communities, possessing organisations sufficient for the construction of works of enormous magnitude, and exhibiting in their construction a common agreement or public feeling strong enough to control the general expression of form and character of these works over an area so wide as from Caithness to Cornwall. These vast sepulchral constructions, which were necessarily the work of aggregates, were in their nature and significance essentially evidences of civilisation. The manner of its expression was doubtless different from that which now prevailed. The man who now subscribes his guinea to the public memorial of a leading citizen removed by death would then have performed the same duty by adding stones to his cairn. But it was the outward form of the act alone which differed: its inward significance remained the same. This man of the stone age, whose culture and civilisation were thus made dimly visible to us by the relics of his life and the memorials of his dead, was the typical representative of primeval man in Scotland. There was no evidence of the existence in the Scottish area of any representative type of man of higher antiquity or of lower culture than this. It was true that we possessed no means of converting the significance of these early manifestations into equivalents of the culture and civilisation which now existed; but if it be also true, as all experience showed us that it was true, that the systems of the present gave birth to those of the future, and were themselves begotten of the past, it followed that the early culture and civilisation were but the younger stages of those which now existed; and thus regarding them, he could not but conclude that they were the younger stages of the highest, as well as the lowest, of the modern forms.

Looking back over the way they had traversed, and having regard both to the manner and to the results of the investigation, he might say that he would have failed in one of its principal objects if it had not been demonstrated that it might be possible, from purely scientific materials, by purely scientific methods, to construct a logical, though not a chronological, history of culture and civilisation within a given area sufficiently wide to comprehend a series of representative types—that the logical history thus established by archæology dealt with the succession of types and stages of culture, but not with the determination of dates and epochs, which, in their very nature, were incapable of being extracted from its materials, and lay wholly in the province of chronological history, because they were attainable only through the medium of record—that the historic and pre-historic stages of human existence within a given area did not differ necessarily in the essential nature of their conditions and phenomena, but only in the manner in which these conditions and phenomena were presented to our intelligence—that the ascertained or recorded conditions and phenomena of man's existence in one region could not be taken as revealing the unascertained or unrecorded conditions and phenomena of his existence in another region, and that these must be determined for a wide series and separate areas before there could exist a scientific basis for the inductions of comparative archæology. If this had been successfully demonstrated, the method of the demonstration would also have disclosed the paramount importance of form and character for the determination of type, and the significance of systems of ornament as affording indications of the conditions of culture by their character, and determining the sequence of these conditions by their development. The disclosure of that importance and significance would also have shown that it might be possible to deal with the ornament of the pre-historic ages as an index of culture in much the same manner as the student of culture might deal with language and literature as supplying materials for his deductions with respect to the historic period, because it had been found that in thus dealing with the decoration of objects that were decorated, analysing the elements of which the ornament was composed, observing their various combinations, and deducting from the manner and results of these combinations the order of the development of the successive systems of ornamentation, the sequences of the systems were seen to follow the same order as the sequences of the forms and materials to which the decoration was applied. But most of all he hoped it might have been made clear that it was not the knowledge of the various dates of the different specimens, but the knowledge of their types; not the knowledge of their precise uses, but of their precise areas; not the knowledge of the measure of antiquity that might belong to them, but of the quality of the culture they indicated, that were the primary objects of their investigation. Besides these more general indications, it might have become evident to those who had followed the whole of the four courses of lectures, that, taken together, they were parts of one special demonstration, the total outcome of which was that Scotland had an archæology disclosing a series of manifestations of special forms of culture and phases of civilisation peculiar to her own area, and that she must therefore of necessity create and maintain her own school of investigation.

**Llanrhaidr.**—The ancient parish church of Llanrhaidr-yn-Mochnant, Montgomeryshire, has been reopened, after having been closed nearly four years for restoration. The work has been done from the designs of Mr. W. H. Spaul, of Oswestry. The contractors were Messrs. W. & G. Thomas, of Oswestry.

## NOTES AND COMMENTS.

AT the last meeting of the Académie des Inscriptions et Belles-Lettres M. FERDINAND DELAUNAY, who has just paid a lengthy visit to the excavations that have been carried out for nearly two years past by the Père DE LA CROIX at Saunay, read a paper on the subject, and exhibited some drawings illustrative of the important discoveries that have been made. His description of the hypocaust shows it to have been constructed on quite as grand a scale as those found at Pompeii. It is a vast circular furnace; the thick vaults, built of concrete blocks, are supported upon pillars of broken tiles and cement. Above the vault is a thick layer of cement, in which is laid down a flooring of Dissais stone, forming the bottom of the piscina, which is circular, and 1<sup>m</sup> 40<sup>c</sup> deep. The fire, or rather the burning gases, after heating the walls and vault of the furnace, passed through arched openings into a circular flue running right round the masonry of the piscina, so that the latter should be entirely enveloped in flame or hot air. The Commission of Historic Monuments has voted the adoption of M. LISCH's special report, which recommends the immediate acquisition by the State of all the area explored by Père DE LA CROIX. As there are several owners on the land, the Government will probably proceed by way of expropriation.

It is not often that Mr. RUSKIN asks for a grant from the public, and his appeal for funds to purchase some of the Hamilton manuscripts ought to have been enough to suggest the importance of securing the whole collection. Mr. RUSKIN was not supported, and now it has been revealed that the Prussian Government have purchased the whole of the manuscripts for 75,000*l*. Some will say that little advantage could arise to this country from the possession of the collection. The works would not of course be of equal value with a common encyclopædia for reference, and the illuminations would hardly serve for patterns for textiles. But it is not in this light that the Germans look at the relics of mediæval scholars which they have carried off from the richest nation in the world. They esteem the manuscripts simply as treasures which are invaluable in illustrating the history of European art and literature.

It has for many years been the rule of the French Government to make considerable purchases of paintings, sculptures, &c., from among the works exhibited at the annual Paris Salon for the provincial art collections. The lately-appointed Director-General of Fine Arts has just announced his intention of entirely changing the principle upon which the distribution of these treasures among the various local museums has hitherto been effected. M. PAUL MANTZ is of opinion that every locality possessed of a collection should endeavour to make of it, by the quality and artistic value of the works it contains, a fruitful centre of art education for the inhabitants, as well as an attraction to foreign visitors, and thus from every point of view a source of prosperity to the town. He is therefore desirous of favouring especially those municipal museums which have hitherto missed their fair share of the Governmental gifts, and are rich only in copies and second-class works. While acting upon this principle, he will, on the other hand, however, insist that the municipalities shall augment the yearly sum devoted to the keeping up and development of their art collections in proportion as these increase in importance—thanks to the intervention of the State—and this under penalty of suppression of all Government aid. As for those towns that already possess large and valuable galleries, such as Lille, Lyons, &c., the Director-General purposes henceforth to regulate his conduct towards them in accordance with the sacrifices they themselves make in adding to and perfecting their collections. This new plan of distributing State patronage meets with general approval, and must contribute greatly to raise the level of the public taste in art matters throughout the country.

THE competition in Christmas cards this year promises to be more intense than ever. MESSRS. HILDESHEIMER & FAULKNER, who are the first to appear, have issued a series which it will be difficult to surpass. It will be remembered that this firm offered an immense sum for original designs, and left the selection to some of the members of the Royal Academy. As was to be anticipated, an immense number of excellent designs

were in consequence obtained. The premiated figure subjects, landscapes, and flower pieces are very beautiful, but it must be admitted that many of the designs which were selected by the firm are more appropriate for Christmas. MESSRS. HILDESHEIMER & FAULKNER have also been able to reproduce some paintings of flowers by Mr. MUCKLEY which are vastly superior in style to the work that is generally copied. Altogether the collection is a remarkable example of ability and enterprise.

A FINE collection of pictures has been bequeathed to the Yorkshire Fine Art Institution at York by the late Mr. JOHN BURTON. Among the pictures are the following:—*Rembrandt in his Studio*, by Sir JOHN GILBERT, R.A.; *Buying the Wedding Gown*, by DYKEMAN; a landscape by W. MÜLLER; *Highland Sheep*, by R. ANSDALL, R.A.; *The Volunteers*, by J. D. HARDY; *Hogarth Painting the Portrait of Captain Coram*, by E. M. WARD, R.A.; *The Harvest Cradle*, by J. LINNELL; *Collecting the Offering in the Scotch Kirk*, by J. PHILLIP, R.A.; *The Mountain Spring*, by F. R. PICKERSGILL, R.A.; *The Three Orphans*, by J. D. HARDY; *Cattle Piece*, by Mr. SIDNEY COOPER, R.A.; and a landscape by the late CLARKSON STANFIELD, R.A. One of the conditions of the bequest is that the pictures are to be placed in a special gallery to be named after the donor.

AT a time when communication across the Thames below London Bridge is receiving attention it may be interesting to note that more than fifty years ago the late Mr. GEORGE DANCE, the City Architect, prepared a design for a bridge with a double roadway and drawbridges. It was not then adopted on account of the cost. Mr. DANCE had a large oil painting prepared of his bridge, which, with other drawings, is now to be seen at his grandson's house in Torquay.

THE work of demolishing the ruins of the Tuileries Palace is meeting with a considerable and unexpected amount of delay. The matter was brought before the last meeting of the Commission of Historical Monuments, with a view to deciding upon the best measures to be taken to preserve those portions of the building which are interesting from their historical associations or artistic beauty. One of the members, M. BRUYÈRE, submitted a project whereby the ruins should be removed and re-erected intact on the Pré-Catalan. After a long discussion it was, however, decided, upon the proposition of M. DU SOMMERARD, that a committee of the body, with the aid of M. GARNIER, the architect of the new building that is to be erected on the site, should be appointed to make a choice of the fragments to be preserved. The parts thus chosen will be carefully deposited in the central court, and the Commission will hereafter decide what is to be done with them. For this purpose a new credit will have to be obtained from the Ministry of Fine Arts, for the sum of 50,000 francs voted by the Chambers will be more than absorbed in the demolition. Here, moreover, the chief difficulty arises, for owing to the right taken by the State of reserving to itself a portion of the materials, no contractor can be found to undertake the work; so that it is probable the conditions, as at present laid down, will have to be altered.

THE network of lanes and alleys in the neighbourhood of the New Law Courts will become unbearable when the buildings are open. There are few public buildings in London having worse approaches. It is proposed to remove Holywell Street in order to improve one western approach to the Courts, but this will be inadequate, for lawyers, clients, and witnesses will come from all parts of the metropolis. Mr. C. F. HAYWARD has prepared a plan which would amend the defects in one direction at least. He proposes the construction of a street which would connect Holborn and the Strand—the two great lines of thoroughfare. Starting in Great Queen Street, opposite Little Queen Street, it would run in a straight line to the Sardinian Chapel, and thence by a convenient curve to a "circuit" which would be on the site of the Clare Market rookeries. One branch would lead to the Strand opposite St. Clement's Danes Church, and another would form a continuation of Newcastle Street. With the exception of a couple of printing offices and a vestry-hall, the property along the route is about the worst in the district, and it would be a blessing if it were removed. The advantages of Mr. HAYWARD's project are so apparent we hope that the Government will take it into consideration.

## ILLUSTRATIONS.

CENTRAL PORTION OF THE GLASGOW INSTITUTE OF FINE ARTS.

THIS illustration is a reproduction by the ink-photo process of a drawing by Mr. JOHN JAMES BURNET which was exhibited at the Royal Academy. It shows part of a building which visitors to Glasgow rarely fail to admire, for the Institute is one of the best examples of modern architecture in that city.

THE LONDON AND COUNTY BANKING COMPANY, LIMITED:  
BEDFORD BRANCH.

THIS building, which is just completed, occupies a prominent position in the High Street near to the Post Office, and comprises the business premises and manager's residence. The bank office is a handsome room, 28 feet by 28 feet and 14 feet 6 inches high, well lighted and ventilated. Adjoining it is the manager's room and a waiting-room opening on to a glazed quadrangle, including the minor offices and a way of approach to the strong-room and basement, and likewise to the manager's residence, which also has a private approach from the High Street. The materials of the structure are local brick faced with Fareham and Red Mansfield and Corse Hill stone masonry. The roofs are covered with Westmoreland slates. The joiners' work in the interior is of selected red deal and pitch pine, and in the exterior of oak wood; the bank fittings are in pitch pine, American walnut, and mahogany.

The builder was Mr. THOMAS SPENCER, and the bank fittings were furnished by Messrs. WELLS & Co., of Bedford; the whole of the works having been carried out in a most satisfactory manner, according to designs by Messrs. USHER & ANTHONY, architects, 9 St. Paul's Square, Bedford.

GARDENER'S COTTAGE AT DOWNES.

THE illustration shows a gardener's cottage recently erected at Downes, Devonshire, the seat of Colonel BULLER, V.C., C.B., C.M.G., from the designs of Mr. HARBOTTLE, A.R.I.B.A., of Exeter. It is built of red brick and tile, the colour of which and the outline of the cottage give it a picturesque appearance, seen through the beautiful old trees in one of the finest parks in Devonshire.

The work has been done by Colonel BULLER's estate workmen.

"KENT HATCH," WESTERHAM.

KENT HATCH, the residence of Mr. FREDK. SCORER, is situated at the junction of the Kent and Surrey Hills, above the town of Westerham. The house has been satisfactorily completed by the contractors, Messrs. FOSTER & DICKSEE, of Rugby, under Mr. M. ED. MACARTNEY as architect. The original drawing, from which our illustration was reproduced, was exhibited this year at the Royal Academy.

BEECH CROFT, NORBITON PARK.

THIS detached residence, standing in its own grounds, has been erected for Mr. F. SLEDGE, at Norbiton Park, New Malden district, Surrey. The house contains ten rooms, spacious entrance hall, and out-offices. The building is faced with picked red bricks and Bath stone dressings. The hall is paved with encaustic tiles, and lighted from behind the pediment with plate-glass roof in addition to the side lights. The entrance door and the upper parts of windows are glazed with cathedral glass in small squares of selected tints. The house is fitted with electric bells by Messrs. JOHNSON, of Wardour Street, W.C. The whole of the works have been carried out by Mr. JOSEPH SANDERS, builder, New Malden, under the superintendence and from the design of Mr. T. LOCKWOOD HEWARD, architect, 7 John Street, Bedford Row, at the entire cost of 750*l*. The mantelpieces and grates, which have given every satisfaction, were selected from the stock of Messrs. NEWTON & Co., Holborn Viaduct, E.C.

**Stockport.**—The parish church of St. Mary has been reopened after restoration, from the plans of Mr. Crowther, architect, of Manchester. Messrs. Cordingley & Stopford, of Manchester, were the contractors for the stonework; Mr. Roger Bateson, of Stockport, for the woodwork; Mr. William Booth, also of Stockport, for the painting and decorating; and Mr. Hardy, of Heaton Norris, for the removal and alteration of the organ. About 4,000*l* has been expended on the restoration.

## THE WORKS OF JOHN LEECH.

AT a recent *soirée* of the Manchester Literary Club a suggestion was made as to the desirability of obtaining by public subscription a selection of drawings by John Leech, similar in character to the beautiful series now in the South Kensington Museum, to be offered in the first instance to the Manchester Corporation for the permanent Art Gallery of the city. It was stated that the mayor was cordially in favour of the proposal. This suggestion was warmly approved, and a subscription list was opened in the room, to which about fifty of the gentlemen present at once contributed; and Mr. George Milner (the president of the club), Mr. Robert Crozier (president), Mr. William Percy (member), Mr. H. H. Hadfield (hon. secretary of the Manchester Academy of Fine Art), the Rev. W. A. O'Connor, Mr. Richard Smith, B.A., Mr. Councillor Rowley, and others promised to serve on any committee that might be appointed to carry the matter into effect. It is known that there still remain in the possession of the artist's sisters a large number of most valuable drawings, which these ladies desire to see worthily bestowed in public galleries. It is hoped that the public response to this effort may result in the purchase of the whole of the remaining works, in which case selections could be made and placed not only in Manchester, but in Liverpool, Leeds, Sheffield, Nottingham, and other large towns; and thus Mr. Ruskin's wish 'to see the collection divided, dated carefully, and selected portions placed in good light, in a quite permanent arrangement in each of our great towns,' be to some extent realised. Mr. Ruskin allows his name to appear on the committee, and has subscribed to the fund. In a letter which is appended to the circular Mr. Ruskin says: "It is with the greatest pleasure that I accept the honour of having my name placed on the committee for obtaining funds for the purchase of these drawings; and I trust that the respect of the English public for the gentle character of the master, and their gratitude for the amusement with which he has brightened so many of their days, will be expressed in the only way in which expression is yet possible, by due care and wise use of the precious possessions he has left to them." The provisional committee have received most encouraging offers of adhesion and assistance. In addition to Mr. Ruskin the following gentlemen have consented to join the committee and have promised subscriptions:—The Mayor of Manchester, Mr. John Tenniel, Mr. J. E. Boehm, R.A., Mr. George Bentley, of New Burlington Street, and Mr. Charles F. Adams, of Barkway, Hertfordshire.

## THE IPSWICH ART SCHOOL.

THE annual meeting of the Ipswich School of Art was held last week, when an address was delivered by Mr. Sparkes, headmaster of the Training School at South Kensington. He said that on examining the drawings of the students he saw there was a wholesome simplicity about them, especially the drawings from life. There was always a character about our designs which was peculiarly English, and which was, perhaps, more evident to foreigners than to ourselves. Our mediæval cathedrals at Salisbury, Durham, &c., &c., had a strong character about them, such as we saw in no country in the world but in England. The same might be said of our mediæval castles. In Suffolk there were many examples, the one at Framlingham being, probably, the finest of all. There was an essentially distinctive character about the large Tudor houses during the time which preceded Elizabeth's reign, and during that reign. At Hengrave and Helmingham were two magnificent specimens, not so much in their size as in their English character, which it was so necessary to preserve. In the town of Ipswich there were five examples of street architecture. The house in the Old Butter Market and the gables of St. Clement's, for instance, which he remembered seeing years ago, and which seemed to him at the time characteristic of Ipswich, Ipswich being a particularly characteristic English town. Wolsey's Gate was another example, nothing of the kind being seen in any other county. Mr. Sparkes spoke of the beautiful churches which were to be found in that part of the country, those at Cromer, Long Melford, and Lavenham standing alone in the country as fine village churches, peculiar not only in their size, but also in their style. The treatment was large, in the art sense of the word. At Bury St. Edmund's there was formerly a group of churches such as existed nowhere in the world. He referred to those at the Old Abbey with a magnificent Norman gate in the middle. No place on the Continent had anything like that magnificent group of churches. Speaking of the period which gave birth to such artists as Hogarth and Gainsborough, Mr. Sparkes pointed out that there was at the same time the growth of art in pottery and furniture, the latter beginning to be very highly appreciated in the present day. These things came to an end, and it was easy to understand why. The French Revolution, and with the wars that followed, and the struggle there was for national existence, there was no money and little inclination left for art productions, and a blank period came. There was no revival until the year 1851, when the great Exhibition was held, when we took stock of our deficiencies in this respect. It has often been said that in 1851 we found

ourselves absolutely behind in the race for industrial art. The consequence was we set to work in our peculiarly English manner. We took stock of our deficiency, and we devised a scheme to recover the ground we supposed that we had lost. To that scheme was, to a great extent, due the development of a system of art instruction. It was better conceived than carried out—so well conceived that other nations took it up. There was an awakening from our so-called want of taste and the extreme was immediately run into. French designs were to a great extent imported into this country, but it had almost entirely stopped now. The art schools were established by Parliament with Government money, but on the condition of only educating artisan students. These students, however, did not fill the schools. It was thus found necessary to open the schools to all who paid to enter, and hence the upper and middle classes were now taught, and to them it certainly proved a benefit. The amateurs, too, in these schools were the most useful instruments in advancing the interests of high art. Mr. Sparkes pointed out the necessity of students avoiding all wish to become painters before they even studied drawing. Amateurs were so apt to shrink from the drudgery, and many seemed to desire to begin at the end where great painters left off. That was the greatest difficulty that was experienced in dealing with amateurs. He pointed out the necessity of observing absolute accuracy. The French appeared unable to copy the traditional accuracy of the English, so necessary to the development of the amateur. There was frequently a great deal of unnecessary labour on the part of students from the want of accuracy. Instead of thoughtlessly putting the pencil to paper, and probably having to use the india-rubber frequently, the student should be painstaking, and before using his pencil think and deliberate, not troubling because the work was done more slowly. It was necessary for drawings to be as absolutely accurate as human beings could make them. Art in England was of a national character, as they in Suffolk might well understand when he referred to such names as Gainsborough and Constable—men who could scarcely be approached in their own line. Constable even disregarded picturesqueness for the sake of fact, and from him the French school of landscape painting had been formed. The French, however, he must confess, followed him in a most extraordinary manner. With regard to the Ipswich Fine Art School, it had added considerably to the number of artists in the county, and in speaking of Cotman and Symonds, he was speaking of men still remembered as pupils in that school, and who were now in town, coming to the front, and he felt no doubt would make their mark among the artists of the day at a very near future.

### TRURO CATHEDRAL.

A REPORT on the progress of the works at Truro Cathedral was presented to the Diocesan Conference which was held last week. According to it the committee had expended about 2,800*l.* beyond what they had in hand, but seeing they had the whole twelve months to collect that sum, they had not much to fear. By incurring that expenditure, too, they secured the munificent offer of Canon Phillpotts of 1,000*l.* and 500*l.* at a future time. They had also received the memorial fund of 1,000*l.* from Lord Robartes, and they hoped other memorial funds or legacies would come in to help them in their deficiency. Last year they had a deficiency of 1,300*l.*, and that was calculated upon the building of the choir division alone; and no allowance was made for necessary expenses, such as architect's commission. Now, they had only a deficiency of 2,863*l.*, not upon the choir division alone, but upon other features which they had authorised to be carried out, including the south aisle, which was to serve as the parish church of St. Mary, and the south transept. In regard to offertories, about which a question had been asked, the treasurer had given him a statement which showed that for this year the amount already returned as offertories within the diocese was 243*l.* 13*s.* 8*d.*; and elsewhere 101*l.* 4*s.* 7*d.*

The following report, dated October 5, from Mr. Pearson, R.A., was also read:—

"A few days ago I again visited the works at the cathedral, and it affords me much pleasure to report that they are progressing most satisfactorily. The north aisle of the choir is very nearly completed to its full height; it only wants its parapet to finish it. The east gable of the choir is carried up to the point of the lower tier of windows, and the ends of the aisles are as high as the side walls, and are therefore also nearly to their full height. The arcades dividing the choir from the aisles will in the course of a few days be all completed, and in less than a fortnight I hope that the string course over these arches, and which is at the level of the triforium floor, will be fixed. The other arcades are in a similar state of forwardness, and will in the course of this month be brought up to this triforium level. The two tower piers are less forward than the other features, but they will now be carried up to this same level. When the whole of the building has thus been carried up, there will then remain to be built the triforium and clerestory stages of the choir, with the remaining portion of the east gable end, the remaining portion of the two tower piers and

the arch over them, and the upper part of the ends and sides of the two eastern transepts; and then, when these works are finished (which I hope they may be by the summer of next year), the masonry may be said to be nearly completed, for there will then only remain to be put in the ribs and filling in of the groining, which is a work of no difficulty, and will not require an expenditure of much time."

It was resolved by the Conference not to proceed with the construction of the great transept until sufficient money had been secured.

### THE VENTILATION OF THE GUILDHALL.

ANY ordinary observer who has had the privilege of entering the Council Chamber at the Guildhall, London, even when devoid of occupants, would be almost sure to ask himself the question as to how the room was ventilated. It is one of those apartments that appears to strike the mind that a something more than can be seen is necessary for the healthful comfort of those whose civic duties compel them to pass a portion of their time in it, and if the stranger has had an opportunity of being present when the City parliament have been holding their debates, he would have soon found that the atmosphere was anything but inviting; and had he asked any of the officials, or even the members of the Council themselves, he would have heard dissatisfaction expressed on all hands, for it is notorious that, spite of different attempts to remedy it, including what we may term an elaborate system introduced no later than three years since, the room in which the City Fathers hold their conclaves has been one of the worst ventilated apartments for its size, as a public one, in the metropolis. We say "has been," for a new system of ventilation has recently been completed that promises to surpass all previous attempts to introduce fresh air and exhaust the vitiated, and one that after many severe tests has received the approbation of all concerned in the carrying out of the plan. Smarting under the annoyances they had long laboured under, the City Architect, by the direction of the Corporation of London, requested Messrs. Robert Boyle & Son, of Holborn Viaduct and Glasgow, whose success as ventilating engineers has become matter of world-wide notoriety, to submit to him a system of ventilation adapted to the requirements of the chamber, but on the conditions that it would only be accepted after exhaustive trials had proved to the City Architect and a committee that it was successful; and if not to their satisfaction every vestige of it was to be removed within a specified time, and everything made good, at Messrs. Boyle's expense.

Thus the contract was entered upon on the principle of "no cure, no pay." Confident in their system, the firm accepted the terms, and the guarantee, which was of a very stringent character, was drawn up by the Corporation themselves, and was of such a nature as would put Messrs. Boyle's system to a most severe and crucial test. In January last the chamber was handed over to them to commence operations, and as we have carefully watched the progress of the work, and were present only a few days since—it now having passed through the ordeals prepared for it—we have much pleasure in adding our testimony to its satisfactory results. It has received the approbation of the City Architect, the committee, and we may add of the public. Messrs. Boyle have had the privilege accorded them of inviting as many as they pleased to witness the results, and a large number of invitations were issued by them, in which they included those gentlemen they considered interested in the question of ventilation and competent to pass an opinion upon the work, and also competitors in their own profession, advocates of a totally different system. Amongst those who accepted the invitation were Dr. C. W. Siemens, Captain Douglas Galton, Professor Corfield, Captain McHardie (Home Office), Dr. Steele (Guy's Hospital), Mr. Ernest Hart, General Cotton, Mr. A. Billings, Mr. H. Currey, Mr. Alexander Graham, Dr. Sedgwick Saunders, Medical Officer of Health to the City of London, Dr. Lavies, Medical Officer of Health for Westminster, Mr. Thornhill, Mr. Butterfield, Messrs. Hanson, Griffith, Pugin, and Bruce, besides numerous other architects, civil engineers, and medical men.

The application of the system adopted may be described as follows:—Nine of Messrs. Boyle's patent self-acting air-pump ventilators are fixed on the top of iron shafts, standing at various heights above the roof, to clear them of obstruction. Four of these shafts, viz. two at each of the chamber, are of 13-inch diameter, branching off a little above the ceiling into two 10-inch pipes, communicating with openings in the ceiling 2 feet in diameter, concealed by means of ornamental centre flowers, or ceiling plates. On the top of each shaft is fixed a 2-foot air-pump ventilator. At the east end of the chamber a shaft 18 inches in diameter is carried through the roof, having a 30-inch ventilator on its top. This shaft expands at the bottom to 2 feet 6 inches by 2 feet 3 inches, covering an opening of the same dimensions in the ceiling. At the west end, a shaft 30½ inches by 20½ is brought into requisition, and is carried up a considerable height to the top of an adjoining building, surmounted with a 3-foot ventilator. A shaft

16 inches diameter, that is connected with the large "sunlight" gas-burner in the lantern over the central dome of the chamber, is also run into this shaft, the ventilation of the body of the room being partially effected by this means. On the top of the outer casing of the lantern three 13-inch shafts are fixed at equidistant spaces, and crowned with 20-inch ventilators, the shaft communicating with openings in the interior of the lantern by means of expanded iron hoppers, and these complete the arrangements for the extraction of the vitiated air from the chamber. It may be mentioned *en passant* that a portion of these shafts formed part of the old system of so-called ventilation, and were then surmounted with revolving cowls.

For the supply of fresh air to the chamber Messrs. Boyle have turned to account, with certain alterations, some of the modes of ingress they found existing when the work was entrusted to them, and that were then of but little use. On the south side of the chamber four vertical air tubes or brackets are fixed against the walls, two of these being of the size of 2 feet by 2½ inches by 3 feet, the other two, which are placed a little higher up the wall, measuring 18 inches by 4 inches by 2 feet. The tubes communicate direct with the outer atmosphere by holes cut through the walls and covered with cast-iron gratings. The air inlets are fitted with Messrs. Boyle's patent heaters, which are now so generally known amongst the profession as to render description here unnecessary. These are, of course, added for the purpose of warming the incoming air to any temperature required as it enters the building. The north wall is similarly treated, with the addition of an extra tube at the end by the Lord Mayor's seat. At the public end of the chamber three more inlet tubes are fixed, similarly fitted with the air-warmers, while others amounting in the aggregate to sixteen, are fixed in other positions, completing the arrangements for the fresh air supply. We may add that an abundant quantity is admitted, and the tests have shown that the air can be warmed in cold weather to a temperature of from 60 deg. to 120 deg., thus entirely preventing cold draughts, the usual attendant on most methods of admitting cold air to a building where provision is not made for warming it.

Referring to the extraction of the vitiated air, it is not necessary to give the full table of results from January until the present time; we need only say that the average quantity withdrawn amounted to 500,000 cubic feet per hour, and that during the whole of the experiments, official and otherwise, not the slightest down-draught was experienced; had it been otherwise the conditions would not have been complied with, and the firm would have been called upon to remove their appliances, and their system would have been pronounced a failure, one of the principal conditions being that down-draughts should be entirely absent, and that a continuous and powerful up-draught should be maintained.

Previous to Messrs. Boyle undertaking this work great complaints had been made of the amount of draught always present in the chamber, but since the completion of their arrangements lighted candles have been placed in various parts of the room, the flame has been watched, and it has been clearly demonstrated that they were in all instances perfectly steady, showing that the draughts had ceased to exist.

After six months' practical experience, Mr. Horace Jones, city architect, and President of the Royal Institute of British Architects, has certified that all the conditions have been fulfilled, and that the ventilation is successful; and, as we before observed, this has been endorsed by the committee, and Messrs. Boyle have received their account. Thus another public building has been added to the long list of those that the firm have successfully ventilated.

The following letters have been received by Messrs. Boyle from Sir John Monckton, the Town Clerk of the City of London:—

Guildhall, E.C. : July 10, 1882.

DEAR SIRS,—I gladly give you the enclosed letter of introduction to my friend Mr. Whichcord, and hope that his high professional position may make it of use to you. You have the permission you ask to copy it for use elsewhere, for really I am personally grateful for the alleviation we now experience in the condition of the air we have to breathe for so many hours together.

Faithfully yours,

(Signed) JOHN B. MONCKTON.

Guildhall, E.C. : July 10, 1882.

MY DEAR WHICHCORD,—I am asked by Messrs. Boyle & Son to state my personal experience of the recent ventilation of the Council Chamber. I can do so in very few words. Until the present year I never knew what it was to leave the Guildhall on a "Common Council day" without a headache. In fact the palpable alteration for the better in the atmosphere, even on crowded days is very satisfactory, and it appears to me—a non-expert—that Messrs. Boyle's system is eminently valuable and practicable.

Yours very obediently,

(Signed) JOHN B. MONCKTON.

In addition, the officials of the Court and many members of the Council have personally thanked Messrs. Boyle for the benefits they have derived, from a healthful point of view, from the application of their system. From a large number of equally favourable letters received by the firm from independent sources we abstract the following from an eminent London physician and sanitarian, whose name for certain reasons is suppressed:—

"After thoroughly testing and examining your system of venti-

lation as applied to the Council Chamber of the Guildhall, I have great pleasure in being able to say that I am in every way satisfied with the result. It is, in my estimation, the most perfect system yet introduced, and I greatly doubt there being any room for improvement upon it. The fact of your appliances being entirely self-acting and having no movable parts liable to get out of order after having been placed is a great boon, as it renders any after-cost or attention unnecessary. During the time that I have devoted to testing your appliances I have always found them entirely free from down-draught, a feature I have not found in any other system, and which I opine to be of the greatest advantage, as it not only serves to ventilate the building more thoroughly, but furthermore maintains an even temperature therein, which no sudden change of weather can affect. My pursuits have rendered me practically acquainted with many systems of ventilation now in use, both automatic and otherwise, and after careful examination I have arrived at the conclusion that your system is not only the simplest but the most efficacious I have yet met with. This opinion is, in so far as the Council Chamber is concerned, also shared by some friends of mine who are members of the Council, and who pronounce the application of your process simply faultless."

As a result of Messrs. Boyle's success here and at the Custom House they have received orders for the ventilation of over 300 public buildings, the more recent being the Reform Club, Lloyd's Royal Exchange, Claremont, the residence of His Royal Highness Prince Leopold, New Royal Courts of Justice Chambers, the Imperial Mint, St. Petersburg, Portland Prison, Stonyhurst College, Royal Naval College, and Greenwich Hospital. It is also being applied to Mr. Gordon Bennett's steam yacht *Naumina*.

## THE GLASGOW INSTITUTE OF FINE ARTS.

THE annual general meeting of the members of the Glasgow Institute of the Fine Arts was held on Monday last. The twenty-first annual report stated that when the books were closed on August 31 the capital amounted to 17,310*l.* 16*s.* 11½*d.*, showing an increase for the year of 5,280*l.*, arising from the bequest of the late Mr. McGavin, and contributions from new members. During the year two exhibitions had been held, the Water Colour and the Black and White, in the autumn of 1881, and the usual spring exhibition in 1882. In the Black and White exhibition the high standard of excellence reached in the exhibition of 1880 was fully maintained, and the spring exhibition was also one of great merit. The amount obtained for season tickets, admission, &c., was 52*l.* in excess of 1881, and the expenses of both exhibitions were considerably lower than in previous years. There were 196 works, producing 6,244*l.*, sold at the spring exhibition, and 173 at the Black and White exhibition, producing 1,398*l.* There were now 419 members on the roll, made up of 15 private gentlemen, 250 merchants, 77 professional gentlemen, and 77 artists. The report concluded as follows:—"The Council must, as in previous years, impress upon their fellow-members the imperative necessity to the progress of the Institute of each member taking a personal interest in its operations and extension. The Institute has since its establishment done much, quite unaided by outside help, to further art education and improve art taste in Glasgow, and to enable it to persevere successfully in its career of usefulness the hearty co-operation of the members is earnestly requested. In other towns, such as Liverpool, Manchester, and Birmingham, art matters are yearly receiving increased attention, as their important bearing on the well-being of the community is being more clearly understood. To keep Glasgow from lagging behind, the Institute must have the cordial support of its own members and through them of the general public."

Mr. Reid, the chairman, said the report was so full and explicit that nothing fell to be added by him. He drew attention to the membership, which, for a city like Glasgow, was very small. It was for all members of the Institute to endeavour to add to the list by getting the names of gentlemen willing to join. The interests of the gentlemen who were not members of the Council were identical with those who were. The statement of accounts showed some little deficiency in their revenue. Of course they would understand that arose through the halls not being so fully let as in the previous year, and they had not drawn such a large sum for rent. It came to be a serious question for the Council to consider what was the best plan to adopt to bring the expenditure and revenue nearly equal. In letting the halls for exhibition purposes the Institute was no doubt carrying out the intention of the society, but of course there were some objections to this. If they invited foreign parties to come and exhibit works of art, it would tend in a great measure to curtail the sales made by local artists. By the exhibitions held during the preceding year the rent received was much larger than last year, when they confined themselves almost entirely to their own exhibitions and bazaars. It was clear that something would have to be done to improve matters. As regarded the expenditure, he was happy to say that as compared with the previous year it had been much less, their secretary

having been looking into the accounts and curtailing the expenses where it was possible to do so.

A letter was read from the Marquis of Bute, in which his Lordship declined to undertake the office of president. Sir Peter Coats was elected. Mr. James Duncan, of Benmore, and Mr. James King, of Levernholm, were elected vice-presidents. Mr. Reid was re-elected chairman of the Council. Messrs. William Carlaw, A. C. Holms, D. E. Outram, and Robert Ramsay were elected members of the Council.

The names of the gentlemen proposed as members of the Institute were then agreed to, and the chairman stated that forty-seven had been added to the roll. They wanted, however, to get a thousand names, and he did not see why they should not easily obtain that number in a city of about 800,000 inhabitants.

### ARBITRATION CASE.

THE award of Mr. T. Huskisson, the arbitrator in the case of *The Countess of Ossalinsky v. The Corporation of Manchester*, heard in August last in London and previously in October of last year, has been presented. The question was as to the value of the Armboth estate, situate on the banks of the Thirlmere, and required for the purposes of the proposed waterworks. The hearing of the case occupied about fourteen days.

In his award Mr. Huskisson fixes the value of the freehold lands at 47,120*l.*, and the value of the customary lands, &c., at 12,461*l.* In arriving at these valuations the arbitrator has considered certain stints as mere rights to take herbage. He puts an additional value of 1,728*l.* on the freehold stints in respect of any right they may give to the soil of the fells. He puts 960*l.* additional value on the customary stints in respect of any interest they may have in the soil of the fells. Again, he puts an additional sum of 2,000*l.* as the value of that portion of the bed of the lake which may be held to belong to the Countess as riparian owner. Then he puts 128*l.* as the value of certain stints which were not included in the notice to treat, and he puts 48*l.* as value to be added in respect of the right which these stints may be held to have in the soil. An addition of the several sums here mentioned gives a total awarded in favour of the Countess of 64,445*l.* But this does not cover the whole of the issues involved. The arbitrator says that the lands, &c., taken by themselves and in conjunction with other adjoining lands, are naturally and peculiarly adapted for collecting and storing water and for the construction of a reservoir, and that he has in his award taken into consideration the enhanced value of the lands by reason of this fitness, whilst he has not included any value in respect of this adaptability along with other lands for the same purposes. He submits a special case as to whether he ought to have allowed for this latter. If it should be held that he ought to have allowed for it, then he says further that if the title shows that the bed of the lake is part of the land of the Countess he awards 6,000*l.* for this extra matter. If the title shows that the bed does not form part of her land, then he awards 4,000*l.* The general result is that there is an absolute award in favour of the Countess of 64,445*l.*, and a contingent award as the result of a special case of 6,000*l.* or 4,000*l.* to be added, the difference depending on a question of title.

### ELECTRICAL ENGINEERING.

THE subject of the opening lecture of the session in the Engineering class of the University of Edinburgh was "Electrical Engineering." Professor Fleeming Jenkin said that, when closing the class last session, he had spoken of the desirability of having a course of lectures on electricity, and it appeared that it would not be very difficult to prepare a course which would be exceedingly useful to students in large cities. He found, however, that the development of the science was so great that it would be an exceedingly laborious matter to prepare a course on the subject without efficient apparatus; and after his visit to the Electrical Exhibition in London he became more and more convinced that the delivery of such a course without apparatus, and very expensive apparatus, would simply be time lost. Of the immense importance of lectures on electrical engineering he was more and more convinced, and he had come to the conclusion that a new chair was required for its proper teaching. The developments in the science could hardly be exaggerated, and while at one time scientific men were of opinion that the popular mind was expecting too much from electricity, he suspected that the general popular opinion was coming to be about right. The popular mind erred in supposing that electricity would supersede steam as a motive power. What had taken place was that engines were employed to produce electricity, and electricity afforded us the very best means yet discovered of distributing power. Electricity did not take the place of steam, but it took the place of cog-wheels, and of shafting and belting. It took the place of hydraulic machines. Instead of shafting, they had a wire from the engine to the machine that required to be driven. It was as a means of distributing power

that electricity had become so very important an agent in engineering work. In regard to electric lighting, the quality of colour and brightness seemed to him to be matters of exceedingly small importance. In these respects it seemed to be much like a slight change of fashion in dress, the newest style of coat being for a time preferred to the older. But there were numerous advantages to be gained in the carrying on of works which it was impossible to carry on by gaslight; while for domestic purposes with the incandescent light they had no bad air and very much less heat than from gas, and this was important from a sanitary point of view. After alluding to many of the uses to which electricity could be conveniently applied—such as the carving of stone, the hoisting of goods, and to farmwork—the lecturer referred to the importance of having technical classes, with suitable laboratories, for instruction in the principles of electric engineering. Touching on the subject of legislation in regard to electric lighting companies, he remarked that every possible obstruction seemed to be thrown in the way of these companies. This, however, might be attended with good in the long run, because electric lighting companies did not seem to be deterred in overcoming those legal difficulties. If anything was to be done at all in the way of studying electrical engineering in the University, it must be well done, and ample apparatus must be provided to enable the teachers in Edinburgh to give as good instruction as could be given in any other town in the kingdom.

### LANCASHIRE ART PATRONAGE.

THERE is a considerable colony of Manchester and Liverpool artists settled in Tal-y-Bont, a quiet and charming village between Conway and Llanrwst. A few weeks ago a gentleman from Blackburn was introduced to this happy family of artists by a Manchester man, and he gave every artist there a commission for a 20-guinea picture or drawing. The works were completed, and the gentleman advised about it. The artists met and rigged up a large outhouse belonging to Mr. Charles Potter, who is a kind of governor and leader down there. In this building the drawings and pictures were displayed, and the Blackburn gentleman was so pleased with the result that he at once paid the commission and bought some more drawings, notably two very good ones by Mr. Potter. This pleasant episode gave great pleasure to the group of artists at Tal-y-Bont, but it is doubtful whether they received as much gratification as the owner of the drawings.

### NOTES ON NOVELTIES.

#### New Draw-off Cock and Safety-Valve.

Our readers must be well acquainted with the troubles to which householders are too often subjected through the months of a severe winter in connection with the bursting of water-pipes through frost, and more particularly during the two winters previous to the last, when many serious, and in one or two instances fatal, accidents occurred from this cause, particularly when high-pressure boilers were in use. Several safety-valves were then brought prominently before us, and one of them, "Randall's," made by the firm of which we are about to speak, has been extensively used, and has answered its purpose remarkably well. We have now to call attention to a combined draw-off cock and safety-valve for a kitchen boiler, which will obviate the necessity of having the additional appliance fixed, and we doubt not prove even more reliable than when an independent safety-valve is fixed. This tap is the invention of Mr. S. B. Goslin, for many years connected with the old-established firm of John Warner & Sons, Crescent Foundry, Cripplegate. Its body or shell is formed with a diaphragm dividing the inlet or pressure side from the outlet, and through this diaphragm there is a passage, with a seating for the valve, by which the pressure is closed and opened. The valve is of the disc form, and its stem passes up into a spring-box which is capable of sliding in a direction to and from the diaphragm, in a quick barrel formed upon the shell or body. The spring box contains a coiled spring, which is sufficiently stiff not to yield to the ordinary pressure upon the valve, but it bears upon a disc upon the valve stem. A spindle carries the spring box at its end, and a screw thread upon the spindle works in a female screw in the body, or in a nut which is received into a recess provided in the cover of the guide barrel. Over the nut there is a stuffing-box to maintain a tight joint around the spindle. The latter is provided with a head handle, by which it may be turned to open and close the water passage. The distance to which the spindle can be screwed down is limited by stop nuts, which screw on to the exterior of the stuffing-box cover. The head or handle comes into contact with the stop when the handle has been screwed in far enough to bring the valve against its seat, but without further compressing the spring in the spring-box. When the spindle is turned in the contrary direction the spring-box is carried back away from the diaphragm, and the valve is withdrawn from the seat. Ample arrangement is made to enable the valve to rise

from its seat should an undue pressure accumulate; and the spring within the spring-box may be replaced by a weight or weights. Although the description we have given of this new appliance for safety may to the uninitiated appear somewhat complex, if one of the new cocks were in the hands of the reader, its arrangements would prove to be of the most simple character, and we anticipate its almost universal adoption when generally known.

## LEGAL.

### Sheriff Court, Falkirk.

#### MEASUREMENT OF TIMBER.

A case of some importance to timber-measurers has been decided by Sheriff Bell. The case arose out of a dispute between the Caledonian Railway Company and Mr. John Cook, timber-measurer, Grangemouth, as to a charge made by the latter for measuring fully 10,000 tons of deals and battens lying round Grangemouth Docks. There had been a fire in the Canal Office, which destroyed the books showing the quantities of timber on which storage dues were charged to the timber merchants; and the pursuer was employed, without any bargain as to price, to measure the timber. After being engaged five days at the work, he was stopped on account of the merchants offering to give all the information required. The pursuer charged for his statement 134*l.* 1*s.*, being at the rate of 3*d.* per load of 40 cubic feet. The defenders maintained that 10*l.* was ample remuneration, but offered 20*l.* judicially. A number of timber-measurers from the Clyde proved that their rates were the same as those charged by the pursuer. The Grangemouth merchants, on the other hand, maintained that there were no such rates known in Grangemouth, and that the defenders had offered ample remuneration for the work, which was so easy and simple that it was invariably done by their clerks. The Sheriff has allowed 45*l.*, being at the rates allowed by the Custom House for such work, with expenses, modified to three-fourths, as the pursuer had failed to sustain his claim fully.

### Court of Session, Edinburgh.

Before Lord LEE.

#### GARDEN *v.* BEATTIE & SONS.—DALY *v.* SAME.

##### EMPLOYERS' LIABILITY ACT.

The pursuers or plaintiffs in these were labourers who were employed by the defenders, who are builders in Edinburgh, in May last, in digging out the foundations for the site of a front wall of a new tenement that was to be erected in room of an old tenement in Advocates' Close, which had been condemned, and which had been taken down by the defenders. Instead of removing the stones of the old tenements from the ground, the defenders, before the pursuers were employed, had them piled in three heaps on the ground between where the side walls of the old tenements stood. It was alleged that several necessary precautions had been neglected by the defenders, or those for whom they are responsible, to see to the proper building and stability of the piles; and the piles endangered the safety of the workmen employed near them. The track for the foundation for the new wall passed close to the side of the central pile; and, in order to make sufficient room for the track of the foundation, some of the stones composing the pile were removed from its side, which further endangered its stability, and no precautions were then taken to prevent it giving way. Complaints were made by the pursuers and their fellow-workmen to the defenders' foreman, and he had a prop put up at the side where the bulge was greater, and on the opposite side from where the pursuers were working. The pile still further gave way, and further complaints were made to the foreman, but nothing was done. He informed them there was no danger, and to proceed with their work, which they did. On the morning of May 4 the pile fell and covered the pursuers up, and inflicted on them the injuries which were here founded on. In defence it is denied that there was fault on the part of the defenders, and it is said that the injuries sustained by the pursuers were of a very slight character, not necessitating their ceasing work for more than a few weeks at the outside.

The jury, after a considerable absence from Court, returned an unanimous verdict for the pursuers, but stated that they were divided as to the amount of damages. It was agreed to take the verdict of the majority on this point—that is, 10*l.* each to the pursuers. The defenders had sometime previously offered the pursuers 12*l.* 10*s.* with expenses. The verdict did not carry expenses.

**An Interesting Discovery** has just been made in the course of the excavations in the Forum. In removing the causeway passing across the area in front of the Arch of Septimius Severus, the remains of an ancient and forgotten church, now recognised as that of Santa Maria in Foro, have been found beneath the road. The church, which is of small size, was constructed within the western porticoes of the Basilica Julia and on the ancient level.

## CHURCH BUILDING AND RESTORATION.

**Birmingham.**—The chancel and nave of St. Nicolas' Church, Lower Tower Street, have been enriched by the insertion of two additional lights in the east window and the erection of a stone pulpit. The pulpit, which is executed entirely in selected Bath stone, is raised five steps above the level of the nave, and stands contiguous to the easternmost pillar of the nave arcade on the north side of the church. It is a tasteful piece of work, and has been executed by Messrs. Jones & Willis from the designs of Mr. John Cotton, architect. The pulpit is the gift of a lady recently deceased. The two additional lights inserted in the east window complete the subject of the Crucifixion commenced a year ago. The work has been executed by Messrs. R. W. Winfield & Co., successors to Camm Brothers, of Smethwick, and under the personal direction of Mr. T. W. Camm, at a cost of 120*l.* The glass is remarkable for its brilliancy. The window is the gift of a lady, and will, when complete, be one of the finest in the town.

**Penkridge.**—The parish church, which has been undergoing works of restoration, under the direction of Mr. J. A. Chatwin, architect, of Birmingham, has been reopened. The work has been carried out by Messrs. P. Horsman & Co., of Wolverhampton. Messrs. Charles Smith & Son, of Birmingham, put in the heating apparatus, and also the wrought-iron framed guide for the bell-ropes.

**Marhamchurch.**—A Wesleyan chapel has been opened at Titson, near Marhamchurch, providing accommodation for about 100 persons. The building, which has been erected by Mr. W. A. Beckly, builder, of Holsworthy, has been designed by Mr. C. P. Wise, architect, of Launceston.

**Perth.**—Plans for a new church at Perth for the congregation of Free St. Leonard's have been prepared by Mr. J. J. Stevenson, London. The church will be erected in the later Scotch Gothic style of architecture, founded on old examples, such as St. Giles's, Edinburgh, Stirling, Linlithgow, and St. Monance, in Fife. In the area of the church there will be 545 sittings in pews, 53 in open seats, and 58 seats for the choir and elders, and in the gallery accommodation will be provided for 329 persons, making a total of 985 sittings. In connection with the church there will be a hall seated for 309 persons. It is estimated that the buildings will cost between 7,000*l.* and 8,000*l.*

**Essex.**—Pattiswick Church has been reopened after restoration from the designs of Mr. Dampier, of Colchester, Messrs. Gardner & Son, of Coggeshall, being the builders. The nave has been thoroughly restored, and the old pews have been replaced by benches, or otherwise altered and improved. The roof of the nave has undergone thorough repair, and the flooring laid with Godwin's tiles. The contract amounted to 1,462*l.*

**Ipswich.**—The restoration of the tower of St. Lawrence Church, Ipswich, has been completed. The work of restoration has been carried out by Mr. George Barrett, contractor, under the direction of Mr. Barnes. The tower has been re-cased with new flintwork, the old decayed material having been cleared off. The panelling and tracery are carried out in accord with the general style of architecture in the building itself, whilst beneath the belfry windows is rich diapering. The belfry windows, four in number, are reset in Portland stone, there being on each side buttresses carried by angels, and Portland stone has also been used for the quoins and other parts of the new work, the wall space being inlaid with masonry. The tower is surmounted by a pierced parapet in pinnacles. The work has cost some 1,400*l.* to 1,500*l.*

**Sowerby.**—The Methodist Free Church has been reopened after enlargement. The contractors were:—Mr. Siddall, Sowerby Bridge, ironwork and masonry; Messrs. C. & W. Whiteley, Rishworth, joinery; Mr. R. Stafford, Sowerby Bridge, plumbing, glazing, and gasfitting; Mr. J. Robinson, Luddenden Foot, slating and plastering; and Mr. J. Lumb, Gatelands, painting. Mr. T. L. Patchett, of Halifax, is the architect.

**Cannock.**—The parish church of St. Luke has been reopened consequent on the completion of alterations and extension. The work of enlargement has been carried out under the direction of Mr. N. Joyce, architect, of Stafford. The contractor was Mr. Williams, of London. A stained-glass memorial window has been inserted at the cost of Mr. E. Christian.

**Crewe.**—The foundation-stone of a Methodist church has been laid. The building, estimated to cost 4,400*l.*, is to accommodate 764 persons. The architect is Mr. Hirst, of Southport, and the builder Mr. Cotterill, of Crewe.

**Coventry.**—A new chapel is being erected in Vine Street, Coventry, to provide accommodation for about 550 persons. Messrs. G. & J. Steane, of Coventry, are the architects, and Mr. C. Hayward, jun., of Coventry, is the builder.

**Wellington.**—The parish church has been reopened, after undergoing works of renovation and decoration under the direction of Mr. Randal, F.R.I.B.A., of Shrewsbury. The building work has been executed by Messrs. Bullock & Son, and the decoration by Messrs. Marston Bros., of Shrewsbury and Wellington.

## ART SCHOOLS.

**Nottingham.**—Two very useful scholarships are offered to students of the Nottingham School of Art. One, given by Mr. S. Dutton Walker, F.S.A., a member of the committee, is for the encouragement of the study of architecture, and is of the value of 25*l*. Its direct object is to assist the successful competitor to visit the Continent for the purposes of study; and, to ensure this, the amount will be paid to him on signing an undertaking to carry out the intention of the donor, and on his return to submit the works executed during the tour to the committee. Competitors must have been students of the School of Art for not less than four months previously to April 2, 1883, and must have made not less than thirty attendances. The competitors will be subjected to an examination in writing, in which they are expected to show a general knowledge of the principles of ancient architecture and of the leading features of the Classic orders; also a knowledge of the characteristics of the style generally termed Gothic. They will further be expected to submit a design for a new building, in any style, to be chosen from the following:—A church, a mortuary chapel for a cemetery, a Nonconformist chapel, a market hall, a town hall, a free library, a museum, a school of art, a school-board school, or a villa residence to cost not more than 1,200*l*., or a pair of villas to cost not more than 2,000*l*. The second scholarship, entitled the "Nil Desperandum" art scholarship, is open to the same class of competitors, is also of the value of 25*l*., and is intended to assist the competitors to study in Continental galleries and towns, under conditions similar to those imposed in the case of Mr. Walker's scholarship. In this competition there will have to be submitted:—A sheet of foliage, drawn from nature, in outline; a sheet of at least two flowering plants, painted in water-colour from nature, without background; and a group of still life, or a landscape from nature, or a painting of a head from nature. There are various other conditions imposed in each case as to dates and the adjudication of prizes.

## ARCHÆOLOGY.

**Newcastle Society of Antiquaries.**—A meeting of members of the Newcastle Society of Antiquaries was held on October 25. Dr. Bruce stated that they had had a stone figure presented to them from London similar to those at Alnwick Castle and other places. At one time stone figures were placed upon the walls of Newcastle with the view of impressing invaders with the idea that the townspeople were on the *qui vive*. As a fact, invaders were never deceived after the first time, and the stone figures passed into disuse. When the wall was repaired they were put into it. Besides the one that had just been presented to them they had several others.—Mr. Hodgkin stated that the committee in connection with the Black Gate had made considerable progress. They found the premises in a most wretched condition, but the place would come out all right he thought. The upper part had been condemned as unfit for human habitation, and was full of all sorts of dirt. The matter was in the hands of Mr. Johnstone, the architect, who was preparing plans, and he thought it would be certain to be in shape by the next meeting of the society. The great point upon which the committee seemed rather divided about was whether to recommend a flat roof with battlements or the reconstruction of the present roof. The difficulty about the battlements was they had no authority for the construction of battlements. They did not know that there ever had been battlements there; and if there had they did not know what the battlements should be like. Besides, battlements would be a little more expensive. He thought that the majority of the committee were in favour of the reconstruction of the present roof.—It was agreed that the thanks of the society should be tendered to the Duke of Northumberland for the present of the following books:—"A Descriptive Catalogue of Antiquities (chiefly British) at Alnwick Castle," "Catalogue of the Collection of Egyptian Antiquities at Alnwick Castle," by S. Birch, D.C.L., LL.D., F.S.A., keeper of the Egyptian and Oriental Antiquities in the British Museum.—Dr. Bruce stated that the fourth Duke of Northumberland spent many years in Egypt and brought home with him a valuable store of antiquities, which had been referred to in the writings of Sir Gardiner Wilkinson and others, and which had been catalogued in the magnificent book presented to them by Mr. Birch, one of the highest authorities on these matters.

**The Ardagh Chalice.**—A copy of the famous Ardagh chalice has been placed in the Science and Art Museum, Edinburgh. The chalice, which with a number of brooches was found at Ardagh in Ireland on the estate of Lord Dunraven, at the foot of a tree, is understood to belong to the fifth century, and is considered by antiquaries to be the finest piece of Irish Celtic work of the kind extant. The present copy, one of five which have been made, faithfully reproduces in every detail the features of the original, which is of silver and gold chastely enamelled and decorated with precious stones. The chalice stands 6 inches in height, the diameter of the bowl being 7 inches. Just below the brim, on the outside of the bowl and passing through the opening of the handles,

is a band of gold filigree work, divided into panels, which are separated by bosses of enamel mounted in gold. Each panel has a separate pattern worked out in it with rare artistic taste. The handles are in enamel and gold; and below them, and on each side of the cup, between them, are massive circular gold plates, showing characteristic Celtic scroll work, and studded with bosses of enamel. The stand is of gold, with rich scroll ornamentation; and round the foot of the chalice is another decorated band. The foot of the chalice is hemispherical; and a remarkable feature of it is, that the concave under-side has also been most lavishly decorated, the work being of quite as high a character as that on the outside of the bowl. In the centre is a large and pure conical rock crystal, and around this runs a broad band of gold bearing exquisite scrollwork, and in which are set five emeralds. Round the inner edge of the foot there are eight narrow panels—six in silver, all of different patterns, and two in gold, the latter being decorated with the "Fylfot" ornament, and the panels being separated by enamel work sunk into the band. On the outside of the bowl, and below the gold enamelled band already mentioned, is an inscription in old Irish characters, the beauty of which adds very much to the appearance of the cup. Along with the chalice were found four handsome Celtic brooches, of which also casts are shown. One of the brooches is a penannular of very chaste design. Another part of the "find" was what had apparently been the bowl of another chalice, but which had been broken while in the hands of the artificer. The break, which is a somewhat curious one, is cleverly reproduced in the *fac-simile* now on view beside the chalice.

## GENERAL.

**Mr. G. E. J. Powell**, Nantow, Aberystwith, has bequeathed to the museum of the University College of Wales a valuable collection of art treasures and antiquities.

**Mr. Edward Ryde** will deliver an address at the opening of the session of the Surveyors' Institution on the 13th inst.

**Messrs. Douglas, Hunter & Whitson** have been appointed surveyors for the new Municipal Buildings, Glasgow. The other candidates were Messrs. Henry Herbertson & Co. and Messrs. Shields & Walker.

**Messrs. Jones & Willis** have completed a set of oak choir stalls for Trinity Church, Llandudno. The front desks are carried out with richly-cut mouldings and carved strings, with an arrangement of sunk quatrefoils separated by buttresses dividing the desks into panels.

**The Birmingham Master Builders' Association** will hold its annual meeting at the Great Western Hotel, Birmingham, on Monday.

**The "Gazette"** announces the dissolution of partnership of Messrs. Austin, Johnson & Hicks, architects, Newcastle-on-Tyne, and also of Messrs. Hargreaves & Bailey, of Bradford.

**The Russian Finance Ministry** have assigned a sum of 400,000 roubles for the construction of a Custom-house and warehouses on the new St. Petersburg Sea Canal.

**The General Commission** for the International Exhibition of Fine Arts in Rome have approved the proposal of the executive committee to postpone the opening of the exhibition to January 14, 1883, and to prolong the period for the delivery of works until December 1 next.

**A Collection of Greek Cups**, found at Delphi, will shortly be exhibited in the British Museum.

**The Sanitary Institute of Great Britain** has accepted an invitation to Glasgow for the Autumn Congress and Exhibition next year.

**The Directors of the Hull Savings Bank** have awarded the premium of 20*l*. to design by Mr. Robert Clamp for the new bank at the corner of George Street and Smeaton Street. Thirty-two designs were submitted.

**The Post Office Authorities** propose to erect the Parcels Post Receiving Office in Somers Town, in order to be near the railway termini at Euston and at King's Cross.

**Mr. F. Villiers**, one of the special artists of the *Graphic* during the recent war in Egypt, and Mr. Melton Prior, have been decorated by the Khedive with the Order of the Osmanieh.

**Professor Colvin** is now delivering a course of lectures in the Fitzwilliam Museum, Cambridge, on Tuscan sculpture. The opening lecture on Tuesday was on "The Greek and Mediæval Uses of Sculpture." The remaining lectures will be as follows:—Nov. 3, "Varieties and Applications of Sculpture in Italy, A.D. 1250-1500"; Nov. 7, "The Revival: Nicola and Giovanni Pisano"; Nov. 10, "Andrea Pisano and Orcagna"; Nov. 14, "Jacopo della Quercia and Ghiberti"; Nov. 17, "Donatello"; Nov. 21, "The Della Robbia"; Nov. 24, "Verrocchio and Pollaiuolo"; Nov. 28, "Desiderio da Settignano, Bernardo and Antonio Rossellino"; Dec. 1, "Benedetto da Majano, Mino da Fiesole, Civitate."

# The Architect.

## THE NEW PRESIDENT OF THE INSTITUTE OF ARCHITECTS.

THE address with which a new session of the Institute of Architects has been opened by Mr. HORACE JONES as President, regarded with reference to its substantial merits, is sufficiently promising. This is not the first time that the members have experienced a certain relief in descending from the higher ground of literature and art to contemplate the practical affairs of ordinary life. Of all men Mr. HORACE JONES is emphatically one of those who are animated by a single-minded desire to do what in them lies to promote "the greatest happiness of the greatest number," and to do so not philosophically, but—what is better—experimentally. The large experience of affairs which he has acquired as architect to the Corporation of the City of London, even if he were not personally so characteristically genial and goodnatured as he is well known to be, qualifies him especially for assuming the duty of discoursing in unaffected language upon the everyday things of his profession and his guild. The manner, also, more than the matter of his address—the general scope of it rather than its argument in detail—may be accepted with no little advantage as material for thought rather than criticism. In short, the question may be far from a profitless one, What has an architect in the position of Mr. HORACE JONES to say just now about the affairs of the Institute and of the architects of England as thereby represented?

There are two points amongst those which were thus dealt with which may be supposed to be of chief prominence; namely, the introduction of the examination qualification, and the demand of the provincial members for participation in the elections. We may observe *in limine* that Mr. JONES was extremely frank in his account of the first of these, and equally liberal in his views upon the second.

The impression which was probably left upon most minds as regards the newly-established "exam" for associateship would seem to be that the principal anxiety of the Council and the examiners has turned upon the fear of making it not sufficiently easy. Whether this is a policy which will meet with universal approval is doubtful. Possibly the repeated reiteration of the idea—for every opportunity has been taken by the Council to put the case in this light—may be no more than a bid for candidates by advertising facilities. Possibly also the remarkable and scarcely dignified rush of applicants for admission last year, just before the new rule was brought into operation—some two hundred young men, in fact, having thus openly avowed their horror of examination—may have naturally alarmed the authorities. But men of academical experience will probably be found to advise that much more care should be taken in avoiding the establishment of a low educational standard than in merely facilitating the admission of new members; and consequently it may soon become an urgent question whether the apparent encouragement of weak candidates ought not to be changed for a practice of a directly opposite character. It may be deemed by many, therefore, to be a pity that Mr. JONES should have dwelt with such excess, as they will say, of kindly feeling upon the desire of the Council to temper the wind so very carefully to the timid lambs of the architectural fold. What we want, they will go on to say, is strong men, not weak, in an age which has little sympathy anywhere for people who cannot take care of themselves, and very little indeed for professional persons who cannot take care of their clients.

If we understood the President aright, it is the further policy of the Council to give the go-by to art altogether in this examination; and if so, a considerable section of the professional community will unquestionably not be disposed to take kindly to this. It is, of course, easy enough to say that matters of taste are always matters of dispute; but this is not the point. Even if what used to be admired so much not very long ago under the name of eclecticism were much more nearly extinct than it is, surely there ought to be found in the

front ranks of the Institute men sufficiently able to judge of design in more styles than one? In fact, at the present moment especially the state of experimental criticism ought rather to be unusually free from personal prejudice; and if not, it would scarcely be a difficult thing to appoint for this particular part of an examination several adjudicators of diverse tastes, so that the work despised by one might be esteemed by another. At any rate, one point upon which a great many advocates of an educational test have been especially urgent is the necessity for every recognised member of the guild being competent to turn out common artistic draughtsmanship and design, in some style or other, creditably; and even if the style selected were no less extraordinary than that of the Himalaya Mountains—which, it seems, is to form the subject of a lecture in the course of the current session of the Institute—there is no reason why this should not be accepted, and perhaps with satisfaction for the sake of change. We would venture to express the hope, therefore, that before long the exclusion of artistic design from the examination will be reconsidered, and the power of producing at least a good commonplace composition insisted upon as an essential part of an English architect's accomplishments.

Referring to the application of the members resident in Manchester and elsewhere for such an alteration of the mode of voting as shall afford to them a share in the election of officers, Mr. HORACE JONES, in his genial way, informed the meeting that a deputation is to discuss the matter with the Council presently, on the understanding that, if any means can possibly be devised for meeting the wishes of the provincial members, the Council may be relied upon to approve such a scheme in the interest of fair dealing. We have already discussed the subject in the pages of this journal, and it is unnecessary to repeat our opinion that some means ought certainly to be contrived for thus enfranchising what is probably a clear majority of the members—at present virtually shut out from voting. How this is to be done is the only question open to discussion; and the best answer to offer is to quote the familiar proverb, "Where there's a will there's a way." The President now tells us that the Council have developed the will; we may be quite sure the President himself possesses it without reserve. The way, then, is simply this, that the accidental language of the law, adopted at a time when the Institute consisted of a small number of members, almost all resident in London, shall be re-interpreted so as to accord with the changed circumstances of the present day; for example, that an informal vote shall be taken on paper preliminarily, and its result admitted at the meeting as an act of courtesy. In a word, the obstacle to be overcome is the use in the law of a single phrase—namely, "members *present*"; and it is too plain to be a subject for argument that these words could not possibly have been intended to mean, half a century afterwards, that a good half of the members, being necessarily precluded from being present, should be expressly deprived of their fair share in the franchise.

Judging by the demeanour of the new President as a whole, we are not indisposed to think that his presidency may turn out to be no small boon to the Institute. There are so many and such diverse objects to be attained in such a society, that it is by no means a feeble suggestion to offer, that if the President is really in some measure to be a governor now—as seems to be probable—a change of mind in such governors is essential. The late Mr. STREET would no doubt have exercised the full authority of his office as President in a way entirely his own; just as Mr. BARRY did in a widely different way. Why should not Mr. HORACE JONES do likewise in a way not at all like either of these? To calm the discontent which prevails as the result of "strong" government, why should not the good-natured *bonhomie* of the City Architect be exactly the proper treatment? A thoroughly genial liberality of sentiment goes a long way in smoothing difficulties. Royal Academicians and Royal Medallists are no doubt glorious personages; but we should not be surprised if a great many of the members of the Institute were to find out that a City Architect, who is neither an Academician nor a Medallist, but a "jolly good fellow," may answer their purpose quite as well as either, and even better than either, when the work to be done is the work of simple common sense and entirely unpretentious goodwill to all men. We consider it a duty, therefore, to bespeak for the new President the most conscientious consideration; and this all the more because of the circumstance of his right having been in a manner disputed,

which entitles him, as we think, now that the controversy is over, to expect a generous support from all liberal-minded brethren. We wish Mr. HORACE JONES, therefore, every possible success in the new position which he occupies; and we again take leave to offer the hint, that the surest way for him to secure such success is to lay himself out for the earnest promotion of disinterestedness, impartiality, and true fraternal feeling.

#### TRAVELS IN SOUTH KENSINGTON.\*

MR. CONWAY is so liberal in his praise of English institutions that one can hardly venture to find fault with his book. A Frenchman or a German who knew something about the museums and art schools of the Continent might be in a position to write about South Kensington and its system, but as an American Mr. CONWAY cannot have had much experience in art teaching, and his book shows that he knows little about art. Besides, he has been too long in this country not to be affected by English prejudices, and he cannot therefore represent the impressions of a student who came fresh from Boston or New York. A series of essays by Mr. R. G. WHITE on the subjects selected by Mr. CONWAY could hardly fail to be useful as well as interesting, for they would express the thoughts of a shrewd and self-reliant observer, and exemplify that "restless, prying, conscientious criticism" which, according to Mr. EMERSON, is a product of modern New England. It is indeed difficult to describe Mr. CONWAY's volume. It is not what we should expect from an American, and yet it is not English in tone, and it does not display that knowledge of art which educated Frenchmen and Germans possess. What is most characteristic in the "Travels," &c., is the courage of the author. An English writer would shrink from the task of producing a volume which begins with a "prolegomena" about the journey of London during eighteen centuries, and winds up with a laudation of the author's landlord, the landlord's property, and the landlord's family.

It is, we suppose, natural for an American's thoughts to run upon revolutions, otherwise it might be difficult to explain why it should be stated, in accounting for the origin of South Kensington, that "the Great Exhibition (of 1851) may be termed, so far as English art is concerned, the great revolution." Improvement in design was visible before that time. We give Mr. CONWAY the credit of supposing that he was not in London in 1851, and that he was relying on some worthless authority when he speaks about the English articles there seen, "exciting the laughter of cultivated foreigners to such an extent that English gentlemen were scandalised and abashed without knowing precisely what was the matter." We have no hesitation in saying that people who remember that wonderful sight hold a different opinion. There was much, very much, in the Exhibition of which England might well be proud. One circumstance will suggest the truth of the assertion. In those days it was the policy of the men who were endeavouring to excite interest in the extension of art by the establishment of art schools to enlarge upon the defects of English work. But the words of the most prominent among them may be cited as evidence to prove the inaccuracy of Mr. CONWAY. HENRY COLE was not likely to flatter designers and manufacturers who were without the advantage of official teaching. But when lecturing on the Exhibition soon after it closed, he acknowledged "that certainly the industry and perhaps even the art of the United Kingdom took the first place in the race;" and in another part of the same lecture he says: "England, even on the question of art, was not behind other nations." If HENRY COLE was not scandalised and abashed by what he saw, it may be doubted whether other people were more susceptible. Mr. CONWAY says "such a display of florid and gorgeous tinsel, to use REDGRAVE's description, was never seen, unless in the realms of King COFFEE." Let us ascertain what authority Mr. CONWAY has for ascribing the description to Mr. REDGRAVE. It will be remembered that Mr. REDGRAVE wrote a report on the Exhibition, which, among other good qualities, is distinguished by an absence of rash statements that is rare in criticism. There was one style which the artist disliked above all others, viz. the Louis Quatorze. He explained its defects, but he pointed out its adaptability for magnificence and display, and suitability for

the display of gilding. "From these qualities," adds Mr. REDGRAVE, "it has long maintained its hold on the public taste, and its florid and gorgeous tinsel still prevails in three-fourths of the works of the Great Exhibition." There is nothing in these words to suggest barbaric art, and it is unjust to the author to twist his words into a meaning which he did not intend by them.

It will be seen from what we have said that in setting out on his travels Mr. CONWAY stumbled, and he hardly recovered himself throughout the journey. When he describes the outside of the buildings at South Kensington he tells us that Mr. MOODY's sgraffito on the back wall of the Science School was produced "by filling in the hollows of the cement," and that is "analogous to the niello which was graven in silver and the lines filled in with carbon." It is needless to say that Mr. CONWAY's words are more suggestive of what sgraffito is not than of what it is. There is no "filling in," for the process is allied to cameo cutting rather than to niello work.

When our traveller enters the Museum he is forthwith captivated by the windows (or as he calls them window etchings) in the Ceramic Galley, by his friend Mr. WILLIAM B. SCOTT. Seven pages are occupied in eulogising them. We should not object to the appropriation of so much space to one kind of work if the whole Museum were described on the same scale. But when it is found that hardly a word is said about the oil paintings or the water-colours, and that entire sections of the Museum are unnoticed, the object of Mr. CONWAY's travels is beyond comprehension. His book suggests that the most important things in the Museum are some specimens of pottery, the examples of Indian art, and Mr. SCOTT's windows, and that visitors are most impressed by the expressionless visage of the colossal bronze figure of BUDDHA.

Modern collectors will rejoice to find a kindred spirit in Mr. CONWAY, for when describing the contents of the Museum he appears to be most delighted in looking at things of which the money value has increased. Its buildings and contents, he says, "have cost the nation about one million pounds; an auction on the premises to-day could not bring less than twenty millions." Some of the Sèvres vases in the Ceramic Gallery are, it seems, "marked at 100*l.* or 200*l.* of a like quality with those six for which Lord DUDLEY recently paid 17,500*l.*" Not a word is said about the appearance or the intrinsic worth of the bargains. The HENRY DEUX candlestick, which cost 750*l.*, is "one of the cheapest purchases ever made," because the ROTHSCHILD family are willing to pay high for examples. The cartoons of RAPHAEL suggest the thought, "What would not now be paid for the three that are lost?" And the style in which the donations to the Museum are mentioned is enough to excite the cupidity of all the States. Mr. CONWAY advises his countrymen to build museums, and treasures must gravitate to them. "This Museum," he says, "has received seven collections worth collectively more than two million dollars, thirteen bequests worth over half-a-million dollars, and a large number of donations whose aggregate money value is very great, though not yet estimated." It matters little what valuation brokers may place upon collections, unless the artistic worth of the objects is of a kind that is enduring. Mr. CONWAY, from thinking mainly of the financial aspects of a subject, has, we regret to say, been led into countenancing a mischievous policy when describing the art schools at South Kensington. He speaks of the exportation of designs to France, and he adds: "Even this is hardly so grateful to the English as a report lately made by a Glasgow firm, that it has for some years been obtaining from this Museum, at the annual cost of a few hundred pounds, designs such as it had been previously securing from Paris and Lyons at a cost of 2,000*l.* per annum." If for the French cities we substitute London and Glasgow, there would not be much cause for rejoicing in the report, and this should be done. The fact is, South Kensington allows itself to be made the tool of miserly manufacturers by encouraging competitions which are a ruse to obtain a variety of designs at nominal charges from students who are paid by the State, and consequently are able to work under different conditions from ordinary designers. It is therefore erroneous to estimate the condition of design in England from what is done at South Kensington. Far better would it have been for Mr. CONWAY to have consulted a few of the professional designers, when he would have discovered the true position of this country, and the extent to which we are able to compete with foreign artists.

The second part of Mr. CONWAY's book treats of "Decora

\* "Travels in South Kensington, with Notes on Decorative Art and Architecture in England." By Moncure Daniel Conway. Trübner & Co.

tive Art and Architecture in England," but there is little about the latter. He describes the decoration of several public and private buildings; and as he relies upon his own eyes for information, it is not only the most interesting part of the book, but the part which contains fewest errors. One sentence will suggest Mr. CONWAY's system of philosophy in other things besides art. "The houses of the millions are," he writes, "conventionally decorated now, and they are ugly; the individual taste will convert the commonplace forms and colours into individual expression, as his soul has previously transmuted the commonplace clay into a physiognomy like and unlike all others."

The outcome of all the organising, speculation, and practice in art matters during thirty years in England would appear to be found in Bedford Park, where Mr. CONWAY resides, and in which he claims an ownership, for he talks of our young men, our streets, our trees, our artists, and so on. The third part of the volume, in which the property is described, is enough to make the eloquent GEORGE ROBINS unhappy in Elysium, for his most famous advertisements are prosy if compared with Mr. CONWAY's visions. On his first sight of the building estate our author tells that he was afraid to rub his eyes "lest the antique townlet should vanish," and accordingly "he crept softly along as one expecting to surprise fairies in their retreat." When a man is given over to such illusions, how marvellous everything seems! The trees and houses, it is recorded, wave and smile through Mr. CONWAY's windows when he writes. The little club in Bedford Park becomes in his eyes "as pure a sample of civilisation as any on this planet." When the householders light their candles at night he beholds "unpurposed tableaux, which, were they visible any evening at the opera, would be declared fine achievements of managerial art." Whether the scenes recall grand or comic opera is not stated. In the public-house opposite the church luncheons and dinners are supplied according to the general practice of licensed victuallers, but the joints and vegetables are sublimated into a realisation of the dreams of PÈRE ENFANTIN and SAINT SIMON. The prices of the communistic feasts are not given, but Mr. CONWAY informs the public that at the *table d'hôte* the "rate is sufficiently moderate to place a daily dinner within reach of families who may find that desirable." One would have thought that in "a Utopia in brick and paint" sustenance of a less material kind would be sufficient. As the Park requires provisions, it must also, like other parts of benighted London, give attention to sewage, but even in relation to this matter Mr. CONWAY's eyes are not disenchanted, for he believes that Nature has provided a main sewer for the use of himself and his neighbours. Bedford Park, he says, "has easy access to the river for its drains," a statement which it is to be hoped may never meet the eyes of the Conservators of the Thames.

It is not surprising that so wonderful a region, where there appear to be no quarter-days or applications for taxes, should attract sightseers. We are told that "now and then the fair riders of Hyde Park extend afternoon exercise to enjoy a look at the new suburbs." Real live members of Parliament have trod the bosky avenues, and, incredible as it may appear, Mr. CONWAY asserts (and we see no reason to impugn his veracity) that "one day the grand face of JOHN BRIGHT, with its white halo of silken hair, was seen among us." It might be supposed that that visit would be enough to satisfy the inhabitants, but Fortune had another favour to bestow. "H. H." appeared in the townlet! Who "H. H." may be we have not the privilege of knowing, but Mr. CONWAY, in his description of the phenomenon probably is as accurate as he is in other parts of the book.

"Our most memorable visitor was," he says, "'H. H.,' whose eyes illuminated our town for a day or two, and then went away with such pictures as can only be painted when such vision as hers comes upon such a vision as she found here. She came from a beautiful home in a beautiful land; from bright rooms decorated with many a brilliant stripe and spot contributed by the wild creatures and growths of Colorado, and touched all over with her own poetic taste; and she realised at once that she had come to sister homes with hers, where there was the same desire to cultivate beauty in harmony with Nature," &c., &c.

How commonplace after that does the description seem which the old-fashioned Vicar of Wakefield wrote concerning his distinguished visitors. Although there is no report of the discourses of "H. H.," we may be sure she would not demean

herself by talking of pictures, taste, SHAKESPERE, and the musical glasses, like Lady BLARNEY and Miss SKEGGS, and from this we can gauge the progress of civilisation during a century and a half.

The visited in Bedford Park, if not equal to the visitors, are likewise in their way notabilities. Among the tenants, we are informed, may be reckoned an ornithologist, the writer of a book on demonology, a biographer, a philanthropist, a storyteller, and a member of a School Board. These may be the chief celebrities of the Park, but there must surely be many tenants who have reputations. Notwithstanding his modesty, we are confident Mr. CONWAY has as much right as any of the people he names to be classed among those he calls "minds." His "Travels" alone should be enough to qualify him.

From what we have heard of his career we believe Mr. CONWAY to be a very worthy man, and he has done service from time to time in making England and America better known to one another. But his desire to be useful sometimes places him in awkward positions. The late Duke of WELINGTON, in his curt way, once said that the best policy for the Papal Court would be to grip the coat-tails of Austria and hold on. This is the principle by which, unless we are mistaken, Mr. CONWAY is guided. He lays hold of all sorts of causes and persons, apparently regardless whether he is serving them or not. He is, no doubt, eager to see art cultivated among his countrymen, but there would be more likelihood of attaining this end if, instead of attempting the journey himself, he had persuaded one of the clever American artists who are every year visiting Europe to undertake the "Travels" through South Kensington.

## THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE first ordinary meeting of the Institute was held on Monday evening, Mr. Horace Jones, President, in the chair. The decease was announced of Mr. R. L. Sibley and Mr. T. E. C. Streetfeild. The following gentlemen were elected by ballot:—Fellows—Mr. C. Trubshaw and Mr. W. H. Picton. Associates—Messrs. F. de Jersey Clere, J. W. Simpson, A. S. Gover, F. Hooper, N. J. Stanger, C. J. Tait, C. S. Smith, G. A. T. Middleton, S. C. Rogers, P. Cowper, E. W. Poley, and R. W. Bousfield.

The President then delivered the opening address, of which the following is an abstract:—

### The President's Address.

The PRESIDENT spoke of the events of the past session, the hopes and expectancies of the present one, and generally of matters now interesting the world of architecture and its sister arts. The Institute's losses by death had been more than ordinarily serious, first and foremost being a national rather than a merely professional bereavement in the vacating of the Presidential chair by the death of Mr. Street. They were the more forcibly reminded of the sad event by the circumstance that at this very time arrangements were being made for the State opening of his greatest work, the most important national building completed since the Houses of Parliament. Had he lived to see the inauguration of the New Law Courts it might have been hoped that some special decoration, in public recognition of his toil, skill, and genius, might have been granted him. The audience was reminded of Mr. Street's earnest advocacy of the preservation of the City churches, and of his brilliant and exhaustive opening address last year. One further act remained for the Institute—the placing of his memorial portrait on its walls. For though it had been often mooted that the custom of thus honouring their past Presidents should not be allowed to harden into an inflexible rule, he felt sure none would be for making the break upon this occasion. In the new Palace of Justice its architect would have his statue, but that was no reason why the Institute should forego its right to a canvas memento of its late illustrious President. Brief obituary notices were next given of two past Vice-Presidents, Mr. Decimus Burton and Mr. Mocatta, neither of them of late much spoken of in the profession, but both noted more or less in former times, Burton especially having been a ruling light and power in architecture half a century ago. The death of Mr. George Somers Clarke was too recent an event to allow of his being as yet adequately commemorated. The President had lost in him a special friend. He was a pupil of the late Sir Charles Barry, travelled through Italy, France, and Germany about thirty-six years ago, and wrote for the Architectural Publication Society. Tallis's printing-house and other large mercantile buildings in the City were designed by him, and, together with some of his country-houses, especially one for the late Mr. Hermon, marked well his talent and originality. The accessions to the ranks of the Institute during the past year had been 42 Fellows and 223 Associates. Some of the papers read at their meetings had been more than usually interesting. The

President instanced Mr. Hugh Stannus's on "The Artistic Treatment of Constructional Ironwork" as a most acceptable essay. Indeed it might have been wished that the author could have had more time allotted to him; but they were willing to accept it as a prelude to a future paper on the same subject, which might be further developed to the great advantage of them all. Mr. John Slater's paper "On Recent Progress in the Electric Lighting of Buildings" was perhaps even a more popular production of the session. The practical utility of the subject, the interest felt and shown by all in the wonderful adaptation of science to the wants of the whole world, an interest resulting in so many national and international electric exhibitions; and the pleasant way in which the whole was popularised, could not fail to charm and instruct the audience. The President did not wish his special allusion to these two papers to be understood as a depreciation of other communications. Reference was next made to the Institute's important labours for the adjustment of the vexed question of Light and Air. The report was not yet ready for presentation to the members, but when produced it would be found, the President believed, useful, valuable, and exhaustive. Many minds had been brought to bear upon the problem, and to harmonise the various views they had taken of it, so as to reduce them into an orderly and useful digest, required time, care, and discretion. Two or three other questions before the Council had in like manner long waited to be reported on, not from any supineness on its part, but with a view to make the reports as perfect as possible.

The session of 1881-2 would long be memorable for the inauguration by the Institute of its system of compulsory examination. The Council, having seriously weighed the question, had come to the determination that they would begin with an examination neither too strict nor too exhaustive. After complimenting the examiners, with special mention of Messrs. Grüning, Mathews, Robson, Watson, and others, the President remarked that at present their curriculum might be truly described as a preliminary one, not insisting on more knowledge than was absolutely indispensable to any aspirant to employment as an architect. He was firmly convinced, however, that whilst it would be both practicable and wise to extend the range and to increase the stringency of the examination, it would be difficult and injudicious to make a fresh start from such a high level as to necessitate a recurrence to a lowering of their standard. Very much remained to be done in future years, not only by the Board of Examiners, but also by the candidates themselves. Every candidate should be encouraged to pass as an Associate before aspiring to be a Fellow. The examination must be scientific and practical rather than æsthetic. Art could not be tested in the same way as arithmetic, and what Cowper said of a poet was no less true of an architect—

A poet does not work by square or line,  
As smiths and joiners perfect a design.

Perhaps there was no better test of art knowledge than the numerous and valuable prizes offered for competition by the Institute. The President spoke highly of the good work done by the Architectural Association in preparing for the examination many of the best candidates. The Royal Academy was able to bestow even more valuable awards and honours than the Institute, and he believed they were always given with great care and appreciation. The curriculum of the Academy's Architectural School, under Mr. R. P. Spiers, a friend and Fellow of the Institute, showed that in many branches of art no student lacked opportunity to perfect himself, any more than in the scientific branches of the profession. Careful drawing and modelling were insisted on, as well as attendance upon lectures on perspective, and there were liberal rewards inducing to earnest study. Like aids in mastering the theory and practice of their art were to be found in the architectural classes at University and King's Colleges. No doubt museums of models and casts, for which there was still much outcry, would prove a great boon to many, but casts were no proper substitutes for originals, where these themselves could be studied. But after all that schools could do to fit a man for the present examination, or for some higher one, there was still to be acquired the practical education best learnt in an architect's office, whether large or small—for each had much to be said for it—and in everyday business red tape was, perhaps, a bad master, but it might often be found a good servant. In every calling there was much detail work which was best learnt when very young, and familiarity with which saved much time in after-life, often enabling men to form quick decisions seemingly prompted by instinct or intuition. The President illustrated the importance of the practical side in the architect's education by pointing out the prominence of the element in the examination for the military profession. He referred also to actual or possible relations of the Institute with schools of practical engineering and with the City and Guilds of London Institute, whose Technical College would doubtless welcome such an alliance. The college would afford young architects insight into artificers' work, whilst its students might be aided by the body to which his audience belonged in the study of the more scientific and æsthetic branches.

National and International Exhibitions were the next topic, *à propos* of those forthcoming at Amsterdam and Berlin, both of which, it was understood, would devote much of their space and efforts to art. At the outset, the President threw out a suggestion

by the way, that the Sanitary Institute of Great Britain might well make itself the Sanitary Institute of Europe, and hold forthwith, as such, an International Congress of its own. There were many sanitary matters of cosmopolitan interest, and especially applicable to all large European towns. The safeguarding of public buildings, especially theatres, against fire was another question of common interest to all the great capitalists, and the panic caused by the terrible catastrophe at Vienna drew attention to the want of international conference on such problems. Friendly converse between experts from the different countries might lead to the general adoption of all really necessary precautions, and at the same time tend to moderate the excesses of Government interference, such as those into which the Austrian authorities had been frightened in this melancholy instance. The President here glanced at Mr. Aitchison's advocacy of the artistic employment of colour in the interior of houses before a Provincial Congress, and took occasion to notice the sudden turn taken by the public taste in a polychromatic direction.

The year had not been rich in architectural and æsthetic literature. Such productions as the Edmund Sharpe Memorial were not common, and its usefulness to the architect, as well as to the general art student, would make this unique work highly prized. The "Lectures" of a former vice-president of the Institute, the late E. Middleton Barry, edited by his brother, Canon Barry, came next; and a projected reproduction of Art Costumes. The completion of a translation of Viollet-le-Duc's "Lectures on Architecture" had appeared, and there had been published several treatises on Warming, Ventilation, Plumbing, Sanitation, Practical Geometry, and Iron Construction as applied to Roofs. The Americans had sent us their views on Cottage, Farm, and Villa Architecture, as well as on the Interior of Dwellings. From France has been received the concluding *livraison* of "The Vatican"; a work on the construction of the Hotel de Ville; another on the Chateau of Versailles; several on the Renaissance; and another part or two of the works of Viollet-le-Duc. Germany had given us photographic views of executed buildings in her chief cities, and works on the various architectural styles and their history.

Passing to the subject of restorations, the President said those at Bristol under their friend and Fellow, Mr. J. L. Pearson, R.A., would doubtless add to his laurels, but some regret had been expressed that his plans involved the destruction of the abbot's lodgings. St. Albans was still a focus of discussion and criticism, and was likely to be so for some time to come. The Tower of London was now, he believed, about to receive the attention of the restorer.

In the archæological investigation of Classical architecture what now mainly interested men of culture was the contemplated resumption of Mr. J. T. Wood's excavations at Ephesus. They could only hope that an undertaking on which that gentleman had lavished so many years of patient and thoughtful toil, and from which nothing but the exhaustion of his resources could have induced him to desist, might be started afresh and brought to a successful issue. The Temple of Diana at Ephesus was unique among Greek fanes. It was not a copy of the Parthenon at Athens, but had an individuality of its own, making it a type by itself. As to the importance of its rescue from the dust of ages, Professor Newton's words were quoted:—"The complete excavation of the Temple of Diana at Ephesus is an object well worthy of support from the nation, which now possesses in the British Museum the only portions of the beautiful sculptures as yet discovered of the temple." The President earnestly appealed to those present to do their best in enlisting the sympathies of all able to help forward a renewal of the enterprise. The cessation of his labours just at the time when he was expecting to find the most important remains of the temple, including the sculptured frieze and cornice, was a bitter disappointment to the man who had made for a noble end so many personal sacrifices, amongst them being his professional prospects as an architect. Roman remains of some interest to architects seemed to have been recently found at Bath, and the more important discovery of a Gallo-Roman city near Poitiers was reported from France.

Metropolitan improvements, decided on or proposed, were next passed in review. Below London Bridge the President strongly deprecated any other bridges, as tending to shift the world's commerce, which had made London what it is, to Blackwall, Gravesend, possibly to Southampton.

The new system of graded architectural competitions had been tried at Glasgow and Birkenhead, so far with success. At Glasgow there were some 140 primary candidates, from whom 10 were selected for the final struggle. At Birkenhead 130 sent in preliminary sketches, of whom 5 were selected for the final competition. In both cases the commission had been confided to the winner in the last trial of strength. Perhaps the most important competition abroad in the course of last year was that for the Berlin Senate House. The Institute should endeavour this session to bring to a practical conclusion its discussions on this head. From a list of British architects who had achieved successes during the past year were named Brock, Brandon, Blomfield, T. C. Clarke, Ferrey, Lainson, Low, Peebles, Phipps, Plumbe, Robins, Robson, Shaw, Verity, Vulliamy.

Turning hopefully to the opening session, their newly-instituted

examination might be trusted for the recruiting of their ranks, which would also continue to be swollen by ever fresh accessions of painters, sculptors, and other fellow-artists, through the Honorary Associateship, dating from 1877. And whilst knitting their bonds of amity with votaries of other arts, there was room, the President thought, for improvement in their relations with the Royal Academy, so far as concerned the Institute's friendly rivalry with the architectural section of that body. Did he trespass unfairly on dangerous ground by hinting that were that section placed under a more catholic *régime*, the Academy would be more popular with architects, without any loss to the public? One other all but vitally important matter that would have to be dealt with was the relative position of the metropolitan and provincial members of the Institute. The latter complained that whilst the burden of support fell on all alike, the benefits were not so equally shared, and accordingly demanded a conference. The President felt sure the Council would heartily welcome their country brethren to such a meeting, hear them with attention, and redress any proved grievances. The forecast of the session concluded with the expression of the hope that some of the forthcoming papers would prove interesting to the general public, as well as to the profession, instancing accounts of Cypriote, American, and Himalayan travel.

Mr. C. H. GREGORY, C.M.G. (Past President of the Institution of Civil Engineers), proposed a vote of thanks to the President for his address. He said he could look back some half a century to the time when, through the kindness of Mr. Donaldson, he had been allowed to attend the meetings of the Institute, a struggling body, which, though warmly supported, had not then attained its position as representative of so noble a profession. He would not attempt to follow the President through the different stages of his address, an address which he considered was typical of the distinguished architect who had delivered it. While the President had spoken much of others, he had been silent in regard to himself. The works completed under his direction were not perhaps so extensive as in past years, but it was not fitting that the records of the year should pass away without reference being made to the completion of a truly metropolitan work—the great markets at Smithfield—by the carrying out of the fish market; and though an engineer himself, he might speak of the skill with which the markets had been laid out, both above and below. The new Council Chamber at the Guildhall was another work he would mention; and though yet on paper, he believed it would do credit to its designer and be a noble addition to the buildings of the metropolis. He wished that the triumphal arch erected at the foot of Ludgate Hill on thanksgiving day for the Prince of Wales, and which for a time proved a most beautiful screen for a far less beautiful object erected by a member of his own profession, could have been perpetuated in stone. If it did not, however, occupy a place in stone, a representation of it had a favoured place in her Majesty's apartments at Windsor.

Professor T. R. SMITH seconded the vote of thanks, and observed the kind way the President had spoken not only of the dead but also of the works of living architects.

The vote having been formally put to the meeting by Mr. GREGORY, the PRESIDENT replied, and the proceedings terminated.

#### MR. F. MADOX BROWN ON ART EDUCATION.

AN address was delivered by Mr. Madox Brown on last week when distributing the prizes amongst the successful students at the Altrincham and Bowden Art Classes. He said—The subject of drawing for the people, which was now becoming a very prominent question in England, divided itself, it seemed to him, into two categories. The first category consisted of what was now called technical drawing as a branch of technical instruction generally, and all over Europe it seemed to be the opinion that a great deal of good might be done to the working classes by the spread of a sound knowledge of technical drawing, and it was of that kind of drawing he designed to speak chiefly on this occasion. The second category consisted of the teaching of drawing as an education, but not for the purpose of making artists. Now the idea prevailed over the Continent, and he thought in England also, that the two kinds of drawing were highly desirable. Education in both branches was already being carried on to a great extent in England, at South Kensington and elsewhere. There were schools in almost every large town where lessons in drawing could be had, but while the technical drawing there taught to the working classes might be of the greatest possible importance to the working man, it had in truth as little to do with real art as the first lesson in reading or writing had to do with writing a poem or a play. Nevertheless it was an important branch of technical education, and as such it also was important that it should be taught expeditiously—that no time should be lost in the teaching of it—for the workmen who wished to learn drawing had, generally speaking, but a limited amount of time at their disposal. They should not therefore be kept at any preliminary studies which might be done without. That was the very point that was being taken up at present by the Royal

Commission which had been sent to the Continent to study the subject of technical education. Professor Roscoe, the renowned Professor of Chemistry in Victoria University, who was one of the members of that Commission, in distributing the prizes at a school somewhere not very far from Altrincham, delivered a speech in which he noticed that drawing from the flat had been entirely given up in Government schools on the Continent. The question of whether pupils should be taught drawing from a small copy-book or from some round object had very little to do, he (Mr. Madox Brown) apprehended, with the ladies and gentlemen he was addressing, but it had a great deal to do with the workmen and children who were to be taught drawing. It was a very important matter to them whether they should spend two or three years in drawing from the flat, if it could be dispensed with. In connection with this point it was necessary to bear in mind that the object of teaching drawing as a study was not to teach the pupil to imitate other drawings, although that was a notion so prevalent in the public mind that it was a common thing for people to ask an artist where he got the model for his picture. Not very long ago a distinguished American gentleman, inspecting the pictures in the Town Hall of Manchester, asked him whether the cartoons from which the pictures were taken were got by contract, or how they were got. If drawing was wanted for any particular purpose, what was wanted was drawing from nature, and not copying the work of any other man. When one had been drawing a long time from the flat and began to draw from nature, he found himself very little more advanced than if he had not been drawing at all. On the Continent, it would seem from what Professor Roscoe said, they had given up this preliminary waste of time altogether, and in the speech already referred to he said that the Royal Commission on Technical Education would inform the Government of England that such was the case abroad, and that this waste of time would have to be done away with in England also. He (Mr. Madox Brown) did not pretend to object to Professor Roscoe's remarks. There was a great deal of truth in them. But objection might be taken to the way in which they were put; and some of the other statements the Professor made required modification. The fact that a learned professor of chemistry was sent to the Continent to study the question of whether it was desirable that a child should be taught drawing from a copy-book rather than from a leaf or something of that sort, and the fact that we had right reverend prelates condescending to favour us with their opinions about high art and the drama generally, and "Black-Eyed Susan" in particular, showed that the matter to which he was alluding was one that must be faced. Professor Roscoe seemed to have the idea that because he had seen in France what he referred to, it had always been in France. He (Mr. Madox Brown) had been born and educated on the Continent, and he could remember perfectly well that more than fifty years ago he was set to draw, not from the round, but exactly as in England now, from the flat—from lithographs and drawings. That was the system then followed, not only in France, but in Belgium and other countries. How long that system prevailed he could not exactly tell. Some thirty years ago a friend of his, an English artist who acquired some notoriety, conceived the idea of forming a school of drawing and modelling for the working classes in London exactly on the plan and principle which Professor Roscoe said prevailed so very much now on the Continent, and the adoption of which in England he now advocated. A large room was got and filled with casts; it was denominated "The North London Drawing School," and the classes were advertised as specially for the working people, who were told that they might come six days in the week and learn drawing and modelling. The teachers also attended gratuitously one or two nights in the week and gave instruction. He (Mr. Madox Brown) taught there for about a year and a half. One hundred and eighty pupils, male and female, were got together. No drawing from the flat was taught at all, and the results were very satisfactory. When he had not time to attend to it and gave it up, the school was handed over to South Kensington. After that there was established by the late Rev. F. D. Maurice in Great Ormond Street a working-man's college, at which he (Mr. Madox Brown) and several of his friends taught drawing, and he supposed that institution was still going on. There the drawing was conducted in the same way—with no drawing from the flat at all. The pupils, when able to draw from casts, were set to draw in water colours from the living model. Thus they learned to draw and paint, and got on well and rapidly. After these schools were started in England an attempt was made to discover whether schools of a similar nature existed in France, but none was found. He did not mean to say that on the Continent they had heard of the schools started in England and copied them, but when these things were in the air, one nation took them up, and others soon followed. Professor Roscoe ended by saying that a French painter whose name was exceedingly well known had said to him, "Your artists do not teach art in England, and your teachers of art are not artists." He (Mr. Madox Brown) did not know who that artist was. He knew a great many French artists who were quite capable of saying equally incorrect things, but he would like very much to know the name of the artist in particular who had made that observation. It was all very well

for the French artist to say that the English artists did not teach; but the question was, How did English artists learn? There were a great many artists in England. Was it supposed they were all heaven-sent, and did not need to learn anything? He held that the French artist, whoever he was, was in error. There was this difference between France and England, that in England pupils did not speak much of their masters. Very often the pupils received instruction as friends. He had himself instructed he did not know how many artists, but he did not speak of them as his pupils. In France, on the contrary, it was regarded as a point of honour that the pupil should proclaim his master on every possible occasion. He thought that technical drawing was valuable. If it did not lead to one thing it led to another. But as far as our manufactures, decorations, and patterns were concerned, it must be considered that there were no primary drawing schools in Greece or Egypt or Assyria; and in India and Persia, and those countries whence the most beautiful designs now came, the whole thing is learned as a business was—like a trade. So, if we had not had much primary drawing hitherto, perhaps we were not so very badly off in consequence. And as for the primary drawing that had been going on for thirty years or so in France, what had been the result of it? A French newspaper, against which he had no reason to be prejudiced—he had not seen it before—was sent him the other day. It was considered the leading art paper in France, yet it had pattern borders of a kind that would not be issued by a fifth-rate printing establishment in England, and altogether contained some of the worst ornamental work possible, and the publishers printed the name of the designer at the foot, as if the borders were something admirable. This was the result of all the technical drawing in France. In England, meanwhile, the firm of Morris & Co. had revolutionised decorative art. People might go to the St. James's Hall in Manchester and see the decorative art exhibited there, not only by that initiating firm, but by others which had since followed—Manchester houses some of them—and then they might go to the Continent and see if they could find anything like it there.

#### LEEDS ARCHITECTURAL SOCIETY.

THE first ordinary meeting of the seventh session of this Society was held on Monday evening. Mr. Jas. Barlow Fraser, the President, occupied the chair. Mr. W. H. Thorp (hon. sec.) read the annual report, which stated that the number of members was now much larger than a year ago, being seventy-eight as against seventy-one. There was still, however, room for improvement in this respect. The report proceeded to set forth the proceedings of the Society during the year. Reference was made to the presentation of a memorial to the Mayor and Corporation urging the desirableness of the Cloth Hall site being purchased for the building of a new post-office. Although nothing had yet been definitely settled, it was hoped that the obstacles which stood in the way of the purchase of the site for the new post-office would speedily be removed. The report was adopted, and it was agreed that it should be printed.

The President, in addressing the meeting, said he regretted that he could not refer in more cheerful and hopeful terms to the commercial outlook of their profession. Notwithstanding the enormous energy developed in the production of merchant shipping, which would appear to point to the increased circulation of wealth in the country, the more than fairly average harvest, and the briskness of many staple manufactures, there seemed still to be a lack of money for permanent investment and want of buoyancy in the building trades, and as a consequence they found themselves for the most part by no means so actively engaged as they should like to be. The returns of the Inspector for Buildings in Leeds and of the Building Committee of Bradford, showed very plainly and somewhat painfully that, although the population was increasing, the demand for house property was, instead of being on the increase, actually declining. In Leeds, during 1879, 1,721 houses were completed and certified for occupation; in 1880, 1,388; and in 1881, 1,012; for the present year the returns are 1,044. In Bradford a still more extraordinary diminution was shown, for whereas in 1877 the number of new dwelling-houses certified for occupation was 1,213, this year it was only 319, or little more than one-fourth. In Leeds, under the heading of miscellaneous buildings, the figures ran for the three years 886, 847, 905, and for the present year 852; at Bradford, curiously enough, under the same heading, there was a considerable increase, which they might try and regard as a hopeful sign for the future, particularly if they bore in mind the fact that a few years ago, when at the height of the great revival of trade in both districts, the building of houses was considerably overdone, and a number of those built in the Bradford district had never yet been occupied, though owing to the increase in trade a decided improvement was apparent. They might congratulate themselves on the likelihood of soon possessing a suitable building for their purposes, and of having at last a local habitation as well as a name. It had occurred to him whether it would not be desirable to arrange for a loan exhibition at some time; if taken up with spirit, and on a

sufficiently large and attractive scale to interest the general public, it ought to be a success. The advantage of technical exhibitions in the provinces was now universally admitted. Why should they not have a Yorkshire Exhibition of Building and Sanitary Appliances, together with a Fine Art Gallery devoted to design, not only in architecture proper, but also to all decorative arts? They could not be altogether satisfied with the result of their competitions amongst students. Considering the very generous and handsome way in which the older members of the Society came forward with their aid and encouragement, they ought to have had better results and more work to show. After referring to the evil of architects' assistants undertaking work without the consent of their employers, the President next alluded to the deaths of two of the most earnest and brilliant members of the profession, Messrs. Burges and Street; also to those of Messrs. Hansom and Somers Clarke. In the all-important matter of sanitary science good progress was still being made in many respects; but as regarded the vital question of the treatment of our sewers and drains it appeared to him that they were commencing their reforms at the wrong end. Instead of wasting ingenuity and money on complicated traps, which were almost always too small, and were often rendered useless by the higher temperature of our dwellings creating an upward draught, he ventured to think they should consider the desirability of inducing local authorities to ventilate the main sewers with large extracting shafts, specially constructed for the purpose, having a steady but not too powerful gas furnace, which might be regulated in a simple manner if the weight of the atmosphere should make it desirable. The very heated controversy on the question of rebuilding the old church at Headingley, or rather building a new church to replace the present one, had led to considerable feeling against the proposed disturbance of the ashes of the dead. For his own part, his sympathies were with those who would rather suffer inconvenience than desecrate the graves of their forefathers. Of course there were cases when sentiment must give way to downright necessity; but in this case there was no lack of sites for a new church, if the spiritual needs of the parish required one, and the old church might be kept *in statu quo*, and used, say once a month, to preserve its sacred character. No doubt the advocates of the cremation theory would point to this case as being a telling argument in their favour. The terrible stories of the ravages of zymotic diseases, of which they so frequently heard, in neighbourhoods where the graveyards abut on streets of dwelling-houses, must eventually call successfully for some energetic action in this matter. Another important public question was the housing of the very poorest of our working population. It was high time that legal powers should be granted to enable corporate bodies, or even private companies, to obtain dilapidated untenanted property, not at the ridiculous prices awarded by arbitrations, but at so low a price as to make the erection of new and improved dwellings on the sites thus obtained a remunerative speculation. Whenever a corporate body found it necessary to pull down the houses of the very poor, the erection of suitable dwellings, under careful superintendence, should be immediately undertaken, having at least as many rooms or tenements as were removed; and he would further suggest that the Corporation, backed by the Poor Law authorities, should build at any rate one block as an experiment, as they had almost unlimited borrowing powers, and the absence of any interest above what would be necessary to pay the Loan Commissioners would not be of consequence. There was also a field for very practical and useful benevolence on a large scale for some of our wealthy merchants and manufacturers; if they would find the money, he thought there would be no difficulty in getting excellent designs in competition. The President concluded by referring to recent improvements and discoveries in science.

A hearty vote of thanks was accorded to him at the conclusion of his address.

#### BIRMINGHAM ARCHITECTURAL ASSOCIATION.

THE annual meeting of the Birmingham Architectural Association was held on Tuesday evening at Queen's College. The President of the Association (Mr. J. J. Bateman) occupied the chair.

The Secretary (Mr. F. W. Franklin Cross) read the report, which stated that the committee could not regard the results attained during the past year as entirely satisfactory. They believed that every session ought to be opened with a large accession of new members, that the classes ought to be more numerously attended, and that the report from every branch of the association ought to present an improvement on that of the preceding year. The committee appealed to the ordinary members to use their utmost endeavours to procure additional members, and to work individually for the welfare of the association, thus rendering it more useful, more successful, and stronger numerically at the close of the ensuing session. The ordinary meetings held during the session were generally well attended, as also were the Saturday afternoon visits to buildings in course of erection. During the summer several archaeological and sketching excursions took place, and the large attendance at each was an evidence of their popularity. The

classes were joined by a fair number of members, and the amount of work contributed to the class of design was satisfactory, but in the other classes the work done was not equal to some previous sessions. The balance-sheet showed the receipts to have been 36*l.* 9*s.*, and the expenditure, including the balance of 12*l.* 8*s.* 7*d.* due to the treasurer at the last annual meeting, amounted to 41*l.* 1*s.* 8*d.*, thus leaving a balance due to the treasurer at the present time of 4*l.* 12*s.* 8*d.* Appended to the report was a syllabus of meetings to be held during the ensuing session, from which it appeared that various papers will be read on architectural and archæological subjects. The officers elected for the session were: President—Mr. J. J. Bateman; Committee—Messrs. W. H. Kendrick, J. Essex, F. G. Hughes, A. V. Ingall, V. Scruton, F. Simon, J. S. Webster, and E. Wood; Treasurer—Mr. A. Reading; Librarian—Mr. Norman Gething; Secretary—Mr. F. W. Franklin Cross.

On the motion of Mr. Kendrick, seconded by Mr. Gething, the report was adopted.

The President then delivered an address, in which he considered that portion of their professional practice connected with the duties of a surveyor. He divided the subject into, 1st, those duties immediately connected with the practice of an architect; and 2nd, those connected with the practice of a surveyor. Connected with the practice of an architect were land surveying and levelling, landscape gardening, development of building estates, and legal knowledge respecting easements, Acts of Parliament affecting building, law of contract, dilapidations, and fixtures. Connected with the practice of a surveyor were valuations of property, parochial assessments, and compensations. He made general references to those subjects, and noticed in detail the more important, to show the necessity of acquiring such a knowledge of them as might enable the students to pursue that portion of professional practice. With regard to landscape gardening, he said the judicious development of the grounds surrounding suburban residences, and more especially country houses, tended so greatly to heighten the architectural effect of the building that the study of landscape gardening was essential to the architect. As suburban gardens would perhaps to a large extent engage their attention, he advised them to place their house on a well-developed terrace, and not to attempt too much, or be too ambitious in the general plan of their garden, as the more simple the plan the more effective it would be. They must avoid unnecessary divisions, multiplicity of flower beds, numerous walks, and also vases and pedestals, excepting on terraces and in special situations. The surface of the ground would determine the character of the plan—if undulating, a curvilinear treatment would be most suitable, and if flat a rectangular plan. Without the special observance of aspect no garden arrangements would be successful; and the main approach or carriage drive should be planned so as to obtain the greatest amount of privacy. He next alluded to the development of building estates and legal knowledge, after which he referred to "easements," which, he said, were prescriptive rights acquired by time and use, the most important being that of light. There was no subject connected with the profession of an architect which was more fruitful of vexatious litigation than rights of window lights. As few buildings of importance could be erected in the centre of a closely-built town, the architect was considerably embarrassed by the obstructive interference of adjoining owners. A strict right of property enabled the owner to so much light and air only as fell perpendicularly on the land. In England a right of light in a lateral direction was protected, and called an easement, and after existing for twenty years it became an ancient light. The law permitted the opening of windows over adjoining land, but the adjoining owner could obstruct such windows within twenty years by an erection on his own land. He was of opinion that the repeal of the law permitting windows being opened over the adjoining land might be very profitably considered, as it admitted of an encroachment on the rights of adjoining owners, which by the lapse of time became an easement or legal right. It appeared to him to be a legal anomaly to admit a right to one party which might be cancelled by another, while at the same time it inflicted great inconvenience and expense and loss in so cancelling or making void such right. He reviewed the Acts of Parliament affecting buildings, and said it was to be regretted that in Birmingham they had not a comprehensive Building Act, which would relieve architects of considerable difficulty in dealing with party walls and other vexatious questions, while at the same time it would ensure the erection of more uniformly substantial property. He recommended the study of the Metropolitan Buildings Act, which regulated all building operations in the metropolis to secure sound construction and protection from the spread of fire. Town Improvement Acts, where they existed, were also necessary to be studied. As to the Artisans' Dwellings Act, he said that it might be fairly questioned whether the Corporation of Birmingham had legitimately used this Act in forming Corporation Street. He referred to that in order to correct any erroneous impression that the Act was intended to be used for the purposes of street improvement, instead of, as its name implied, for the improvement of artisans' dwellings. He spoke of the law of contracts, dilapidations, fixtures, parochial assessment; and in conclusion alluded to compensations, cautioning the students in the discharge of a surveyor's duties, and more especially in com-

pensations, never to undertake the advocacy of a case which they could not conscientiously support.

On the motion of Mr. R. B. Morgan, seconded by Mr. F. E. F. Bailey, a vote of thanks was passed to the President for his address.

### THE ROMAN VILLA, BRADING.

A STATEMENT has been prepared by Messrs. J. E. and F. G. H. Price, explaining the progress of the excavations at Morton, near Brading. They say:—The whole of the site being now the property of Lady Oglander, we have been enabled to remove the hedge which formerly separated the two estates. This obstruction is now cleared away, and in the course of the removal some interesting discoveries have been made; for example, a chamber paved with mosaic, adjoining those previously described as having tessellated floors. Originally this pavement was about ten feet square, but a portion only remains to indicate a geometrical pattern in varied colours, the main design having been destroyed, probably centuries since, when the liminary hedge was planted. In addition, and in a south-westerly direction, a way or passage, composed of a rough mortar or concrete floor, leads to a doorway, or piers of masonry indicating what may be presumed to be one of the entrances to the villa.

On the newly-acquired land a wing, or range of buildings, corresponding to those described last year, is in course of excavation; the chambers have yet to be developed, but they already define, with those referred to, the enclosure of a quadrangle of considerable extent. To the east of this some important structural remains have been unearthed, viz., an apartment, which, from the quantities it contained of fragments of fresco or wall-painting, must have been of a superior character. It had, judging from the tiles found and the remains of transverse flues, together with traces of the furnace, been warmed by a hypocaust, but in later times had been appropriated to quite a different use. Constructed within the area, and mostly put together with old materials, are some singular structures, resembling kilns or ovens, which had been adapted to domestic or manufacturing purposes, and serve to illustrate the prolonged occupation of the place. Near to these is an interesting square of masonry in good condition, the walls formed of flint boulders, in regular order, and the corners of well-squared blocks of native stone. In the centre is a bath or cistern some five or six feet long, and paved with slabs of stone; it is lined with salmon-coloured mortar, a neat fillet running round the base and up the angles of the bath; a drain or outlet, in fair condition, still remains *in situ*. This bath or tank appears to rest on a suspended floor; adjoining are some interesting examples of the form of drainage selected for the respective buildings.

These remains, as interesting to many as are the mosaic floors, are enclosed in an area of about 50 feet square, and as already the effects of the late continuous rain is a matter for anxiety, we purpose covering in the whole ere the frost set in; but the necessary expense is very heavy, and we must trust to external help. The gate-money taken during the summer season, while sufficient for ordinary working expenses, is totally inadequate to the responsible task of covering in and protecting what is found with substantial sheds, so constructed and arranged as to be at all times open to public inspection. Subscriptions therefore are needed. The managers of the Capital and Counties Bank will take charge of any sums forwarded to their branches at Ryde or Sandown, or they may be confided to the care of Messrs. Child & Co., Fleet Street.

Of additions to the museum we may refer to a richly-ornamented vase of Durobrivian pottery, unfortunately broken, pateræ and cups of dark grey ware, a series of bone counters suggestive of Saxon influence, lock furniture in iron and bronze, a silver coin of Trajan, and many miscellaneous objects.

**Gorton, Manchester.**—A large block of general offices is now being erected for Messrs. Beyer, Peacock & Co., the well-known engineers, at Gorton Foundry, opposite the Manchester, Sheffield, and Lincolnshire Railway Works. The building occupies an area of 224 feet by 44 feet, by about 42 feet in height, and will be faced with red pressed bricks, having moulded arches and cornices, stone string-courses, cappings, &c.; and all the internal woodwork will be of pitch pine varnished. It comprises a very complete range of private offices, a large office for clerks on ground floor, 70 feet by 40 feet by 16 feet high, with separate room for cashier and fireproof safe; and on first floor a general drawing office 90 feet by 40 feet by 24 feet high, with open roof and glazed central double light in addition to the side windows; also a separate tracing office, photographing room, model room, &c. Arrangements have been made for warming and ventilation on Messrs. Haden's system, for which a special smoke and ventilating shaft is provided at one end, rising to a height of 80 feet, and at the other end of buildings will be a clock tower 90 feet high. Messrs. T. Bates & Co., of Droylsden, are the general contractors for the work, which is being carried out according to plans and directions of Mr. Thos. Worthington, F.R.I.B.A. and Mr. John G. Elgood, A.R.I.B.A., architects, 110 King Street, Manchester.

## NOTES AND COMMENTS.

MR. ROBERT LACON SIBLEY, District Surveyor of Clerkenwell, died at his residence, No. 39 Great Ormond Street, on Saturday evening, October 28. About two years ago he inhaled poisoned air in a cellar visited in the course of official duty, and though before that enjoying sound health regularly, his blood seems to have been affected, and as a result tumours appeared, particularly in the neck, which at last broke into the windpipe, and caused his death by suffocation. He was appointed to the district on the death of his father, Mr. ROBERT SIBLEY, a well-known architect and surveyor, who died in 1849, after having held the offices of County Surveyor of Middlesex, Surveyor to the Ironmongers' Company, as well as that of District Surveyor. Mr. R. L. SIBLEY was elected an Associate of the Royal Institute of British Architects in 1849, and a Fellow in 1861.

IN measuring land in Ireland three measures of acreage are recognised, viz., Statute, Plantation, and Cunningham; the statute acre being the smallest of the three. It is sometimes difficult to ascertain, when dealing with leases and other deeds, which of them was adopted. In the Dublin Appeal Court on Tuesday a case was tried relating to a will by which 45 acres were demised. The witnesses said that the testator meant Irish plantation acres, but the Lord Chancellor and Lords Justices decided that the word acre must be taken to mean statute acre.

THE awards in the yearly Jauvain d'Attainville competition have just been published. The members of the jury were MM. CABANEL, ROUX, GALLAND, LÉVY, and MAILLART. The prize for historical painting (subject *Les Trois Parques*) is carried off by M. DUDICOURT, a pupil of M. CABANEL; while MM. BASCHET and THOMAS, pupils of MM. JULES LEFÈVRE and BOULANGER, receive mentions. In the competition for landscape the prize was unanimously awarded to M. RECIPON, pupil of MM. DUMONT and FRANÇOIS; M. CAMBROGLIO, pupil of MM. LEHMANN and HERBERT, and M. DELBOS, pupil of M. CABANEL, obtaining honourable mention.

THE authorities of the Louvre have just replaced in the Apollo Gallery the *châsse* or chest containing the relics of St. POTHENTIN, the martyr, which was concealed during the Franco-Prussian war. This chest, which dates from the twelfth century, and was found in an old monastery on the banks of the Rhine, is in a perfect state of preservation. The work on it is remarkable. It is made entirely of Eastern woods, which were precious at the epoch of its construction, and is entirely covered with silver-gilt plates, inlaid with uncut stones at the corners and projections. The Twelve Apostles are represented in relief on the two sides, and at one end the saint is to be seen wearing a coat of mail and accompanied by two acolytes.

THE Committee of the British Association have appointed a committee for the exploration of the ancient camps in Epping Forest. It has been found that on both sides of the Thames "dene holes" exist which date from a time when the art of building can scarcely be said to have existed in this island, and when invisibility formed the best security against the sudden attacks of an enemy. In Essex "dene holes" are abundant in the district between East Tilbury and Purfleet. In Kent they are especially abundant near the old settlements, or sites for settlements, on the river, at Greenwich, Woolwich, Erith, and Greenhithe. Their position, one, two, or three miles from the river, and their concentration in spots about the same distance from the natural sites for settlements on the Thames, seem to suggest that they were used both as storehouses and as places of occasional refuge from pirates who might attack the villages on the river bank. It is proposed to explore the Essex "dene holes" when the work at the Loughton camp is completed.

A NEW room will shortly be opened at the Cluny Museum. It is to be entirely devoted to the fine collection of shoes, boots, &c. (*chaussures*), of all ages and nations, got together by the late JULES JACQUEMART, and which for want of space has not yet been exhibited. The new room is on the first floor, next to the armour galleries, and will be hung with the famous Boussac tapestries belonging to the Museum, and now being repaired.

THE annual exhibition of paintings in Kirkcaldy was closed on Tuesday. It was announced that the season had been successful, paintings to the value of 900*l.* having been sold. A speech was delivered by Sir COUTTS LINDSAY, in which he referred to the progress of industrial art in this country. In pottery the French had been beaten out of the field in England, and a very large amount of the finer works in pottery were sold in France and Germany. Not only was that the case in pottery, but it was also the case in lacework, English patterns, he said, being highly appreciated all over the Continent.

DR. LYONS, who is one of the members for Dublin, has tried to set aside the result of the late competition for the Museum in Dublin by suggesting to the Treasury that the question of the site should be reconsidered. It is a very primitive sort of tactics to object to a site when all other means have failed, and in this case Dr. LYONS could hardly expect to succeed. The people of Dublin should have pointed out the defects of the site long ago, when the Government scheme was first proposed. It is too late now to become zealous about securing the best possible arrangement. If the competition had been originally restricted to architects living in Dublin, no objection would have been raised in England; but as it was an open competition, the conditions must be strictly observed. The twentieth clause of the particulars furnished to architects stated that "the committee of selection shall report to the Treasury upon the five selected designs, and the Treasury will select the author of one of them to execute the new building as architect." With this before them, it is unworthy of the Irish architects to act as they are now doing. They failed signally in the competition, and they cannot expect a series of experimental competitions to be initiated in the hope that in some remote period one of their countrymen may succeed in winning a place.

LAST week a largely-attended meeting of the carpenters and joiners engaged in the Paris building trade was held at the Salon du Pont d'Austerlitz to debate and agree upon the demands to be addressed to the masters for an advance in wages, diminution of working hours, and other changes in the conditions of labour. After considerable discussion it was decided that the working day should be fixed at ten hours both summer and winter; that overtime should be suppressed as far as possible; that the rate of wages should be 80 centimes per hour; that men, taken out of their district for temporary work should receive 2 francs extra per day as *dérangement* money; that so-called special work should be paid 1 franc instead of 80 centimes; and finally, in case of pressing and exceptional jobs where overtime is absolutely necessary, it shall be counted at the rate of 1*fr.* 20*c.* per hour (time and a half) for the first two hours, and 1*fr.* 60*c.* (double time) for all hours after. These demands will be immediately brought to the attention of the Masters' Chambre Syndicale, and in case they should be refused, an extensive strike is likely to ensue.

MR. MATORELL Y PENA, a citizen of Barcelona, has founded a prize of 20,000 francs for the best work on Spanish archaeology, to be competed for every five years by archaeologists of all countries, with the sole restriction that the papers sent in must be written either in the Spanish or French language. The prize will be awarded for the first time on April 23, 1883.

THE works that are being executed for the reconstruction and extension of the Paris Ecole de Médecine are for the moment almost completely suspended. Owing to the demolition of the buildings formerly occupied by the Clinical School of Midwifery, the space lying between the Rue Monsieur-le-Prince and the Boulevard St.-Germain is transformed into a vast building yard, which, although crossed by the Rue de l'Ecole de Médecine, has the appearance of a town that has been given over to fire and pillage, as, owing to the blocking up of the street, the only passers-by to be seen are the medical students climbing across the heaps of rubbish and materials on their way to and from lectures. The new buildings, the principal façade of which on the Boulevard St.-Germain will have a frontage of nearly 400 feet, are already up as far as the first floor, the iron joists of which are in position. They will extend back right to the Rue Monsieur-le-Prince, where, owing to the higher level of the soil at that side, the entrance from the street will open on to the first floor. Orders have been given for the immediate resumption of the work, which will be pushed on henceforward as speedily as possible.

BUCHAN HILL, SUSSEX.

THIS mansion, which is situate about three miles from Crawley, is in course of erection for Mr. P. SAILLARD. The main building is arranged round a fore-court, one side of which is formed by a tall wrought-iron enclosure and gates. Entering the house from a carriage porch, a lobby leads into the hall, 40 feet by 28 feet. It is oak panelled, a portion being lined with the local Barnsnpap stone, and occupies the height of the two storeys. At one end is a hooded chimney between lofty windows; the other end is spanned by an arcaded oak gallery, which is part of the first-floor corridor. On one side of this hall are placed the drawing-room, morning-room, &c., principally used by the ladies; on the other side being the library, billiard-room, and dining-room—the latter being also approached by the servery contiguous to the offices. Near to the offices, and by a garden entrance, are the business-room and school-room, with lavatory, w.c., &c., for use of the children. The grand staircase of oak is in the tower, the newels being carried up as posts, the spaces being arcaded. Near the drawing-room and morning-room is a circular turret-stair leading to Mrs. SAILLARD's boudoir, bedroom, &c., which occupies one wing of the building on first floor. The kitchen is lofty, with an open roof and domed lantern-light for ventilation. The offices are arranged round a kitchen-court. All these are lined with white glazed bricks. The open arches beneath the coupled gable form an open loggia to a large play-room adjoining the nurseries. There is a basement under one wing containing cellars, &c., the remainder of the building being excavated sufficiently to admit of all the chimneys being swept from below. The picturesque tower above the main staircase provides large water-tanks for the supply of the house, a belvedere above this being reached by stairs in the octagonal turret. The walls are of red brick with dressings of Ham Hill stone; the roofs are of red tile. MESSRS. ERNEST GEORGE & PETO are the architects, and the contractor is Mr. MARK MANLEY, who took the work at 45,000*l.* in competition.

## DESIGN FOR TOWN HALL, BIRKENHEAD.

THE accompanying illustration is a design submitted to the Town Hall Competition for the borough of Birkenhead by Mr. EDWARD BIRCHALL, F.R.I.B.A., of Leeds. It was intended to harmonise with the contiguous buildings and carry out the issued restrictions. The ground-floor has the main central entrance to the front, and two other entrances, one of which would be a covered way to carriages. To the right of the main entrance would be the Town Clerk's offices, with gas and water offices behind; to the left, the Borough Treasurer's offices, with Borough Surveyor's, &c., behind. On the first floor to the front would be the Mayor's apartments *en suite*, fitting up to the Council Chamber, also on the same floor; the large hall, 70 feet by 50 feet, with attendance and committee rooms, with plenty of staircase and landing accommodation, and all the corridors would be well lighted.

## THE WOODLANDS, GILDERSOME, NEAR LEEDS.

THE house and premises shown in the illustration belong to Mr. GEO. WEBSTER, manufacturer, of Gildersome and Leeds, and a member of the Leeds Town Council.

The grounds and park, which are away from the village, are 23 acres in extent, falling gradually to the south, which is bounded by a small run of water and a wood behind it.

The house has dining-room (24 feet by 16 feet 6 inches), hall (10 feet wide), drawing and breakfast rooms, front and back kitchens, pantries, lavatory, &c., on the ground-floor. On the chamber and attic floors there are ten good bed-rooms, closet, w.c., rooms for bath and lavatory, which is fitted up with the ordinary slipper bath for hot and cold water, steam bath, douche bath, and circular-needle bath. The room has a fireplace, and in addition has a small heating apparatus for winter, supplied from the kitchen fire.

The material used for external walls is the best Delph stone all round, with hard white ashlar dressings. Pitch pine is used extensively in the inside, and the whole of the woodwork in the dining-room is in solid mahogany, French polished and picked out in black; and the suite of furniture for this room is in mahogany to match, and of the same period as the house, specially designed by Mr. CHARLES MILLS, of Bradford. All the reception-rooms have ceilings divided into small panels and well filled with ornament.

The outbuildings comprise stable, loose box, harness-room, coach-house, wash-house, lodge for coachman, garden-house, conveniences, billiard-room, 32 feet 6 inches by 18 feet, and 13 feet high. The court-yard of house and stable-yard are quite separate, and the latter cannot be seen at all from the kitchen.

The vineries are 120 feet long in one line of buildings, being divided internally into four 30-foot houses, specially arranged for early and late grapes. The other greenhouse buildings are about 60 feet long. One peculiarity of this horticultural scheme is that the firing-shed is 100 yards or more away from the glass, and the pipes are laid under ground.

The grounds are just about on the point of completion, although Mr. WEBSTER has been living in the house over twelve months.

The works have been carried out from the designs and under the supervision of Mr. W. HANSTOCK, A.R.I.B.A., of Batley, by local builders.

## HOLY CROSS ABBEY, CO. TIPPERARY.

THE Abbey of Holy Cross was one of the most beautiful in Ireland. It was founded by King DONAGH O'BRIEN, who died in 1241, for monks of the Cistercian Order. It was a "cell," or daughter church, of Furness Abbey. Among the features for which the abbey is distinguished are the careful detail; the exquisite sedilia, commonly called a tomb; the shrine of the Holy Cross, called the Waking Bier; and the beautiful tracery of the windows. The nave is 60 feet 9 inches long by 50 feet 11 inches wide, inclusive of the aisle. The choir is short, with elaborate groining; four finely-wrought arches support the tower. The transepts have spaces for four altars, two in each. The shrine of the Holy Cross divides the two chapels in the southern transept. The choir of the abbey really extends from the eastern end to a point 31 feet west of the tower, this, as at Ross Abbey, being cut off from the main body of the nave by a solid wall. The canopy of the sedilia is decorated with the shield of HENRY IV. after his accession; in the first and fourth quarterings being only three "fleurs-de-lys," styled France modern, distinguished from the shield "semée-de-lys," or France *ancient*. The following description of Holy Cross is from a paper by the late Rev. J. L. PETIT:—

The abbey is of the Cistercian Order, and though most of the remains are rather a late Gothic, very similar to the French Flamboyant, the Cistercian type and arrangement is preserved as fully as in specimens of the twelfth century. The central tower is low and massive and of an oblong plan; its parapet has disappeared. It has a short choir or chancel, and north and south transepts with two eastern chapels to each. Those of the southern transept, instead of being divided, as usual, by a solid wall, have between them a screen of two arcades on shafts enriched with a spiral moulding. The space between them seems to have been intended for a monumental figure. The arches are pointed, and apparently of a late date. In the chancel are rich sedilia, or else a tomb occupying their position, having a little of the character of Late Perpendicular (the true Perpendicular does not, I think, exist in Ireland), and consisting of three tall arches under a horizontal cornice of delicate work. The tower compartment, the chancel and north transept, are groined with ribs, but no bosses at the intersection; above them are rooms. The east window has six lights, which are trefoiled; but the tracery above, which is reticulated, has no foliation. Some of the smaller windows have Flamboyant tracery with foliation, and some without. The nave is of good length, but divided by a partition at the distance of about a square from the intersection. This partition, which does not extend across the aisles, is pierced by a plain pointed arch of a single square order, and terminates with a gable, so as wholly to cut off the eastern from the western part of the church. Probably one was conventual, the other parochial, as at Wyndham, Boxgrove, and other places. The pier arches of the nave are of one square order, very plain, pointed on the north side, and round on the south. The piers also are plain and square; in fact the nave has few architectural features by which its date may be determined, for the absence or narrowness of the chamfer is no proof of an early style in Ireland, as it occurs in the latest Gothic. A small lateral door presents the only remains of twelfth-century work. The abbey buildings are on the south side, forming the square between the nave and transept, and extending to the south-east. There are no remains of the cloister arcade, if any existed; but one or two of the doors opening into the space are rather curious.

Holy Cross Abbey is now in charge of the Commissioners of Public Works, and under the direction of Mr. T. N. DEANE, R.H.A. The following repairs were carried out during last year:—The tombs have been relaid, and the general floor of

the abbey levelled, the walls in parts pointed with cement, the parapet of the main tower repaired, upper surfaces of groined arches coated with concrete, tracery secured, buildings built against the abbey removed, *débris* and earth taken away from the bases of the walls, broken and missing quoins replaced, arches put in where walls were in danger, mullions replaced where tracery might have fallen, cut stone collected and stored, several of the cloister arches rebuilt on their old foundations, casts taken of the most interesting corbels and other carved stones.

### THE HAMILTON MANUSCRIPTS.

THE *Times* of Saturday says:—A large number of our readers will learn with much regret that the information telegraphed by our Berlin correspondent on Wednesday is but too true, and that the entire collection of valuable manuscripts formed by Alexander, tenth Duke of Hamilton, has become the property of the German Government, and is already lodged in the Königl. Museum at Berlin. The negotiation was completed about ten days since by Dr. Lippmann, the curator of the Fine Art Museum, with the assistance of Messrs. Ellis & White, of New Bond Street.

The MSS. may be divided into three classes—first, those which are specially valuable from an artistic point of view; second, those which have a particular antiquarian and critical value; third, those whose interest is historical and literary. Above all others in the first class must be mentioned the manuscript of Dante's "Divina Commedia," written in the fifteenth century, and illustrated with upwards of eighty drawings by the hand of Sandro Botticelli. This priceless volume may without exaggeration be described as the most valuable manuscript in existence from its artistic interest, for it stands alone as an example of a literary work of the first order illustrated by an artist of the highest rank.

Next may be mentioned a Missal executed for Pope Clement VII. shortly before his elevation to the Pontificate. This splendid volume is esteemed as the work of the exquisite but almost unknown artist Antonio da Monza, who flourished at Milan at the end of the fifteenth and beginning of the sixteenth century. The calligrapher was Ludovico Vicentino, well known to bibliographers as the author of a work on the art of which he was so great a master. The illuminations consist of 13 large and 19 small miniatures, besides 28 full-page borders of surpassing beauty of execution. The whole volume is in perfect preservation, and in its original binding. Another truly splendid volume is a Bible of the fourteenth century, decorated with 297 exquisite paintings, besides 127 smaller miniatures, and 130 richly-illuminated borders. This grand book possesses the unusual distinction of bearing the name of the artist, John of Ravenna, which is thus given on the last leaf:—

Hujus Biblie scriptor  
Eterne sit vite possessor  
Cujus nomen habetur,  
De Ravenna Magister Johannes.

Another splendid and truly royal volume is the works of Horace, written and illuminated in the first years of the last decade of the fifteenth century for Ferdinand I. King of Naples. This beautiful book is attributed to Marco Attavanti, Miniatore Toleo Ten. A Psalterium of the eleventh century is a volume of extreme interest for the early history of art, containing as it does 200 drawings in colours of a remarkable character.

Petrarch has been much more frequently than Dante the subject on which miniatori have delighted to exercise their art, and the former of this collection was happy in securing one of the finest ever made. It is a large folio volume containing the poems of Petrarch, with the Commentary of Francisca Philelpho, and it was under the care of the commentator that this superb MS. was completed. It has twelve gorgeous pages, the subjects being enclosed within borders of very beautiful design of the Florentine school of the fifteenth century.

Among the French MS., "Les Illustres Malheureux de Jean Boccace" is specially remarkable, both for the beauty of its execution and its perfect condition. It is enriched with eighty-four miniatures, nine of which are of a large size, and the whole of them finished with consummate skill. This noble work is dated 1409.

The "Roman de la Rose" is a work of which a very large number of manuscripts exist, but probably no other surpasses that contained in this collection for the number of the miniatures—no less than 100—or the delicacy of their execution. This beautiful book is esteemed to have been made little, if any, later than the lifetime of the author, Jean de Meun, who died in 1364. A French translation of Diodorus Siculus is remarkable as being the identical copy presented to Francis I., with his monogram impressed on the sides of the binding. The first page represents the King seated on a throne, surrounded by his courtiers and his three sons (the Dauphin Francis, afterwards married to Mary, Queen of Scots; Henry, afterwards Henry II. of France; and Charles, Duke of Orleans). The painting is a *chef-d'œuvre* of the French art of the period, from its perfect finish, and the detail is carried out with the greatest minuteness.

In such a library of manuscripts we naturally expect to find

some fine specimens of that favourite work on which illuminators were so wont to spend their best efforts—viz., the "Hours of the Blessed Virgin." There are no less than twenty-seven examples of this book, several of which are of unusual beauty and excellence. A French "Heures à l'usage d'Anges" is indeed a gem of its kind, ornamented with thirty-eight miniatures of exquisite finish. This volume belonged to the library of the Cardinal de Soubise, and is described on the fly-leaf as "Superbe manuscrit le plus beau de la Bibliothèque de Soubise." It is in the old red morocco binding, with the Soubise arms on the sides and back. Another manuscript of the "Horæ Beatæ Mariæ Virginis," though coarse and rude in its execution, has a great historic interest from having been executed for Isabella of Scotland, daughter of James I. of Scotland, married to Francis I., Duc de Bretagne, October 30, 1442. The first miniature represents the Duchess Isabeau on her knees, the robe biparted with the arms of Brittany and Scotland. Between the Office for the Dead and the Hours of the Angels, the scribe had left seven pages blank, which are filled up with prayers in the autograph of the Duchess Isabeau herself. Another volume of a similar character but of surpassing beauty of execution, is an "Officium Divæ Mariæ Virginis," adorned with twenty-nine very beautiful miniatures by an Italian artist, or possibly by a French artist who had studied in Italy. Independently of the beauty of the paintings, this book is altogether so daintily got up, the vellum of the finest texture, and the preservation so spotless, that it might have been completed but yesterday. An exquisite binding by Derome, with dentelle borders on the sides, makes this splendid volume all that can be looked for in such a book.

The foregoing articles do not by any means exhaust the works of interest in the first division, the difficulty being rather to choose from among so many which to describe, than any lack of others worthy of description.

In the second division, first and foremost we must regret the loss to this country of a volume which came here under circumstances of the highest interest, and which we lose again after an interval of a little more than 350 years. This is nothing less than a manuscript of the Gospels in Latin, dating from the seventh century, and written in golden uncial characters on purple vellum. It is said that only three or four examples of such manuscripts are known; but what gives to this one so great an interest and value is the fact that it was presented to Henry VIII. by Leo X., on the occasion of conferring on him the title of Defender of the Faith. On the first page is the following inscription, in letters of gold, surmounted by the royal arms of England:—

Fato servatus tibi sum ter maxime princeps,  
Te quoque servarunt aurea fata michi;  
Instaurata nitent per te sacra Dogmata heri;  
Aureus est author Christus ubique meus."

A Psalterium of the ninth century presents a peculiarity very rarely found. It is written in double columns, on the left side the Greek and on the right the Latin; but that which is most noteworthy about it is that the Greek text is written in Roman characters, thus helping us to a knowledge of the pronunciation of the Greek language at the time when the Byzantine Empire was in its literary glory. The date of the execution of this venerable manuscript is discovered in the Greek inscription in capital letters prefixed, showing that it belonged to the Monastery of St. Ambrose at Milan, when Peter II. was abbot, who was created in 856 and died in 897. Another Psalter, second in interest only to the foregoing, is a folio volume dating from the seventh century, and known as the "Psalterium Sanctæ Salabergæ." The writing is in uncial characters, and was done by the hand of the Abbess St. Salaberge, who died in 655, for the use of the nuns of St. Jean Baptiste de Laon. In the Creed are three remarkable variations from later versions, viz.:—(1) "Natum ex Patre;" (2) omitting "Deum ex Deo" before "Lumen de Lumine;" (3) "Spiritus Sanctus ex Patre procedens," not "ex Patre et Filio." This venerable manuscript, more than twelve hundred years old, is in perfect preservation.

"Biblia Latina"—a grand manuscript of the tenth century. An inscription informs us that it was written by Aldibaldus, the monk, by command of Gulielmus, the abbot. The former name leaves little room for doubt that the manuscript is of English origin. The once warmly-disputed text of the three heavenly witnesses, 1 John v. 7, finds no place here in the text, though a much later hand has inserted it in the margin.

A copy of the Gospels in Latin of the eighth century, from the library of the Benedictine Monastery at Stavelot, in Belgium, is beautifully written in the characters known as "Minuscules Carlovingiennes." The beginning of each book is executed in letters of gold, and the first page of each Gospel is decorated in the style of the celebrated Missal of Charles le Chauve, preserved in the National Library at Paris.

"Evangelistarium sive Evangelia IV. per Anni circulum." A Greek manuscript of the eleventh century, richly decorated with thirty-three miniatures by a Byzantine artist, painted in vivid colours on a gold ground.

Among the manuscripts of historic interest the foremost place is occupied by a collection of English State papers relating to the history of England and Scotland between 1532-85. It comprises upwards of 1,200 documents and autograph letters, including

several in the hand of James V. of Scotland and Queen Margaret, sister of Henry VIII., and others from nearly all the statesmen who moved in that important period of our history. We have reason to believe that it is not even now too late to secure these important papers for this country.

### GLASGOW INSTITUTE OF ARCHITECTS.

**A**N extraordinary general meeting of the Glasgow Institute of Architects was held on the 3rd inst., to consider the new Police Bill. Mr. James Thomson, F.R.I.B.A., President of the Institute, occupied the chair.

Mr. Wm. Maclean, writer, the secretary, read the report of the Council of the Institute on the Police Bill. The report was as follows:—The Council of the Glasgow Institute of Architects having considered the sections of the new Police Bill from 307 to 392 inclusive, relating to the jurisdiction and procedure before the Dean of Guild Court, Master of Works, his powers and duties, streets and courts, sewers and buildings, their erection, alteration, and use, are unanimously of opinion that these sections should be omitted from the Police Bill, and that all necessary building regulations should be embodied in a Building Act applicable not merely to the city, but also to the suburbs. The growing need for such an Act to regulate building operations in this large city has been apparent to the architects of Glasgow for many years. In 1878 and 1879, in particular, the subject was discussed at numerous meetings, and a deputation from the Institute had several opportunities of conferring with a committee of the Town Council which had this matter under consideration. At that time it seemed probable that the different municipalities would co-operate with the view of promoting a general Building Bill applicable to the whole of Scotland—a course which the Institute warmly approved and recommended—but the scope of the measure now under consideration proves that the Town Council has entirely abandoned all idea of proceeding with a Building Bill either in conjunction with other corporations or separately. Instead of that they propose to mix up building laws with the miscellaneous provisions of a Police Bill, in such a way that the original mistake of so doing shall be perpetuated and aggravated. But if time for due consideration be allowed (and your Council can imagine no valid reason for precipitation), the opportunity seems favourable for taking up this matter in an impartial spirit, and the Council recommend that the Institute should give expression to its opinion on the subject, and use all competent means to convince the authorities and their fellow-citizens of the urgent need which exists for a complete revision and codification of building regulations. If the course which the Council recommend—the substitution of a separate Act for the clauses relating to buildings in the draft Bill—meets with general approval, and if it is adopted by the Town Council, it will then become the duty of the Institute to consider what regulations would most conduce to the public advantage, and to use its influence to protect the owners of property—and therefore necessarily the occupiers of property—from unnecessary and vexatious interference with their rights. In the meantime it seems only necessary, with reference to the clauses of the Police Bill already referred to, to express the opinion that they are in many respects most objectionable, being arbitrary and unjust, and throwing burdens upon dwelling-house property which must result in the great majority of the population being required to pay higher rents than at present. The Council regard this as a very serious consideration, and not at all likely to conduce to improved sanitary conditions, it being perfectly well known that the direct consequence of high rents is overcrowding. It will, however, be unnecessary to criticise these clauses in detail unless the Town Council resolve, in spite of all remonstrances, to go on with the Bill this session. With the view of bringing the opinion of the Institute before the Town Council in a formal manner, your Council submit for the approval of the general body the following resolutions:—1st. That it is expedient that the clauses relating to buildings and the jurisdiction of the Dean of Guild be omitted from the Police Bill. 2nd. That the laws relating to building should be consolidated and amended by a new Act dealing with that special subject, similar generally to the Metropolitan Buildings Act, and applicable to the suburbs as well as to the city of Glasgow. 3rd. That inasmuch as it is impossible for the Town Council or the ratepayers either to consider the advantages of the course now proposed by the Institute or the merits of the draft Bill now published, before the day on which Bills for next session must be lodged, therefore the Institute protests against the Town Council giving notice of their intention to proceed with the Bill at this time. 4th. That a copy of the foregoing resolutions be forwarded to the Town Council.

The Chairman moved the adoption of the report. Mr. James Salmon in seconding the motion expressed an opinion that the Institute should have been consulted by the Town Council in the preparation of the Bill.

Messrs. James Sellars and Campbell Douglas addressed the meeting, and it was unanimously resolved to protest against the Town Council proceeding further with the Bill at present.

### GLOUCESTER CATHEDRAL.

**A** LECTURE was delivered lately in Gloucester by Dr. E. A. Freeman on "Gloucester—its Abbey and Cathedral, and their place in English History." He said it used to be an ancient saying, "As sure as God's in Gloucestershire." That proverb, he believed, had its origin in the great number of religious houses in the county and city, especially in the county at large. But that was not peculiar to Gloucestershire. Gloucestershire was part of a great whole, and they must take Gloucestershire and Worcestershire together, and they would certainly find a collection of great religious houses which there were only two other parts of England that could have any pretensions to rival. One of these was Yorkshire, and the other was the Fen land. The fame of Yorkshire in the matter of monasteries rested mainly on those which had vanished, or were now in ruins—on those beautiful Cistercian houses which had passed away, and which never played any very important part in history. One of these, the Abbey of Selby, was pretty nearly perfect. But somehow people seemed to fancy that an abbey meant a ruin—that every abbey was a ruin, and every ruin an abbey. It was in the Fen land that this Severn land had its real rival. There they had Ely, Peterborough, Lynn, Crowland, Ramsey, and several others—a crowd of great religious houses which would rival or surpass those that lay along this valley of the Severn and Avons; and, on the whole, he doubted whether it would be quite wise to put Gloucester, and Tewkesbury, and Cirencester on a level with Ely and Peterborough. But, on the other hand, they must remember that in that land they had drawn so little from Nature that they had a special necessity to draw upon art.

It was in 1100 that the minster of Gloucester was newly consecrated, which he was inclined to believe contained a very great part of the church now standing. There were at least two churches before this. There was the church of Osric, of which he could tell them nothing except that it contained an altar to St. Petronella; and in 1058 a new church built by Wulfstan, Bishop of Worcester, was consecrated. Did it not strike them as an extraordinary thing that if a church was built and consecrated in 1058, only thirty-one years after the church should need to be rebuilt? Here came in the great question as to the change in architecture which took place in the eleventh century. He would not go over again arguments he had already answered. He thought he could tell them why Abbot Serlo thought it needful to rebuild the church. During the reign of Edward the Confessor there were two styles of architecture and two fashions of church-building going on side by side. There was the old English fashion and the newly-bred Norman fashion, an example of which was set in the Church of Westminster. The Norman prelates often destroyed English churches because they were not large enough, and the fashion came in of building churches on an ornamental scale. This might explain why the smaller church was pulled down and the larger one built. The smaller church was perhaps more like Deerhurst than Westminster, and so Abbot Serlo thought it did not suit the dignity of his house, and he pulled it down. He thought that might be the real explanation. No one had pulled down Westminster, because that was built in the new style. How much of the church was consecrated in 1100? Was it merely the eastern end, or was it the whole of the building, including the eastern and western limb, except that part of the western limb which was manifestly later? There was a good deal to be said about that, but he could hardly enter upon it at length. It was very interesting to compare this church with Tewkesbury. They were both in course of building at the same time, and they had very much in common, and some of the same people had a hand in both. Though the eastern and western limb were in the same style, and there could be no great difference of date between them, they were built according to quite different patterns. They could easily see in the eastern limb of Gloucester, though a network of Perpendicular work was spread over it, what the original might have been—very low piers, and a very great triforium. But going into the nave they would see piers of enormous height, surpassing those of any other English church except Tewkesbury, and a small triforium and clerestory. Going to Tewkesbury, changed as the eastern limb must be, they could see an enormous apse, with the same low piers, while in the nave the pillars were yet higher than at Gloucester, and the triforium smaller. Gloucester was consecrated in 1100, and the monks entered the new minster at Tewkesbury in 1102, and there was a dedication in 1122. The same man as at Gloucester, Robert Fitzhamon, was the second founder of Tewkesbury. He was a great benefactor of Gloucester. He enriched the Abbeys of Gloucester and Tewkesbury with the spoils of the churches in his Welsh conquests and in Glamorgan. The number of Welsh churches which he gave to those two abbeys was amazing. So the Welsh churches passed away. Then wealth came to Gloucester and Tewkesbury; while on the other hand a cell or two rose in Wales, of which the admirable Romanesque church of Ewenny was an example, in exchange for the large amount of wealth taken from them. Was Tewkesbury an exaggeration of Gloucester, or was Gloucester a taming down of Tewkesbury by some one who liked the high piers, but who thought they had gone rather too far when they drove the triforium and

clerestory into nothingness? The dedication of 1122 did not necessarily prove that the Abbey Church of Tewkesbury was quite new then. At the extreme west end of Tewkesbury there was a most remarkable feature, which one would like to place as early as possible. In the west front there were little towers, just as at St. Albans, with the peculiar shafts which were one of the signs of primitive work—one of the features which the new Norman style did not disdain to borrow from the old English style. He should think a feature like that, handed on from earlier times, agreed with 1100 a great deal better than 1122, when the improvements in art brought in by Bishop Roger of Salisbury were beginning to take effect. On the whole there was a great deal to be said on both sides, though the least bit of direct evidence would settle the question either way. Until he got that he was inclined to think that the nave of Gloucester must have been finished by 1100. He could not find any Gloucester history that went minutely into these things. He could find nothing like a rebuilding of the nave. The Chronicle mentions a rebuilding of the great tower in 1222, and a dedication in 1239, the year when so many churches were dedicated, because an order had been put out two years before that all churches which remained undedicated should be dedicated. This showed that the fact of Tewkesbury minster being dedicated in 1122 did not prove it was quite new. The dedication could have nothing to do with the building of the present nave. He suspected it was the changes in 1122 which made the consecration in 1239 needful. Between 1100 and 1222 there was nothing that could be turned to imply anything like a building of the nave. Therefore he was inclined to think it was a perfect church, and not a mere fragment, that was consecrated in 1100. There were parallel cases both ways. Canterbury was built in seven years; so he supposed the minster of Gloucester might have been built in eleven years. Whether they consecrated a fragment or waited until the whole church was finished, depended on whether the new church was something wholly new, or whether it stood on the site of an old one.

### GREEK PAINTING.

THE first of a course of lectures on ancient Greek painting was delivered on the 3rd inst. by Professor C. T. Newton, C.B., at University College. The lecturer began by reminding his audience of the course of lectures on Greek sculpture, from the earliest times to the Roman period, which he completed this year. The main epochs in the history of ancient sculpture had an intimate connection with the general history of the Greeks, with their intellectual, political, and social development. We could not profitably study the history of ancient sculpture except as part of the collateral study of ancient life as a whole, nor could we get a clear idea of the history of ancient sculpture without tracing out, so far as our imperfect knowledge permits, the characteristics and successive stages of ancient painting. Between these twin-sister arts there had been in all times, and especially in Greek antiquity, a close sympathy and a reciprocal influence. The method in dealing with the history of Greek painting in this course would be similar to that adopted in the course on sculpture. The evidence of ancient authors as to the works and characteristics of Greek painters would be first examined, then the extant monuments which illustrate the history of this branch of art would be described. In the case of painting, the extant monuments were few and far between, but we might learn much by the careful study of the mural paintings from the buried Campanian cities, Pompeii, Herculaneum, and those found in the tombs near Rome and Etruria. The paintings on Greek vases would enable us to trace the history of what is called ceramic art from 600 B.C. for nearly five centuries onwards. After noticing the traditions preserved by Pliny and others as to the earliest painters, the lecturer passed on to the period after the Persian war. Polygnotos of Thasos was the earliest Greek painter of celebrity. He flourished 480-460 B.C. At Athens he decorated with paintings the portico called the Stoa Poikile, the Temple of the Dioscuri, the Temple of Theseus, and the Pinakothek on the Akropolis. At Delphi he painted on the walls of the building called Lesche two celebrated pictures, the taking of Troy, and the descent of Ulysses into Hades. All these were mural paintings; the subjects were, partly mythical, partly historical. Thus in the Stoa Poikile were represented the taking of Troy, the battle of Theseus with the Amazons, the battle of Marathon. In the Temple of Theseus came the battle of the Lapiths and Centaurs, and the battle of the Amazons again. In the other two Athenian temples he treated mythological subjects. These great public works were executed during the administration of Kimon, to whom Polygnotos stood in the same relation as Phidias did to Perikles, the successor of Kimon. The paintings in the Stoa Poikile were executed by Polygnotos gratuitously, for which service the Athenians rewarded him with the freedom of their city. His greatest and probably his earliest works were the two pictures in the Lesche at Delphi. Of these there was a very full description in Pausanias. The building called Lesche was thought to have been of elliptical form, with a colonnade on either side, separated by a wall in the middle, and to have been about 90 feet in length. The figures were probably life-size. According to the list given

by Pausanias, there were upwards of seventy in each of the two pictures. In that representing the taking of Troy, Polygnotos had brought together many incidents described in the Cyclic epics. Menelaos, Agamemnon, Ulysses, Nestor, Neoptolemos, Antenor, Helen, Andromache, Cassandra, and many other figures, with which the Homeric poems have made us familiar, all appeared united in one skilful composition, arranged in groups. The other picture, the descent of Ulysses into Hades to interrogate Teiresias, might be called a pictorial epic of Hades. On one side was the entrance, indicated by Charon's boat crossing the Acheron, and the evocation of Teiresias by Ulysses, besides the punishment of Tityos and other wicked men. On the other side were Tantalos and Sisyphos. Between these scenes on the flanks were various groups of heroes and heroines from the Trojan and other legends. From the remarks of ancient critics it might be inferred that the genius of Polygnotos, like that of Giotto, was far in advance of his technical skill. Aristotle called him the most ethical of painters, and recommended the young artist to study his works in preference to those of his contemporary Pauson, who was ignobly realistic, or those of Zeuxis, who had great technical merit, but was deficient in spiritual conception.

The course will comprise four more lectures, as follows:—November 17, "Greek Painters from 460 B.C. to accession of Alexander the Great, 336 B.C.—Apollodoros, Zeuxis, Parrhasios, Pamphilos, Aristides;" November 24, "Greek Painters from Age of Alexander to Augustan Age—Apelles, Protogenes, Theon;" December 1, "Pictures on Greek Fictile Vases;" December 15, "Mural Paintings from Pompeii, Herculaneum, and other ancient sites."

### COVENT GARDEN AND THE CRITERION THEATRES.

AT the meeting of the Metropolitan Board of Works on the 3rd inst. reports were presented from the Building Act Committee on the Criterion Theatre, Piccadilly, and the Royal Italian Opera, Covent Garden. The Committee stated that they had carefully considered the question of the present arrangements for the egress of the public from and the prevention of fire at Covent Garden, and the improvements which it was desirable to effect in the same under the provisions of the Act of 1878, and that they were of opinion that the following alterations of a structural character should be made, in order to remedy existing defects in the building:—That a proper proscenium-wall be built to divide the stage from the auditorium; that such wall be carried down to the level of the foundations, and carried up to the height of 3 feet above the highest part of the roof to which it adjoins; that a wall be built in continuation of the proscenium-wall under the proscenium opening, such wall being carried up to the underside of the stage and carried down to the level of the foundations, and that all openings in this wall, and in the walls dividing the dressing and other rooms, at the side of the stage, from the staircases adjoining, be closed by wrought-iron doors in wrought-iron frames, fitted without woodwork, and hung so as to shut automatically. That the floors of so much of the workshop and store-rooms in the roof of the theatre as extends over the auditorium be formed of fire-resisting materials, or covered with Drake's concrete slabs. That an additional staircase, with the necessary exits, leading directly into the street, be provided from the gallery and the amphitheatre on the south side of the house. That strong handrails be fixed on both sides of all staircases, where not already provided, and that a central double handrail be fixed to the grand staircase. That the doorways between the theatre and the Floral Hall be closed with wrought-iron doors in wrought-iron frames, fitted without woodwork, and hung so as to shut automatically; that the doors throughout the building be made to open outwards; and recommending that a draft notice embodying the above requirements be prepared by the solicitor; that the clerk be instructed to transmit a copy of such notice to the owner, with an intimation that he may submit to the Board any observations thereon; and that the Building Act Committee be authorised to confer, either directly or through their sub-committee, with the owner upon the Board's requisitions, and to report further to the Board on the subject. Recommending that the Board, in exercise of the authority conferred upon them by the 45th section of the Metropolitan Board of Works (Various Powers) Act, 1882, do make the following rules with respect to Covent Garden Theatre, for the safety of the public:—That notices be legibly painted upon the exit doors of the theatre, stating that they may be opened by any one in case of an emergency; that exit doors be secured by bolts only to be shot by a handle to be placed at a height of 3 feet from the floor; that notices be also placed in the various corridors indicating the direction of the several exits; and further recommending that a notice in writing to this effect be prepared by the solicitor, sealed in duplicate, and served upon the owner of the theatre; and that the assistant architect be authorised by the Board, in writing, to survey the theatre from time to time and report whether the rules made by the Board have been observed.

In regard to the Criterion Theatre, the Committee recommended that the Lord Chamberlain be informed that the Board, having regard to the peculiar circumstances surrounding the case

of the Criterion Theatre, in Piccadilly, are of opinion that the theatre is entirely unfit for a place of public entertainment, and that Mr. R. Vigers, in reply to his letter asking that the owners of the Criterion Theatre might have an opportunity of conferring with the Board as to the structural defects of the building, be informed of the decision of the Board upon the foregoing recommendation. The report went on to describe the position of the theatre, that it was not originally intended as such, and that no structural alteration that could be made would afford a sufficient means of egress in the event of a panic or alarm of fire.

Mr. Verity, the architect of the Criterion Theatre, in a letter to the *Times* says:—This theatre was opened in 1874, and at the time of its completion the Board of Works certified that it had been constructed in accordance with the provisions of the Building Act, and to the satisfaction of their district surveyor; indeed, the building could not otherwise have been opened. No alterations in its arrangements have been made since that time. All the staircases and corridors are of fireproof construction, and no question has ever arisen as to the sufficiency of its approaches or exits. So far as I am aware, the only objection ever raised was its position, which necessitated artificial ventilation. This has been so successfully accomplished, that a comparison with other theatres shows that even in this respect it is better than the majority of other houses. As to the usual risks, this theatre is entirely free from them. There are no carpenters' or scene-painters' workshops, all doors open outwards, and every precaution is taken to insure the safety of the public. The fireproof corridors are alone sufficient to contain the whole audience. Up to the present time the proprietors have not had the opportunity of conferring with the Board as to the possibility or desirability of making any alterations. When the matter comes before the arbitrator I have no doubt I shall be able to show that the Board has arrived at a judgment which will not be sustained.

### SANITARY INSTITUTE OF GREAT BRITAIN.

AT the examination held on November 2 and 3 eight candidates presented themselves. The Institute's certificate of competency to discharge the duties of local surveyor was awarded to Mr. C. H. Cooper; and the certificate of competency to discharge the duties of inspectors of nuisances was awarded to Messrs. J. Brown, S. C. Legg, D. Richards, A. Taylor, and J. Watson.

The following questions were set to be answered in writing on the 2nd, and the candidates were examined *vis à voce* on the 3rd.

#### Examination of Surveyors.

##### First Paper.

1. What are the chief Sanitary Acts in force?

- (a) In the Metropolis.
- (b) In other parts of England.

What are their chief provisions?

2. What are the principal provisions of the model bylaws issued by the Local Government Board with reference to—

- (a) Building construction.
- (b) House drainage.
- (c) Ventilation.

3. What is the primary principle to be observed in the drainage of a town or district, and how would you proceed to determine the size and capacity of the outfall sewer?

4. What rules should be adhered to in regard to gradients, man-holes, lampholes, ventilators, and flushing in a sewerage system? Illustrate your answer by sketches.

5. Describe the rules that govern the question of sewage disposal at the outfall.

6. How far is a separate system of sewerage desirable?

7. Describe the essential points to be observed in carrying out a system of house drainage. What are the desiderata of a good form of water-closet? Illustrate your answer by sketches.

##### Second Paper.

1. What are the first considerations in designing and constructing water-works?

2. Describe the conditions to be kept in view in selecting a source of water supply.

3. How much water has been proved by experiment to be used per head in an average household by constant and by intermittent supply? Compare this with the average expenditure of a large town, and explain the cause of the difference, if any.

4. Describe the best means of casting and testing water-pipes, and of making joints.

5. What amount of cubic space per head is required for healthy sleeping-rooms? Why is it necessary to have a certain amount? What limit of height should be allowed to reckon in the calculation?

6. Describe by a sketch the best transverse section of a paved and of a macadamised street, each 40 feet wide. How should macadam be formed and laid?

7. What is the most economical mode of watering and cleansing streets?

#### Examination of Inspectors of Nuisances.

1. What are the provisions of the Public Health Act with regard to cellar dwellings?

2. In inspecting a stream which is complained of as a nuisance, to what points would you direct your attention with the view of making a report?

3. Give the dimensions of a sleeping-room which you would consider suitable for six adults, and state your reasons.

4. Describe some of the simple forms of ventilating valves in general use, and explain their action.

5. In what ways may water become polluted after delivery into houses?

6. What are the objections to brick house-drains? How should house-drains be constructed?

7. What sanitary defects would you look for in inspecting a house where there has been a case of diphtheria?

8. What are the characteristics of various kinds of unsound meat and fish?

### DECORATIVE ART.

MR. J. H. CHAMBERLAIN has mberlain delivered his second lecture upon "Decorative Art, Ornament, and Design," at the Midland Institute, Birmingham.

He commenced by reminding his hearers of the conclusion which he endeavoured to illustrate in his last lecture—that the faculty of admiration lay at the root of all possible power in art and design. He should like to see Wordsworth's words, "We live by admiration," written up over the entrance to every school of art, for however the motto might be fitted to the world in general, it belonged especially to the art student. Their admiration must be based upon the things which they saw; and what was it they saw when they looked around them? There were two great divisions—they were both one in point of fact, but they might be conveniently divided, especially in their endeavour to analyse ancient art, into two—namely, man and nature. With regard to man they must be able to admire him and his ways, or they must drop man out of their art altogether. That, however, would involve their cutting themselves from nine-tenths or perhaps more of the art the world had known. They saw a good deal about man—and man in this case included woman—but did they admire him very much? Every day in their life they saw crowds of people hurrying in the morning to the centre of the town to engage in their business pursuits, but he did not suppose they took much notice of them, except that they appeared in a hurry and seemed glad it was a fine morning. "Oh," someone would reply, "that's everyday life: who cares for everyday life?" Well, the absolute truth about art was that it had been made up of the doings of everyday life, and if they could not get an interest in the ordinary business and occupations of the hour—the ordinary work by which they must all get a living—they were deprived of one of the principal elements that in past times had gone to compose living art. Perhaps if they could not take an interest in man's work they might in his amusements, or in collective acts and movements with his fellow-men. If they could not take a deep interest in man in some or other of his aspects, there was a great gulf between them and the past, for they would find that in all past ages people did make practical art out of all these things. Next they came to the division of Nature, by which they meant beauty in the natural world, and about which in the present day they prided themselves a good deal. They said that their eyes had been opened, and that they admired a great many things to which people a century ago were dead. They were fond of excursions into the country and beautiful scenery, and the frequency of their visits to see beautiful things might perhaps be taken as a gratifying proof that they cared more about the beauties of Nature than their forefathers three hundred years ago. But if he went into a Wesleyan chapel, or almost any building men put up, he did not find in their work any evidence of this greater fondness for Nature. Possibly it was because their ideal of Nature clashed with their ideal of getting rich. They did not find that a railway company had any hesitation in destroying any beautiful thing in Nature if they thought it was to their profit, and he verily believed that if Paradise itself were "to let" to-morrow, and a company could be persuaded they could make 20 per cent. out of it, they would cover it with cheap buildings, and be glad that they had done so. Putting this practical side against the assertion of their greater love of Nature, he thought it was a difficult matter to settle. What he now proposed to do was to take them a journey along the path of admiration the past nations had travelled in, and to see what it was by the wayside that they admired and founded their art upon. They would find that with some nations form was everything, with others colour; some saw more of sadness in the universe perhaps than any other quality; others, on the contrary, more of joy and cause for laughter. There were three headings under which the art of past times might be divided—namely, that in which interest in and admiration for man formed the base, that in which Nature only formed the base, and that in which both were mixed. Going back to barbaric times, the lecturer proceeded to point out and to illustrate by drawings that probably the earliest form of decoration that

suggested itself to the human mind arose from the simple weaving of grass, upon the diaper pattern of which many important decorative forms, such as the zigzag and the Greek fret, were built. The twisting of a rope would give the spiral ornament. Barbaric art, however, soon took higher flights, and the growth of tribal feeling led to efforts to portray and leave a permanent record of the victories of the tribe over its enemies. What had we been doing during the last few weeks in the illustrated papers but the same kind of thing, though in some cases not so artistically. Barbaric art was thus based, first, upon admiration of the manufactures of man, and next upon the deeds man had done. The lecturer went on to point out that in the next stage, the civilisation of Egypt, the profuse pictorial art of the Egyptians was largely based upon admiration of warlike achievements, but that the portrayal of these deeds of cruelty was tempered by evidences of the Egyptian admiration and love of Nature in the introduction of representations of the great sacred river, and the marvellous forms of beauty that grew on its reedy banks. Views were thrown upon the screen, showing the embodiment of a love of natural forms in the architectural decoration of the Egyptian temples. Mr. Chamberlain then passed on to Greek art, of which he took as an illustration the architecture and sculptures of the Parthenon at Athens, one of the most marvellous works the world had ever known. He graphically described its beautiful decoration, and showed that it had for its theme, man perfect in physical beauty, and rising almost—perhaps quite in the Greek mind—to the level of a God. Those sculptures were not done by contract or by competition; there were none of your nasty methods in Greek art; but the artists had the marble given to them, the time given to them, the best men were got to do the work, and they did that which God sent them specially into this world to do. He also pointed out how the mural tablets of the pan-Athenaic procession showed an admiration of man in his social life, that the work was not merely ideal art except in its method, but good thorough portraiture of the people of Athens at the time it was executed. He promised in his next lecture to draw the parallel between the place which humanity occupied in the Greek temple and the place it occupied in the Mediaeval cathedral. They would see humanity there no longer glad, triumphant, and rejoicing, but humanity crowned with sorrow and suffering, but with new developments and new powers; and he thought he should be able to persuade them that the Middle Ages carried their art in its fulness to a greater height of excellence and greater beauty than even was done by the Greeks.

### BIRMINGHAM MASTER BUILDERS' ASSOCIATION.

THE annual meeting of the members of the Birmingham Master Builders' Association was held on Monday at the Great Western Hotel. Mr. C. W. Barker presided. The report, which was taken as read, stated that in consequence of the continued quietness in trade there had been no dispute with the operatives in any branch. The demand for labour had been very limited and supply abundant, as it had been generally throughout the country. The committee were surprised at receiving demands from the carpenters, bricklayers, plasterers, and labourers for an increase of wages, together with notice for alterations in various working rules. Whilst the committee characterised the agitation as being most unwarrantable in the present depressed state of the trade, they wished the members of the association to know that, although there were various matters which in their opinion required readjustment in the interests of the employers, yet, for the sake of peace, they refrained from giving any notices; but, under the circumstances, the whole questions would be submitted to the new committee, who would bring them before a general meeting of the trade. The carpenters demanded an advance of  $\frac{1}{4}d.$  per hour, the bricklayers  $\frac{1}{2}d.$ , the plasterers  $\frac{3}{4}d.$ , and the labourers  $\frac{1}{2}d.$  At the present time there were no working rules with the bricklayers, but they submitted a code for consideration. The Water Committee of the Corporation of Birmingham having proposed a scheme for the insurance of water-fittings and for licensing plumbers, the committee and the Plumbers' Association felt that it would interfere with their rights and interests, and thereupon took active steps to offer the most strenuous opposition. A memorial was drawn up, signed very numerous by the members of the association, and a copy sent to every member of the Town Council, praying for the rejection of the scheme. A sub-committee likewise had several interviews with a gentleman who undertook to present the memorial to the Council, and to whom the strong objections urged against the scheme were forcibly explained. The result of the discussion in the Council, however, was that the scheme was adopted as an experiment for two years. The committee regretted that the opposition they made was not more successful. The insurance company promoted by the National Association had been able to reduce their premiums by 25 per cent., thus bringing the rate to a little under three-fifths of a penny for each  $1l.$  paid in wages, and the directors confidently recommended that rate to the trade, especially as the company was of a mutual nature, each insurer getting thereby the same

benefit. There had been no meeting of the Standing Committee or Conciliation Board during the year, as no dispute had been brought forward. The balance-sheet showed the total receipts for the year to be 122*l.* 3*s.* 4*d.*, which, added to last year's balance of 106*l.* 2*s.* 3*d.*, made a total of 228*l.* 5*s.* 7*d.* The expenditure amounted to 118*l.* 19*s.* 11*d.*, leaving a balance in hand of 109*l.* 5*s.* 8*d.* The number of members of the association was seventy.

The Chairman moved the adoption of the report, which he considered was a fairly satisfactory one. Mr. J. Webbe seconded the motion, and it was carried unanimously.

Mr. T. Barnsley was elected president of the association for the ensuing year. The other officers and committee were appointed, and a resolution was passed referring the notices which had been received from the operatives for an increased rate of wages to the new committee.

### GENERAL.

**Mr. John O'Connor** is painting scenery for the "Ajax" of Sophocles, which will be performed in St. Andrew's Hall, Cambridge, on November 29 and 30, December 1 and 2, by undergraduates of the University. Great care has been taken to ensure accuracy in the costumes, armour, and other accessories.

**Mr. Cornelius Walford** has just completed a new work on "Ancient and Modern Fairs." It will be published shortly by Mr. Elliot Stock in the first series of the "Antiquary's Library."

**The Duke of Teck** will preside at the opening of the Hornsey School of Art on the 15th inst.

**Mr. W. B. Richmond** has resigned the Slade Professorship of Art in the University of Oxford.

**Mr. W. L. Christie** has presented a new mace to the Corporation of Lewes. It was designed by Mr. Birch, and was made by Messrs. Hancock. The cost has been nearly 600*l.*

**Mr. T. Morgan, F.S.A.**, will read a paper on "The Mural Tablet in St. Olave's, Hart Street," at the meeting of the London and Middlesex Archæological Society on Monday next. A paper will also be read by Mr. Rye on "The Pipe Roll for London and Middlesex."

**Rudolph Hoffmann**, the historical painter, died lately at Darmstadt. He was one of the artists of the Wartburg frescoes.

**Mr. G. H. Birch** will deliver a course of three lectures at the Society of Arts in April next on "The Decorative Treatment of Metal in Architecture."

**Mr. A. W. Blomfield** has been appointed cathedral architect for Salisbury.

**Mr. Edward Webb, A.R.I.B.A.**, of Exeter and Barnstaple, has prepared plans for a new hotel proposed to be erected at Morthoe, about five miles from Ilfracombe.

**The Lectures at the London Institution** for the session will commence on December 4. Among them will be the following:—"Crystallography," by Mr. Ruskin; "Modern Pictorial Art," by Mr. H. Blackburn; "The Proper Use of Modern Classical Architecture," by Professor Kerr; "Æsthetics of Nature," by Mr. A. Tylor; and "The Great Masters of Etching," by Mr. Seymour Haden.

**A Contract** for rebuilding the first house in the square of Ibrahim Pasha, Alexandria, has been signed with the Travaux Publics Company. The work of restoration is to be finished at the end of next year.

**The Hamilton Collection of Manuscripts**, which have been acquired by the Prussian Government, mainly through the personal influence of the Crown Prince and Crown Princess, will be paid for out of the fund placed at the disposal of the Emperor for expenditure by him at will on the advice of this or that Minister.

**Royal Scottish Academy.**—The annual meeting of the Royal Scottish Academy was held in Edinburgh on Wednesday, when Mr. Robert MacGregor, Mr. David Farquharson, and Mr. J. H. Lorimer were elected Associates.

**A Dissolution of Partnership** has taken place between Messrs. J. Bromilow and H. A. Cheers, architects, of Liverpool.

**The Goole School Board** have approved of plans by Mr. Watson, of Wakefield, for the extension of Alexandra Street Schools.

**St. Mary's Church, Monmouth**, has been reopened, after restoration, at a cost of over 7,000*l.*, from designs by the late Mr. Street, R.A. The church was founded in the year 1069.

**An Exhibition of Architectural Drawings** is to be opened on the 16th prox. in Edinburgh, in the rooms of the Royal Scottish Academy. It will comprise an historical collection of drawings, and is being promoted by the Edinburgh Architectural Association.

# The Architect.

## A MODEL GUILD.

AMONGST the multitude of learned societies, colleges, professional associations, and other such confederacies for the advancement of knowledge, with which we are in these days environed, it will be difficult, we venture to think, to point to one which does better duty, or does any kind of duty in better form for practical benefit, than the Guild of Junior Architects—in other words, the Architectural Association so called—whose “Brown Book” for the new session has just come into our hands. It is known to everybody connected with English architecture that “the Association” holds a position of great influence with the younger men; and it is known also that this position is kept up by persistent hard work of one sort or another; but it seems to us by no means likely to be so generally understood as it ought to be how great the amount of work really and substantially is which this most successful organisation is doing from year to year, indeed from week to week, for the education of the young men of the profession.

There is a little controversy upon the point whether the Architectural Association ought to be considered as having been established in 1847, when the name at least was newly taken, or in 1842, when a few of those who then became principal members had established a Society of Architectural Draughtsmen, which merged in it; but one thing is certain, that neither at the one date nor at the other could the wildest imagination have been privileged to foresee that in 1882 the little fellowship of youths not only would still be in existence, but would command a list of nearly nine hundred members, a revenue of nearly a thousand a year, a lending library of 1,200 volumes, an organisation spread all over the country, prizes and honours of its own in plenty, even a travelling studentship amongst the rest, festivities and amusements of its own by way of a little relief, and a scheme of educational classes scarcely surpassed, if surpassed at all, so far as a single specialty can go, in any school or college in the land. We may well claim to be excused, therefore, if we request attention more particularly than usual to a statement of what is being done in this institution.

The Architectural Association, let us premise, does not begin by “keeping up appearances” in respect of a stately and empty house. It disburses 75% a year for little else than the use of a meeting-room on Wednesdays and Fridays; 16% for heating, lighting, and cleaning; 22s. 6d. for insurance; and nothing at all for the item of “salaries and wages,” so important in many other societies in which the performance of work is of less interest to the officials than the receipt of remuneration. But then it provides and pays for a public conversazione in state; a soirée, private and confidential, and brimful of amusement to the members; a register of employment; a round grant to the library; and a goodly list of prizes. It will not surprise the intelligent reader to be further told that, as one practical outcome of all this, it secures for its members the best of the rewards which are bestowed by the Royal Institute of Architects and the Royal Academy itself.

The most prominent feature in the year's work is, of course, the series of ordinary or public meetings at which papers are read and discussed. There are thirteen of these laid out for the session now begun; and of the subjects which are to be considered, and the lecturers who are to discourse upon them, we may give half-a-dozen examples, thus:—“Sundry Working Drawings,” by Mr. SEDDON; “Vaulting,” by Mr. WOOD; “The Ornament of the Period,” by Mr. DAY; “Modern Design,” by Mr. SEDDING; “Theatres,” by Mr. EMDEN; and “Italy,” by Mr. BAGGALLAY. Although the Architectural Association makes no pretension to go beyond the range of what we have called a Guild of Juniors, we must observe that the dissertations which are thus delivered, and the discussions which follow them, are found fully worthy of being reported *in extenso* by the press, and are attended by large meetings.

A “Class of Design” comes next. Eight meetings of this sub-section were held last year, with an average attendance of

16 members, producing 12 designs or more for inspection at each sitting, and dealing with subjects of building of such a class as a chapel, a small hospital, an inn, and so on. Subordinate to this, for the younger members, there is an “Elementary Class of Design,” attended on an average by 26, producing 18 designs at each sitting, the subjects being adapted to the order of less-advanced students. But there is also in connection with these excellent classes a course of nine lectures treating of historical style *secundum artem*. Mr. TARVER is the professor here, and he takes his hearers, from 25 to 50 in number, through the whole of the marvellous narrative—one of the most marvellous in all the philosophy of human work—from the Greek and its predecessors to the Modern Italian and its successors. The students pay 7s. 6d. for this, and half-a-crown optionally for lithographs of the diagrams; and it is to be hoped his scholars repay the lecturer in cordial thanks much more than in money.

Colour Decoration is a subject which is separately treated in another class, holding 10 meetings, and doing good work, although with no very large numbers as yet.

The class of Construction and Practice is a more important one; the attendance averaging 36, and 118 papers being produced by them during the session. An advanced class in this division is attended by from 6 to 12, and the subjects treated of belong to the highest order of constructive skill. There are 8 papers read. Then there is a special course of lectures in connection with these classes also, under the charge of Mr. BLASHILL; there being 8 evenings at his disposal, and the whole range of building construction being gone over. A few shillings pay for the privilege of attending here as before, and there are from 25 to 60 pupils.

A new class for the study of Planning and Specification-writing holds 6 meetings, about 9 members being present, delivering 9 sets of papers at each meeting; a particularly useful class, if the others were not all particularly useful.

Land Surveying forms the subject of yet another class, there being 6 lectures indoors and 6 field meetings on Saturday afternoons. It had 8 students last year.

The usefulness of the circulating library may be indicated in half a dozen words, by stating that there are 35 evening attendances for the exchange of books, and that from 20 to 90 books are so exchanged on every occasion.

The annual excursion of the Association is so well known and so much appreciated that it has become one of the chief events of the professional year. In August 1882 the thirteenth excursion in Norfolk was attended by nearly 40 architects, young and old.

The Sketch Book of the Association has long been a production beyond all praise. Twelve monthly parts are published annually, each containing 6 plates “contributed and lithographed by members”; and a subscription of one guinea from members and one and a half guineas from strangers pays for the volume.

We ought not to omit to mention that prizes are given in all the classes, and in connection with the Sketch Book also.

The Travelling Studentship, recently instituted, is not yet able to compete in value with those of the Royal Academy and the Institute; but it has a certain advantage over both of those, in so far that the recipient is enabled to feel that his honours and reward come from his own fellow-students, and indicate the approbation of the young rather than the old, and perhaps the bright rather than the dull.

The “Brown Book” closes its catalogue of studies by referring the members to the Royal Academy Schools, the lectures at King's College and University College, London, an “Artists' Society for General Study from the Life,” the Royal Architectural Museum and School of Art, the National Art Training School at South Kensington, and “the Artists' Rifle Volunteer Corps”—last not least as a bond of brotherhood and manly virtue.

Have we not redeemed our promise to describe a Model Guild? Speaking very soberly indeed, we know of no professional society to compare with it; and it would be difficult to over-estimate the effect which it must be producing upon the practical architectural world of London. Not only do many individual architects already owe to its agency their success in life, but upon the whole profession throughout England its quiet influence cannot but be powerful for good, and the honour in which it is held by the senior body, the Institute, and by other artistic and scientific societies, affords further proof, if it were needed, of work exceedingly well done. May it long prosper!

## ILLUSTRATIONS OF VENICE.

THE interesting little exhibition now opened at the Fine Art Society's smaller room, under the plea of illustrating Venice and things Venetian by the hands of living artists, has been really organised for the sake of bringing forward the work of the late JAMES BUNNEY, who two months ago was also among the "living." The large study of the façade of San Marco, which for six years had been growing under the hands of this patient artist, takes the central place; while smaller oil studies and drawings of the church and of details about the exterior of the Ducal Palace and a large number of sketches in opaque on tinted paper, form together the main part of the collection. We will first glance at the outlying contributions. Here are a number of CLARA MONTALBA'S clever Venetian sketches (17-34), in the three aspects under which the city of the sea seems to appeal to her—luminous with golden mist; cold, pale, and pearly; and gloomy with contrasts of chill grey water and swarthy red sails and black keels—such as she paints in like harmonies about the Thames wharfs and bridges in London. Here are a drawing of blue moonlight and a careful little study of a narrow canal by Mr. POYNTER, R.A. (36, 37); and poor examples of what Mr. D'EGVILLE and Mr. E. GOODALL have done, besides several other unimportant pictures. Mr. ARTHUR SEVERN, who is ambitious rather than successful, partly from certain unhappy mannerisms and a failing perception of colour, has an opportunity here of showing no less than fourteen pictures in oil and water, which all have a certain intelligent grasp of the subject, and are broadly treated, but yet fail somehow to impress. The scene in which a hailstorm is driving down in fierce slants upon the Riva degli Schiavoni and the sullen water, where the boats lie close huddled in-shore for shelter (95), is one of the most striking things the artist has done. Several pencil sketches and drawings by Mr. RUSKIN (90-94) are extremely interesting, and show how, with a rather uncertain hand, he yet seizes on significant lines and details, emphasising what to him are the important facts in a view, or maybe a house-front, or vista of houses and water, seeing and noting tenderly the subtle curves of ogee arch, the half-effaced sculpture, or wall scarred by time. One little oil-picture of an *External Window and Staircase in the Contarini Palace* (45), by HENRY DARVALL, with a single figure descending the steps, has the poetic selection and treatment of subject which mark the few pictures by Mr. DARVALL that find their way into London exhibitions. *The First Dip* (16) is the title of a careful oil figure-subject by VAN HAANEN, which has none of the "busyness" and motley restlessness of colour that have often marred his clever work. This is a group of women and boys gathered at the canal entry of a house to superintend the first bath in the waterway of a little fellow of six or eight, whose tender flesh and sunny hair contrast with the swarthy skin of the lad who holds him, and the thick rich gowns of the girls. The figures are grouped in a skilful serpentine line; the colour is brilliant, yet kept well in harmony; and the whole, solidly painted and strong, is one of the pleasantest, and at the same time most forcible, things we have seen by VAN HAANEN. His follower, Mr. WOODS, A.R.A., has sent a good study of a *Country Priest*, and a group of figures about *The Foot of the Giant Staircase*, in which the chief actor is a smartly-attired Venetian lady, with the traditional veil and fan and modern furbelows. The picture is very well painted and put together, and yet strikes a false note in taste. Some nine oil pictures are sent by DAVID LAW, whose work with the etching-point is familiar and admirable. Most of these views strike us as rather poorly composed and wanting concentration; the technique is a little thready, and the colour tends to the crude; yet there is atmosphere in these pictures and decided power in the management of various detail. One of the best is *The Fish-market*, where the houses are so well set back behind the picturesque sheds of the fish-vendors at the water's edge, and the laden craft are pushing to and fro with their wares. Yet one more painter's work, and we turn to Mr. BUNNEY. The name of A. N. ROUSOFF stands against fifteen drawings of Venetian interiors, street views, lagoons, &c., in which the characteristic figures introduced are as deftly drawn as the surroundings are effectively portrayed. There is a suspicion of "picture making" about these drawings, and yet they are undoubtedly attractive—painted with pure, forcible colour, in a brilliant key, and with a clean, broad brush; drawn and composed with facile cleverness, and by no means devoid of genuine feeling. Alto-

gether this Russian painter has the higher kind of qualities which ensure popularity.

Thoroughly to criticise the St. Mark's façade as recorded by Mr. BUNNEY would require many pages instead of one, because it would entail historic investigation, comparison of engravings and photographs, and so on. At the same time, to criticise this canvas as a picture by ordinary rules would also be a mistake, because in the full acceptance this is not a picture, but a painted record, and to a certain extent it was thus intended by Mr. BUNNEY himself. He wished to set down, not any striking pictorial effect or special aspect of the wondrous façade which has not its rival in the world, but rather such portraiture of it, under the most revealing light of morning, as should show all the colours, the materials, the sculpture, the uncertain levels and perpendiculars, the massing of various forms and strange lines which "unrestored" St. Mark's presented; in such portraiture handing down a loving chronicle of what has been of glory even within our own century. To start with, portraiture of a building does not make a picture; and, besides that, an artist painting with the intention of Mr. BUNNEY, as a recording angel, unconsciously paints not only what he sees, but what he knows. This is not, therefore, nor are the other studies of St. Mark's, exactly what any person would see, nor how the objects at one given distance could be seen. Hence spring chiefly the artistic shortcomings of Mr. BUNNEY'S pictures; he doats upon the lovely marbles, the quaint sculptures, the golden and many-coloured mosaics, until he is apt to ignore not only the wear and tear of time, but sometimes also the relative truth of bulk, form, and space in the larger masses. The restorer has not been at work on the architecture of Mr. BUNNEY'S façade, but the *cleaner* decidedly has, and not on the façade alone; and many a pillar has been scrubbed and polished to make the veining show up, until, to speak lightly, it is ground flat. A technical reason for this flatness of effect, besides the exaggeration of surface quality, is the thin painting or stain-like quality of the artist's brushwork. These are all faults of manner: it is easy to find many merits. No praise can be too high for the laborious pains and careful drawing of all the finished pictures; and more than that, the colour is often exceedingly beautiful, and harmonises a range of rich and varied hues with an uncommon perception of relative tone. It is astonishing that the artist should have brought his pictures into such unity of effect, as his habit was to finish them piecemeal, a bit at a time; and as he worked always from nature and literally, and also slowly, this sweetness and harmony of colour shows a very vivid sense as a colourist.

We must be allowed, under all due sympathy with the anti-restoration societies, to say that Mr. BUNNEY'S portrait of the façade to some extent adds an argument for repair from an engineering point of view, so palpably unsafe are the levels. On the other hand, at the right corner the grey tone of the restoration makes itself felt, and there can be little doubt that the delicious and glorious colour of the façade will vanish under the process of renovation.

The most satisfactory of the smaller oil studies are perhaps *The North-west Door in the Porch of St. Mark's*, lent by Mr. RUSKIN; *The Horses of St. Mark's*, lent by Mr. GEORGE HOWARD, M.P.; the studies of the *Judgment Angle of the Ducal Palace*, lent by Mr. GEO. SMITH and H.R.H. the Duke of ALBANY; and the *North-west Angle of St. Mark's, with the Piazzetta del Leone*, lent by Mr. S. BEAUMONT. Also particularly good is Lady SYKES' picture, *Under the Broglio of the Ducal Palace*. Two very fine interiors of St. Mark's, of considerable scale, were added after the issue of the catalogue: both are impressive, even grand, in effect and colour.

The collection of sketches in opaque show the artist's delight in colour and capacity for making charming pictorial notes. It is melancholy to remember that the skilful and loving hand has ceased from its labour. In the sympathetic memoir written by Mr. WEDDERBURN for the catalogue, there is a sentence which gives the character of the man in his single-hearted devotedness. After six hundred mornings given to the large picture of St. Mark's façade, "when it was finished, and he thought that some people at least must care that St. Mark's should have been so faithfully reproduced, he said, in his quiet way, that he liked to think that on not one of those many mornings had he felt his heart sicken or his hand weary of the work, but had, on each of them, started to it with equal energy and fresh delight."

## WALTHAM ABBEY.\*

By J. ARTHUR REEVE.

A BOOK on Waltham Abbey by Mr. BUCKLER, bearing no date, but seeming to have been brought out during the last twelve months, has lately been placed in my hands. It has a taking exterior: it is well bound and well printed, is embellished with various initial letters and final devices, and possesses, moreover, six plates of considerable size, containing twenty-two separate sketches and diagrams illustrating the architectural and other remains connected with the Abbey.

On becoming better acquainted with its contents, however, one does not find that the fair promise of the book is maintained; it bears evidence of considerable want of care and thought in the compilation of the letterpress, and the drawings are faulty both in perspective and proportion; they also show so much want of precision in the indication of detail where detail is of great importance, that from an architectural or archaeological point of view they may be said to be useless.

It may perhaps be recollected by those interested in Waltham Abbey that in the months of January and February 1876 some half-inch scale drawings of mine of this very magnificent building were published in *The Architect*, together with some rough notes made on the spot, in which I called attention to the differences which exist between the eastern and western portions of the existing nave. Both the drawings and the notes were made at the suggestion of the late Mr. W. BURGESS, under whom I was at the time acting as clerk of the works to the so-called Lady Chapel, which was partially restored during the summer of 1875 by him. The drawings were undertaken, as stated in the notes above named, for the purpose of throwing some light, if possible, on the vexed question of the dates of the building as we now see it; and as I went on I was astonished to find how much genuine evidence was obtainable.

I began my work with a fairly unbiassed mind, not having at that time gone into the arguments on either side; but after a very few days' work I became entirely convinced that on one hypothesis alone can the existing state of the building be explained, and nothing which has since come to my knowledge has caused me to alter the opinion then formed—viz., that part of HAROLD's church is still in existence.

It is, perhaps, unnecessary to remind those who are acquainted with the Abbey that the question at issue for years past has been as to whether there is any portion of HAROLD's church still standing, and whether the two easternmost bays on each side of the nave are earlier or later than the remainder—Mr. E. A. FREEMAN maintaining that they are later, and Mr. J. H. PARKER, that they are earlier. With these authorities respectively at the head of the rival factions, it can hardly be thought presumptuous on the part of a fresh student of the subject to attempt to strengthen the arguments on either side. I will, therefore, not apologise for again opening the question, but will proceed at once to criticise those portions of Mr. BUCKLER's statements and deductions which my knowledge of the building leads me to call in question.

Mr. BUCKLER divides his work into three parts—(1) historical notes, (2) architectural notices, and (3) description of the plates. In the first section there is little which demands notice. We all know the legend which is contained in the old MS. "De Inventione Sæ. Crucis," and the facts connected with the foundation and execution of the splendid church built by Earl GODWIN (or, as Mr. BUCKLER calls him, "Earl HAROLD") when by some means he became possessed of Waltham Abbey and its sacred relic. It is also well known that King HENRY II. altered the foundation from a community of secular canons to one of regulars, and also that during the thirteenth century some contention arose between the monks and the townspeople as to their respective rights in the church, which seems to have resulted in the separation of the nave from the choir and transepts by means of a wall built across the western arch of the central tower.

Perhaps the most interesting part of these "Historical Notes" is that which relates to the question raised by the statement of MATTHEW PARIS to the effect that the consecration of Waltham Abbey took place in 1242. This part of the controversy, however, we will not go into further than to say that some such explanation of the difficulty as that suggested

by Mr. BUCKLER seems fairly satisfactory. It is clear that no thirteenth-century consecration can have immediately succeeded the erection of any of the existing building, and, therefore it does not in any way affect the question of dates, which after all is the most important point to be settled in connection with Waltham Abbey.

I will now pass on to the second division of Mr. BUCKLER's work, in which there is much more to criticise than in the foregoing; in fact it seems to me that hardly any of his statements and arguments will bear the test of a careful investigation on the spot.

In order to show that the author has not given as much serious study to the building as anyone desirous of writing about it should do, it is only necessary to point out that he makes no allusion whatever to the fact that the clerestory on the north side of the nave in the five western bays is clearly of a later date than any of the other Norman work in the whole building. It was probably put in by HENRY II., when he made the alteration in the institution above alluded to, which seems to have been completed in the year 1177. The design of this late work is, it is true, very similar to that of the earlier portions of the clerestory, but the differences are very marked, and in all probability would have been more so had HENRY II. not been desirous of making his alterations to the nave harmonise as much as possible with the more ancient parts of this end of the church.

Another curious error which Mr. BUCKLER falls into is to be noted in the suggestion which occurs on pages 32 and 33 of his book, that it was the intention of the original designers of Waltham Abbey to vault the nave in stone, in which assumed fact he perceives "another difficulty in the way of our belief that this church is of his (HAROLD's) time." But had Mr. BUCKLER gone a little more carefully into the matter, he would have found that this difficulty is entirely dissipated by the real facts of the case; HAROLD clearly had no more intention of vaulting his nave than any of his Norman contemporaries or immediate successors ever had. The pseudo-vaulting shafts at Waltham, as at Peterborough, are carried right up past the clerestory windows to the springing of the roof, where they terminated in capitals, and no doubt supported the ends of tie-beams. The neckings of one or two of these capitals still show below the flat ceiling, but in most cases they are hidden by it. Surely Mr. BUCKLER must be aware that vaulting, at all events to a large nave, springs either from the level of the string below the clerestory, or from the springing of the clerestory itself—never from a point some 3 feet 6 inches above the top of the clerestory arches.

On pages 22 and 23 Mr. BUCKLER proceeds to compare the type of work found at Waltham Abbey with that which exists in other early Norman buildings in England. He says: "Here (i.e. at Waltham) we find neatly-cut stonework; mouldings are ably executed;" and "The work affords evidence of the use of the chisel rather than of the pick. The plan, too, is that of a fully-developed Norman church of the largest class, showing in all its parts traces of the experience which practice alone could give."

"These evidences would be amply sufficient to prove that the work is well advanced and not early Norman."

In answer to this I say that in my opinion the early work throughout the western portion of the church bears distinct evidence of having been done with a pick and not with a chisel, but it has been done with extreme care, which proves that first-rate workmen must have been employed.

As to the fact, moreover, that the plan is that of a fully-developed Norman church, I see no reason whatever why such should not have been adopted by HAROLD. As Mr. BURGESS said in 1860, in a pamphlet published on Waltham Abbey in that year, "The richness of a building is no certain criterion of date;" and again, "To sum up, although it can scarcely be denied that the architecture of the nave of Waltham more resembles the work of the time of HENRY I. than that of the very few remains of buildings contemporary with HAROLD, still it is quite within the range of possibility that HAROLD might have built it, and there is no distinct proof to the contrary."

From the ancient documents relating to HAROLD's church we know that the building was looked upon in its day as one of extraordinary magnificence, that it was built of stone, that its roof was covered with lead, and that in parts the church was decorated with gilding and bronze plates. History also tells us that Earl GODWIN, having once been wrecked on the coast or Normandy, was taken to the Norman court, and remained

\* "The Abbey of Waltham Holy Cross: Historical and Architectural Notes." By Edward H. Buckler. London: Elliot Stock.

there for some time; while it is well known that intimate relations and much intercourse existed between the court of the English king, EDWARD the Confessor; and that of his Norman contemporary and successor, WILLIAM the Bastard. It seems most natural to assume, therefore, that highly-cultivated men, such as HAROLD and EDWARD undoubtedly were, must have been much impressed by the great grandeur of the buildings which were to be found at this period in the northern part of France, and that when they determined respectively to found abbeys at Waltham and Westminster they would derive not only their inspiration from Normandy, but probably even their materials and workmen as well.

It appears to me, therefore, by no means surprising that HAROLD, beginning to build in 1056, should have employed very much the same style of architecture as that which ten years later became the architecture of the country, having been introduced by the very men with whom he must have associated whilst he was perhaps a somewhat unwilling guest at the Norman Court.

So much for the indirect evidence suggesting the probability that a portion of the existing church may be of HAROLD's design. We will now proceed to a closer investigation of the direct evidence which may be derived from the building itself.

Many eminent archæologists, such as Professor WILLIS and Mr. J. H. PARKER, have attempted to establish the theory—originated, I believe, by Professor WILLIS—that it is possible to apply an almost infallible test to Norman buildings in order to decide whether they belong to an early or a late period. They would have us believe that all the earliest examples are executed with very wide or moderately wide joints, and that fine jointed work is never found until about the middle of the twelfth century.

There is, unquestionably, much truth in this theory; it is supported by numerous examples of existing Norman buildings, and seems naturally to commend itself to one's understanding; but that it cannot universally be applied is admitted by Mr. BUCKLER by a reference to Canterbury Cathedral in the very paragraph in which he quotes the theory in support of Mr. PARKER's argument, that it proves the sequence of dates at Waltham Abbey. Under these circumstances it hardly seems so conclusive as might be desired; nevertheless, Mr. BUCKLER is content to accept it as proof that the wide-jointed work at the eastern extremity of the building is earlier than the rest of the church, and having assumed that as settled, he founds a further theory upon it to account for the present condition of the building.

There are certain mouldings in the wide-jointed work at the east end of the south aisle which everyone must acknowledge clearly fix the date of that portion of the church at about 1120; therefore, following out the theory of jointing above noticed, Mr. BUCKLER naturally concludes that the whole of the fine-jointed work to the west of the second pier from the east end—namely, five bays on each side of the nave—belong to a later date than the first quarter of the twelfth century.

People who have adopted this view have, however, always seen that it is difficult to account for the total destruction of HAROLD's nave only about sixty or seventy years after its erection, and in order to avoid this difficulty Mr. BUCKLER somewhat ingeniously argues that HAROLD's church never was finished, that in all probability the presbytery alone was completed to begin with, and that the early Norman kings went on with the building gradually from east to west until it was finished somewhere about the middle of the twelfth century.

If this be the correct view of the case, then the change of date which unquestionably takes place at the second pier from the east end on both sides merely represents a period of a few years in the earlier half of the twelfth century, when for some reason the work of completion came to a standstill; and no doubt this supposition is quite tenable, provided no conflicting evidence exists.

But does a really searching and unbiassed investigation of the building support this theory? It is necessary in any such research as this to enter upon the question without any preconceived ideas, such as, for instance, the comparative antiquity of wide and fine jointing, or, within certain limits, the particular type of masonry employed. These arguments can only be admitted as of weight when no clearer proofs are forthcoming, but in the present instance I think I shall be able to show not only that very clear evidence of the sequence of dates does exist in the building itself, but that it is entirely in opposition to the above theory.

In the first place, if we compare the architecture of the eastern and western portions of the church, we find that the former, although more rudely executed, is clearly later than the latter. This becomes apparent in several ways, but especially on account of the fully-developed running arch mouldings already alluded to as occurring at the east end of the south aisle; these distinctly belong to the wide-jointed work, as stated above.

Now, throughout the Norman work of the western portion of the church, there is no attempt at a running moulding, with the exception of a very shallow bead on the edge of the lower rim of the triforium and clerestory arches—a moulding which might evidently have been done with an implement of the nature of a light axe.

If, therefore, we assume that the western work is later than the eastern, we have to believe that the Normans in the second quarter of the twelfth century abandoned a development of mouldings which had obtained at the latter end of the first quarter of the same century, and which may be said to have become universal in the third quarter. It is unnecessary to enlarge upon the improbabilities of this theory; indeed, these facts alone, which are incontrovertible, are almost sufficient to prove that the eastern part of the church is the later. But as pointed out in my former notes on Waltham Abbey, already referred to, the most important evidence of all is to be deduced from the subsidence which took place at some period in the second pier from the east end on the south side of the nave, which Mr. BUCKLER only mentions in a very casual manner.

Anybody who will take the trouble to visit the church and study the effect of this settlement will find that all the arches supported on the western side of this pier—nave, triforium, and clerestory—have been affected by it. They are all badly cracked, and the columns supporting the interior arches of the clerestory are considerably out of the perpendicular. The string-course also, below the clerestory, is much broken at the joints.

This is as conclusive evidence as could possibly be desired that these arches were resting on the pier in question when the subsidence took place, and as all the arches on both sides of the nave to the west of this pier and the opposite pier are of exactly similar design, with the exception of the north clerestory, and of course the fourteenth century alterations towards the west end, it is clear that the whole of the five western bays of the church on both sides of the nave were standing when this second pier from the east end on the south side gave way.

Now let us see in what condition the arches are which rest upon this pier to the east. Here, again, the evidence is most strangely clear, for although all the arches spring from a lower level on the west than they do on the east, in no case is the jointing at all disturbed. The columns to the clerestory, also, are upright, and the string-course below the clerestory is jointed in a very peculiar manner, evidently for the purpose of bringing it down easily from the higher and correct level to the point down to which the earlier string had been carried by the subsidence of the pier. It is a remarkable fact, moreover, that the course of ashlaring beneath this string-course dies out against the string as it comes down from the higher to the lower level. Again, I ask, could proof be stronger that this work was put up after the settlement took place?

We may therefore take it as proved beyond question, notwithstanding the wide jointing of the eastern work and the fine jointing of the western, that the former is later than the latter, and consequently that unless the nave was pulled down and entirely rebuilt by WILLIAM the Conqueror or WILLIAM RUFUS—a supposition which appears to me to be improbable in the highest degree—then that the five western bays up to and including the second pier from the east end on each side of the nave do absolutely belong to the church which was founded by HAROLD in the year 1056, and was completed about 1060.

By thus reversing the dates of the existing portions of the nave given by Mr. PARKER, and followed by Mr. BUCKLER, it becomes much easier to account for the plan of the choir and transepts, which was discovered in 1863 by Mr. EDMUND LITTLER.

Mr. BUCKLER brings forward the dimensions of the choir as further evidence in support of his theory, and it would indeed be extraordinary if HAROLD had designed the church with the immense choir which these foundations indicate, especially as his institution was for secular canons. But since it is evident that at the beginning of the twelfth century large works were undertaken at the eastern extremity of the nave, it is most

reasonable to assume that these extended to the choir and transepts as well.

In a report on the condition of the Abbey, published in 1860, Mr. BURGESS suggested the probability of HAROLD'S church having consisted on plan of the nave as we see it, short transepts of equal width with the nave, without aisles, and a short choir extending about one bay to the east of the crossing, and terminating in a semicircular apse. This gives a most probable looking plan, and it is very interesting to note that Mr. EDMUND SHARPE in 1874 drew attention to the fact that choirs of somewhat these dimensions, but without the semicircular apse, were adopted universally by the early twelfth-century Cistercians; and I cannot but think it is probable that in thus making short choirs a distinctive feature of their churches these early reformers were merely reverting to a form of church already in existence, and belonging to a period when greater simplicity obtained in the offices of religion.

In HENRY I.'s time, however, the choirs of larger churches were usually of considerable size, and therefore we should expect to find the foundations of an extended building to the east of alterations which, as we have seen, must have been undertaken in the nave of Waltham Abbey during the first quarter of the twelfth century.

But, for my own part, I am much inclined to think that the safest way to account for the great length of the choir at Waltham—as Mr. BUCKLER points out, a length probably greater than that of the nave—is to assume that, although the alterations were commenced, and possibly in part finished, by HENRY I., it was not until HENRY II. established regular canons in place of seculars that the whole of the choir was executed; that is to say, that although the alterations to HAROLD'S church began somewhere about 1120, they were not completed before 1177, in which year the formal institution of the regulars took place.

By these means, as it seems to me, the whole of the phenomena found at Waltham Abbey may be explained in a rational manner. Other explanations which I have seen, and these of Mr. BUCKLER'S now before us, are to some extent plausible, but they do not take into account the whole of the evidence which may be derived from the building itself, and so cannot be perfectly satisfactory.

I feel convinced that any archæologist, especially if he be also an architect, who will go down and study the building carefully, will come to the same conclusion which forced itself upon me in 1875, namely, that the western bays must have been built before the settlement described above took place, and if so, that the probabilities are immensely in favour of the whole of the western portion of the church being part of HAROLD'S original abbey, always excepting the north clerestory and the fourteenth-century alterations towards the west end.

And here I must conclude my observations, space not permitting me to take particular notice of the third portion of Mr. BUCKLER'S work. It contains little, however, which bears upon that side of the discussion connected with Waltham Abbey upon which it has been my endeavour to throw some further light in the foregoing remarks.

### THE ROYAL SCOTTISH SOCIETY OF ARTS.

THE Committee of this Society appointed to award prizes for communications read or reported on during the session 1881-82 report—That the special thanks of the Society are due to the president Mr. Henry Cadell, of the Grange, for his address at the opening of the session; to Dr. William Joseph Black, Surgeon-Major, for his "Account of the Mersey Tunnel, and of the Physical Geography of the River"; to Mr. Edward Sang for his "Lecture on the Transit of Venus in December 1882"; to Mr. David A. Scott, S.S.C., for his "Obituary Notice of the late Sheriff Hallard, past President of the Society"; to Dr. Stevenson Macadam, F.R.S.E., for his paper "On Spurr's combined Wood and Paper Veneers"; to Mr. Richard Kerr Miller, C.E., for his paper "On Diving and Submarine Work"; and to Mr. William Eglin, Glasgow, for his "Account of recent American Inventions in Spring-Hinges, Springs, and Locks." The Committee have awarded the following prizes:—To Mr. Benjamin Askew, foreman smith, for his "Improved Coupling and Uncoupling Apparatus," 20*l.*; and for his "Account of his Discovery of a Method of Welding Cast Steel," 5*l.*—the Keith medal, value twenty-five sovereigns; to Mr. Daniel William Kemp, manufacturer, for his "Description of an Electric Barometer, a new Apparatus for ascertaining Atmospheric Pressure at any distance," a Keith medal, value ten sovereigns; to Mr. Thomas Gillespie, for his "New Safety-gate for Mid-shaft

Workings," a Brisbane medal, value five sovereigns; to Mr. Samuel Benjamin Wilkins, Master of Fire Engines, for his papers "On a Method for Preventing the Destruction of Theatres and the Loss of Life by Fires," and "On Improvements on Fire-shutters and Doors," a Hepburn medal, value five sovereigns; to Mr. Alexander Clark, C.E., Colinton, for his paper "On the Unloading and Storing of Grain," the Society's honorary silver medal; to Mr. Charles Alexander Stevenson, B.Sc. Ed., C.E., for his "New Form of Seismograph," the Society's honorary silver medal; to Dr. Stevenson Macadam, for his paper on "Poisonous and Non-Poisonous Wall Colours and Wall Papers," the Society's honorary silver medal; to Mr. John A. Ross, merchant, for his description of an "Automatic Measuring Machine for Woven Goods," the Society's honorary silver medal; to Mr. George James Wishart, F.C.S., for his paper on the "Manufacture of Sulphuric Acid," the Society's honorary silver medal; to the representatives of the late Mr. Robert Wilson, F.R.S.E., Patricroft, Manchester, for his description of an "Apparatus for Heating Water for Domestic Purposes," the Society's honorary silver medal. The Committee also report that the best thanks of the Society are due to Mr. David Kirkwood, gunmaker, Boston, U.S.A., for his "Description of a Hammerless Action for Breechloaders"; to Mr. Alexander Fraser, M.A., optician, for his paper "On the Graduation of Thermometers with reference to the Measurement of Extreme Cold"; and to Mr. John Greig, jun., engineer, for his "Description of the Tea Manufacture in India, and of a Machine for Cutting the Leaves into Squares."

### THE ARCHITECTURAL ASSOCIATION.

THE first ordinary meeting of the Association was held on Friday evening, the 10th inst., Mr. E. G. Hayes, President, in the chair. Votes of thanks were passed to Mr. Crossland in connection with the visit made to the Sanatorium at Holloway; to Messrs. Croggon & Boyle, Strawberry Hill; to Mr. Birch; and to Messrs. Gardner. The thanks of the Association were also awarded in connection with the conversazione—to the Royal Institute of Architects for the use of their rooms, and to the Entertainment Sub-committee, coupled with the name of Mr. Appleton. Thanks were also awarded to the various donors of books to the library. The consideration of the annual report was deferred to the next ordinary meeting, to be held on the 24th inst.

#### The President's Address.

THE PRESIDENT, in his opening remarks, reviewed the work of the past session. Not to go over the same ground again, he referred his hearers to the practical advice given to the students by Mr. Aston Webb in his presidential address at the opening of the previous session. He did this to impress on them the desirability of adopting a regular and systematic course of study at the commencement of the session. He alluded to the large increase in the number of members, the attendances at the ordinary meetings, and the improvement evinced in discussion of the papers read. The work done in the classes was good; far too few, however, took advantage of them. After touching on other details of the past session, he said—

If we look around we see on every side great activity in the architectural world. There is no doubt that our art has been making great progress in late years. Many large and important buildings have been put up in different parts of the country in almost every known style of architecture. These buildings show in most cases a variety in design and fertility of imagination which is very creditable to the profession at large. All this variety of design and the information necessary to meet the numerous and varied uses of our modern buildings necessarily entail an increased range of study upon the part of the architectural student, and I think that anyone who looks at the history of the Association will see how it has endeavoured to keep abreast of the demands of the age, and to satisfy the probable wants of its members upon all artistic and practical subjects. The so-called Queen Anne revival still continues to be fashionable, and appears likely to hold its own for some time to come. It includes in its modern treatment a wide range of design, which makes it equally suitable for a cottage or a mansion, or for public buildings of almost any kind, and whatever may be the objections to it, we cannot say so much of many other kinds of work. It is adapted to modern requirements in various ways; first because it allows of large windows and plenty of them, and does not altogether ignore the good qualities of plate-glass, for which so many of our clients entertain such an unbounded admiration, while at the same time the artistic eye can be partially satisfied by stout sash-bars and small squares introduced into other portions of the design. Then it does not altogether object to lifting sashes, and it admits of the more artistic treatment of this deservedly popular form of window. Also, on account of its entire freedom from rule or order, it lends itself to all our modern requirements in planning, and at the same time allows in buildings of even the simplest kind internal features to be introduced which give character to the work throughout.

Another important consideration which has made this kind of

work so suitable is that it is essentially a brick style of architecture; and although in its more elaborate developments of carved brickwork it is almost as costly as stone, yet these elaborations are luxuries which need not be introduced. These are some of the chief reasons for the rapid rise and extensive use of this fashion of buildings, and which will in all probability serve to keep it in fashion for some time to come. We know that it is looked down upon and ridiculed by many, and that the detail has been stigmatised by a great poet as "jolly rubbish, which can be rattled off by the mile." This, however, is not an essential quality in the work, although, no doubt, it is a distinguishing mark of much that is done. Many modern buildings might be mentioned in which great refinement is shown in the details and mouldings. I think the charge of want of refinement is with more reason to be brought against the work in its main features and general outlines, in which quaintness of form is frequently carried to a point verging upon extreme ugliness. I leave for the present the question how far these ugly, hump-backed, one-eyed effects are useful in architecture in enabling us to appreciate the more beauty of form and purity in outline when we see them.

We have lately seen some revivals of a slightly earlier type of work, when the mouldings and ornaments of the Renaissance were being engrafted on to the dying-out forms of Tudor work which had preceded. This was to a great extent the type of work visited in the recent excursion—generally picturesque and interesting, often good in form and sometimes in detail, but often coarse both in the one and the other; in any case an undesirable training for a student, who ought certainly to be encouraged to gather his inspiration from purer sources. It would seem that in designing work of this description more than the usual amount of care and taste is necessary to prevent the introduction of features which, however picturesque they may be in themselves, tend to vulgarise the design. These mixtures require to be compounded with great skill and judgment, or they had better be left alone.

We seem to be unable at present to pin our faith to any particular style of work for secular purposes; there seems to be such a ceaseless craving for novelty and variety. This is no doubt due to a large extent to the prevalence of the competition system, the desire or the necessity to produce some startling novelty, some sensational effect, which shall attract attention and purchase obtain the work. Were it not for this, architects would, I doubt not, be willing enough to be "sober in their designs," and to cease striving after eccentricities which tend so much to vulgarise our art, and there would be a better chance of carrying on more generally some kind of work, and possibly developing it in a way that should make it distinctive of the latter part of the nineteenth century.

I ventured the other evening to make a few remarks upon the prospect of a new style in architecture, and to express my opinion as to the possibility, or rather the impossibility, of such a thing. This opinion was based upon the assumption that the various combinations of forms which in past ages have been adopted, and which constitute the different styles, are in reality well nigh worked out and exhausted, and that it is hardly possible to devise any sufficiently new combinations to produce a really new and distinct style. I will not take up your time by attempting to follow out this reasoning, because it can have no practical result, although the subject is one of much interest as a mere speculation. However, I may say this much, that if we are to have anything approaching a new style in architecture, which I am not at all sure is wanted, it will be produced only by combined effort and by steady systematic work in one direction, starting with some particular style as a basis, and training students to work in it alone. Then in time the requirements of the day, being expressed by many minds, may possibly develop into a really modern style. This is, however, but a mere dream. At the present time we are farther from it than ever; all the change and variety in which we are now indulging will certainly not conduce to anything of the kind.

And now let us consider for a few moments what is the chief end and object of all our work here. It is in order that we may endeavour, as far as possible, to follow out the advice given in our motto—"To Design with Beauty, and to Build in Truth." How difficult it is to arrive at any proper appreciation of what is really required by the first part of this instruction, and how much more difficult it is to explain! We can, no doubt, all talk glibly enough about beauty in architecture, and each one of us probably thinks he knows what he means, but it is not easy, if not impossible, to define it closely. Mr. Fergusson, in his work upon the subject, says:—

One of the most prevalent sources of error being the assumption that beauty is one single and well-defined emotion, and capable of being reasoned on as such, whereas, in truth, nothing can be more various and at the same time more universally prevalent, and so variously are we formed that to no two men is it the same thing, though all can perceive it, and most men fancy they see it as others do; so each man assumes the beauty he sees or can appreciate to be the only true one, and excludes all others from the category.

This is very true, because, in considering the question in regard to architectural design we are confronted at the outset by the fact that, unfortunately, architects who make these questions the study of their lives are so seldom able to agree as to the

merits of any particular work. There are, of course, the differences of opinion caused by a partiality to some particular style or period of work. A Gothic man cannot see any beauty in a Classic design, or the reverse. However, differences of opinion arising from any of these causes must be disregarded as not worth a moment's consideration, being prompted by individual taste or by fashion, both of which nowadays change rapidly. There is no doubt that each style may lay claim to some particular merits, that all have some qualifications which may entitle some buildings erected in them to rank as works of art and beauty. These qualifications may be defined somewhat as follows:—A perfect sense of repose, of constructive fitness and suitability, a feeling that everything is in its place exactly where it is required, and a sufficiency of ornamentation to impart proper richness of effect, but no excess; in one word, the work must be well proportioned. The word for this purpose must be taken in its widest sense, and must regulate not only the quantitative relation of the various masses and voids, but the size, position, and amount of all the accessories, such as mouldings, carving, and other ornament. In a perfectly well-proportioned building it will be found either that the bare forms of solids and voids are such as to satisfy the eye by their proportions, and that the arrangement is such as not to be materially affected by the addition of the mouldings and ornament, or it may be that the building requires the addition of its mouldings, strings, or dressings to complete the forms intended, and to make them satisfactory in their individual proportions or relatively to each other.

A great deal has been written and said at different times upon the subject of proportion in buildings, and many attempts have been made to show that beauty in proportion—that is to say, satisfactory relative dimensions of the various parts—is founded upon regular geometrical forms, and that without such geometrical basis such proportions can hardly be satisfactory or beautiful. It is not possible for me now to attempt to discuss this question; it is one of great interest and well worthy of close attention. However, I must say this, that although I believe there is a great deal of truth in the system proposed, I do not think it is possible or hardly even desirable to reduce the process of architectural design to any such almost mechanical method. The variety of form is so great, and the requirements of our art so various, as to baffle any attempts to systematise them on a geometrical basis. Ruskin, in his "Lamp of Beauty," says:—

Proportions are as infinite as possible airs in music, and it is just as rational to attempt to teach a young architect how to proportion truly and well by calculating for him the proportions of fine works, as it would be to teach him to compose melodies by calculating the mathematical relations of the notes in Beethoven's "Adelaide" or Mozart's "Requiem." The man who has eye and intellect will invent beautiful proportion, and cannot help it.

Now it seems to me that the idea suggested by this quotation is the true one, and I do not suppose any one will disagree with the proposition. I wish particularly to commend it to your consideration, with this addition—that the question of fitness and suitability in architectural proportion is to be judged readily and satisfactorily by the eye alone, but that in order to do this the eye must have been trained by a course of study which shall enable it to appreciate the true and the beautiful.

There are and must necessarily be many different degrees of beauty in architecture, as there are in nature, and the differences are caused by the predominance given to one or more of the various qualities of which it is constituted. It is not possible, perhaps not even desirable, for many buildings to possess the highest form of ideal beauty which I have been endeavouring to describe. In buildings of the highest type the world has ever seen, such as a Greek temple or a Gothic cathedral, the effect is produced by the careful blending in the composition of all these qualities, and the result is the production of works of sublimity and grandeur which have never been equalled. These results of sublimity and grandeur can only be obtained in buildings of considerable importance or monumental character; in most cases we can only attain a much lower standard, until at the lowest end of the scale we must be content with an honest expression of the minor requirements, and with such forms and proportions as good taste may suggest, only taking care to prevent the introduction of meaningless and vulgar ornament which one so frequently sees, and which spoils what might otherwise be a satisfactory design. Buildings of this kind may be exceedingly plain in outline, entirely devoid of ornament, of quaint, squat, or ugly proportions, but yet bearing upon their face clear evidence of the designer's thought and care. Such buildings, I say, are of great value in the architectural world. There is a beauty in their simple form, in their plainness, in their quiet proportions—in short, in their extreme ugliness, which is of the same use in architecture as the ungainly form of a hippopotamus is in the animal world; that is to say, to set off by contrast other forms and other proportions which are better, and in which more excellences are combined. At the same time it must not be forgotten that even this perfection in ugliness is not achieved without much care and study.

The sense of a keen appreciation of beauty of form and proportion is one which every student should endeavour to acquire. This sense is, I believe, to be most readily obtained by a diligent

course of study from the human figure, and such a course is most desirable for an architectural student. By carefully drawing the figure in outline, or with some rapid kind of shading, not attempting any of that delicate but rather mechanical stippling that we are accustomed to see practised in our art schools, the student learns in time to appreciate delicacy and refinement in form, and the subtleties of perfection in proportion, in a manner and with a rapidity which is, I believe, attainable by no other means. I am told Mr. Burges always attached very great value to this kind of study, and said that he regarded it as a most essential element in the education of an architect. The facilities offered for work of this description in the various schools of art in London are available to all students. I may also draw your attention to the Langham Club, of which particulars are given in our Brown Book. In addition to this drawing from the life, the architectural student must neglect no opportunity of drawing and measuring such executed works as may commend themselves for the purpose. The objects to be attained by architectural sketching, I take it, are threefold :—

1. To obtain a practical familiarity with the forms and details which were in use, and which constitute the distinctive features of a style, and which cannot be learned from books alone, and to study their proportions.

2. By studying features which are admirable when executed, and transferring all particulars carefully to paper, to acquire a knowledge of the reverse process.

3. To lay up in the mind stores of forms and ideas which can be and are unconsciously drawn upon in designing, and which materially assist in combination of new forms.

Under the first heading would be classed all the carefully-drawn outline sketches which are or should be made by a student, and in making them the objects to be gained should not be forgotten ; these are to learn the character of the work and to study the proportions (which, of course, by the selection we assume to be good), but certainly not to make pretty pictures. It is important to pay attention to these points. One frequently sees brilliant, showy sketches rapidly done, but far from being true representations of the portion of the building sketched. It is hard to see how work of this kind can be of much value. With the second object in view—namely, to learn the relative effect of features upon paper and in stone—the best plan undoubtedly is to draw and measure the work, and to plot it to scale upon the spot. It is much better to do so than to leave it to plot afterwards, because it can be done with greater accuracy. And it is as important, if not more so, to measure and draw out the mouldings as the complete feature, in order to learn the effect that the different sections have when executed in the round. The third object is of course attained by drawings of both the kinds we have been considering, but the various notes and little bits which one does from time to time are done solely with this object. These little sketches are not to be allowed to take the place of the other two kinds referred to, but only to supplement and follow them. These small sketches are often necessarily roughly done, and an architect looks upon them simply as memoranda to give him hints for new combinations, and trusts to his own power to adapt, modify, and shape them as occasion may require. In these days of changing fashion and requirements, and of the frequent necessity there is to make a design rapidly, it is of importance to every architect to have a store of such material laid up in the recesses of his mind, and he is likely to succeed best who has the largest store to draw upon.

One word as to the manner of sketching before leaving the subject. Ruskin says : “ All merely outlined drawings are bad, for the simple reason that an artist of any power can always do more, and tell more, by quitting his outline occasionally, and scratching in a few lines for shade, than he can by restricting himself to outline only.” And again, in another place : “ A good artist habitually sees masses, not edges, and can in every case make his drawing more expressive with any given quantity of work by rapid shade than by contour.” Now, how far are we as architectural students to consider it desirable to follow this advice ? The answer seems to be that, so far as we are simply studying effects which we see executed, in order to be able to produce similar effects from geometrical drawings, outlines are the best. But if we are wishing to carry away memoranda of massing and general effect, or of details, this is more effectually and rapidly done by means of shaded sketches.

The necessity of following out, as far as possible, the advice contained in the second part of our motto is one which we shall no doubt all be ready to admit. It is desirable, apart from any question of truth or honesty in the interests of art, for nothing can be really beautiful unless it is true. The beauty that is attained in a building by honestly expressing the arrangements and requirements of the interior ought to be of more value than that which is obtained when the necessities of the interior have been sacrificed to produce it. And this honesty of expression as regards the elevation of a building is the chief thing to be considered, because there is, I think, no more necessity, as a matter of principle, to insist upon the details of construction in architecture being shown for the sake of truth and honesty than there would be for insisting upon our seeing the framework or skeleton of every leaf and flower that grows, and of every being upon the face of the earth. There can

be no objection, but rather the reverse, to cover up, clothe, and decorate the rough unsightly forms which compose the framework of a building whenever desirable, and it only becomes wrong to do this when the covering is used to disguise and apparently alter the forms, and not merely to cover them, or when it is done with any intent to deceive. The requirements of modern building unfortunately often compel us to do things which are and cannot but be most unsatisfactory, artistically speaking ; such, for instance, as the small supports and wide openings filled with plate glass which are required in shop-fronts. It is impossible to make anything decent of this sort of thing, either by showing the supports and girders or by casing them ; the latter plan I think generally preferable, for several reasons. But there really are very few cases in which an architect is tempted to disguise his construction in any way, and it is always made more satisfactory to ourselves so to proportion our work as to satisfy the eye and mind of the observer. Then, with regard to truth in finishing and decoration, for similar reasons it is quite permissible to clothe and cover up any common material for the purpose of adding a better surface. Why should it have been thought almost wicked to plaster the walls of churches, as it was some time since ? If one cannot afford to build the walls with a material which has a sufficient finish for an inside lining, it is much better to plaster them. There is no deception done, or intended to be done. The question of painting in flat colours *v.* graining has been often considered, and the flat colouring is generally voted the more artistic treatment. There are many advantages in the other method, but although it rarely does deceive, whatever may be the intention, we must not hesitate to condemn it on principle ; and, as a general rule, the treatment of one material in more or less direct imitation of any other is to be deprecated.

I think it was Professor Roger Smith who paraphrased the language of Demosthenes in saying that the three chief qualifications in an architect are—“ 1st, Drawing ; 2nd, Drawing ; and 3rd, Drawing.” This, no doubt, is good advice, but I think it requires a certain amount of modification. There is a great danger, nowadays, of falling into the opposite error of forgetting that our drawings, after all, are but a means to an end, of making them as if they were merely intended for pretty pictures, and not as an honest attempt to show a building as it would appear. This is what another learned professor said upon the subject :—

Let architects be sober in their designs, let their drawings be made so as to represent the building as the building would be when it was built, eschewing all those tricks and peculiarities of draughtsmanship which were so charming in a picture or an etching. Then if the building were bad in design it would appear bad in the drawing. A great deal of bad architectural work at the present time was to be attributed to nothing more than the self-deception of the designer by his draughtsmanship.

Now we have in these two opinions some apparently opposite views upon the subject ; the one seems to magnify unduly the necessity of drawing, and the other implies from the cautions conveyed that the drawing of the present day is frequently made too much of ; that the draughtsman, in his desire to make a pretty and attractive drawing, entirely overshoots the mark, and deceives himself as to the effect that will be obtained when what he is supposed to be representing is carried out in brick and stone. This over-elaboration in drawing—this, so to speak, wilful perversion of the truth—is no doubt, to a great extent, the outcome of the system of perpetual competition under which architects now suffer, and in these cases we can only look to the forthcoming rules and regulations for the remedy. We must, I think, all admit the necessity for caution in this respect, and bear in mind, as architects, that as a good design may undoubtedly be marred and spoiled by bad drawing, we must be able to express our ideas upon paper so as to convey a correct impression of our building ; but we must never allow ourselves to be carried away by the desire to make a pretty picture only, and deceive ourselves as well as our clients. Manual dexterity is no doubt a good thing, but it may be made too much of, and mislead woefully, and in any case it plays a secondary part to that more important qualification, a correct and well-trained eye. It should be the aim and object of all architects so to refine and elevate their work that it may show to an educated observer unmistakable evidence of the thought bestowed upon it. In proportion as this is the case, so does the building rank as a work of art, and its designer may lay claim to the title of artist.

The world has lately been informed by a great legal authority that architects can have no claim to that title, not so much even as a hairdresser ; and why ? Because they do not work with their fingers. It is hardly worth one's while to take any notice of such a statement. We all know that real architects do occasionally have to use their fingers. I only refer to the subject because I have been at some pains this evening to impress upon you that it is the spirit of our work that is of the greatest value, and that the fingers are but agents—most necessary ones certainly—to convey it from the mind and eye on to the paper. It must also be observed that the power of fully appreciating, as of producing, beautiful works is not acquired by study of the law, or of mathematics, or even of campanology, but by careful and loving study of the beautiful in nature and art, and an earnest desire to apply the principles learned to our own work.

I have endeavoured, in putting down these few thoughts for

your consideration this evening, to touch upon some of those matters which, whether as architects or students, should ever be uppermost in our thoughts. It is both pleasant and profitable for each one of us, amid the hard matter-of-fact details of everyday life, to study and think them out for himself.

Mr. STANNUS proposed a vote of thanks to the President for his address. The Queen Anne style had, he said, as the President remarked, a wide range. The range was too wide for a student, as it had become a haven for all wretched and impure detail, thrust out elsewhere. Architects now saw the evil they had let loose, and were trying to keep it within bounds. It was getting purified, and would eventually pass into pure Classic. No recipe could be given for proportion, though principles as to what was bad and to be avoided might be laid down. The sense of proportion could not be learnt by teaching or argument; it should be acquired rather by accustoming the eye to look at objects of acknowledged good proportions. A new style of architecture might arise, but he doubted it. In the Elementary Class of Design this year one subject would be taken through all the styles. By working the same subject through all the phases architecture had passed through, the student would learn the various features of different styles, which would suit themselves to the wants of the present day if amalgamated.

Mr. CLARKSON seconded the vote of thanks, and remarked that the President had made a good apology for the necessity of draping unsatisfactory features of construction. He had perhaps hardly insisted sufficiently on the fact that they were by no means proud of such work, though they admitted its necessity. Architecture that was thoroughly one from foundation to roof-tree belonged to quite a different category from the make-shift style necessitated by the exigencies of the present day.

Mr. JAMES SMITH expressed surprise that while the number of members in the Association increased so largely, the classes were standing still; so few comparatively availed themselves of the opportunities of study afforded by them.

Mr. ASTON WEBB said he had heard with pleasure the President's remarks on educational matters. The results of the Institute examinations had proved that students of architecture were willing to make every effort to qualify themselves for practice, and to take advantage of all opportunities afforded them for study, and this being so, he considered they should still keep before their eyes the idea of an architectural college, and work away for its establishment. He believed, as regarded a new style, that the past years had witnessed an analysis and study of styles, resulting in design worked out from Classic and Gothic, and it was frequently difficult to say from which end the designer had worked.

After some remarks from Mr. COLE ADAMS, the vote was put to the meeting; and the President having replied, the proceedings terminated.

### THE NORWICH SCHOOL OF PAINTING.

A PAPER was read by Mr. T. Palmer at the closing *soirée* of the Art Loan Exhibition at Swaffham on "Crome and the Norwich School of Artists." He said—The artist of whom the county of Norfolk was justly proud is "Old Crome." He had a son, John Berney Crome, also a distinguished painter. The few remarks he was about to make arose from his (the speaker) having seen in the news of the day that in a sale of pictures two by Old Crome were sold for a high price. It was said after the sale that some doubt existed whether those two pictures were not by his son, J. B., generally called in art circles "Young Crome." More than fifty years since he (Mr. Palmer) was, like many other boys, a pupil of J. B. Crome, and he mentioned that in order to say that at that time the small things by Old Crome were in no great repute; moderate-sized finished oil pictures could be bought for 4*l.* or 5*l.* each, and there were plenty to be had at such low prices. His son informed him that for some of his large and best pictures his father occasionally obtained 40*l.* and 50*l.*, and perhaps a trifle more. He had a hard struggle to get a decent living for himself and family. Old Crome was not the fashion; out of Norfolk he was not appreciated, and there he was content with the low prices he had named; but high figures were given to some men. When Crome died Turner had grown rich, but poor old Crome's family were unprovided for. In looking at old Crome's works you will not observe much decided or sharp pencilling, only now and then a little in the lights. His foregrounds and middle distances generally run into each other by almost imperceptible gradations; not many strong contrasts in colour, nor striking effects in light and shadow. The general appearance of his pictures is very sober and quiet, but very natural, and you are impressed with the idea that you have seen many such a landscape; and so you have. They are wonderfully true to nature in that particular garb in which he thought fit to represent her. He (the speaker) recollected nearly twenty years since seeing two pictures by him of rather large size in an exhibition at Norwich, one representing the Boulevards in Paris, the other a seaside scene with many elaborate figures. These sort of representations were entirely exceptions to the usual practice of Old Crome, and some discussion ensued as to whether the pictures were painted by him. Henry Ladbroke informed the

public that he saw Old Crome painting them, and so put that doubt at rest. He (Mr. Palmer) recollected the pictures perfectly, and that they were painted as well as Bonington could have done them. He considered that Crome shone most in painting an open heath scene, a gravel-pit, a few large oaks in simple landscape, a farmhouse with a few trees, or a wild river scene with a few boats. The simpler, the more the subject suited him; and in such scenes he always appeared to him to be in painting; what Bloomfield was in verse—simple, natural, and unpretending; and such are the pictures in which, to his mind, the genius of Old Crome appeared to the greatest advantage. He had seen pictures by him of a more elaborate character. The great difference in the pictures of Old Crome and his son is this—that those of his son are not so artistic, and never have that quiet, sober tone and character which his father's always had; and although his son painted some nice pictures there is not in any lane or other country scene depicted by him that peculiar rusticity of character which the father so well portrayed, and which is so eminently necessary in pictures of that description. It was quite refreshing to look at one of Old Crome's sober things, after the fine colours and far-fetched effects now seen in painted landscapes. It was this quality of rusticity which the son missed, and it was the presence of this quality in the pictures of Old Crome which made them so far superior, not only to his son's pictures, but to those of every other Norfolk man. The father and son frequently painted moonlights in the same tones, and remarkably well; but the difference here also was in favour of the father, inasmuch as the son, by his dashing style, left them rather hard, whereas Old Crome's softer method gave his moonlight pictures a sort of dreamy appearance, very appropriate to the subject. But the moonlights of both the Cromes are superior to the pictures of that class by any other painters; they have a peculiar yellow indistinctness of tint, yet luminous, which he (the speaker) had never observed by any other hand. Such were the differences in the paintings of the father and son, and they are discernible by any person in the habit of seeing the works of other painters. He would have his hearers beware how they laid out their money about Old Cromes—they were manufactured; for his part, he had never dared to buy one. There were many Old Cromes, genuine pictures, now in the county, and when sold fetch high prices, and will continue to do so, because they are true to Nature as she shows herself in our lanes and fields and rivers—they were not like very many of those gaudy canvases in our exhibitions which were meant to represent her. Too many artists paint a scene, not in colours like those Nature puts on, but in such colours as they think she looks the best in. Old Crome, above almost any other painter, was a delineator of Nature in her everyday appearance; he aimed at no out-of-the-way effects; he only sought to paint what he saw, and what everybody else might see, and he did it admirably. The speaker said his first intention was to have said nothing further about the Norwich painters, but all of them having lived in his time, and most of them personally known to him, he would say what he had thought and known about the rest of them, and more, too, about Old Crome, and, as their works were appreciated, it was a pleasure to recount the doings of people he had known and respected. William Crome painted some very nice pictures, neat and artistic, but he did not succeed. Miss Crome, his sister, painted birds and small landscapes in good taste; these two were children of Old John Crome. In his (the speaker's) school days the pictures of George Vincent were often to be seen in and about Norwich. He was talented, but, like many another clever artist, ruined himself by excesses. His position in art was secured by the large picture of *Greenwich Hospital from the Thames*, and which of late years has been seen in the Great Exhibition. One of the most prudent of Old Crome's pupils, and a very good painter indeed, was James Stark. His pictures realise good prices. His views on the rivers of Norfolk are very beautiful. Many of the engravings from those pictures, by the best engravers of the time, show how he could depict, in a natural and artistic form, the beautiful scenery of the Wensum, the Yare, and the rustic neighbourhood of Norwich. *The Duck Decoy* and *The Sheepwashing*, and many others, are capital. Some of his later pictures are dull, and want variety and force. The willows in his best work are extremely pleasing, and harmonise well with the oaks and other sturdy trees around them. John Crome, besides the pupils above mentioned, had many others of respectable abilities, and the amateurs of his day in Norwich were numerous, and some of them very clever. He kept alive the artistic spirit in his own county, but he was not prosperous; those were the days of war, frolic, and the Regency, and if the Norwich artists did not save much money, they enjoyed themselves (too often, perhaps, in high jinks)—they had merriment, and were respected. The artists of Norwich, with Crome at their head, were especially fond of a day on the river, and we can fancy him and two or three others on board sketching, laughing, and enjoying themselves, and finishing up at one of the riverside inns, and making a jolly night of it. He was always looked up to, and was the centre of a notable company in the eastern counties. John Sell Cotman was another Norfolk artist of celebrity, flourishing at the same time with Crome, and his pictures are much sought after by collectors. Some of his water-colour drawings are beautifully true to nature and elaborate. He

had two sons, artists. Miles Edward painted in oil and water-colours. His pictures of shipping are very clever. John Joseph Cotman, the younger son, who died in March 1878, was an extraordinary person, very irregular in his habits, and during the last ten years of his life was at times almost a lunatic. Many of his pictures during the latter period were peculiar—yellow clouds and wonderful trees. But in his best days he was one of the most talented artists of the Norfolk school. Some of his drawings are very beautiful; no more splendid sketches can be seen by any artist than some of his before his mind was affected by drink. Perspective and air were never exhibited in greater perfection. Had he been a prudent man, he must have been in the front rank, and some of his things will before long take a high position. We are proud of our country gentlemen, as we ought to be, as their worth and consideration for their neighbours are fully testified upon the walls of this exhibition. A few months before poor J. J. Cotman died a very worthy Norfolk squire commissioned him to do a sketch or two on his estate. One view was an old wooden bridge, with very picturesque surroundings. Cotman, instead of using reality, used his imagination, and put in a fantastic cottage and other accessories which did not exist, with outrageous clouds. The squire rather objected to these things, and the painter went into an harangue about genius and all that, and quietly gave the patron the notion that he was as mad as a "hatter," and that the picture quite partook of the infirmity. However, the price was paid, and off went Cotman to the neighbouring alehouse, where he had been staying some days. During the evening he became very friendly with an old shoemaker, and supplied him very liberally with the good things the house afforded. At last they quarrelled, and Cotman, in an arrogant manner, called the cobbler hard names, and had to put up with the vulgarity of his illiterate opponent. Another young artist began at the same time with Old Crome—Robert Ladbroke: he and Crome married two sisters, and commenced in partnership as teachers of drawing. Crome was fond of company, a dashing fellow, with great ideas; his brother-in-law was plodding, prudent, and took care of what cash came in his way; taught his family to be so, and acquired a competency for his old days. Ladbroke never achieved much renown; his style was not attractive; but by painting and teaching he saved money. He had two sons, artists. John Berney Ladbroke, a bustling little man, taught drawing and painted for sale, built a nice little house on Mousehold, with Kett's Castle in his grounds. His pictures fetched large sums. His works, he thought, would not be considered to be of high order of merit. Some of his pictures of oak trees are well done, and his pictures are pretty; but from continual painting in his studio they are mannered, and have not the quality of nature to be observed in those of the Cromes, the Starks, and Cotmans. His foliage is flat; he does not understand light and shade; they want air and perspective; and are rarely enlivened with figures. He prospered, and deserved it. Henry Ladbroke painted more after the manner of his uncle Crome—his colour quiet, and often of good quality. He appreciated the scenes he depicted. He (the speaker) had travelled a good deal with him, was a very intelligent man, talked well about art, and his anecdotes of the artists of the olden time were very entertaining. He has been dead many years. Another family of Norwich artists were the Stannards, and their fame is well sustained by Miss Stannard, whose representations of fruit and flowers may well challenge comparison with the most admired painters of those subjects. The productions of the Hodgsons and others might be mentioned as partaking of the genius of the school. James Tillett's (of Norwich) pictures were neatly executed. Mr. Barwell, although an amateur, must not be forgotten, through his long life he was a staunch supporter of the Norwich school. He was a most accomplished artist, as were most of his family, and one of his sons followed painting as a profession. The Norfolk artists are now much more esteemed than in Crome's time. The reason for their pictures commanding high prices in a London sale-room is not far to seek. As Burns in his humble jingle and rustic language gave us the scenes of every-day life in descriptions so natural, so Crome has achieved a success with the like materials as great as any artist England has produced.

**Birmingham.**—Mr. C. Ede, the well-known milliner of Birmingham, has been erecting a number of shops, situated in Constitution Hill, one of the leading thoroughfares of the town. They are very conveniently arranged, and in the early Gothic style, freely rendered. Considerable picturesqueness has been attained in the elevation by a series of bay windows, two storeys in height and diminishing in width, terminating with panelled and enriched pinnacles. The parapet is ornamented with stone panels and trusses, moulded bricks and terra-cotta, and a considerable amount of carving. The front of the building is relieved by bands of moulded stone and brick, terra-cotta panels, and stone diapers. The shop-fronts have weathered and bracketed cornices, carved trusses, &c. The chimney caps are entirely of stone, and of an ornamental character. The work has been performed in a very creditable manner by Mr. Evans, builder, from designs prepared by Mr. J. Statham Davis, architect, both of Birmingham. The cost of erection, when the shops are entirely completed, with fittings &c., will be about 5,000l.

## EDINBURGH ARCHITECTURAL ASSOCIATION:

THE first meeting for the winter of the Edinburgh Architectural Association was held on the 8th inst., Mr. D. M'Gibbon, the newly-elected President, in the chair. In his opening address the President reviewed the past history of the Association. It was instituted, he said, in 1858 by a small number of young men interested in architecture. It was then more of a debating club than an architectural association, as they now regarded the term; but its founders were enthusiastic and in earnest, and resolved to persevere in their efforts to establish the Association on a firm basis and extend the field of its operations. Animated with such a spirit, the Association grew and prospered. In a few years the number of members had increased from seven or eight to about fifty, and now there were not less than 150. It was in 1860 that he first came in contact with the Association, having been applied to by the secretary to see whether an amalgamation could not be effected between this Association and the Architectural Institute of Scotland. He highly approved the proposal, and urged it on the Council of the Institute; but it unfortunately was not carried out. He regretted that, believing that the amalgamation would have been greatly for the benefit of both societies. The result would probably have been that they should all along have had in Edinburgh an important and prominent society to represent their profession. However, the laws of nature must be obeyed, and the process of natural selection seemed to have determined the survival of the fittest in the person of the Association. Perhaps, after all, it was well for the Association that the amalgamation was not effected as then proposed. The Association had thus been compelled to fight its own battles and push its own way. Its growth had been more natural than if forced forward at an early stage of its existence, and therefore he believed it would be found more enduring. Already this Association had achieved for itself a good position, and a considerable number of gentlemen who formerly took an interest in the Institute had joined its ranks. He trusted that shortly all the architects in Edinburgh would be enrolled, and thus complete in an unforeseen way the amalgamation contemplated long ago. After referring to the publication of the Sketch Book as a matter deserving continued encouragement, the President gave a review of the work cut out for the Association during the ensuing winter, and then proceeded to explain that arrangements had been commenced for the holding of an architectural exhibition, to include paintings, drawings, sketches, photographs, detailed drawings, and every kind of pictorial representation of their art. The Council, he said, were strongly of opinion that such an exhibition, under the auspices of the Association, would not only be an excellent thing in itself, but would prove advantageous to the Association by bringing it more prominently before the public, and asserting its position as a representative body. After considering various places for the exhibition, they at last thought that the scheme had grown to be of sufficient importance to warrant an application to the Board of Manufactures for the use of some of the rooms where the exhibitions of the Royal Scottish Academy were held. This application had been granted, but the rooms could not be put at their disposal till December 19. It was thought that the hanging of the pictures might be completed in eight days, and that the exhibition might be opened about December 26. It was proposed to open with a *conversazione*, to which each member, with a lady, should be invited, besides a number of leading citizens, artists, and others interested in architecture. The exhibition would remain open for a fortnight, and a charge of sixpence for admission would be made. As it would be open during the Christmas holidays, it was believed that many of the public would gladly avail themselves of the opportunity of studying architecture, ancient and modern—an opportunity such as had never been before presented, as far as he recollected, in Edinburgh. Drawings were to be invited from architects and others in every part of the country. Already a number of gentlemen, in Edinburgh, Glasgow, and London, had been communicated with, and everywhere the idea was warmly supported. It was expected that every member of the Association would do his utmost to render the exhibition a great success. Not only large and finished drawings were wanted, but architectural sketches, framed or unframed, would be well received and suitably hung. It would be necessary to appoint a large special committee to carry out the arrangements. As to the cost of the exhibition, seeing they got the rooms gratis, it was hoped that the admission money would about clear expenses; but should there be a deficit, the success of the exhibition was considered of such importance to the Association, that it was believed there would be no difficulty in raising the sum requisite by subscription among the members.

Mr. Brown having expressed some doubt as to the amount of support likely to be received from the public in the way of attendance, Mr. M'Lachlan submitted that, if they got the best works of the best London men, and formed a large collection of designs by old Edinburgh architects, and had busts and portraits of the architects themselves, and sketches of old buildings, the exhibition would prove very interesting, even to those who were not architects. He proposed a vote of thanks to the President for his address, which was duly accorded.

## NOTES AND COMMENTS.

THE following papers will be read at the meetings of the Leeds Architectural Society during the present session, 1882-1883:—"Constructional Ironwork as applied to Architecture," by Mr. F. CAMPIN, C.E.; "The Foundation of Art in Architecture," by Mr. E. R. ROBSON, F.S.A., F.R.I.B.A.; "The Place of Tradition in Modern Design," by Mr. J. D. SEDDING, F.R.I.B.A.; "Kirkstall Abbey," by Mr. J. WREGHITT CONNOR, F.R.I.B.A.; "Art Foliage," by Mr. J. K. COLLING, F.R.I.B.A.; "Wakefield Town Hall," by Mr. G. B. BULMER; "Hindrances," by Mr. J. HONEYMAN, F.R.I.B.A.; and "Recollections of Flemish Architecture," by Mr. WILLIAM H. THORP, A.R.I.B.A.

In a report just issued by the Board of Trade respecting their proceedings under the Weights and Measures Act, 1878, it is stated that there are nearly 700 different designs of stamps in use for the verification of weights and measures. The Board of Trade is, it appears, making efforts to obtain a uniform design of stamp for use by local inspectors, and with considerable success. Many local authorities, however, prefer for local reasons to keep their old designs, and with the view of facilitating the identification of these by inspectors fac-similes of them are attached to the above-mentioned report. It is further stated in the report that, in consequence of representations made to the Board of Trade by Chambers of Commerce and others as to the loss and inconvenience which arise from the variety of sizes of wire gauges now in use in trade, the question of legalising a standard wire gauge is now under consideration.

JUDGING from several sales that have lately taken place, the value of old family houses in France is wofully declining. A remarkable instance of sacrifice is that of a château near the town of Auxerre, which, although dating from the latter part of the seventeenth century and containing some very fine monumental carvings and chimney-pieces, as well as ceilings painted in historic subjects, was lately disposed of for the paltry sum of 17,000*fr.* (68*ol.*). The reason of this extraordinary depreciation in the value of country houses and what the French call pleasure properties (*propriétés d'agrément*) situate in the provinces, lies in the increasing indisposition of the rich and upper classes to live for long out of Paris or some other large centre, except it may be for the annual trip to the seaside. It must be remarked, however, that this tendency in the case of châteaux and properties either historically famous, surrounded by particularly beautiful scenery, or situate within easy distance of the principal towns, has been in considerable measure counterbalanced by the eagerness of foreigners—especially Americans and Russians—to possess themselves of a seigneurial domain in *la belle France*.

THE Wigan Town Council announce that it is intended to introduce a Bill into the next session of Parliament giving them the same powers with respect to mines under their sewers and works as are possessed by railway and waterworks companies respectively. The Corporation state that they are encouraged to take this step by the Local Government Board. It is probable that a public Bill, having similar objects, will be promoted by the Government, and in the event of that measure passing no further progress will be made with the local Bill. The Wigan Corporation have been inviting the neighbouring towns to share the responsibility for the expenses of the Bill. It is remarkable to find local authorities powerless in dealing with mines, but it was not anticipated by the Legislature that sewers were likely to be injured by settlements which arose from mining operations.

FROM the latest statistics issued by the municipal authorities it appears that Paris possesses 82,352 dwelling-houses. The number in 1876 was only 71,873, so that the increase in a little over five years has been 10,479, or about 2,000 per annum. These figures by no means, however, represent the number of new buildings erected during that period, for during these five years no less than 7,325 houses have been pulled down, so that the new ones built amount to 17,804. It must be remembered, moreover, that the new constructions are on an average much larger than those demolished, and the number of inhabitants per house in Paris now reaches 27.

It seems that the Greek Government are at the present moment devoting particular attention to the development of the country by means of an extensive system of public works. M. TRICOUPIS, the Premier, having applied to the French Government for aid in carrying out his projects, ten engineers are to be sent out from France to superintend their execution, and M. RONDEL, Chief Government Engineer of the Poitiers district, has already left for Athens to undertake the direction of the whole system, which consists chiefly in the construction of good roads and several lines of railways.

THE latest of Mr. MILLAIS' representations of child-life is the *Pomona*, which has been added to Mr. TOOTH's exhibition. It is free from the surroundings which have been introduced in the *Mrs. Gamp* and some other of the painter's works. In this case the young lady is not masquerading; she is represented filling a big barrow with apples in an orchard. Like others, which may be said to form a series with it, the figure is a three-quarter length. The girl is dressed in white muslin, with a mob cap and a blue sash. In the face and background Mr. MILLAIS is at his best, but the apples and barrow have the crudeness he sometimes affects. The picture is to be engraved, and we hope justice may be done to it. Of late years the best reproductions of Mr. MILLAIS' figures are often found in the plates of the illustrated papers. Some of the expensive mezzotints do not suggest the original works.

THE Prix Troyon will be awarded by the Académie des Beaux-Arts during the course of next year. On this occasion, moreover, its value will be doubled. The subject set for competition is: "Oxen harnessed to a waggon, with waggoner alongside, descending a narrow and difficult road through a forest—in early morning." This competition will be one of the great events of the artistic year.

IN Eastbourne there seems to be some difficulty about the plans for the proposed Town Hall. They appear to have been prepared by the building surveyor of the Local Board. Another surveyor in the town was employed to take out the quantities, and on analysing the plans he declared that they were not what they ought to be. In a letter to the Parliamentary Committee he wrote—"Passing over the inconsistency of the inside with the outside style of architecture, I beg to state that I am not *merely of opinion*, for that involves doubt, but *certain* that the works cannot be carried out in accordance with the plans in their *present condition*. The specification is, for an important building, the most deficient I have ever seen (and I have seen a great number), the omissions being many and serious. I have, as far as possible, supplied these omissions in the bills of quantities, which are therefore sufficient to cover the cost of erection, of course excepting modifications or additions that may be made during the progress of the works. With regard to the practicability of erecting the building, it can be carried out if the plans are altered, proper detail drawings made—the quantities being altered accordingly—and the specification corrected and completed." Both surveyors having supporters among the members of the Board, the subject has been the cause of the expenditure of a great deal of debating power. It was proposed to submit the plans to the County Surveyor, but this was rejected. The tenders for the works are, however, to be sent in on or before December 1, and it may safely be assumed that if there are defects in the plans, they will be ascertained before that time by builders.

THE *Société libre des artistes français* held a general meeting last Saturday evening in the Salle de la Redoute, for the purpose of electing a new committee for the year 1883. The vote resulted as follows:—*Painting and Engraving Section*—MM. FRAPPA, ROBERT-FLEURY, LALANNE, HUMBERT, BENJAMIN CONSTANT, RENOUF, H. LEROUX, LANSYER, R. DE GATINE, QUOST, LAVIEILLE, DUTSCHOLD, PÂRIS, VALLOIS, SAUSAY, BRIELMAN, LUBIN, ISTRA, POLACK, PILLE, COBLENTZ, HEILL, BERTHON, YON, SAINT-PIERRE, POINTELIN, BRACQUEMONT, BEAUVERIE, and BENNER. *Sculpture Section*—MM. BAUJAU, BOISSEAU, CAPPELLARO, DECROIX, DELORME, DELOYE, GUILBERT, JETOT, MARCELIN, MATHURIN MOREAU, OLIVA, TALUET, TRUPHÈME, VAUDÉT, and VEDEL. This committee will take entire charge of all the affairs of the Society during the coming year, including the organisation of next Salon.

## ILLUSTRATIONS.

ST. MARY OVERTY'S WHARF, SOUTHWARK.

THIS block of buildings is now in course of being rebuilt for Mr. GEORGE DOO on a portion of the site of the old palace of the Bishops of WINCHESTER.

The foundations are very massive, and the bottoms of the trenches are of an average depth of 25 feet below Trinity high-water mark. In the course of the excavations several relics were found, among others a seal having on the obverse a figure of Virgin and Child seated on the bank of the river, and a Greek inscription, which has not yet been satisfactorily deciphered.

The fronts are being faced with Shrewsbury paviors, relieved with rusticated pilasters of red bricks, and red and blue brick arches are turned over all openings. The cornice, perforated parapet, and copings of gables will be executed in red terracotta from Messrs. H. DOULTON'S factory, Lambeth.

Mr. S. CHAFEN, of Albion Road, Rotherhithe, is the general contractor, and Mr. HOWARTH foreman.

The architect is Mr. GEORGE A. DUNNAGE, A.R.I.B.A., of No. 5 John Street, Adelphi.

NEW BAPTIST CHAPEL AT BECKENHAM, KENT, FOR THE LONDON BAPTIST ASSOCIATION.

THIS building, the foundation-stone of which is to be laid on November 28, is now being erected from the designs and under the superintendence of Mr. C. W. MOUNTFORD, A.R.I.B.A., of 22 Buckingham Street, Strand, W.C., and Mr. H. D. APPLETON, A.R.I.B.A., of 264 Wool Exchange, Coleman Street, E.C., who were appointed joint architects after a limited competition, their design having been recommended for acceptance by the professional referee, Mr. JAMES CUBITT, of Broad Street Buildings, E.C.

Upon plan the building consists of wide nave with narrow side-aisles, tower, transepts, and chancel—the latter containing the baptistery and choir. The seats are so arranged that the whole of the congregation may have an unimpeded view of the officiating minister, none being placed in the side-aisles, which merely serve as passages to those in the nave.

The height of the nave from floor to ceiling is 36 feet.

Adjoining the chapel there is intended to be a lecture-hall, together with numerous class-rooms for the Sunday school, vestries for minister and deacons, retiring-rooms, kitchen, &c.; but this part of the building, which is estimated to cost about 2,000*l.*, is not to be commenced at present, temporary vestries being provided, while a portion of the nave is screened off to form a Sunday school.

The walls externally and internally are to be of brick, finished with a struck joint, Doultling stone being used for the dressings throughout.

The roofs will be boarded internally, the timbers being stained and varnished and covered externally with Broseley tiles. The flèche on tower is to be covered with oak shingles, and the extreme height from ground to summit of finish will be 100 feet.

The present contract amounts to 3,420*l.*, which includes lighting and heating (by hot water); and considering the substantial nature of the work, this chapel may be considered a decidedly cheap one, as, when the galleries are added, accommodation will be provided for over 800 people at a cost of about 3,700*l.*, or 4*l.* 10*s.* per sitting, including tower.

The builders are Messrs. W. KING & SON, of 3 Vauxhall Bridge Road, S.W.

COFFEE PALACE AND PUBLIC HALL, BURGESS HILL, SUSSEX.

THE erection of this block of buildings is shortly to be proceeded with. The site is an admirable one on the main road, and not far from the railway station on the London and Brighton line, being at the corner of Church Road and Mill Road.

The materials of construction will be, externally, the local red kiln bricks and ornamental tiles, the internal arrangements being made as complete as possible for the purposes intended. Besides the income derivable from the actual business, it is intended to create a revenue from the shops, &c., on either side, as well as from letting the large hall. It will be started by ardent friends of the temperance cause, and formed into a limited company. The architect is Mr. ARTHUR LOADER, 54 Old Steine, Brighton.

WAREHOUSE, SOUTH SHIELDS.

THIS building is now being erected in Queen Street for Mr. R. NESS, of Farning Slade. Mr. R. B. CROSBIE is the builder, and Mr. H. GRIEVES the architect.

HAWKHURST CHURCH.

THE village of Hawkhurst is about five miles from Cranbrook, in Kent. The large sandstone church is picturesquely situated in a decidedly picturesque village. The chancel, generally speaking, is Decorated, and in treatment reminds one of the delightfully-complete and beautiful old church at Etchingham, about four miles distant. The whole of the other part of the church is Perpendicular. There are north and south porches, each with a parvise chamber, some excellent tiles, and at one time the east window was very rich in stained glass. The Abbot of Battle, who had extensive property in the neighbourhood as lord of the manor, erected the first church here in the reign of RICHARD I. Hawkhurst was noted, in common with Lamberhurst, in the early days of the iron trade, for its furnaces, which were started and worked by WILLIAM PENN, the Quaker, and, like all other villages in the neighbourhood, had for great part of the last century a bad pre-eminence as the resort of smugglers and "water-thieves." "I found a paper t'other day," wrote WALPOLE in 1750 to MONTAGUE, who had an estate near Hawkhurst, "with a list of outlawed smugglers. They were JOHN PRICE, *alias* Miss MARJORAM, BOB PLUNDER, BRICKLAYER TOM, and ROBIN CURSEMOTHER, all of Hawkhurst in Kent."

EDWIN G. HARDY.

## ITALIAN ART EXHIBITION AT GLASGOW.

FOR several months past, says the *Glasgow Herald*, a sub-committee of the Museum and Galleries Committee of the Town Council have been quietly but energetically at work organising the Exhibition of Italian Decorative Art, which, with the sanction of the Council, is to be held in the Corporation Galleries during the present winter. The results of the similar exhibition of Oriental Art held last winter have greatly encouraged the committee in their exertions; for though that exhibition was not of a kind which powerfully appealed to the masses, yet it presented a rich field of study to the art student and the professional designer, and by these classes it was thoroughly appreciated and used with most gratifying results, while all persons of educated taste spoke of it only in terms of the highest praise. The committee have found the task of preparing and collecting works of art for the Italian exhibition much more arduous than was the case in dealing with preparations for the Oriental collections. They have resolved to seek only works of real artistic merit, and these, as far as possible, authenticated by coming through the hands of well-known collectors, and their aim is to make the Exhibition remarkable more for unexceptionable quality than for an overpoweringly large collection of objects, good, mediocre, and bad. The consequence is that the objects sought are far from numerous; they are dispersed throughout the whole country, and being generally of great market value, they are treasured by their owners, who do not care to subject them to the necessary risks of packing, railway carriage, and other possibilities of injury inseparable from lending. Nevertheless, the committee have obtained such promises of assistance as will certainly secure an Exhibition of even greater artistic interest and of a more generally popular character than that which was brought together last winter. Several months ago the Lord Provost addressed an application for loans to her Majesty, which was graciously and promptly responded to. The loans which are to be received from the royal collections are not yet finally determined upon; but the committee are hopeful her Majesty may be graciously pleased to select, among other objects, the Cellini Shield at Windsor, one of the greatest triumphs of art metal-work in the world. Whatever the contributions may be, there is no doubt they will be worthy of their royal source and command the attention of her Majesty's loyal subjects in the West of Scotland. As on the last occasion, the nucleus of the collection will be supplied by the Science and Art Department, and while both Lord Spencer and Mr. Mundella have expressed the most lively interest in the undertaking, Sir P. Cunliffe Owen and the officers at South Kensington Museum have with more than goodwill set about carrying out the instructions issued to them. The South Kensington collections will embrace some of the finest and most typical examples of Italian art in the Museum, which can be removed with safety and sufficient convenience, and will illustrate all the leading art manufactures of which Italy was in the Middle Ages the original home and source. In the South Kensington loan will be included a number of exquisite water-colour copies of the greatest Italian pictures, prepared specially for the Duchess of Edinburgh, and graciously lent by her Royal Highness. From the Prime

Minister there will be received three cases of ivory carvings and enamelled jewellery contributed from the collections accumulated in the leisure moments of his busy life; and these, we may assume, will attract popular attention not the less on account of the source whence they come. Probably the most important contribution, from a strictly artistic point of view, which the committee have obtained, is that made by Mr. John Malcolm of Poltalloch, from his famous collection of drawings by the great Italian masters. As is well known, Mr. Malcolm has, with a cultivated taste which is like an instinct, and with a rare amount of knowledge, devoted himself to the acquisition of a collection of drawings by the old masters, the leading features of which, after excellence of condition and artistic preciousness, are undoubted authenticity and greatness of source. Fifty of these drawings have been selected by Mr. Malcolm to be contributed to the Exhibition, embracing works by Sandro Botticelli, Leonardo da Vinci, Michael Angelo, Raphael, Titian, and nearly every other name great in Italian art. The value of such drawings to art students does not need to be pointed out; but even in a popular sense it is not too much to say that an ordinary observer will feel a nearer approach to the personality of these mighty names by a study of their drawings than they could obtain by any other means. Other loans from Mr. J. C. Robinson, the Duke of Buccleuch, the Marquis of Bute, the Marquis of Lothian, and many others, will in their way be not less important.

### DECORATIVE ART.

THE fourth of Mr. J. H. Chamberlain's course of lectures on "Decorative Art, Ornament, and Design," was delivered in the new Lecture Theatre at the Midland Institute on Tuesday evening. The lecturer said that for a good many years a considerable amount of advice had been offered to art students, upon such occasions as the laying of the foundation-stone of a new art school, by persons often not thoroughly acquainted with the business in hand. There was a strong family likeness in most of those addresses, and they generally had for their burden the necessity of producing design. Design, it was said, was wanted; we were in competition with the foreigner, our trade was likely to suffer if they did not produce this needed article; and why did not they do it? Such advice was a little unreasonable. It seemed to assume that art was governed by some species of deity who had gone to sleep, and, like a deity of old time, required a good deal of shouting in order to awaken him. It was assumed that it was within their power to become designers, and to turn out as many new kinds of design as the manufacturer or factor called for. Those who gave this advice forgot that two things were necessary. The first requisite was that they must have the faculty when they were born, for a designer was as much born to do that particular work as a musician was born to do his; and the second was that in their little designing shop they must have some little stock-in-trade. As regarded the latter necessity, it would be his endeavour not to give them receipts for designing, but to show them what they must know and what they must do before they could make those designs which the world generally seemed agreed were so much wanted. He was compelled to take them back to a word with which he was afraid he was beginning to tire them—"admiration." They had got to do it, or they had better give up the business, and they had got to admire as intensely as they possibly could. All practical art that appealed to others could only come out of intensity of feeling on the part of the artist. If they did not care very much about what they did they might depend upon it that other people would care less. No one in the world could quite tell all he knew and all he felt, and whatever the intensity of their admiration might be, that which they endeavoured to impart to others would be in some degree feeble compared with that which they themselves felt. One of the first and best duties which schools of art or Kyrle societies could take up was to learn to admire. How was it to be done? They had classes almost for everything, and an admiration class would not be so absurd as some persons might at first think. It was possible for them to take some familiar objects from nature, and to point out what it was in them which was worthy of attention and admiration. They wanted to get art into the same state as literature was at the present time. What would they think, for instance, of a book if it was simply a revival of old ideas that the world was familiar with two or three thousand years ago, without the admixture of much idea that was new or bearing upon the wishes and wants of the present day; and if, in the second place, the ideas were conveyed in the old-world phraseology? This, however, was what was done to a large extent in the domain of art. By the misuse of examples, and even of museums, the student's memory or brain was stored with art phrases; but they were old-world phrases, and he was asked to make them into an art essay. They did not set out to make a book without having something to say, and it was as essential in art that they should not sit down to make a design for a tile or anything else without having something to say. Admiration, he thought, might be taught; and he thought they might be a little cheered when they called to mind that during the last few years admiration had grown to such proportions that it had become a

subject of ridicule. As soon as they found that men were laughing at a cause they might be sure that the public interest was awakened in it, and that the cause was growing. There were people who thought it was wonderfully droll that there were other people who admired lilies and sunflowers too much. Perhaps it was; but, on the other hand, it was much more droll, or rather much more sad, that if there were a few people who admired lilies and sunflowers too much, there were thousands and thousands of others who admired them far too little. Admiration being necessary, let them have it, if they could, at first hand. Second-hand admiration was better than none; but a great deal of their admiration was third and fourth hand, resulting from their copying copies instead of going to the original source—namely, interest in humanity and the works of Nature. They could not, of course, despise the use of examples. At the present time the Town Council of Birmingham was engaged in forming a museum, which he hoped would be of great use. It would have a twofold use. He had no doubt it would show them in the first place what they all needed to remember—that art belonged to no particular clime or country, but was the heritage of all; and, in the second place, if they examined the various works rightly, it would show them the various methods in which nature after nature and people after people managed to put into their work the admiration which they felt for the world in which they lived. Dwelling upon nature as the great source of inspiration, the lecturer spoke of and illustrated the forms of beauty which were to be found in the grass of the wayside, and even upon the counter of any greengrocer's shop. The Greek volute was nothing to the beautiful form of the "curly-green." He then went on to show that true art never interfered with utility, and that it frequently happened that when perfection of utility was sought after it led to a refinement but one step removed from art. Illustrations of this were to be found in the beautiful lines of sailing boats, of the violin, and sometimes of carriages. In nature use and beauty were always inseparable, but in human work they could too frequently be divided. He urged the need of understanding the nature of the work they had to make or to do, the best material to use, and the best treatment to give that material. In conclusion, he described at length the reasons of utility which led to the beautiful form of the Doric column in the architecture of the Parthenon.

### HYDRAULIC MEASUREMENTS.

AT the first meeting of the session 1882-83 of the Institution of Civil Engineers, held on Tuesday, November 14—the President, Sir W. G. Armstrong, C.B., F.R.S., in the chair—the paper read was on "Recent Hydraulic Experiments," by Major Allan Cunningham, R.E., Honorary Fellow of King's College, London.

This paper was mainly a general account of some extensive experiments on the flow of water in the Ganges Canal, lasting over four years (1874-79). Their principal object was to find a good mode of discharge-measurement for large canals, and to test existing formulæ. There were about 50,000 velocity and 600 surface-slope measurements, besides many special experiments. The Ganges Canal, from its great size, from the variety of its branches abounding in long straight reaches, and from the power of control over the water in it, was eminently suited for such experiments. An important feature was the great range of conditions, and therefore also of results obtained. Thus the chief work was done at thirteen sites in brickwork and in earth, some being rectangular and others trapezoidal, and varying from 193 to 13 feet in breadth, and from 11 feet to 8 inches in depth, with surface-slopes from 480 to 24 per million, velocities from 7.7 feet to 0.6 foot per second, and discharges from 7,364 to 114 cubic feet per second.

For all systematic velocity measurements floats were exclusively used—viz., surface floats, double floats, and loaded rods. Their advantages and disadvantages had been fully discussed in the detailed treatise, "Roorkee Hydraulic Experiments" (1881). They measured only "forward velocity," the practically useful part of the actual velocity. The motion of water, even when tranquil to the eye, was found to be technically "unsteady"; it was inferred that there is no definite velocity at any point; and that the velocity varies everywhere largely, both in direction and in magnitude. The average of (say) fifty forward velocity measurements at any one point was pretty constant, so that there must be probably average steady motion. Hence average forward velocity measurements would be the only ones of much practical use. To obtain these would be tedious and costly; and special arrangements would be required to obviate the effects of a change in the state of water which often occurred in a long experiment, as when velocities at many points were wanted.

As to surface-slope, its measurement (from nearly six hundred trials) was found to be such a delicate operation that the result would be of doubtful utility. This would affect the application of all formulæ into which it entered. The water-surface was ascertained, on the average of its oscillations, to be sensibly level across, not convex, as supposed by some writers. There were 565 sets of vertical velocity-measurements, combined into 46 series. The 46 average curves were all very flat and convex down-stream

(except near an irregular bank), and were approximately parabolas with horizontal axes; the data determined the parameters only very roughly. The maximum velocity line was usually below the surface, and sank in a rectangular channel, from the centre outwards down to about mid-depth near the banks. Its depression seemed not to depend on the depth, slope, velocity, or wind; probably the air itself, being a continuous source of surface-retardation, would permanently depress the maximum velocity, whilst wind failed to effect this owing to its short duration. On any vertical the mid-depth velocity was greater than the mean, and the bed-velocity was the least. The details showed that the mid-depth velocity was nearly as variable from instant to instant as any other, instead of being nearly constant as suggested, by the Mississippi experimenters.

The measurement of the mean velocity past a vertical was thought to be of fundamental importance. Loaded roads seemed by far the best for both accuracy and convenience in depths under 15 feet. They should be immersed only  $\frac{1}{4}$  of the full depth. The chief objection to their use, that (from not dipping into the slack water near the bed), they moved too quickly, was thus for the first time removed. A double-float, with two similar sub-floats at depths of  $\frac{1}{2}$  and  $\frac{3}{4}$  of the full depth, would also give this mean with more accuracy and convenience than any instrument of its class: this instrument is new. Measurement of the velocity at  $\frac{1}{2}$ -depth would also afford a fair approximation.

One hundred and fourteen average transverse velocity curves were prepared from seven hundred and fourteen separate curves. These average curves were all very flat, and were convex down stream (over a level or concave bed), and nearly symmetric in a symmetric section. The velocity was greatest near the centre, of deepest channel, decreased very slowly at first towards both banks, more rapidly with approach to the banks or with shallowing of the depth, very rapidly close to the banks, and was very small at the edges, possibly zero. The figure of the curve was found to be determined by the figure of the bed, a convexity in the bed producing a concavity in the curve and *vice versa*, and more markedly in shallow than in deep water. Curves on the same transversal, at the same site, and with similar conditions, but differing in general velocity, were nearly parallel projections. At the edges there was a strong transverse surface-flow from the edge towards mid-channel, decreasing rapidly with distance from the edge. The discussion showed that it was almost hopeless to seek the geometric figure of the curves from mere experiment.

Five hundred and eighty-one cubic feet discharges were measured under very varied conditions. The process adopted contained three steps: (1) Sounding along about fifteen float-courses, scattered across the site in eight cross-sections; time, say four hours. (2) Measurement of the mean velocities through the full depths in those float-courses, each thrice repeated; time, say four hours. (3) Computation, say two hours. This process was direct and wholly experimental; each step was done in a time which gave some chance of a constant state of water. From an extended comparison of all results under similar conditions, it appeared that the above process yielded, under favourable circumstances, results not likely to differ more than 5 per cent. The sequel showed that in a channel with variable regimen, a discharge-table for a given site must be of at least double-entry, as dependent on the local gauge-reading, and on the velocity or surface-slope.

Special attention was paid to rapid approximations to mean sectional velocity. The mean velocity past the central vertical, the central surface-velocity, and Chézy's quasi-velocity (*i.e.*  $100\sqrt{RS}$ , where  $R$  = the hydraulic mean depth, and  $S$  = the surface-slope) were tried in detail; thus 100, 76, and 83 average values thereof respectively were taken from 581, 313, and 363 detail values. The ratios of these three velocities to the mean velocity were taken out, and compared in detail with Bazin's and Kutter's co-efficients. Other formulæ were contrasted also in slight detail. Kutter's alone seemed to be of general applicability; when the surface-slope measurement is good, and the rugosity-co-efficient known for the site (both doubtful matters), it would probably give results within  $7\frac{1}{2}$  per cent. of error. Improvement in formula could at present be obtained only by increased complexity, and the tentative research would be excessively laborious. Now, the first two ratios varied far less than the third: thus their use would probably involve less error than the third, or approximation would be more likely from direct velocity-measurement than from any use of surface-slope. The connection between velocities was probably a closer one than between velocity and slope; the former being perhaps only a geometric, and the latter a physical one. The mean velocity past the central vertical was recommended for use, as not being affected by wind; the reduction co-efficient could at present only be found by special experiment for each site.

Three current-meters were tried for some time with a special lift, contrived to grip the meter firmly parallel to the current-axis, so as to register only forward velocity, and with a nearly rigid gearing-wire. No useful general results were obtained. Ninety specimens of silt were collected, but no connection could be traced between silt and velocity; it seemed that the silt at any point varied greatly from instant to instant, and that the quantity depended not on the mean velocity, but probably on the silt in the supply-water.

Forty measurements of the evaporation from the canal-surface were made in a floating pan during twenty-five months. The average daily evaporation was only about  $\frac{1}{10}$ -inch. The smallness of this result seemed to be due to the coldness of the water (only  $63^{\circ}$  in May, with  $165^{\circ}$  in the sun and  $105^{\circ}$  in shade).

Lastly, it must suffice to say that great care was taken to insure accuracy in both field work and computation.

## THE LATE MR. E. B. STEPHENS, A.R.A.

ON the 10th inst. Mr. E. Bowring Stephens, A.R.A., died at his residence in Buckingham Palace Road. He was born at Exeter in December 1815. Having at an early age shown a taste for art, he was sent to London in the Midsummer of 1835, and placed as a pupil with Mr. E. H. Bailey, R.A., the sculptor. In the following year he was admitted a student of the Royal Academy, and there made such progress in the art that in 1837 he won the silver medal of the Society of Arts for a small original model of *Ajax Defying the Gods*. A few months later he executed his first commission, for Mr. Thomas Sheffield, of Exeter, a gentleman-who was much interested in everything connected with art—a bust of his daughter Blanche. His first appearance at the Royal Academy was in 1838, when he exhibited a statue of *Diana*, in the manner of his master, Bailey. In the early part of 1839 Mr. Stephens went to Italy, and while there visited all the art galleries from Venice to Naples, and worked principally at Rome, in a studio formerly occupied by John Gibson, in the Palazzo Cecaglia. On his return to England, after an absence of nearly three years, he lived for about a year at Exeter, and while there obtained a commission from Sir John Yarde Buller, M.P., for a life-size statue in marble of Lord Rolle. In 1842 he took up his permanent residence in London, and in the following year obtained the gold medal at the Royal Academy for a small relief subject, *The Battle of the Centaurs and Lapithæ*. He also executed marble busts of the late Earl of Devon, Lady Courtenay, Sir W. W. Follett, and the Dean of Exeter. In 1845 he assisted in ornamenting, in conjunction with other artists, her Majesty's summer pavilion at Buckingham Palace; and in the same year he executed marble busts of Bishop Philpotts, General Gage Hall, and Colonel Fulford. In several subsequent years he added largely to his previous productions, and to the Great Exhibition of 1851 his contributions were a colossal group of *Satan Vanquished* and *Satan Tempting Eve*. He also exhibited, among others, a marble bust of Lord Palmerston, which was presented to Viscountess Palmerston by the electors of Tiverton. In 1858 he produced a posthumous marble bust of the Hon. W. Reginald Courtenay, and busts of Viscount Ebrington and Earl Fortescue; and in the following year his most successful works included the bronze bas-relief of Balacava to the memorial to Colonel Morris on Hatherleigh Down. In 1861 he completed a colossal statue in marble, on Northernhay, Exeter, to the honour of his friend and patron, Sir T. D. Acland. There had at one time been much discussion whether this statue should not have been publicly competed for, in order that the city should be enriched by the best work of art procurable in the country; but when the figure was unveiled there was general satisfaction. In 1863 his work consisted of a colossal statue of the late Earl Fortescue, erected in the Castle Yard, Exeter; a statue of *Alfred the Great*, placed in the Egyptian Hall, Mansion House, London; and a marble statue of the Earl of Lonsdale, placed in Lowther Castle. Mr. Stephens was, in 1866, elected an Associate of the Royal Academy, and it was generally supposed that his success was due to his being confounded with the late Alfred Stevens, the sculptor of the Wellington Memorial. He completed a bronze statue of the Duke of Bedford at Tavistock, and in the following year a sitting statue in marble of John Dinham, erected in Northernhay, Exeter. In 1869 he received a commission to execute a recumbent monumental figure of Elizabeth, Countess of Devon, which is now placed on a Gothic altar tomb in Powderham Church. Mr. Stephens produced many other very successful works which added greatly to his reputation as a sculptor. He received a commission for a life-size statue of the late Mr. Alfred Rooker, to be placed in the Guildhall Square, Plymouth. It was a difficult task, as he had no previous knowledge whatever of the gentleman whose features he was called on to produce; but he entered into the work with ardour, and succeeded in producing an admittedly excellent likeness. "It would," said one of the speakers at the ceremony of unveiling the statue in September 1878, "test the skill of most men to execute the likeness of any one well known to them, in whose personal presence they had often been, and had studied their living features with that expression which guaranteed truth of likeness. But in the present case we are reminded of the prophet of old, who had not only to interpret the dream, but to recall all the details of the forgotten mystery. In the same way our sculptor had to collect from very fragmentary sources the true likeness, the particular expression of the original whom he had never set eyes upon; but all will admit how well and nobly he has executed the work." The *Deerstalker* group, which now occupies a prominent position on Northernhay, Exeter, was also the work of Mr. Stephens, and is regarded as his *chef-d'œuvre*. He also modelled, the bust of Mr. C. C. Whiteford, the late town-clerk of Plymouth

which now stands in the Plymouth Council Chamber; and one of his latest works was the statue of the Earl of Devon in Bedford Circus, Exeter. Mr. Stephens was not a great sculptor, but he "nearly touched the top of mediocrity," and he possessed so many friends in the Royal Academy that for several years he secured second place in the elections for Academicians.

### THE SUNDERLAND "PETRARCH."

AT the sale of the Sunderland Library on Saturday there were no less than seventy-one editions of Petrarch offered, three of which were printed on vellum, one being the first edition of 1470 by Vindelin de Spira, of which probably there are not two perfect copies in existence, this having lost two leaves; another was the first Aldine of 1501; and the third a small, very thick 8vo., Venice, 1558. Important as these were, they sank into insignificance before the folio of 1488, printed at Venice on paper, which was rendered unique by containing a set of six old copper-plate engravings of the Triumphs, besides the woodcuts. Very little notice had previously been taken of this book, which has now become famous for those extraordinarily fine engravings by some great unknown Italian master of the time, and has enhanced the renown of the Sunderland Library by bringing the enormous price of 1,950*l.*, the highest sum in the sale, and one of the highest ever paid at auction for any book. It appears to have lain hidden away among the Petrarchs in the vast mine of rare books so long unworked in Blenheim Palace, and the discovery of the rare treasure at the moment of the sale came as a complete surprise. It had not wholly escaped the observation of the very able cataloguer, as the engravings were specially referred to; but the real value of the book had only been discovered by such keen experts as Mr. Quaritch, Mr. Thibaudeau, and Mr. Ellis, who had naturally each kept his own counsel. That they had not neglected to refer to Bartsch about the engravings was soon evident when the book (lot 9,545)—"I Triumphi col commento di B. Glicino; e Sonetti e Canzone col commento di Fr. Philelfo, fol. in Venetia, per Bernadino da Novara, 1488," described as "a valuable and interesting edition on account of the engravings," leaf 5 supplied in MS.—was put up, after several fine copies had been sold at considerable sums, at a commonplace bid of 1*l.*, followed immediately by one of 100*l.* from Mr. Ellis, and another of the same amount from Mr. Thibaudeau, who continued advancing quickly to 1,000*l.* by bids of 100*l.*, calmly watched by Mr. Quaritch, who then joined issue, till, at 1,600*l.*, Mr. Ellis retired, leaving the field to Mr. Quaritch and Mr. Thibaudeau, who continued it amid the greatest excitement up to 5*l.*, beyond which there was no advance, and Mr. Quaritch carried off his prize. The whole affair was over in about five minutes, and was one of the sharpest and most determined fights ever witnessed at a book sale. Mr. Quaritch, on being congratulated upon his victory, was so enthusiastic as to declare that neither the Paris Bibliothèque nor the Berlin Government should have the opportunity of purchasing until the book had been offered to the Royal Library and to the British Museum. These most interesting engravings and this copy of Petrarch are mentioned by Bartsch, but erroneously, as three only, and by Nicoletto of Modena. Probably neither the book nor the engravings had been seen by Bartsch, but the Abbé Lani appears to have seen it, and correctly describes the set of six engravings, which he considered to be quite unique and the work of some early engraver after the designs of Philippino Lippi. Passavant also refers to them as resembling the style and work of Philippino, but whether this identical copy is the one referred to by these writers is the point of interest which will now be so much discussed. The book itself is of comparatively small value. It is a folio measuring about 12 by 8, bound in calf, in what is called Cambridge binding, no doubt after the Earl of Sunderland became possessed of it. The engravings are on paper the same size as the book, with a full margin of an inch and a half, and in perfect condition, being evidently early impressions issued with the book in 1488. They are printed in the fine grey ink which denotes the genuine untouched plate, as seen in the rare engravings attributed to Botticelli in the Althorpe Dante and in the Dante of 1481 to Baccio Baldini, after the designs of Botticelli, sold in this sale in April last for 35*l.* They are placed next to the leaves with the ornamental bordered woodcuts, and represent each of the Triumphs—Time, Fame, Divinity, Love, Chastity, Death. Each is a composition of many figures, and many of the heads certainly resemble those seen in the pictures of Filippino, with a strong resemblance also to Botticelli, though the work is much more elaborate than any engraving by his hand. The drawing throughout shows a master hand, and many of the female draped figures are full of beauty in the heads and the graceful attitudes, particularly in the *Chastity*, in which beautiful girls dance round the car on which is the figure of Chastity holding a pen in one hand and book in the other, with a nude female, blindfolded, kneeling before her. It will be remembered that Baccio Baldini also engraved the six Triumphs (Bartsch, 13), a set of which was brought together in the Art Treasures Exhibition at Manchester, 1857, from the Wellesley and other cabinets; but Baccio is said to have died in 1480, eight years before this book was printed.

### ELECTRIC LIGHTING.

THE opening meeting of the winter session of the Society of Arts was held on Wednesday, when an address by Dr. Siemens, the chairman of the Council, was delivered upon the present condition and future prospects of electric lighting. After describing the difficulties which had stood in the way of the practical introduction of the light, he considered the recent legislation on the subject. Dr. Siemens spoke favourably of the Electric Lighting Act passed last year, and seemed to think that the complaints now appearing in the papers, that municipalities refuse their assent to applications by electric light companies for provisional orders, were often not well founded. The authorities would clearly be justified in refusing any application of a speculative character, and no licences or provisional orders should be granted unless the applicants could give assurance of being able and willing to carry out the proposed work within a reasonable time. The technical questions involved are hardly yet sufficiently understood to admit of immediate operations upon a large scale. The area that each lighting district should comprise varied according to the opinion of different witnesses before the recent Parliamentary Committee, from Dr. Siemens' own estimate of a quarter of a mile to estimates suggested by others of as much as four square miles. In the case of gas, considering the unpleasant nature of the manufacture, it was necessary that the supply should range over a large area; in the case of electricity this did not apply, and for many reasons it might be desirable to limit the size of each district to that above-mentioned—a quarter of a square mile. Such is about the area of the parish of St. James's; and Dr. Siemens then proceeded to sketch out in some detail the arrangements which would be required for supplying this parish with a sufficient amount of the electric light. The number of incandescent lights required for a house of moderate dimensions might be taken as 100, the lights being from 15 to 18 candle-power each. This is in effect the number of Swan lights employed by Sir William Thomson in lighting his house in Glasgow. Eleven horse-power would be required to excite this number of incandescent lights, and at this rate the parish of St. James's would require 3,018 multiplied by 11, or 32,200 horse-power to work it. It might be fairly objected, however, that there are many houses in the parish much below the standard here referred to; but, on the other hand, there are 600 shops, involving larger requirements. Nor does this estimate provide for the large consumption of electric energy that would take place in lighting the eleven churches, eighteen clubhouses, nine concert halls, three theatres, besides numerous hotels, restaurants, and lecture halls. A theatre of moderate dimensions, such as the Savoy Theatre, has been proved by experience to require 1,200 incandescent lights, representing an expenditure of 133 horse-power; and about one-half that power would have to be set aside for each of the other public buildings here mentioned, constituting an aggregate of nearly 2,926 horse-power. Again, this general estimate did not comprise street lighting, and to light the 6½ miles of principal streets of the parish with electric light would require, per mile, 35 arc-lights of 350 candle-power each. This, taken at the rate of 0.8 horse-power per light, represented a further requirement of 182 horse-power, making a total of 3,108 horse-power, for purposes independent of house lighting, being equivalent to 1 horse-power per inhabited house, and bringing the total requirements up to 109 lights, equal to 12 horse-power per house. Dr. Siemens, however, could not agree with those who expect that gas lighting will be entirely superseded; on the contrary, he maintained that the electric light, while possessing great and peculiar advantages for lighting our principal rooms, halls, warehouses, &c., owing to its brilliancy, and more particularly to its non-interference with the healthful condition of the atmosphere, would leave ample room for the development of gas. Assuming, therefore, that the bulk of domestic lighting remains to the gas companies, and that the electric light is introduced into private houses only, at the rate of (say) twelve incandescent lights per house, the parish of St. James's would have to be provided with electric energy sufficient to work (9+12) 3,018, equal to 63,378 lights, equal to 7,042 horse-power effective; this is equal to about one-fourth the total lighting power required, taking into account that the total number of lights that have to be provided for a house are not all used at one and the same time. No allowance is made in this estimate for the transmission of power, which, in course of time, will form a very large application of electric energy; but considering that power will be required mostly in the daytime, when light is not needed, a material increase in the plant will not be necessary for that purpose. As a position for the engines and machines, Dr. Siemens suggested Golden Square. If the unoccupied area of the square were excavated and arched over to the present level, sufficient space would be provided. The cost of these works, including engine power and machines, might be estimated at 140,000*l.*, not including the conductors, &c. The size of the conductor is a most important consideration. Two things have to be considered—first, the charge for interest on the original cost and depreciation, and secondly, the cost of the electrical energy lost by resistance. The sum of these two, as has been pointed out by Sir William Thomson, is least when the two

components are equal, and thus we obtain the principle on which the size of the conductors should be calculated. Working on this principle, Dr. Siemens calculated that the proper size of conductor for the installation he is describing would be a rod of 8 inches diameter. If the mean distance of the lamps from the station be assumed as 350 yards, the weight of copper used in the complete system of conductors would be nearly 168 tons, and its cost 15,120*l*. To this must be added the cost of iron pipes for carrying the conductors underground, and of testing-boxes, and labour in placing them. Four pipes, of 10-inch diameter each, would have to proceed in different directions from the central station, each containing 16 separate conductors of 1-inch diameter, and separately insulated, each of them supplying a sub-district of 1,000 lights. The total cost of establishing these conductors may be taken at 37,000*l*., which brings up the total expenditure for central station and leads to 177,000*l*. It was assumed that the conductors would be placed underground, it being quite inadmissible, both as regards permanency and public safety and convenience, to place them above ground, within the precincts of towns. With this expenditure the parish of St. James's could be supplied with the electric light to the extent of about 25 per cent. of the total illuminating power required. To provide a larger percentage of electric energy would increase the cost of establishment proportionately, and that of conductor nearly in the square ratio of the increase of the district, unless the loss of energy by resistance were allowed to augment instead. The statement that a conductor of such a size would be required to supply a single parish with electricity might surprise many of the uninitiated who had heard of the suggested transmission of the energy of waterfalls over long distances by electrical means. In answering the question it had to be admitted that the transmission of electric energy of such potential (200 volts) as is admissible in private dwellings would involve conductors of impracticable dimensions, and in order to transmit electrical energy to such distances, it would be necessary to resort, in the first place, to an electric current of high tension. By increasing the tension from 200 to 1,200 volts the conductors might be reduced to one-sixth their area; and if we were content to lose a larger proportion of the energy obtained cheaply from a waterfall, we might effect a still greater reduction. A current of such high potential could not be introduced into houses for lighting purposes, but it could be passed through the coils of a secondary dynamo-machine, to give motion to another primary machine, producing currents of low potential to be distributed for general consumption. Or secondary batteries might be used to effect the conversion of currents of high into those of low potential, whichever means might be found the cheaper in first cost in maintenance and most economical of energy. It might be advisable to have several such relays of energy for great distances, the result of which would be a reduction of the size and cost of conductor at the expense of final effect, and the policy of the electrical engineer would, in such cases, have to be governed by the relative cost of the conductor and of the power at its original source. If secondary batteries should become more permanent in their action than they are at the present time, they might be largely resorted to by consumers, to receive a charge of electrical energy during the daytime or the small hours of the night, when the central engine would be otherwise unemployed. The advantage of resorting to these means would depend upon the relative first cost and the cost of working the secondary battery and the engine respectively. Working out on a similar scale the cost for the whole of London, and considering the amount of light which would be required in the richer and in the poorer districts, Dr. Siemens obtains the sum of 14,000,000*l*., without any allowance for lamps or internal fittings. Going still further afield, he finds that to extend the same system over the towns of Great Britain and Ireland would absorb a capital exceeding 64,000,000*l*., to which would have to be added 16,000,000*l*. for lamps and internal fittings, or a total capital of 80,000,000*l*. Some might live to see this realised, but to find such an amount of capital, and, what was more important, to find the manufacturing appliances to produce work representing this value of machinery and wire, must necessarily be the result of many years of technical development. Dr. Siemens was therefore led to the conclusion that the applications now being made by electric light companies for provisional orders to supply electrical energy, not only to the towns of England, but to those of our colonies and abroad, showed that their ambition was somewhat in excess of their power of performance. Turning then to the working charges of an establishment such as that above described, and assuming the 64,000 lights to be working for six hours a day, with coal at 20*s*. a ton, and the consumption 2 lb. per effective horse-power per hour, this would come to about 18,000*l*. Charges for wages, interest, depreciation, general management, &c., make a grand total annual charge of 41,000*l*., or at the rate of 12*s*. 9½*d*. per incandescent lamp per annum. The cost of renewing lamps brings up the charge for each lamp to 21*s*. 9½*d*. for a year. The cost of burning gas in a good Argand burner, which would produce the same luminous effect, would be 29*s*., so that there is an evident balance of cheapness in favour of electric lighting. On the other hand, the cost of establishing gasworks would not exceed 80,000*l*. as compared with 177,000*l*. for electricity; so that it appears that, while it would be more costly to establish a given supply of

luminous power by electricity than by gas, the former has the advantage as regards current cost of production. These calculations, however, being only based upon the present prices of gas, and not allowing for the large dividends paid by gas companies, cannot be looked upon as representing a permanent state of things. On the other hand, it is probable that electric lighting would be cheapened by resort to a larger extent to arc lights, and also by future improvements in the manufacture of incandescent lamps. Considering the two great sources for public lighting, Dr. Siemens came to the conclusion that the introduction of the electric light, even to the full extent he contemplated, would go hand in hand with an increase in the consumption of gas, and that the consequent competition could not fail to improve the quality and cheapen the supply of both greatly to the advantage of the public. As the light of luxury, electricity must win; but gas will at the same time find an increasing application for the more humble purposes of diffusing light.

### THE SLADE PROFESSORSHIP AT OXFORD.

IT is reported that Mr. Ruskin will be invited to fill again the chair of Fine Arts, lately vacated by Mr. Richmond, and that there is good hope that he will accept the nomination. Mr. Ruskin is so completely identified with the study of this subject at Oxford that it will give general satisfaction should he consent to reassume the Professorship. But it is feared by some of his friends that Mr. Ruskin's health will not allow him to undertake the duties. The following letter from Mr. T. Humphry Ward on the resignation of Mr. Richmond appeared in the *Times* :—

Your announcement that Mr. W. B. Richmond has resigned the Slade Professorship of Fine Art at Oxford will have been received with general regret. Mr. Richmond is so accomplished an artist and critic that it might have been hoped that he would find in the University a thoroughly congenial field of work. Are we to suppose that he has found but a barren soil, and that he has seen the vanity of lecturing to an audience of which not one member in ten has any serious interest in art, and of directing a class of young people who cannot draw?

The truth is that, as far as Oxford is concerned, Mr. Slade's splendid bequest is found to be unworkable. The Slade school in London is a reality; at Oxford it is not, and cannot be. The undergraduates, under the examination system, have no time to learn the practice of art; and yet, as at present constituted, the Professor's work goes on the theory that practical and technical instruction is what is chiefly required. It is to be hoped that the University, laying to heart the lesson of this resignation, will take the opportunity of considering whether the conditions of the Professorship may not be so altered that to hold it may be a lasting satisfaction to the Professor, and that in future, when Oxford has got her Ruskin or her Richmond, she may be able to keep him. The conditions were indeed laid down in outline by Mr. Slade's will, and a recent will is generally a difficult matter to deal with. But I cannot help thinking that a way might be found to make the Professorship really satisfactory both to the University and the holder.

What the University requires is not a practical teacher of drawing, however eminent, but (1) a teacher of the history of art, (2) an efficient curator of the collections in Oxford. At Cambridge they have these two most efficiently combined in the person of Mr. Sidney Colvin, who is at once Slade Professor and keeper of the Fitzwilliam Museum. The result is that while no attempt is made to achieve the impossible task of turning undergraduates into artists, the history of art is dealt with as a fit and proper subject for regular University teaching, and the great collections are properly cared for. Why cannot the same thing be done at Oxford? She cannot, indeed, rival the magnificent possessions of her sister, but yet her collections are of high importance. It is not, however, too much to say that their condition at present is one of complete disorganisation. The Randolph Galleries contain a collection of drawings by Raffaele and Michel Angelo which is famous throughout the world, a large number of Turner's finest water-colours, and a respectable gathering of old pictures. With these are associated the Douce prints, a treasure that is literally unknown, for they are huddled away in paper parcels in drawers where they cannot be got at without great difficulty, and no one has ever taken the trouble to catalogue them. Yet I can say from my own knowledge that these prints are of the highest interest, rarity, and value. Properly arranged and catalogued, they would be studied by amateurs from all countries, but properly arranged and catalogued they will not be until they are placed in proper hands.

There is, besides, the Ashmolean Museum; there is the small Castellani collection, ironically called "educational"; there is the totally unknown Hope collection of engraved portraits hidden away in the upper regions of the Camera. Then there is the superb collection of drawings by Leonardo and others, which belongs to Christ Church, and which now is practically inaccessible. Is it too much to hope that if the University collections were properly organised and brought under one roof, and under the charge of one director, Christ Church might entrust these

treasures to his keeping? The present seems an excellent opportunity for carrying out a much-needed reform. I trust that if the University has to lose Mr. Richmond, it will at least give his successor the power of putting the collections upon a regular and orderly footing, and thus take away what is at present a reproach to Oxford.

### REVIEWS.

A MANUAL OF THE BUILDING REGULATIONS IN FORCE IN THE CITY OF LIVERPOOL. Arranged and Annotated by W. GOLDSTRAW. Liverpool: T. Brakell.

The edition of the local building Acts which has been prepared by the Surveyor of Buildings in Liverpool cannot fail to be appreciated by the architects and builders of that city. It is printed in a convenient form, and contains notes referring to the difficulties which are likely to occur in practice. If a similar book could be prepared for London it would be a vast gain, for those in use are too cumbrous and involved.

TRANSACTIONS OF THE ROYAL INSTITUTE OF BRITISH ARCHITECTS. Session 1881-82. Published at the Institute.

The papers read during the last session, although few in number, form with the discussions and memoirs a volume of over two hundred pages. It must be acknowledged that none of the preceding volumes is so skilfully edited as the last. Many things are introduced which help to explain the papers. Among others we find a paper which was read by Mr. Burges in 1876, and one read by the Rev. R. Burgess in 1841; by a curious coincidence both were unprinted until now. The volume is amply illustrated.

LECTURES ON ART, DELIVERED IN SUPPORT OF THE SOCIETY FOR THE PROTECTION OF ANCIENT BUILDINGS. London: Macmillan & Co.

Whatever may be thought about the prudence of the policy adopted by the Society for the Protection of Ancient Buildings, there can be no disputing the interest of the lectures which were delivered in support of the cause by Messrs. Poole, Richmond, Poynter, Micklethwaite, and Morris. The primary purpose of the lectures was to obtain funds from the auditory to carry on the business of the Society, but they were too valuable to be allowed to exist only in the memories of the people who were present at their delivery. They have been now published at a price which is much below what is usually charged for books equally well written. The volume forms an excellent collection of essays by men who are familiar with the subjects they have treated. When it is said that Mr. Richmond discoursed on "Monumental Painting in Italy from Giotto to Michael Angelo," and Mr. Poynter on "The Latest Discoveries of Ancient Decoration," that Mr. Morris read elaborate essays, in that pure Saxon of which he is a master, on "Pattern Designing and the Lesser Arts of Life," that Mr. Poole, of the British Museum, spoke on "Egyptian Tombs," and Mr. Micklethwaite on "Parish Churches," enough is suggested about the importance of the book.

The lectures of Mr. Richmond and Mr. Poynter might have been delivered in Oxford or South Kensington, for they contain nothing that is suggestive of their origin. But in the others more or less was said about the claims of the Society on the purses of the public. Mr. Micklethwaite asked for aid because the Society supplied "interesting information and sound advice." Mr. Morris grounded his appeal on the fact that it was "the most prudent society in England." Mr. Poole was more ambitious, for he must have adapted to the occasion one of the sermons on behalf of orphans and others which depend for effect on the presence of those whose cause the preacher is advocating. In the Kensington Town Hall Mr. Morris was converted into the interesting object to which all eyes were directed. "Here," exclaimed Mr. Poole, "is one who has wrought for us in the field of art, hard and unceasing work, and who, more than any other living man, has brought this great duty home to our hearts. If we owe him gratitude for having delighted the hearing ear as much as the seeing eye, if we feel that our homes have been made by him more restful to the weary head, more educating to the young intelligence, then" — the speaker need not have finished the sentence, for of course every church-goer knew what was to follow. That Mr. Morris must have winced on hearing all this we have little doubt. It might not have been convenient then to stop such an outburst, but surely the absurd passage could have been cancelled in the printing.

Although all the lecturers agree in advising the present age to have recourse to the past for what is best in art, each man has his pet period which he would have taken as the standard. Mr. Poole thinks that the colours as well as the forms of Egyptian art are the most suggestive of permanence, immortality, and the like. Mr. Poynter believes in the supremacy of the Greeks even in painting, and that in spontaneity of life and vigour "the best Italian painters were children even to those secondary artists whose works remain for us to judge from." He imagines that some of the Greeks combined the richness and colouring of Titian with the light and shade of Rembrandt.

On the other hand, Mr. Morris says that the best Greek art is less expressive than later work, and that as regards painting it would be unreasonable to suppose that the Greeks gave themselves up to indulgence in the refinements of colour. His faith is in pattern-designing, while Mr. Poynter's desire is to see Owen Jones' book, which consists solely of patterns representing various times and peoples, at the bottom of the sea. According to Mr. Richmond the education of young artists should be carried on with the severe examples of the Italian painters in view. He admires the monumental paintings of Italy, in which trivial human emotions have no part, but "the steady march of man's life, the noblest of his feelings, the greatest episodes of his career, the highest hopes of his soul and its immortality, are the points upon which the painter of eternal truths loves to dwell." Mr. Morris is sceptical about the expediency of the subjects, for he says that in such cases "the pictured wall is apt to become a window through which a man quietly at work or resting looks on some great tragedy, some sad memory of the past, or terrible threat for the future. The constant companionship of such deeply emotional representations are too apt to trouble us at first, and at last to make us callous," because they are always claiming our attention, whether we are in a mood to be stirred by them or not." It will be seen from the foregoing that there is no slight difference between the opinions of the lecturers, but as they would all agree in denouncing the efforts of architects—(Mr. Micklethwaite calls them "murdering restorers")—to make churches less dreary to congregations, the supporters of the society will no doubt be satisfied.

BEDFORD PARK. Nine Views in Chromolithography. The Stores: Bedford Park.

It was at one time accepted that a little red went a long way in a landscape painting, and many a man was afraid to introduce the colour unless on a cloak or hat of one of the figures. A few years since it would have been held to be impossible to make a series of landscapes out of a place which consists of houses having red walls and roofs, and where the colour has not been softened by the influence of time. The experiment has, however, been made. The artists commissioned by Mr. Carr to prepare drawings of the property which he founded at Bedford Park may not in the opinion of some critics have succeeded, but the difficulty of the undertaking must be admitted. The drawings have been reproduced in chromolithography in a style that is not suggestive of copying, and they form a handsome set of plates. The drawing of the houses is of the kind that finds favour with landscape painters; form and proportion are sometimes sacrificed to the artist's notions of effect. The most flagrant example of this is in the view in which the Art School appears. The building may not be free from defects, but there is no reason that we can see for representing it in a manner that would serve for a caricature.

In the first plate Mr. Berry represents the Bath Road, and makes the most of the trees, which are unlike those commonly found in suburban gardens. The second plate, by Mr. J. C. Dollman, shows the Avenue; and as both sides appear, with one exception all the houses are merely indicated. Mr. Hargitt, we suppose, was of opinion that even at Bedford Park distance lends enchantment to the view, for he takes his standpoint on the common. All things considered, his drawing is the most successful of the series. The fifth view, of the schools and stores, by Mr. Harrison, in treatment differs from the others, for in the wall of the house in the foreground the courses and pointing of the bricks are shown. The figures are exceptionally clumsy. Mr. Jackson gives a pleasant view of the church and parsonage, in which the garden that extends across the front contrasts well with the buildings. While some of the drawings are pre-Raphaelite in the anxiety to express detail, Mr. Nash boldly sketches Newton Grove with a coarse pen and sepia, and then works-up the sketch with colour lightly laid on. But no other style appears to be so well adapted for the occasion, and if the lithographs are ever used for drawing-copies in the Park, this one will be found to be the most difficult to follow with success. The single cottage which constitutes Mr. Paget's "Queen Anne Gardens" seems to be constructed of bricks of a different colour from those in other houses. The depth of colour is intense, and is laid on in a manner that is the reverse of Mr. Nash's. In Mr. Rooke's view the roof and upper part of the "Tabard" are seen, with the porch of the church beyond, but the space that intervenes has not been successfully rendered. The view is little more than a study of roofs and chimney-pots. The last plate is by Mr. Trautschold, and would delight a Japanese, as branches with apple-blossoms are thrown across the foreground. Tower House and Queen Anne's Grove form the subject, and lawns and trees are skilfully made to balance the mass of red brick houses.

Ripon.—New Wesleyan schools have lately been opened. The total cost of the new buildings has been about 1,000*l*. The buildings comprise new infant schools and classrooms. The contractors for the work were Messrs. Mitchell & Webster, builders, Ripon; Mr. Simpson, joiner work; Mr. Baynes, slater work; Mr. Dalton, plumber work; and Messrs. Appleton & Son, stone-work.

## LEGAL.

**High Court of Justice—Queen's Bench Division.**

Before Justices DENMAN and MANISTY.

LAWSON *v.* WALLACEY LOCAL BOARD.

This action was brought by the plaintiff, a contractor residing in Glasgow, against the Wallacey Local Board for a sum of 2,489*l.* 3*s.* 11*d.*, being the balance of an amount claimed by him for executing a contract of dredging at Seacombe Ferry.

The statement of the case showed that on May 2, 1878, a contract was entered into between Mr. Lawson and the Wallacey Local Board, whereby the plaintiff undertook to remove 10,000 cubic yards of soil from the bed of the River Mersey at Seacombe Ferry, for which he was to be paid 5,000*l.* The work, which was to be executed under the direction of Mr. Carson, the engineer to the Board, was to be completed before October 1, 1878, subject to an extension of time in case a temporary staging then erected on the site of the proposed work in connection with the new ferry at Seacombe should not be removed within such time as should enable the contractor to complete the work by the time mentioned. The contractor was to be paid 80 per cent. of the value of the work done each month, and on the completion of the work he was to be paid the balance of the 5000*l.* due. Any difference which might arise was to be settled by the engineer. On September 9, 1878, the contractor commenced work, and finished on January 9, 1879. He then wrote the engineer claiming the balance. Correspondence passed between the engineer and the contractor, the former alleging that the contract had not been fulfilled, and disputed the plaintiff's mode of measurement. On January 15 plaintiff wrote stating that certain piles erected by Messrs. Brassey for a landing stage at Seacombe Ferry prevented him getting on with the dredging. To this Mr. Carson replied that Messrs. Brassey would be urged to remove the temporary stage, adding that if plaintiff suffered injury he would be compensated. Part of this landing stage was removed in February 1879, but the whole was not removed till September 1879. The plaintiff alleged that he was put to considerable inconvenience and expense for wages and rent of dredger through this delay; and on December 10 he wrote to the engineer, telling him that to get a fair profit on the transaction he would require 10,000*l.*, less what he had already received. This amount was subsequently reduced, the plaintiff deducting everything except damage caused by the delay brought about by the non-removal of the temporary landing stage, and he brought the present action for 2,489*l.* 3*s.* 11*d.*, the sum alleged by him to be due from the Local Board after reducing from the total all sums paid by them on account.

Counsel for plaintiff maintained that the Local Board had been guilty of a breach of contract, for which they must pay damages. The matter was not one which under the agreement it was in the power of the engineer to decide. He submitted that there was no evidence of an agreement on the part of the plaintiff to waive his claim for damages; that there had been a breach of agreement by the Local Board; and there being no independent agreement to refer the matter to the engineer, there would be no award which would be binding on the plaintiff. He urged further that the Local Board were bound by the agreement entered into by their engineer, namely, to compensate Mr. Lawson for delay caused by the landing stage. On these grounds he asked for judgment as to whether there was a cause of action. For the defendants it was argued that the plaintiff had been fully compensated for the delay, as 962*l.* 6*s.* 2*d.* had been awarded him on account of that. The plaintiff had in effect submitted the case to the engineer, and when he found he could not get all he wanted he turned round and refused to admit his right to decide the question. In reply it was contended that there had never been a request to the engineer to arbitrate on the question, and that there had been no intention to arbitrate under the agreement.

Judgment was reserved.

**CHURCH BUILDING AND RESTORATION.**

**Clifford's Mesne.**—The new church of St. Peter has been opened. The church is of local stone, with Bath stone dressings, and will accommodate about 100 persons. The work has been carried out by Mr. Wibby, builder, of Gloucester, the architect being Mr. S. Harris, London.

**Clayton-le-Moors.**—A new Baptist chapel and school were opened for public worship on October 24. The building consists of a chapel to seat 276 adults and a school for 400 scholars, and is so arranged that eventually the whole building will be used as a chapel to seat 714 persons, no structural alterations being required except the taking down of a partition wall and completing the seating of the portion now used as a school. There will then be three vestries at the back. Land has been secured behind the chapel for a detached school to be built when required. The site is enclosed by a stone boundary wall with iron gates and railings, and the building is erected of local stone from the plans and under the superintendence of Mr. George Baines, architect, Accrington. The total cost of the buildings is about 2,400*l.*

**Aspull.**—The church of St. Elizabeth, lately erected, was opened on the 1st. The plan comprises a broad nave and chancel of nearly equal width, the chancel being somewhat higher than the nave. With the exception of a contribution of 1,200*l.* from the late Lord Crawford, the new church has been erected at the sole cost of Mr. Roger Leigh, who has also built schools and intends erecting a parsonage house. The total cost of the church has been about 6,000*l.* The various buildings have been carried out by Mr. W. Winnard, contractor for the church, and Mr. T. Darnbrough for the schools and master's house, &c., under direction of the architects, Messrs. Medland and Henry Taylor, of Manchester.

**Bulwell.**—The foundation-stone of a new church has been laid. It will consist of nave, north and south aisles, apsidal chancel, &c.; the style being Early English Decorated; the building to be of Bulwell stone, with Bath stone dressings. Mr. Knight, of Nottingham, is the architect, and Mr. McCulloch, of Bulwell, the contractor.

**Whiston.**—A contract has been taken for the restoration of Whiston church as a memorial of the late Canon Howard. Mr. J. Oldrid Scott is the architect. Designs have also been prepared for the restoration of the tower.

**Paignton.**—A new Baptist chapel has lately been opened. The building has been erected by Messrs. King & Son, contractors, under the superintendence of Mr. G. Soudon Bridgman, architect, of Torquay and Paignton.

**Sudbury.**—The church of All Saints, Sudbury, has been reopened after the carrying out of works of renovation under the direction of Mr. Fawcett, architect, of Cambridge. The cost has been about 1,000*l.* Among other works the east window has been filled with stained glass, the subject represented being the Ascension.

**Stoke Golding.**—The chancel of the parish church has been reopened after being rebuilt. An old gallery, &c., which blocked up the tower arch and the west end of the aisle have been cleared away and the tower arch restored. The works have been carried out by Messrs. Law & King, of Lutterworth, under the direction of the architect, Mr. W. Bassett Smith, of London.

**Washaway.**—A mission church erected at Washaway, between Bodmin and Wadebridge, Cornwall, has been opened. The architect was Mr. Reeve, London, and the contractors were Messrs. Cleave, Gill & Williams.

**Carnarvon.**—The foundation-stones have been laid of a Presbyterian chapel. The building is thirteenth-century in style, and will with site cost about 3,849*l.* Mr. Richard Owen, of Liverpool, is the architect, and Mr. R. R. Williams, of Carnarvon, the contractor.

**Somersham.**—Service has been resumed in the church of St. Mary. Works of restoration have been carried out by Messrs. J. B. & F. Bennett, contractors, Ipswich, from the designs of Mr. Bisshopp. Messrs. Crisp & Smith executed the painting and stencilling; Messrs. Groom and Son, of Ipswich, the carved work.

**Gloacaenog, Denbighshire.**—The parish church was reopened on the 9th inst., after restoration under the direction of Messrs. Perkin & Bulmer, of Leeds, architects. The principal works have been the rebuilding of south wall, and forcing the roof to its original position by means of tie-rods and screw-jacks; new masonry and glass to north-east and south windows; two additional windows in north wall; repairing east window (5-light perpendicular), new tile floor, and Yorkshire steps and footpace to sacrum; new oak porch and north and south doors; new prayer desks and oak lectern; replastering walls internally and pointing externally; cleaning internal seating, oak screen, roof timbers, and pulpit from paint and varnish, and polishing same; reslating lych gate and new gate of old oak; new spouts, fall pipes, and drains (there being no provision for carrying off the water previously). The works have been carried out by Mr. John Morris, builder, Ruthin. The oak lectern is the work of Mr. J. W. Appleyard, of Leeds.

**Darlington.**—The new chancel of St. James's Church, Darlington, has been opened. The old portion of the church was completed in 1876. The additions now made comprise new chancel, organ-chamber, and choir vestry, with heating-chamber under. The chancel is lofty and of pleasing proportions; it is apsidal ended, and lighted by three geometrical traceried windows. The works have been carried out from designs of Messrs. Clarke & Moscrop, of Darlington.

**Manchester.**—The memorial-stone of a new central Board school, Deansgate, has been laid. The school is to be built from the designs of Mr. Henry Lord, whose designs were selected in competition. Messrs. W. Southern & Sons are the contractors. All the floors are fireproof, and communicate with each other by stone staircases. Stock brickwork and stone dressings are being used for the external walls. The schools when completed will accommodate 1,200 children, and there is also accommodation provided for a caretaker. The contract, exclusive of the foundations, amounts to 12,472*l.* 10*s.*

### SCHOOL BUILDINGS.

**Broughton, Manchester.**—In autumn last there was a limited competition for a Baptist chapel and school. The design submitted by Mr. G. Baines, of Accrington, was approved, and the school is now being erected at an estimated cost of 1,500*l*. It will be used as a school chapel until the new chapel is erected, and consists of a schoolroom 63 feet by 33 feet; 13 feet of the end of this room is cut off by glazed sliding screens so as to form two classrooms, each 13 feet by 13 feet, and inner and outer vestibule in centre with two pairs of swing doors. On one side of the main school is an infants'-room, with separate entrance, and 24 feet by 16 feet. A platform is placed at the opposite end of the school to the entrance, and behind the platform end wall is a vestry 11 feet by 13 feet, and another 21 feet by 13 feet with kitchen, lift, and heating-chamber under. The building will be Early English in style, of red stocks and stone dressings. The open-timbered roof and the joinery will be of pitch pine varnished. Mr. George Parkinson, of Ancoats, Manchester, is the builder, and Mr. Robert Cronshaw the clerk of works.

**Worcester.**—The foundation-stone of a school for the St. Peter Extra-Municipal School Board has been laid at the Cherry Orchard. The school is to accommodate 108 children—36 infants and 72 older children. The estimated cost of the site and building is 1,060*l*. The building will be a simple treatment of the Queen Anne style, and will be roofed with Broseley tiles. Mr. A. H. Parker, of Worcester, is the architect, and Messrs. H. and T. Dixon are the contractors.

**Sidcup.**—The National schools, which have just been completed from the designs of Mr. W. Seckham Witherington, F.R.I.B.A., have been opened by the Bishop of Dover. They are erected on a site in the Birkbeck Road, which was given by the late Miss Berens, and accommodate 160 children. The school-rooms are divided in the centre by revolving shutters and curtains, so as to separate the boys and girls, and in connection with each half there is a classroom. The elevation is plainly treated in the Queen Anne style. The nett cost of the schools, fittings, fencing, and playground was 963*l*, or 6*l* per head. The work was carried out by Mr. T. Gregory, of Clapham Junction.

### NEW BUILDINGS.

**Falkirk.**—Owing to the increase of the town, and the rapid development of the iron and timber trades of the district, the present post-office has been found quite inadequate for the requirements of the burgh. Contracts for a new building have been entered into, which will afford every facility for the increasing business. Mr. James M. Monro, architect, Glasgow, designed the plans.

**North Shields.**—Banking premises for Messrs. Hodgkin, Barnett, Pease, Spence & Co., are to be erected on the site of the old "Commercial Hotel" from the plans of Mr. F. R. N. Haswell, F.R.I.B.A., Mr. G. F. Shotton, of North Shields, being the contractor. The buildings will be in Classic style, of polished and moulded stone. The front shows two wings, with centre between slightly recessed. The banking-room will be 36 feet by 26½ feet, extending from front to back, and lighted from both sides. The whole of the ground floor is fireproof, so that if the upper or residential part were destroyed by fire, the bank would remain intact.

**Lanchester.**—The rebuilding of Lanchester Union Workhouse has been completed from the designs of Mr. W. Lister Newcombe, F.R.I.B.A., architect, of Newcastle-on-Tyne.

**Carlisle.**—The new mission hall erected in connection with the parish of St. Paul was opened on Sunday evening last by the Bishop of Carlisle. The site was generously given by the Duke of Devonshire. Mr. Geo. D. Oliver, A.R.I.B.A., was the architect; and Mr. T. Allen the clerk of works.

### ARCHÆOLOGY.

**Discoveries at Revel.**—The *Riga Zeitung* gives an interesting account of the valuable manuscripts lately discovered at Revel. It was proposed to refit an apartment on the ground-floor of the Hôtel de Ville, to serve as an additional receptacle for the city archives. But on examination it was found to be filled almost to the ceiling with manuscripts and books, the bulk of which belonged to the eighteenth and seventeenth centuries, while some thousands of them dated from the sixteenth, very many from the fifteenth, and some even went back to the fourteenth century. The most valuable among them was perhaps a collection of municipal account-books and similar documents. Hitherto only a few of the old city books of this once-famous Hanse town were believed to exist; but about forty of them, of all kinds, ranging from the fourteenth to the sixteenth century, have here been brought to light. Books of all kinds, such as were kept probably only in the Middle Ages, are here represented: accounts of the municipal lime-kilns, mills, exchange of coins, exchequer receipts, beginning

with the year 1432, registers of incoming ships, with abstracts of their bills of lading (from the beginning of the fifteenth century), port dues, lists of citizens, records of inheritances, ledger of receipts from succession duties, record of letters of convoy, several letter-books, one of which ranges from 1383 to 1425, and others for the end of the fifteenth and beginning of the sixteenth century. Among the other treasures here discovered is the chronicles of Dünamunde, long believed to be lost, and a manuscript belonging to the municipal archives of Lübeck. German mediæval archæologists are looking forward eagerly to a thorough investigation and calendaring of the contents of this precious "find."

### GENERAL.

**Mr. R. S. Ferguson, F.S.A.**, has been re-elected Mayor of Carlisle.

**Mr. Samuelson, M.P.**, has offered to contribute 2,000*l*. towards building a School of Science at Middlesbrough.

**Mr. H. H. Statham, F.R.I.B.A.**, at the meeting of the Nottingham Art Society, gave a lecture on "Form and Design in Music."

**Mr. Charles Groves** has offered the sum of 10,000*l*. to the Bishop of Liverpool for the building of new churches.

**Mr. J. Lewis Thomas, F.S.A.**, has been appointed Chief Surveyor to the War Office, vice Mr. J. Atwood, who has retired.

**The Strand Theatre** has been rebuilt from designs by Mr. C. J. Phipps, with the improvements suggested by the authorities, and will be opened on the 18th.

**Mr. W. H. Smith, M.P.**, has given 500*l*. towards the restoration and enlargement of Portsea Church, in which Brunel, the engineer, is buried.

**Messrs. Falkiner & Tancred**, of Westminster, and William Arrol & Co., of the Dalmarnock Ironworks, Glasgow, have jointly undertaken the construction of the Forth Bridge.

**Rev. E. Husband**, of St. Michael's, Folkestone, has received an anonymous gift of 1,000*l*. towards the completion of the church by the addition of a new aisle.

**The Worcester Corporation** has received an offer, under certain conditions, of 500*l*. from Mr. Laslett, the member for the city, towards the purchase of the late exhibition buildings for purposes of public recreation.

**The Albissima Paint Company** have, in consequence of the constant demand for mixed colours, been obliged to prepare their paint ready for use, and to supply it in all colours. At the same time they have added colours for grounds for graining.

**Buchan Hill, Sussex.**—The facing bricks for this mansion, which was illustrated last week, were specially made by Mr. Thomas Lawrence, of Bracknell. They number 300,000, and are the No. 4 orange-red hand-made pressed, the size being 9 inches by 4½ inches by 2 inches.

**The Edinburgh Town Council**, in view of anticipated applications by certain private companies for provisional orders under the Electric Lighting Act to supply the town with electric light, have resolved to give notice of application for an order, so as to retain in their own hands the regulation of the light.

**St. Peter's Church, Plymouth.**—At a sub-committee meeting held on Monday, November 6, 1882, the following resolution was proposed by Mr. John Shelley (the present Mayor of Plymouth) and carried unanimously: "That the committee desire to take this opportunity of expressing their high appreciation of the architect's conduct throughout the whole of the very difficult controversy with the builder, and their gratitude to him for his diligent attention to their interests, and hereby offer him this expression of their thanks."

**Royal Scottish Academy.**—The following members form the Council for the current year:—Sir William Fettes Douglas, president and trustee; Messrs. W. F. Vallance, Robert Gibb, Arthur Perigal, Wm. McTaggart, Robert Herdman, Alex. Fraser, George Hay, secretary and trustee; and Arthur Perigal, treasurer and trustee. The following office-bearers have been elected:—Messrs. J. M. Barclay, trustee; Waller H. Paton and Gourlay Steell, auditors; John Hutchison, librarian; Robert Herdman and W. F. Vallance, curators of library; J. M. Barclay, Wm. McTaggart, W. E. Lockhart, and Robert Gibb, visitors of the Life Academy.

**The Liverpool Architectural Society** held its third ordinary meeting on Wednesday evening, at the Royal Institution, Colquitt Street. Mr. Thomas Cook (vice-president) occupied the chair, and there was a good attendance of members. The following prizes, given by the society, were awarded:—Class of Construction and Design: 1. Mr. T. W. Walshaw; 2. Mr. T. Havelock Sutton. Prizes for measured drawings of Birkenhead Priory: Messrs. W. M. Mercer and G. Hornblower. Mr. H. B. Bare read a paper entitled "A Few Suggestions for Students' Classes," in the course of which he asked if the training of architectural students was sufficiently directed to the artistic side of the profession. The answer, he feared, must be in the negative, and unless some special means were provided for the student out of the daily routine of an office, he would not become in effect an artist at all.

# The Architect.

## THE DRAWING OF THE FIGURE BY STUDENTS OF ARCHITECTURE.

It is frequently urged upon architects, and especially upon those who as yet are chiefly occupied in learning their art, that the late WILLIAM BURGESS, whose authority is entitled to great weight upon such a question, attached the utmost importance to a cultivation of the drawing of the human figure as a means of acquiring facility in both draughtsmanship and design; and when the new President of the Architectural Association makes pointed allusion to this in his recent inaugural address, perhaps no one will hesitate to approve what he says. At the same time it is not desirable that the observation should always pass without examination, or the argument which lies concealed within it be accepted always without reflection, at a time when everything that concerns drawing is so especially interesting, as it at present is, in its bearings upon English architectural progress.

The doctrine that the delineation of the form and features of man is the highest exercise in artistic drawing may remind some sceptical persons of that celebrated trophy of art concerning which the lion in the fable made the apt observation, that if it had happened to be sculptured by a lion instead of a man, *Felis* would have been represented conquering *Homo*, instead of *Homo* conquering him. Now, if the candid opinion of the intelligent occupants of the baboon cage, for instance, at the Regent's Park, could be fairly ascertained, one can scarcely take leave to suggest that the delineation of the baboon figure would be voted the perfection of artistic practice; but there are specimens of animal elegance in the gardens, nevertheless, which even Queen ELIZABETH herself, who above all things "loved to look upon a goodly man," might safely have hesitated to place in a lower rank than the goodliest man she ever looked upon. Not only so, but, when the human figure in art, as will be remembered, may be either draped or undraped, and in not a few cases is preferably draped, whilst our other competitors for the palm of natural beauty are never otherwise than as Nature herself has clothed them, here again we have an incident which must certainly be scored in favour of the lower types of beauty. In a word, although there is much that is satisfactory to our instinct in the dogma which assigns to the human figure not only supremacy but perfection—for the gods themselves with the art-inspired Hellenes were men, and it was only such as the clumsy Egyptians who idealised them in the form of bullocks and cats—yet it is difficult to demonstrate that instinct represents in this case so well as it ought to do the conclusive judgment which is permitted to ignore the logical process it represents only when this is too plain to demand recognition.

If we may therefore dismiss the mere assumption that there is a perfection of beauty in man, and look elsewhere for a reason why the drawing of the figure should be advocated by such an artist as BURGESS for the education of an architectural designer, we may submit more reasons than one; for, as ought perhaps to have been said before, the accuracy of the doctrine, whatever may be said of its first principles, will no doubt be admitted in practice by almost all who are qualified to judge.

One reason, then, seems to be simply this: that the human figure, whether draped or not, affords us the best opportunity of thoroughly understanding what we are drawing. We are so familiar in our own person with every feature of it, every function, and every form of change, that a comparatively slight initiation into the mysteries of its more occult construction is sufficient to enable us to enjoy all the intellectual profit and delight which follow upon a sound critical knowledge of our subject. If we would draw a horse, for example, with equal science, it becomes an anatomical exercise rather than an artistic; and still more in the case of a tree or a flower, not only is the artist's ignorance of structure in perhaps every possible case all too manifest to the scientific botanist, but the game is never worth the candle, for he might just as well bestow his diligence upon the study of a lowly bunch of turnips as upon a lordly oak, or even better on a tuft of dock and

thistle than a bouquet of roses. It is this kind of acquaintance, then, with the articulation of his subject that gives the figure-draughtsman his peculiar interest in his work, and confers upon him also his peculiar success when it is well done; and we may reasonably affirm that the student of architectural drawing and architectural design, who is able to achieve a moderately sufficient facility in dealing with the human figure, must find himself, if he possesses a real aptitude for architecture as well, all the better able to handle his pencil *articulately*, whether in free-hand work or in geometrical. But for this consideration we might probably hesitate to acknowledge all at once the bearing of a life school, or even one much less ambitious, upon the question how to develop into elegance and grace, with drawing-board and square, the rigid and conventional work of the builder.

The distinction is perfectly clear which separates the wholly natural character of the human figure from the wholly conventional work of architectural design. Even the introduction of drapery, within any acceptable limits, cannot be said to conventionalise the figure; and it is only when the artificial in clothing takes the subject into the domain of the milliner and *modiste*, and of course the fashionable or unfashionable tailor, that the distinction in some measure disappears, and then only in the eyes of the philosopher rather than those of the artist. How then is the articulation of the natural figure really to come in aid for the study of the articulation of conventional building? This is a question not easily answered. No doubt the principle of articulation—that is, of constructive fitness—is primarily the same in Nature and in building; but this does not seem to carry us much farther, for the animal anatomy, even when far less complex than in the structure of man, is far more so than the most scientific devices of the building art. The articulation of architecture, indeed, is vastly exceeded, if not in the work of the civil engineer, certainly in that of the machinist in a thousand instances. Nevertheless we will still consent to adhere to our proposition that figure-drawing teaches the principle of articulation, and simply leave the architectural student who draws the figure to find out for himself, as he readily will do, how to articulate his design on the principles which Nature exhibits, where others for want of this supplementary exercise may often fail to do so. For, after all, it is not the imitation of natural construction that is requisite, but the introduction of the artistic-constructive, as an element of common-sense design, from the highest effort down to the lowliest; and we need not hesitate to say that, if architects could be led to unlearn what they have often so painfully learnt in academical superfluousness, and to learn what they have not learnt, if in the form of thought rather than of practice, with regard to that which lies beneath the surface, as the muscle lies beneath the skin and the bone beneath the muscle, then the result might be looked for, we will not say in the abandonment of the ancient mannerisms which we call styles, but surely in the introduction into the practice of such styles of the important element of scepticism, whereby in time there might appear such forms of modification as should reconstitute the whole of the detail.

But another effect, and to many the chief of all, which the study and exercise of the drawing of the figure may produce in architecture, must obviously be the acquirement by the very best means of that peculiar power of freehand draughtsmanship which may be called the very language of the highest endeavours of artistic design. In all circumstances we may say that figure-drawing is a test of the artistic power of the draughtsman. The designer who can accomplish it freely can with equal facility accomplish all else, and amongst the rest even the most mechanical kind of the work of square and rule. Of this there are many examples everywhere around us.

At the same time we must not fail to observe the fact that the mere painter does not make a good architect. (May we suggest also that the mere *sketcher* does not make a good architect?) But this is when he understands painting alone, and not architectural construction at all; and no one will be prepared to say that the architect should allow himself to neglect or ignore architecture because of his feeling himself competent, however much, to draw the figure. Conventional forms to suit the artificialities of building must always be the first consideration, and the facilities of representation always subsidiary; and this of course every good architect clearly understands.

It is with no small satisfaction, therefore, that we observe the progress which is being made in the direction of the

encouragement of figure-drawing amongst our young architects. Of landscape drawing and ornament we might also say much, but scarcely so much as of the figure. Both of these exercises may be directed to more or less of mischief, and indeed to our knowledge have been, as regards both draughtsmanship and design; but of the other we can hardly admit that it is possible to pervert it, or to bring it down, except in vicious caricature, to a lower level than that of high practical art universally available.

### PERSPECTIVE AND ITS PROFESSORS.

By W. WATKISS LLOYD.

IN the interesting biography which Mrs. DE MORGAN has recently given to the world of her late husband, the first Professor of Mathematics at the London University—a worthy as well as affectionate record of a man who combined wit with science, and simplicity of character with good sense and resolute high-mindedness—it is mentioned that in the books of his library, which Lord OVERSTONE after his death purchased and presented to the University, will be found many a piquant manuscript note or pertinent annotation. This notice reminded me that on one of my own shelves I had a little book, picked up at a bookstall many years since, containing the professor's autograph. I found it relegated to a corner where it had the companionship of many other volumes, all condemned after brief but sufficient examination to definitive oblivion. Drawn forth by unexpected release from this limbo it proved to be "The Art of Drawing in Perspective Made Easy to those who have no Previous Knowledge in the Mathematics. By JAMES FERGUSON, F.R.S., revised by DAVID BREWSTER, LL.D., F.R.S.Lond. & Sec. R.S.Ed., &c. A New Edition. 1823." But across the title-page and immediately below these titles of honour and guarantees of competence is to be read this scholion:—

Sir D. B. at this date published more than one mathematical book as the translation of LEGENDRE'S geometry and this. He was not, I should think, mathematician enough for either. The translation of LEGENDRE was certainly done by GALBRAITH.—A. DE M., Feb. 14, 1863.

It may be remarked that DE MORGAN was in error, for the translation of LEGENDRE was by THOMAS CARLYLE, who appended thereto an essay on Proportion. But it would be unfair to Sir DAVID BREWSTER, who had his own titles to respectful consideration, to give public circulation to such a criticism without putting its accuracy to sufficient test; and the critic, on his own part or his representatives, would have a right to challenge an appeal to the matter of fact as protection against suspicion of temper or captiousness.

The Preface to "The Art of Drawing in Perspective Made Easy" contains some curious observations on the treatment of perspective problems by RAPHAEL, for which the revising editor may not have been originally responsible, but which, in any case, he neglected either to revise or protest against. They might not have been worth adverting to, but for their supplying an occasion to recognise what true artistic genius is displayed in the deviations from the rigid formulas of prosaic science;

One instance, it is said, of want of this branch of knowledge—perspective—in the works of one of the greatest painters that ever existed, the celebrated RAPHAEL URBIN, is a very capital mistake in the historical picture of OUR SAVIOUR'S Transfiguration on the Mount. He is represented, with those who were then with Him, almost as large as the rest of his disciples at the foot of the mount, with the father and mother of the boy whom they brought to be cured; and the mother, though on her bended knees, is more than half as tall as the mount is high. So that the mount appears only the size of a little hay-rick, with a few people on its top, and a greater number at its bottom on the ground; in which case a spectator at a little distance could as well distinguish the features of those on the top as those on the ground. But upon any large eminence deserving the name of a mount that would be quite impossible. My only reason for mentioning these extraordinary particulars is to show how necessary it is for painters to be well acquainted with the rules of perspective.

But the reason thus given for so rare an exposition stands in no relation whatever to its effect, which is to show conversely how desirable it is for those who treat of perspective to be well acquainted with the principles and prerogatives of expressive painting. Speaking generally, the works of RAPHAEL are rather a proof of how small a modicum of the rules of perspective were needed for the successful execution of historical compositions. It may be doubted whether the science

of his time was prepared to grapple with any problems than such as could be solved by the simplest application and aid of parallel perspective. This sufficed for the co-ordination of the upper and lower groups of the *Dispute of the Sacrament*, and for the architecture of the spacious vaulted halls of the *School of Athens*. In this last composition perspective is only materially at fault in the lines of the block, against which a solitary booted figure leans his elbow as he sits in deep thought well forward in the foreground. The magnificent cartoon for this grand composition is preserved in the Ambrosian library at Milan. The small space in the corner, which the artist filled in the finished work with his own portrait, and that of his master, PIETRO PERUGINO, is disappointedly left a blank, and the upper architecture of the hall is not included; but otherwise the only other blank is a space left for the studious figure already referred to. The suspicion is strong that the painter left it so when he was quite resolved as to the attitude which he required for the figure, but was not satisfied as to the treatment—which ultimately was faulty enough—of the oblique perspective of the altar-like object which serves him for a desk.

In the cartoon of *Paul Preaching at Athens* it is clear, from the relation of the architectural background to the groups, that its general distribution and ordination were devised by the painter himself, however he may have committed to others the details. Here again we note an instance of palpable inaccuracy where there is requirement for other vanishing points, besides the point of sight and distance points, for the accurate delineation of the capitals of columns under the circular architrave of the temple. But the perspective relation of all the figures, which are introduced at different distances and levels, is perfectly observed. If we carry lines from the head and feet of St. PAUL—the measure of his erect stature, to the point of sight in one direction, and the plane of the ground line of the pavement on which he stands in the other—we shall find that DIONYSIUS is nearer than St. PAUL to the picture plane, and the figures of the other listeners as they are more and more remote, have dimensions assigned to them which are in strict relation to their respective distances.

What, then, is the *rationale* of the abnormal treatment of the groups of the *Transfiguration*? We may ask the same question in regard to some of the cartoons, where the explanation is more simple. In the *Calling of Peter* the Apostles all stand on level ground, and their heads are on a level, as ranging with the plane of the horizon. These heads, moreover, are of general uniform magnitude, albeit the heights of the Apostles at the extreme left, as more remote from the front, receive due perspective diminution. But the expression of the faces was what RAPHAEL was chiefly concerned about and treated as all-important, and at all risks he retained the magnitude which lent this best effect; at the same time, he so successfully masked the incongruity by covering up the limbs in drapery, and made a palpable contrast so dexterously, that the primary incongruity usually escapes notice altogether.

The far more extraordinary licenses of which he made masterly use in the *Transfiguration* are of a different character. Voluntary licenses they are in the strictest sense of the word, and not lapses from ignorance, as our author assumes—an assumption disproved sufficiently by due perspective management in other compositions. His problem is the harmonious combination of incidents which are strongly contrasted but correlative in virtue of their very contrast. In the group on the lower ground level the demoniac boy is convulsed in the midst of his excited and afflicted kindred, who are appealing for comfort and aid to the Apostles—the Apostles, who on their part already recognise their inability and are reduced to refer to the power of the absent Master; on the summit of the mount JESUS appears glorified, and announced by the divine voice as all-sufficing, supreme at once over the representations of both prophecy and the law. Humanity, in fact, is typified below, afflicted, despairing, perplexed, and hopeless, but for rescue by superior power and interference; and in the scene above the justification of such a hope is manifested when JESUS, as the embodiment of all that the ages had slowly or amidst conflict been evolving, receives supernatural sanction of closing once for all the conflict of pretensions between free prophesying and formal legality—between MOSES and ELIAS. The two incidents were therefore to be represented not more positively distinct in scene than interlocked by sympathy. The separation physically is sufficiently indicated by the adoption

of distinct perspective horizons for the two scenes ; below we are on the same ground level with the Apostles and their supplicants ; above we have the summit and surface of the mount under our view. RAPHAEL is as skilful in reconciling us to accepting typical intervals of space as SHAKESPEARE in shortening up a lapse of time.

The true relations of the two main groups, and of the elements of each in themselves, can scarcely be duly appreciated in reduced copies, or indeed by any but those who have had the happiness to stand before the masterpiece itself in the Vatican. It is only then that we recognise, but recognise at once, the full effect in majestic isolation of the glorified figure of the SAVIOUR. When only the engraving has been before us, what is apt to escape observation, notwithstanding the distinctly smaller scale of MOSES and ELIAS, is that they are at some distance behind ; are not regarding or adoring CHRIST, but interchanging communication with each other. By virtue of tone and colour this becomes self-evident ; and, moreover, while the figure of CHRIST receives light from the left, like the group of Apostles, this pair is illuminated upon opposite sides by the burst of radiance from behind which expressively typifies presence and announcing voice. To the same effect the Divine treatment, both in tones and positive magnitude of the three prostrate Apostles, gives them a third distinct position, and completes the marvellous gradation of interest in a composition of which the ultimate and intimate unity comes home more absolutely for those who are worthy of the highest devotional art the longer it is contemplated.

### CUTTING TOOLS.\*

THE modern epic, according to Mr. Carlyle, should sing "Tools and the Man," instead of "Arms and the Man"; and in spite of temporary fits of the war fever, England is beginning to see that her very existence is dependent on the possession and use of improved tools for handiwork and machine work. Hitherto in this country we have been accustomed to treat tools empirically ; it was not supposed that the forms of them could be made subjects of calculation, and that theory was no less concerned in the tools employed in erecting a structure than in the structure itself. It was long ago pointed out by the late Professor Willis that in no department was there so much distrust of science as in practical mechanics, although in none was co-operation more needed. "The untaught inventor," it was said, "struggling to give form and reality to his conceptions of a new machine, is in reality practising imperfectly and unknowingly the very geometrical science he despises, and which, if he had acquired its elements, would at once have shown him how to systematise and arrange his ideas." There has been some improvement of late years, but it cannot yet be said that in general there is much regard given by practical men to the theory of the machines and tools they employ. As a means of increasing the interest in tools, we gladly welcome the volume by Professor R. H. Smith, of the Mason College, Birmingham, which is, we believe, the first of the Manuals of Technology about to be issued by Messrs. Cassell, Petter & Galpin. Unlike so many books for students' use, it is not a compilation. The author would appear to have made the theory of tools a specialty, and we doubt if a book can be found in the English language on the subject which contains so much that is novel as well as useful. If the other volumes in the series will in quality correspond with Professor Smith's, it may be said that the publishers have surpassed all their past efforts in furthering industrial education.

Professor Smith evidently believes in the value of the principle contained in the maxim, "a little, but well." He does not attempt to treat of every kind of cutting tool. Those described in his nine chapters are as follows :—Chisel tools for wood ; chipping chisels and hand-planes ; machine-planes for wood ; saws and milling machines ; planing, shaping and slotting machines ; lathes ; cutting tools for lathes ; boring and drilling tools and machines ; and punching and shearing machines. The principles of all those machines are described in a style which ordinary workmen can understand, and they are illustrated by excellent plates showing sections of machines. There is nothing that can be called "amateurish" in any part. From beginning to end the book suggests that it was written in a workshop.

Among the most interesting details in the book are those relating to the character of shavings. It is needless to say that the length, breadth, and thickness of shavings, whether of wood or metal, indicate the extent of the power which was employed to produce them. Hartig's theory is that "the cutting force varies in simple proportion to the depth of shaving," but this is not accepted by Professor Smith. He has made many experiments, which he

intends to continue, in the Mason College, and he "trusts that the law connecting the force with the depth and breadth of the shaving removed will be ultimately discovered. It is evidently upon the magnitude of this force that all proper calculations made in designing the machine must be based."

The following experiments made by Professor Smith on yellow pine and mahogany, with a chisel  $1\frac{1}{2}$  inch broad, will suggest the extent to which measurement is applicable to the production of a shaving :—

1st. Yellow pine plank, well-seasoned and straight-grained,  $1\frac{3}{8}$  inch thick. The chisel-cut taken was the whole thickness of the plank.

(a) Cut parallel to the grain. Chisel  $1\frac{1}{2}$  inch wide by  $\frac{3}{8}$ " thick ;  $\frac{5}{16}$ " length of bevel ;  $\frac{3}{32}$ " length of small facet forming cutting edge.

Thickness of Shaving.	Force required to drive Chisel forward.
0.01 inches . . . . .	14 lbs.
0.03 " . . . . .	21 "
0.1 " . . . . .	35 "
0.18 " . . . . .	41 "

(b) Cut at  $45^\circ$  to the grain. Chisel  $1\frac{1}{2}$ " wide by  $\frac{7}{8}$ " thick ;  $\frac{3}{8}$ " length of bevel ;  $\frac{3}{32}$ " length of small facet.

Thickness of Shaving.	Force required to drive Chisel forward.
0.02 inches . . . . .	28 lbs.
0.03 " . . . . .	37 "
0.11 " . . . . .	46 "
0.2 " . . . . .	78 "

(c) Cut perpendicular to the grain. Same chisel as in (b).

Thickness of Shaving.	Force required to drive Chisel forward.
0.025 inches . . . . .	45 lbs.
0.08 " . . . . .	90 "

2nd. Mahogany of common cheap quality, quite dry.

The same chisel was used as in (b). It was found impossible to measure satisfactorily the force required to cut parallel to the grain, because of the irregularity of the splitting.

Cut at  $45^\circ$  to the grain.

Shaving 0.02 inch thick. Force required 57 lbs.

Cut perpendicular to the grain.

Shaving 0.01 inch thick. Force required 61 lbs.

Examining the numbers for yellow pine, cut parallel to the grain, it is seen that the force does not increase nearly so fast as the thickness of the shaving. It was shown that the part of the force which is spent in splitting the material increased faster than this thickness. The above result shows, then, that most of the force in this case is spent not in splitting, but in the penetration of the cutting edge, the power to drive which forward into the wood, as previously described, increases only slowly (if at all) with the thickness. To this latter there is also to be added the friction between the chisel face and bevel and the cut surfaces.

Another extract from the chapter on saws may afford an example of Professor Smith's method of exposition. It is given in support of the statement that the power required to drive a saw becomes greater in proportion to the width of the cut it takes.

In the hand-saws used in England the cutting-stroke is a push outwards from the shoulder of the workman. This mode of using the tool has been perpetuated by the Anglo-Saxon race in the United States, Canada, and the British Colonies. The blade of the saw is thus thrown in *compression*, and in order that it may have sufficient stiffness to prevent it buckling, it requires to be made far thicker than if it had to transmit the same force in tension only. This liability to buckle is illustrated by lads beginning to learn to saw, who not unfrequently injure a saw-blade by the unsteadiness of the thrust they give to it, which leads to the teeth catching on one side of the cut and a sharp bend, or even a crack, being caused in the blade. As it is almost impossible to remedy such an injury perfectly, the saw becomes permanently damaged. On this account chiefly, also, English saw-blades for hand-work are (and require to be) made of a much better quality of steel than would otherwise be necessary.

In Germany, Italy, and most of the European Continent, as well as throughout the chief peoples of Asia, hand-saws are used in tension, the cutting stroke being a pull towards the chest of the worker. In consequence, the blades are made very much thinner than those of English saws, less material is converted into sawdust, and less exertion is required for a given rate of cutting.

The English method, however, has this advantage, that a man standing upright can exert a considerably greater force in thrusting forward with his arms than he can in pulling inward. This is still more the case if he leans forward over his work, because he can then throw a large portion of his weight on the saw-handle to drive it forward. The result is, that if an English carpenter be pitched against an equally strong German carpenter, each armed with his own tool, the Englishman will saw through as great, or possibly a greater, length of the same thickness as the German will. But the Orientals sit to this sort of work, and, planting the feet against the log being sawn, pull outwards by the contraction of all the muscles of the body. As is well known to us, from our familiarity with the English style of rowing, this is by far the most powerful attitude into which the human muscular system can be thrown. Thus, unless the peculiar shape and position of his work compels, say, the Japanese carpenter to assume an awkwardly cramped position, he is enabled, with his thin, broad saw-blade, to get through his work with far less fatigue and with greater rapidity than an Englishman can.

Thin saws worked in tension, being extremely pliable, are more likely to make a cut that is not quite straight. The thick saw-blade of the English or American make has superior stiffness, and therefore superior

\* 'Cutting Tools, worked by Hand and Machine.' By R. H. Smith, M.I.M.E. Cassell, Petter & Galpin.

guiding power to keep the advance of the cut always in the same straight line; but this superiority in guiding power is again neutralised by the fact already mentioned of the thrust tending to bend the blade, while the pull on the thin saw tends to straighten its blade.

The price charged for Professor Smith's book is only 3s. 6d., and it is therefore within the means of apprentices and workmen.

## ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE second ordinary meeting of the Institute was held on Monday evening, Mr. Horace Jones, President, in the chair. A letter from Mr. Thomas Fairbairn, Hon. Sec. of the Edinburgh Architectural Association, was read calling attention to the forthcoming exhibition of architectural drawings to be held under the auspices of the Association. Framed or unframed paintings, drawings, sketches, and photographs, sculpture and models, illustrative of architecture, ancient and modern, would be received on December 13 and 14. It was proposed to inaugurate the Exhibition on December 22. Copies of the conditions would be sent to the Institute for disposal to the members.

Mr. Edward P'Anson, F.G.S., then read a short paper on

### Mediæval Buildings in Cyprus.

Mr. P'Anson, at the commencement of his paper, said that having read the recent work written by Chevalier Cesnola, containing the account of his archæological researches in Cyprus, he had determined to visit the island in hopes of discovering some fragments of Greek work among the many ancient temples, &c., said to exist there. But in this he had been disappointed. This small island, which was but 150 miles long from east to west and 60 miles wide in its broadest part, was situated contiguous to the mainland, and in the very heart, as it were, of all the great nations of old. Little remained of the architecture of the more ancient conquerors of the island. In 1191 Richard Cœur de Lion had taken Cyprus and sold it to the French Crusader, Guy de Lusignan, whose dynasty held peaceful and prosperous possession until 1372, after which it was held successively by the Genoese and the Venetians down to the Turkish conquest in 1570. Of whatever works were possibly left by its Egyptian or Persian masters no traces remained. The few architectural constructions which preceded those of the Romans were credited to the Phœnicians. Of the Byzantine occupation some slight vestiges, Mr. P'Anson thought, were left, but of Arabian architecture he could light on no such fine examples as were to be seen at Cairo. Of the French epoch, however, many interesting specimens remained. Of Italian Renaissance but little was to be found. The Turks had built a few mosques, a few tombs, and some aqueducts. Their plan was to appropriate any buildings left by their predecessors which they found suitable for their own purposes, destroying all objectionable features, such as carved images, painted glass, or mural decorations. Amongst the most ancient works was a tomb near Larnaka, partly hewn in the rock and partly constructed, having an outer and an inner chamber. The former was covered with a monolith, fully 12 feet wide, the soffit of which was slightly hollowed out in the form of a flat arch. Another pre-Roman monument was that known as the Ai Katharina near Salamis. It was also presumably a tomb, and was 33 feet long and 20 wide. The roof was built of colossal stones, and formed a pointed arch of the rudest construction. On one side, at right angles to the larger chamber, was another called the Treasury, the roof of which was formed by two inclined stones abutting against each other like the stones at the entrance of the Great Pyramid. There was a cornice to the large chamber formed by a cavetto moulding, like the external cornices of the Egyptian temples. There were indications that the covering stones of the arched roof were stepped like those of the pyramids. In two only of the many tombs which Mr. P'Anson saw in various parts of the island was there any architectural form. One was near Kyrenia, and was evidently late Roman. The only one he actually saw opened was near Salamis; it had an Egyptian cavetto cornice like that at Ai Katharina. Of other classical work he found an Ionic capital near Larnaka, and on the south-west coast many marble columns and fragments of such. But the greatest number were at Paphos, where there were remains of a late Roman temple. Elsewhere he observed much defaced fragments of Corinthian capitals, which he thought were Byzantine of the sixth or seventh century. At Nikosia there were columns of late Roman work. At Salamis, besides the vestiges of the old city walls and of a Roman aqueduct, there were the remains of a large building, 60 feet by 180. On the site of the ancient city nothing was left but vast heaps of worn and broken masonry. Near Nikosia he visited some ruins of walls built of huge stones to the thickness of 16 or 17 feet, as well as the remains of very large tanks formed in the rock. Of the best style of Græco-Roman work was a fine marble sarcophagus, standing in the inner court of the Abbey of Bella Pais. At Kuchlia, where was the official residence of the Roman pro-consul, Sergius Paulus, mentioned in the Acts of the Apostles, the site of the great Temple of Venus, 221 feet long by 167 broad, was traced by Cesnola. He had himself failed to trace the site of the temple described by Cesnola, who found traces of mosaics and fragments

of colossal statues. The situation of the temple was commanding, and not far distant from the sea. Considerable remains of the outer walls of the temple existed, but the ground was so thickly strewn with stones as to leave no sign of any building. Coming down to later periods, Mr. P'Anson said there was a fine example of Italian Renaissance in the gateway leading from the harbour of Famagusta, in which town there was also a handsome arcade in the same style. The fortifications, as well as those at Nikosia, and of Kyrenia especially, were fine specimens of mediæval military architecture. What, however, was certainly the most interesting architectural feature in the island was the noble group of mediæval churches which belonged to the time of the Lusignan kings, and ranged from the end of the twelfth to the end of the fourteenth century. A German pilgrim in 1341 was more struck with the churches of Famagusta than with those he had visited in his travels on the mainland. Men from every clime were met in its streets, and the riches of its inhabitants was the common talk. It was the emporium of the East, and commerce was so productive that the proceeds of one voyage sufficed a merchant to build a beautiful church in honour of the Blessed Virgin. From the time of the murder of Peter I. the fortunes of the Lusignan family began to wane and the prosperity of the country to decline, though commerce still held its ground. Nikosia was so populous a city at the time of the Turkish invasion that the Ottoman commander slew 20,000 persons of both sexes, and carried 2,000 youths into captivity.

These Mediæval churches were to be found at the two towns Famagusta and Nikosia; and as the Turks had used some for mosques and others for storehouses, they had been, with the exception of the painted glass and the sculptures, fairly well preserved, particularly those at Nikosia. At Nikosia was the cathedral church of St. Sophia, the church of St. Katherine (both used as mosques), and a third, the church of St. Nicolas, the interior of which he failed to see, now used as a storehouse for grain. Neither in these nor in the ruined churches which Mr. P'Anson saw at Famagusta were there transepts. Nor was there any triforium over the aisle arches, the peculiarity in their construction being that the only roof each had was the stone-vaulted one covering the aisles or nave. The French architects who designed and built these churches, although in other respects they scrupulously retained the French ecclesiastical style, evidently adopted the flat roofing common in the island. St. Sophia's at Nikosia was 232 feet long and 87 feet wide. The east end was semicircular inside, semi-octagonal outside. The height of the nave was 65 feet, that of the aisles 38 feet. The columns were circular with octagonal bases. The nave was divided into six bays, and the east end into five; there was a grand porch at the west end. There were two western towers, both left unfinished, and it had evidently been intended at a future time to prolong the building. The style, which was good throughout, was Decorated. The cathedral had the peculiarity of a door at the east end, and there was another door on the north side. The masonry of both was in marble, and both seemed to have been made later than the original construction, yet the architectural details matched with the rest of the building. Some of the enrichments in the deeply-recessed doorways of the west front seemed also of later work. They, too, were in veined marble, the body of the cathedral being of a fine hard limestone. St. Katharine's was a vaulted building, consisting of a nave only, which was 58 feet by 27 feet. The height was calculated at 52 feet. This church also had a flat roof. By one account it appeared that there were several interesting sepulchral stones which he had not been aware of, and which were likely to escape observation from the Mohammedan custom of putting down carpets. Adjoining the church of St. Katherine—the windows of which were in the best Decorated style—were traces of low buildings, probably of a conventual establishment, and indications of former cloisters. The style of the third—the church of St. Nicolas—appeared to be later than that of St. Sophia. It had three eastern apses and an octagon tower and dome, the plan being probably that of a Greek cross. The remains of churches were numerous at Famagusta, and were said to number twenty. The cathedral of St. Sophia, also used as a mosque, was well preserved, although considerably injured in the Venetian bombardment. The columns were circular; the nave was divided into seven bays with chapels on each side. It was still later in style than St. Sophia at Nikosia, the style being in parts Flamboyant. Its inside length measured 176 feet, and its total width 75 feet. The height of the nave Mr. P'Anson reckoned at 75 feet, and that of the aisles at 40 feet. Each aisle had an eastern apse. The piscina was still perfect, and there were recesses in the walls of the north and south aisles. The western end was terminated by two noble towers with a fine triple doorway. There was no open porch as at Nikosia. This cathedral had lately been well illustrated by Mr. Vacher in the "Sketch-book" of the Architectural Association. Of none of the many other churches in ruins at Famagusta could Mr. P'Anson learn the name. Wondrously well preserved fresco paintings were still to be seen on the walls of some. Amongst others, he noticed one representing St. George and the Dragon. But the style of these frescoes was not good. In one of these half-ruined churches he observed the haunch of the arches of the roof confusedly filled

with large hollow pots, as if to lighten the construction. There was another ecclesiastical building dating from the Middle Ages, which was of singular interest, and in great part marvellously well preserved. It was called the Abbey of Bella Pais. It was beautifully situated on the side of a mountain, overlooking a fertile plain and the sea between the island and Asia Minor. On the south side of the group of buildings forming the abbey was the church, planned in the shape of a Greek cross. Mr. P'Anson deemed it pre-mediæval in date. North of this was a cloister, three sides of which still remained. This cloister formerly enclosed a spacious court, and on its north was a noble hall, 100 feet long by 32 wide and 40 in height. It was lit by windows on the north side commanding a lovely view, and by a rose window at the west end. This was assumed to have been the refectory, on the north side of which was a small pulpit with steps leading into it formed in the thickness of the wall. Below this handsome room was another of the same size, divided into compartments. Upon the lintel over the door of the great hall were sculptured three shields, one representing the Jerusalem Cross, the middle one the royal arms of the Lusignans, and the third a lion rampant. There were in the island many other mediæval ruins and some remains of Renaissance work, not only those of ecclesiastical buildings, but also of castles, of which latter there were extensive relics at Kuchlia, one very perfect at Episcopi, some near Larnaka, and some in the town of Nikosia, in whose narrow streets, round St. Sophia's Cathedral, might also be seen several mediæval doorways. The paper concluded with slight references to the scanty remains of Arabian buildings in Cyprus, and to the domestic architecture of the Turks.

Mr. J. T. WOOD said he had visited Cyprus in 1878, not for the purpose of studying the architecture of the island, but to report to the Trustees of the British Museum whether it would be worth while to undertake any excavations. He was there only a month, and ill half the time, so that he had not much opportunity left to study the architecture, and he could only make a few remarks on the churches at Famagusta. Though not a student of Gothic architecture, he had observed the peculiarly good and bold character of the style of these churches. He had not, however, been able to find more than twelve churches, including the cathedral, though he had walked all over Famagusta several times. The cathedral and three of the other churches had very perfect stone roofs, and at a small expense they might be made suitable for Protestant places of worship. The cathedral was especially noticeable for grace and beauty of general design, proportion of parts, and detail. The gables and doors were peculiarly graceful, the gables being enriched with well-designed crockets. In the side wall of the cathedral he had found an inscription of the fourteenth century describing when the cathedral was built, and therefore determining the date of its erection. He had been looking through some papers for the date, but was unable to find it; he believed it was 1329. In fact it was only at seven o'clock that evening that he knew Mr. P'Anson was to read a paper on Cyprus, otherwise he would have brought some illustrations to supplement his remarks. He should, however, at a future meeting be happy to submit them, and make them over to the archives of the Institute. A thought that struck him in his short inspection of the churches was that they presented quite a new phase of Gothic. Students of architecture should especially visit Famagusta to study the style, and he would recommend them to measure and make careful drawings of all the details of these wonderful churches. Mr. P'Anson had said that the Turks had obliterated or effaced all figure representations; in one of the churches, however, connected with a convent of nuns—he did not at the moment remember the name—there were a series of wall paintings containing at least twenty figures. Mr. Wood concluded his remarks by referring to the great number of rock-tombs at Paphos. They were most curious and wonderful structures, cut out of the rock, and with little or no masonry about them.

Mr. WILLIAM WHITE proposed a vote of thanks to Mr. P'Anson for his paper. From it he gathered that the island of Cyprus had no indigenous architecture, but that the architecture had been wholly imported by the different people who at various periods occupied or passed through the island. He should like to hear more about the eastern door at the Cathedral of Nikosia. It was a remarkable feature, and quite unknown as far as he was aware, in mediæval architecture. He would like to have Mr. P'Anson's opinion as to whether the interior disposition seemed to have been modified by it with reference to the choral arrangement of the sanctuary.

Sir RALPH THOMPSON said he was sorry to state that he knew little about architecture. He had travelled all over Cyprus, and he should say the island was particularly interesting in regard to the architecture. An old castle, a feature of feudal times, had not been noticed by Mr. P'Anson. The island having been once the home of the feudal system, it was peculiar that this castle was almost the only remains of baronial architecture.

Mr. JOHN HEBB said that shortly after the island passed under British administration it had been rumoured that the church of St. Nicolas at Nikosia, one of the interesting groups of French

Gothic churches there, was to be restored and converted into an English church. If that treatment were to befall all the churches in Nikosia and Famagusta, they would meet with a worse fate than those despoiled by the Turks, who only destroyed what was distasteful to their religious views.

Mr. R. PHÉNÉ SPIERS said that Mr. Vacher, whose drawings of Cyprus has been alluded to, must, when studying the architecture in the island, have gone into great detail and acquired a fund of interesting information, and he would no doubt forward what information he could to the Secretary that it might be given in the Transactions.

Professor T. R. SMITH seconded the vote of thanks. He observed that the churches had been referred to as vaulted, but covered by no additional roofing. He would like to know how the vaulting was filled in and the upper surface formed into a roof.

Mr. WOOD said that the roofs were evidently built of solid stone, and, as far as he remembered, the exterior was also finished in stone-work. There was nothing, at any rate, in the way of tiles for a finish. They would see, however, from the sketches he had promised how the roofs were finished.

Mr. EWAN CHRISTIAN, in supporting the resolution, said that the younger members of the profession might well copy the example of Mr. P'Anson, whose enthusiasm was so great that his holidays were devoted to the study of buildings. His Cyprus drawings deserved attention.

The PRESIDENT observed that Sicily, like Cyprus, being contiguous to the mainland, had been occupied in turn by Greeks, Romans, Venetians, the Knights Templars, and later by English. It was richer than Cyprus in Grecian remains, and no doubt had examples of the works of the Mediæval times, of the Crusaders, and earlier still of the Normans, who ranged over all Europe and the Mediterranean; doubtless also there were many works of the time when Guy de Lusignan and his descendants were kings of Cyprus. The President then put the vote to the meeting.

Mr. P'ANSON, in replying, said in reference to the vaulted roofs that he did not know how the haunches were filled in. The houses, as he had before said, were covered with clay and chopped straw, beaten down together. This practically answered all purposes, though, when it did rain, the surface of the roof got sodden and sticky. More recently, he believed, some such composition as pounded brick and lime was used. The haunches were brought up to a tolerably even surface, covered with clay or mud, and slightly sloped. There was a very slight ridge-and-furrow arrangement that drained the water off to a spout. The internal arrangements of the churches seemed to have been left entirely unaltered by the Turks, with this exception, that they smashed up every morsel of stained glass. The eastern door in the cathedral of Nikosia was more modern than the rest of the work, and was constructed of more precious material. All the details showed it to be as good French architecture as any other part of the work. He could not say whether it had been done during the French time of occupation. If done afterwards, it had been done extremely well, and quite in character with the rest. He had had a letter from Mr. Charles Barry saying that a pupil of that gentleman had been, or was about to be, commissioned to restore the cathedral of Famagusta. The building, though dilapidated, was so perfect in every part that any careful architect could restore it. He knew of no other churches that were to be restored. As to the architecture of the islands of Sicily and Cyprus, no doubt there was an analogy, but there was no similarity. When the French occupied Cyprus it was a rich country, and the French were enabled to erect these beautiful buildings, which were purely and distinctively French. In Sicily the buildings were Norman, with an admixture of Byzantine style.

#### SCOTTISH ACADEMY.—LIFE SCHOOL.

THE prizes awarded by the Council of the Royal Scottish Academy for studies of the figure made in the Life School during the last session were presented on the 15th inst. by Sir William Fettes Douglas, P.R.S.A.

The President said—I have lately had occasion to look over the reports of the Royal Scottish Academy from its foundation in 1826 to the present time, and have been both pleased and interested to observe that so many of the prize-holders in its classes have come to the front—have obtained prominent positions in their profession in after-life. This is very satisfactory to the Academy, and inspiring to the prize-holders of to-day. But at the same time there has always been a minority—perhaps a large minority—who never gained any distinction in early life, and yet acquired it gradually in the course of years. The knowledge of this fact may be accepted as a kind of consolation-prize by the disappointed, and not uncheerfully, for hope is often a better stimulant than success. Members of the Academy have often regretted its inability to keep up its life classes for the more advanced students for a longer series of years, as it is thought by many artists, and apparently by most students, that they cannot have too much study from the nude. I am, however, inclined to believe—nay, am convinced—that a very moderate amount of life-class study is sufficient for the education

of most artists; first and principally, because long-continued study in life classes seems to induce a certain laziness of mind, and tends to prevent the proper development of originality and energy. The young artist, after spending under superintendence three or four years in the life classes, should feel that he is now a man, able to think and act for himself; should feel impatient of supervision and mechanical tutelage; eager to think his own thoughts, and work them out his own way. If he has not such feelings, he probably would like very much indeed to drone on, year after year, painting, painting, painting his mind unstimulated, and his hand cramped to monotony, under a master in the life school. From yet another point of view I must consider much or long-continued study in life classes incompatible with true progress. Students there almost invariably slight their extremities. This is sufficiently marked in the studies this year before us. But I do not blame the present students overmuch, because I consider it a vice inseparable from the study of the nude in classes. It would take long to go into the question why this is so, but there is little doubt of the fact. The most distinguished of all students of the nude—William Etty—who studied, or at least painted, in the Royal Academy classes almost to the close of his life, strikingly developed this seemingly inevitable tendency of classes for the nude, his studies ultimately becoming mere lumps of flesh, possessing little but the narrowest sensuous qualities; and the imagination and thought, in which his earlier works were not deficient, became gradually effaced from all his art-work. When the young artist leaves the classes for the nude, he may consider that he has received all the assistance from others others can give him; he has scaffolded his art life, and the question now is, how to build it up? I do not pretend to tell how it is to be done, but this I know, each man must be his own builder. There is no royal road to art, or if there is, it leads only to the half-way house of "dilettanteism"; or its traces are lost in the slough of despond, through which the young artist must struggle as best he may, no man helping or capable of helping him. You have all heard of the land of Cockaigne, of the Island of St. Brandan, of the Isles of the Blessed—

A pleasing land of drowsyhed it was  
Of dreams that wave before the half-shut eye—

a land where no one need work or think, where every wish, though half unformed, was gratified, and roasted partridges flew to the hungry praying to be eaten. This was the land of the poets; but in their wildest imaginings they never fancied aught good or great ever came from or was done in it. Some young artists—so-called—have, it seems, their own land of Cockaigne, a happy place it is, where easels are placed, pallets set, and models are arranged for them; where they have nothing to do but paint, where there is no need for thought or necessity for energy; where industry is but a name and originality unknown; where work lies ready to their hand, and submissive they remain in their tutelage. This is not the fashion in which Nature and their own energy formed great artists. Read the lives of third or fourth-rate men—when they have been written—and you will find a goodly proportion of them were coddled in comfort, and assisted and patted on the head by admiring friends; while the truly great and original struggled and endured, fought and cursed, and reached their ultimate position independently. Artists more than other men seem to require the stimulant of necessity to develop their powers, or rather to enable them to develop their powers; and I do not know an instance of any man lucky in the inheritance "o' world's gear," and while he yet possessed it, ever bending himself continuously to the labour, the weariness, and the disgust invariably attending the thorough and earnest study of art. While I say this, I do not wish to discourage anyone from studying art; it opens up new sources of pleasure in every position in life. But I cannot avoid the conviction that at present it is, as a profession, becoming rather a favourite in the world; and men are putting their children to art as to any other profession or trade, in which they had a reasonable hope of getting them—as the phrase goes—a good connection. This is unfortunate, but it is not all unfortunate; it is a sign that the loaves and fishes are no longer to be numbered in fives and sevens, but are capable of feeding a great multitude. And although the relatively rich mediocrity may sometimes snatch the bread from the very lips of struggling genius, yet it indicates that a wider field has been opened, and richer prizes are in sight, and the young artist may confidently feel that the hope which too often sickened his predecessors in the fight now becomes a tonic, and gives a fillip to his ability and industry. My lungs are not strong enough to pronounce the last word, "industry," with sufficient emphasis, but I look upon it as the best quality the student can possess. If he has ability, it will ripen it; if he has none, it will at least make him respectable if it cannot make him great.

The President then distributed the prizes to the following competitors:—For the best painting from the life (the Chalmers Prize), J. Austen Brown; for the second best, T. Alison and C. K. Robertson, equal. For the best drawing from the life, J. Austen Brown; for the second best, J. Michael Brown. Keith Prize: for the best work of a student in this year's exhibition, R. Noble and H. Raeburn Macbeth. Maclaime Watters' medal, R. Paton Reid. Stuart Prize: first, for picture, J. Michael Brown; second, for alto-

relievo, J. S. Rhind. A statuette of Balfour of Burleigh, by Mr. J. Birnie Rhind, received honourable mention.

Mr. Herdman moved a vote of thanks to the visitors to the Life School.

Mr. Norman Macbeth, in acknowledging the compliment, bore testimony to the industry and uniform good conduct of the students. It was a class involving an immense deal of delicacy; and he thought they were greatly indebted to their worthy curator, Mr. Clark Stanton.

Mr. M'Taggart, in proposing a vote of thanks to the President, said they could not do better than lay to heart what their President had said. In regard to life studies being carried on too long, perhaps, he said, they saw the result of that in the pictures of the Paris Salon. He strongly advocated a careful study of the head, face, hands, and extremities. He thought the nude should be kept apart from the careful and thorough study of these, and remarked that each student in the life class should show in his study that, whether they were elaborate or not, at least that he had an intelligent understanding how to express the extremities. Nothing could be more disagreeable than want of power of expressing those most beautiful parts of the body.

## NEW BUILDINGS IN LEEDS.

THE following criticism on the new buildings in and near Leeds formed part of the address to the Leeds Architectural Society by Mr. J. B. Fraser, F.R.I.B.A., the President:—

The local works executed during the past year are not so numerous nor of such importance as one could have wished, but still they are for the most part creditable to our architects, and in some cases worthy of more consideration than our time will allow.

Firstly, I think Mr. Corson may fairly be congratulated on the near approach of the completion of his handsome block of offices for the Corporation; they are creditable alike to himself and to the town, and I venture further to express a hope that the architect will be allowed (as indeed architects in all cases should be allowed) to direct the design of the minor fittings and the furnishing, so that all may be harmonious and accord with the general scheme of the design.

The only other corporate building in course of erection that I can call to mind is the new Fire Brigade Station, which is not sufficiently far advanced to allow of any opinion being expressed on its merits. On the adjoining site the warehouse for Mr. James Rhodes, designed by Mr. C. F. Wilkinson, is nearing completion, at any rate in so far as the shell of the building is concerned. It is to be regretted that so extensive a building should have its principal elevation to such a narrow street. The fact is, it is impossible to see the front as a whole; for if you stand immediately opposite to it, you only get a general perspective view of the soffits of the openings and drips of the cornices, &c. The prevailing tendency is in the direction of increasing the height of our building premises year by year; and as space for sites gets more costly, I suppose we cannot hope for any modification in that respect. It would be rather a serious matter for the community if the possessor of every site were to be equally aspiring, and indeed in that case we should have to extend the bylaws to regulate the widths of streets and proportionate heights of buildings. The façade appears to me businesslike and substantial, but with no novel or remarkable feature. If I took special exception to any part it would be to the heavy gables with their pedimented tops and ponderous stonework terminals; one cannot help a sensation of uneasiness when passing near such very bold features in a gale of wind.

Last year I expressed a doubt as to the success likely to attend the alteration of the Cookridge Street Baths; I must acknowledge, however, now that they are completed, I am agreeably surprised with the result, which on the whole must be pronounced satisfactory.

The Coliseum in Cookridge Street, designed by Mr. W. Bakewell, is now sufficiently far advanced to allow of, at any rate, a fair idea of the style adopted for the principal front, and to give good promise of something attractive and piquant. The masonry is excellent both in design and execution, and I can assure you that the treatment of the upper portion will be equally satisfactory. The broad masses of plain ashlar walling and the scale of the arched entrance give a breadth and solidity of effect that is often wanting. In Woodhouse Lane a shop has been erected for Mr. Wood, by Mr. Birchall, along with Mr. Hobson. The work is too small to call for extended criticism, but I must mention it as an example of how pleasing an effect may be produced by very simple means when good taste and care are duly exercised.

The erection of the new Baines Memorial Wing of the Yorkshire College has only just been commenced, so that another year at least must elapse before we shall have the opportunity of criticising it. While we cannot perhaps help regretting somewhat that the work was not confided to a Leeds, or at any rate a Yorkshire architect, we have the satisfaction of knowing that in the hands of Mr. Waterhouse it cannot fail to be an addition to the architectural beauties of our town.

I must call your attention for a moment to the temporary Circus, near the New Station, not in order to criticise its architec-

tural features (if it can be said to possess any), or its construction, which I have no doubt is good and adapted for the purpose, but to protest against the erection of so very inflammable a building in the heart of the business part of the town, and actually abutting against valuable property for its entire length, one of the buildings being an important newspaper office. Surely in no other town of equal size and importance would such a thing be tolerated. In and near Swinegate are three small buildings, two inns and business premises, consisting of a block of shops and warehouses. The inns are both designed by Mr. Ambler, evidently with considerable care, the ground-floor storey having the conventional large window and small pilaster treatment; in the case of the "Prince of Wales" an attempt has been made, with decided success, to produce a good effect, but the arrangement of the down pipes has apparently been a difficult problem to solve.

The block of shops by Mr. Corson has a very pleasing elevation of plain, solid-looking character, with good constructional features and a very picturesque treatment of the frontages by the introduction of a circular turret and the arrangement of the angles.

A Mission Room, also designed by Mr. Corson for Messrs. Tetley, in Crown Point Road, while not differing in external appearance from buildings for similar purposes, has been comfortably fitted up, and has a good effect internally. It is also well warmed and ventilated, and the seats are models of comfort.

Another Mission Room of a more permanent type has been erected in Brama Street, from the designs of Messrs. Smith & Tweedale.

S. Hilda's Church at Knostrop, the work of Mr. Micklethwaite, of London, which has been so long in an unfinished state, has at last been opened for divine service. The exterior is by no means equal to churches of the same class designed by our local men, the best feature perhaps being the porch, which, while very simple in design, is good in detail. The interior, however, is well proportioned and handsome, and admirably adapted for preaching. It is the intention of those interested in the church to add at some future day two bays to the nave and a west tower, also to introduce a rood screen; when this is done the internal appearance will be much improved.

One exceptional feature I may mention is the elliptical shape of the nave and chancel boarded ceiling, which appears to clash very painfully with the lines of the windows, but is, I am told, successful acoustically. The font and choir seats are very satisfactory. The arrangements for gas-lighting have a distressing effect, and detract very much from the beauty of the interior.

I noticed with satisfaction the use of chairs instead of fixed benches. Many of our best interiors are spoilt by the close-boarded heavy sittings, the top of the seats, as far as appearance goes, being practically the floor line, and the proportions of the arcades are in many cases ruined by it.

The presbytery now being erected in St. Joseph Street is a marked instance of a picturesque design spoilt by careless and rough work, but in this case I fancy the design is a little too much broken up. We cannot speak in too high terms of the success achieved by Mr. Adams in the Dewsbury Road Board Schools. As an example of what can be done with brickwork of one colour, with only the skilful handling of ordinary rounded and splayed bricks, they are admirable. The roof-line is simple and not spoilt, as is too often the case in similar buildings, by meaningless turrets and eccentric hips and gables; in fact the whole is simple and dignified. The railing is unusually, and I should have thought unnecessarily high; but in these days of athletic and gymnastic culture I suppose the Board find it difficult to keep the aspiring youth to their own territory. The architect has, however, got successfully over the difficulty, and the filling in of the gates is excellent. The Meanwood Schools are more elaborately treated, being in fact like one of the architect's earlier schools near the Hook Memorial Church. The Whitehall Road and Armley Road Schools are not sufficiently far advanced to judge of the design, but I notice that the same simple brick treatment is adopted, and I have no doubt will be equally successful. I have heard occasional grumbling at the sums of money spent on our new schools and on the high school rate, but I am sure if we are to have good substantial and suitable buildings, the difference of cost between absolutely offensive plainness and simple appropriate artistic design would be very small indeed in proportion to the total expenditure, and it may fairly be assumed that a good effect is produced on the children by the character of the buildings in which they are taught from day to day. Another noticeable brick building, also by Messrs. Adams & Kelly, is a very simple mission chapel and school at Campfield. In this case plain square and splayed bricks only are used, and those too of the same make and colour as the general walling, and notwithstanding the very slender means the building is pleasant to the eye, and is not wanting in artistic effect. The dark brick pointed walls inside make the interior a little gloomy, but I suppose motives of economy were pressing. The only private schools that I have noticed are those at Roscoe Place, in connection with the Wesleyan chapel; the planning seems good and the arrangement of classrooms specially commendable. Mr. Danby is the architect.

A well-arranged and picturesque block, comprising chapel with school and lecture-room, &c., for the Unitarian body, designed by

Mr. Connon, is in course of erection in Domestic Street. Special efforts have evidently been made to obtain as much light as possible, and the site has been made the best of. A very excellent life-size figure, executed by Mr. Appleyard, of the celebrated Dr. Priestley, who was formerly minister of this body in Leeds, is to be placed under a canopy in one of the gables.

There seems to be a special dearth of new villas this year; only five came under my notice—one being at Vesper Lane, Kirkstall, of which Mr. Thorpe is architect; one pair at Far Headingley, by Messrs. Perkin & Bulmer; and the others at Wrangthorne, by Messrs. Smith & Tweedale. The former is well planned and comfortable, and has carefully thought-out elevations of Queen Anne character. The villas at Far Headingley are a very successful example of what can be done by judicious treatment of simple materials, and those at Wrangthorne display a careful and good design in brickwork.

The additions to Meanwood Church have been most judiciously made by Mr. Birchall, who had rather a thankless task in harmonising his work with the strange detail of the original building, which, amongst other peculiar features, has the very unsatisfactory one of sham joints on the ashlar of buttresses, &c.

#### COPYRIGHT IN AMERICA.

MR. T. W. CLARKE supplies the following report of the recent attempt to amend the copyright law of the United States:—

The Act was introduced into the Senate by Mr. Hoar early in April, and a few days earlier a duplicate of the Bill was introduced in the House by Mr. Ranney. The Library Committee desired, on consultation, that it be referred to the Patent Committees, and it was so referred. A hearing was had before each committee. It was explained that there was no intention to make anything copyrightable that was not already copyrightable as a "model or design intended to be perfected as a work of the fine arts." Such things were illustrated by the Matzys wrought iron, the Berlin cast iron, the Parisian bronzes, the Sèvres, Dresden, Della Robbia, Limoges, Louzmy, Minton, and Copeland potteries and faïences, the Cellini *repoussé* work, Palissy and Henry III. ware—confessedly works of the fine arts under any definition. Attention was called to the artistic products of this country in faïence, iron, bronze, brass, silver, and plate, by which the houses and households of the country may be and are made beautiful at small cost, and which have been largely imitated abroad in inferior material and execution and sent to this country; and the committee were shown that copyright protection had been taken on many American designs, but that the requirements about marking had resulted either in disfiguring the goods, or that the requisite finish destroyed the marks; and further, that the place where customers and experts looked for marks was on the back or bottom. It was also explained, and the able lawyers of the committee readily saw, that it was intended simply to change the place of marking copyrightable articles. The question of fact, What is a work of the fine arts? would remain where it was before.

It was argued and conceded that all things upon which labour and expense have been bestowed, unnecessary to prepare them for service, but solely to improve their appearance, are broadly to be considered as "works of the fine arts." Modelling, sculpture, carving, architecture, engraving on wood or metal, lithography, painting, printing, bookbinding, cabinet-work, inlaying, repoussé, enamelling, have always been held to be "fine" as distinguished from "industrial" arts, and works of these sorts are subjects of copyright just as music and prints are.

The difference between copyright and design patent for these things has been heretofore, and now is, this: If the work has been published, the author or proprietor can obtain only fourteen years' protection at most under the patent laws. If it is unpublished, he can obtain copyright protection for twenty-eight years with right of renewal. He can take ten copyrights at least for the cost of one patent. Formerly the law gave advantage to the patentee in the matter of marking his goods. Now the patentee and copyrighters are on the same footing in this regard.

The introduction of the Bill was noticed largely in the papers, the hearings before the committees were spoken of, the leading artists, art manufacturers, and dealers took a lively interest in the measure, and corresponded with Congressmen about it. The Senate passed it unanimously. The House suspended the rules at the request of Messrs. Ranney and Ritchie, and with the advocacy of Mr. Cox to allow it to be reported and passed, and probably it was as fully understood as any measure ever before Congress.

But it must always be remembered that the privilege of adjudication on what is and what is not "fine arts" is vested in the Federal Judiciary and nowhere else, and that a postmaster's receipt is as good proof of entry for copyright as the librarian's certificate, so that an assumption of judicial forms by a recording officer in refusing to record can hurt no one but himself. The only quasi-judicial authority of the Librarian of Congress is under Ch. 301, Acts of 1874. He may refuse registration of a print or engraving which is *not* a pictorial illustration or work connected with the fine arts, and prints or labels designed to be used in connection with other articles of manufacture go to the Patent Office.

## NOTES AND COMMENTS.

WHILE popular orators at numerous public meetings throughout Paris are clamouring for the demolition of the partly constructed Cathedral du Sacré-Cœur on the heights of Montmartre, subscriptions towards the completion of the fabric continue to flow in abundantly. The last list, published about a week ago, brings the total to 11,728,685f. (469,147*l.*), and among the later sums received is one of 10,000f. from an anonymous donor, who has already made three previous contributions of like amount. The fact that subscriptions show no sign of falling off must be a welcome surprise to those responsible for the execution of the work, as it was expected that the terrible financial crisis of January, which ruined or crippled so many families of the clerical party, would have materially diminished the receipts. The work is being pushed on with all possible haste.

THE Government of the Nicaraguan Republic have decided upon founding a National School of Art and Manufacture, to be devoted especially, as are those of France, to the higher instruction of foremen and artisans in their various branches of industry, to the training of engineers, and to the superintendence of public works, bridges, canals, roads, railways, &c.; a farming school will be attached for the training of skilled agriculturists. The organisation of the establishment is due to M. A. PETIT-DIDIER, the French Consul-General in Nicaragua, and to M. RONFAUT, a civil engineer, who has been appointed director. Moreover, the whole teaching staff is to be French, and the requisite material has been ordered in France.

THE Académie des Beaux-Arts has elected M. FALGUIÈRES to fill the vacancy caused by the death of M. JOUFFROY in the section of Sculpture. The competitors for the seat were five in number:—MM. FALGUIÈRES, CROUCK, AIMÉ MILLET, BARRAS, and MERCIÉ, and two ballotings took place before the first-named, whose most formidable opponent was M. CROUCK, obtained the absolute majority necessary under the statutes of the Academy. The new member has had a most brilliant career. After gaining the Prix de Rome in 1859, medals in 1864 and 1866, a First-class Medal at the 1867 International Exhibition, and a Medal of Honour in the following year, he was named Knight of the Legion of Honour in 1870. At the 1878 Exhibition he again secured a First-class Medal, and was promoted Officer of the Legion. A few days previous to his election by the Academy the Ecole des Beaux-Arts had conferred upon him a similar honour. It may be noted that M. FALGUIÈRES has not exclusively devoted himself to sculpture, for in the 1875 Salon he carried off a second medal in the section of Painting. His name has for the last twelve months been brought prominently before the public as the designer of the colossal group now surmounting the Arc de Triomphe, where he has erected the plaster model on approval at an expense to himself of 50,000 fr.

For several years past the Luxembourg collection has been threatened by its neighbour the Senate. The Conscript Fathers, who find themselves in very confined quarters in their part of the Palace, seem inclined to turn the magnificent art treasures contained in the public galleries into the street, although at present the State has at its disposal no building suited for their reception. The Senators, however, continue to encroach. One of the principal picture salons has been turned into a committee-room, and a long gallery is used as a means of entrance, with the result that the paintings and statues they contain are withdrawn from public inspection. A few years back similar encroachments on the part of the Upper House elicited a public petition of remonstrance, which—although signed by only 800 persons, the majority of whom, however, bore illustrious and influential names—effected its object. It is to be hoped that a similar movement may speedily be set on foot to save a collection which contains some of the best examples of modern French art from being closed or dispersed.

For some time past the statues in the Tuileries gardens have suffered from wanton acts of vandalism; and among others, FALCONNET'S *Baigneuse*, placed almost in the centre of the reserved garden, has had four fingers of the uplifted right hand knocked off quite recently.

THE Building Bylaws Committee of the Manchester Society of Architects state that they have had several interviews with the Committee of the Manchester and Salford Sanitary Association, and, as the result, a memorial was prepared and forwarded to the Corporation, again urging them to take some steps towards the consolidation and amendment of the building bylaws of the city. The memorial stated that the Society has at different times during the last fourteen years urged this matter upon the Council. A draft of a suggested consolidation of the existing bylaws and other parliamentary powers, with proposed extension thereof, was placed by the Society in the hands of the town clerk as far back as the year 1873. Up to the present time, however, the Society has not succeeded in obtaining the results desired by it, although both the town clerk and the late city surveyor fully admitted their importance. The memorialists are more than ever convinced of the desirableness and necessity of dealing with the bylaws in the manner indicated, and offer to place at the Council's disposal all the information of which they are possessed, and also every assistance within their power.

LAY RECTORS have sometimes extraordinary notions of their powers. In Woodford Halse, in the diocese of Peterborough, the lay rector happens to be a lady. It appears that she lately sent carpenters into the church to alter certain seats in the south side of the chancel, which, at great expense, had been erected by the late lay rector, Sir HENRY DRYDEN, Bart. The direction to the carpenters was to make three square pews of the seats. The men were, however, stopped, but on the following Sunday the lay rector sent labourers to remove two seats, and they did so, though the churchwardens subsequently replaced the seats. In a case of this kind it is difficult to know what to do, for the lady may have been reading some of the laments issued by the Society for the Preservation of Ancient Buildings, and in consequence tried to restore the pews in all their hideousness. The bishop, however, has decided that a lay rector has no right, in virtue of lay rectorship, to interfere with the ornaments or fittings of the fabric of the church, except by means of a faculty granted by the Chancellor of the Diocese in the Consistorial Court; and any person who proceeded with alterations without such an instrument was guilty of a breach of the laws ecclesiastical, and was punishable under such. His lordship asked the churchwardens to inform the lay rector of what he had stated. As the churchwardens are to be answerable to him for the safe custody of the seats, the case may yet come before the Ecclesiastical Courts.

THE picture called *Pomona*, by Mr. MILLAIS, which is now exhibiting in the Haymarket, is remarkable not only for its execution, but for its financial value. It is worth more than any other single figure by the painter. Already it has changed hands more than once. The present owner paid over 2,500*l.* for it, and he has declined to part with it for 3,500*l.*

THE designer of the County Court in Birmingham would seem to believe in what was said by old Bishop HALL—"Wo the State where lawyers flourish"—for he has already caused much illness among the attorneys and officials. It is to be hoped that he has had more mercy on the litigants and witnesses. A local writer says: "It is easy to understand why the business at the new court has to be conducted amidst a universal chattering of teeth and shrugging of shoulders. The ventilator at the top of the building, whenever it is opened, sends down a dreadful draught, which makes every one anxious to have the offending aperture closed again as soon as possible. Then, again, the architect has only provided for a single door at the main entrance to the court, so that the continual opening and shutting makes it extremely uncomfortable for all who have to sit in close proximity to it. But the most remarkable feature of all these thoughtful arrangements is the heating or rather the refrigerating apparatus of the court, which consists of a small fireplace in the neighbourhood of the judge's bench, and a stove near the door. The modicum of heat which proceeds from this limited apparatus is of the mildest kind. Only those, in fact, who consider it dignified and comfortable to sit on the stove can appreciate the warmth at all." Although the court is in this condition, it yields a profit to the State of about 17,000*l.* a year.

## ILLUSTRATIONS.

DESIGN FOR THE HASTINGS INFIRMARY.

THIS illustration is a reproduction by the ink-photo process of a water-colour drawing which was submitted in the recent competition.

DESIGN FOR ST. ANNE'S SCHOOLS.

THE drawing of the St. Anne's Schools is the perspective sent in for that competition by Mr. M. E. MACARTNEY and Mr. ERNEST NEWTON.

INGLE NOOK, KENT HATCH, SURREY.

THE view we publish to-day shows Ingle Nook and raised dais of the dining-room at Kent Hatch. An exterior view of the house was published by us on the 4th of this month. The whole of the woodwork is of oak. The ceiling is constructed of thin oak planks in narrow widths, nailed to joists which rest on solid oak girders 12 inches by 12. The architect of this work was Mr. M. E. MACARTNEY, and the contractors Messrs. FOSTER & DICKSEE, of Rugby.

NEW BATH BUILDINGS, MALVERN.

THESE buildings, which are in connection with the Imperial Hotel, are on the eve of completion, and have been erected to give increased hygienic and hydropathic accommodation of a superior character. They are, or will be, fitted up so thoroughly that every class of persons can have any particular kind of bath they may be ordered or feel inclined to take, for here will be found douche baths of every description, running sitz, inhaling, electric, needle, wave, sponge, plunge, &c., &c., in specially-constructed compartments for ladies and gentlemen respectively, with hot and cold water to all; a Turkish bath, with shampooing and other appliances *ad infinitum*, is being constructed, heated, and ventilated on the principles so successfully adopted at St. Stephen's Green, Dublin, and elsewhere.

A very handsome tepid swimming-bath, with water surface 80 feet by 27 feet, has a separate entrance from the town for schools, clubs, &c. The most salient feature of the whole is contained in the fact that saline water from the justly-celebrated Droitwich springs is brought by railway, and "brine" baths are administered at this establishment, under medical supervision, with scientific appliances heretofore unaccomplished in any other establishment in the country.

The buildings, which are of a substantial character, have had very special care bestowed upon them, so as to render them fit for the purpose. The inside walls are lined with white glazed bricks, relieved by coloured bands, &c., which not only give a pleasing appearance, but an assurance of cleanliness of the highest order. The fittings generally are of the very best make and description.

The buildings, except the swimming-bath, have been carried out by Messrs. D. C. JONES & Co., of Gloucester; the heating and engineering work (with some exceptions) by Messrs. T. BRADFORD & Co., of the Crescent Ironworks, Salford, Manchester. The contractor for the swimming-bath was Mr. JOHN INWOOD, of Malvern; the heating of same being done by Messrs. GOODMAN & WARD, of Worcester; the whole being under the supervision of the architect, Mr. HENRY HADDON, Rockliff, Malvern.

DESIGN FOR STOKE-UPON-TRENT MARKET.

THIS illustration is reproduced from a drawing prepared by Mr. JOHN P. OSBORNE, of Birmingham. The walls were to be of brick, with stone dressings; the columns and principals to roof of cast iron; the floor of asphalt; the area, 145 feet by 98 feet; and the estimated cost, exclusive of cellage, 4,000/.

## MANCHESTER ARCHITECTURAL ASSOCIATION.

A MEETING of the members took place on the 21st inst. at the rooms of the Association in the old Town Hall, King Street. There was a good attendance; the principal object of the meeting being to receive an address from the President, Mr. J. Medland Taylor, M.S.A., upon "Some Elements of Success." A hearty vote of thanks to Mr. Taylor for his address was proposed by Mr. Brooke and seconded by Mr. Hodgson; the motion was spoken to and supported by Messrs. Chadwick and Baldwin, and unanimously adopted by the meeting.

## COMANA, IN ASIA MINOR.

A COMMUNICATION from Mr. W. M. Ramsay, who is travelling in Asia Minor, appears in the *Scotsman*, in which he gives the following account of Comana:—

We had looked forward with the greatest interest to seeing Comana, the old religious centre of Cappadocia. If we could learn something definite about this famous old city, a flood of light would be cast on the early history and the ethnology of Asia Minor. Comana occupies a remarkable position in history. It is known to have been the chief sanctuary of the race which transmitted its civilisation and its religion to Western Asia Minor and to Greece in very early time; and it continued to be a great religious centre under the Roman Empire, and the seat of a bishopric in the Christian time. But nothing else was known about it. Its site was deserted after the Turks overran Asia Minor, and for centuries no human being knew where it formerly had been. About twenty years ago the Russian naturalist Tchihatcheff, in exploring the mountains of the Anti-Taurus, came upon its ruins in a lonely glen. Since that time a colony of Armenians had come from Marash, a town fifty miles to the south-east, and built a village among the ruins, and called its name Shahr.

The situation of Comana is very striking. It lies, just as the old traveller Strabo describes it, in a deep glen of the Anti-Taurus, and the river Sarus, still called by the Turks Sarrouz, flows through the city. In the upper part of its course this river Sarus flows straight south through a wide valley. About six miles from Comana the river takes a sudden bend to the west. The wide valley, through which it flowed previously, stretches right away on to the south, and the road to Tarsus, Syria, and the coast goes on down the valley. But the river suddenly sweeps round to the west, and runs straight into the heart of the Anti-Taurus. It winds along among the hills, sometimes with a little meadow by its side, sometimes with the mountains sloping right away up from the water's edge. The mountains are limestone, covered with a scanty sprinkling of soil, and clad with a sparse covering of trees, chiefly fir. Comana occupies the space formed by two links in the winding course of the river. In each of these links a little plateau, one or two hundred feet above the river, is interposed between the water and the mountains, and the city was built on these plateaux, and on a meadow by the water's edge. The city lies 4,750 feet above sea level, and is surrounded by mountains 6,000 to 8,000 feet in height. There are remains of some very large and fine buildings of the Roman period, each built so as to show a front to the river. A theatre was placed on the side of one of the hills, and the long wall of the scene rises right out of the water, while the seats rise in tiers up the hillside. But even the vast buildings of Roman time look dwarfish and small in the narrow valley shut in by the mountains. The scenery is most suggestive of the might and grandeur of nature, and even the Roman Coliseum, if placed here, would only make more evident the comparative insignificance of architecture when placed in opposition to nature's creative power. In a former letter I described the curious rock-sculptures at Ibriz, in the Taurus, which mark another old sanctuary of Cappadocian religion. They are situated at the head of a deep cleft in the mountains, where a good-sized river bursts straight out of the rocks. Several other examples besides these two show that this old Cappadocian religion sought out for its sanctuaries places where the power of Nature was most manifest, and where man seemed placed in the presence and under the influence of God; but of all those sanctuaries that I have seen, not one equals in solemnity and impressiveness the site of Comana. Nature looks now very magnificent, when all the grand Roman buildings are crumbling in ruins; but I believe it would look only more powerful when those buildings were in their perfection, and yet looked small against the mountains.

It is a complete change from the thoughts suggested by the beautiful and solemn ruins of Comana to turn to the people that now inhabit the mountains among which these ruins lie. They are inhabited by a race called Avshahr, whom I have already often mentioned. The Avshahrs are probably the latest race that has come from Turkestan into Asia Minor. Many races have successively gone through the same process; they migrate to the west, and the older immigrants are pushed farther across the country as each new race comes in. You find Yourouks close to the Aegean coast; farther inland various tribes of Turkmens, and away in the east the Avshahrs. Most of them are still half nomadic in their habits; they spend all the fine weather in tents, wandering about the mountains with their flocks. In the winter they return to their village, and spend the cold weather in their huts. In travelling during the summer you often come upon empty villages. Every house stands open, but not a soul is left in the place. There is nothing in the house to take, so that it is needless to fasten the door, and any person is free to use the bare walls if he chooses. The people have all gone off to their summer wanderings. But tent life is impossible in the cold of winter; in the Anti-Taurus mountains the Avshahrs are snowed up in their houses for months together.

These semi-nomadic races have all the virtues of a primitive race of hunters; they are simple, truthful, unambitious, free, and

fearless in their demeanour. But there is little hope that they will readily develop into a useful people for the country. When brought in contact with civilisation, they adopt its vices and lose their own virtues. It is impossible for a savage race suddenly to develop into a civilised. The process, to be healthy, must be slow and gradual, extending over many generations; and you find it actually in process in the country. In many cases you find a new village which has just been permanently founded by a set of nomads. The intermediate stage between the purely nomadic and the settled form of life is when the same community has a winter and a summer village, and migrates regularly twice a year between the two permanent establishments. The nomads gradually become more and more settled; the village grows; a good mosque is built. In this way a community is gradually absorbed in the general population, and loses its distinctness of race. This is the healthy and natural process, but the want of communication and the character of the government throw many difficulties in the way. Even after a settled village has grown up, it retains the original peculiarities and the exclusiveness of the nomadic stage. You recognise the Turkmen village as soon as you enter it; its people never mix with other villages, and know nothing of the outer world. Their blood is as pure and unmixed as if they had never left Turkestan.

Many months before we went into the Anti-Taurus we had heard of a wonderful monument, of which we hoped to be the discoverers. An English officer, one of the travelling Vice-Consuls of Anatolia, heard while he was in these mountains that there was a great stone lion among the mountains, covered all over with inscriptions. He made a note of the village near which this monument was, and we directed our route so as to pass by it. All the people of the country round knew of the "Lion Stone," but when we reached the village the people denied that there was any writing on it. We asked whether it was made by man or was a natural rock, and they said they did not know. Next morning I went to visit the lion. The Consul-General, made wise by many disappointments, declined to climb the mountain; but hope springs eternal in the archaeologist's breast, and I induced my horse to struggle up an almost perpendicular hillside fully 2,000 feet high. We came into a beautiful little valley, green and sunny and cool in the bright July weather, and the guide told us that the "Lion Stone" was before us. Nothing was visible but the limestone rocks of the mountains. The "Lion of the Anti-Taurus" was a mere fiction, the last and greatest of the many disappointments which have mocked my wanderings in Asia Minor. But yet the archaeologist goes off with ever-growing interest to investigate the next monument of which reports reach him. In eleven cases he is disappointed, but the twelfth rewards him for all his troubles.

### HOME SANITATION.

A LECTURE was delivered last week at Chiswick by Mr. H. O. Smith, C.E., late Engineer to the Local Commissioners, on "Home Sanitation." He said—My object in this paper is to give a few hints to those who would have a home free from the sanitary defects that are to be found in many houses, even of recent construction. The word "sanitation" is given as the name of a new science which deals with that branch of the laws of health which includes particularly the method of disposing of the polluted products of the household without harm to the individual or the general public. Its meaning is being enlarged with the growth of the science, and it is used at times to include the general laws of health. Its laws are forcing themselves upon the attention of the world by reason of the disastrous results which have arisen from their neglect. They are binding on every individual, for his own sake, and upon the community, for the mutual protection of its members. Hence the laws made by the latter to protect itself from the neglect of the former. At the present moment there is a tendency on the part of the public to look upon sanitarians as despots and tyrants, because they are asking for powers which carry out their principles to their logical conclusion. It is not my intention, however, to deal with the general question further, and I therefore at once turn to the subject of "Home Sanitation." Its personal interest to each will take away the dryness of the subject.

The first principle in sanitation is to ensure the speedy removal of offensive or polluted matters from the home. It is an essential of life that man shall have for his use matters that are pure and sweet. These he pollutes, and renders dangerous to himself by such use. In the ordinary domestic duties of washing, cleansing, cooking, &c., he turns pure water into a liquid which, when allowed to stagnate, engenders products that are very dangerous to him. The best means of disposing of these claim the first attention of all. The old plan of cesspools on the premises was at one time almost universally adopted. They have been tried and found wanting. They offend the first law of sanitation. A cesspool is simply a hole in the ground, with sides of dry brickwork, into which sewage is made to flow, and from which it escapes by soaking into the surrounding soil. It is the worst system of disposing of sewage imaginable. By its very nature the matters it contains are stagnating in their worst form, and are allowed to pollute the ground for yards round in close soils, and in free soils to an unknown extent. The gases there generated, which are the

worst possible of their kind, cannot escape from the ordinary cesspool by any other means than into the soil or up the house-drains, and the latter affords the readiest way, and the most dangerous. Thus the cesspool returns to the householder its evil products. Yet there are not wanting men of authority who declare that well-constructed cesspools are the best means of dealing with the house drainage. We, as sanitarians, answer that the principle of a cesspool, in that it retains upon the premises sewage matter, is radically wrong, and that the difference between a well-constructed cesspool and a badly-constructed one is a matter of detail only. All cesspools are bad, the only difference being that some are worse than others. Without discussing the merits, or rather the demerits, of the many ways of dealing with house sewage, I will at once state that my experience goes to show that the water-carriage system is the best. By a suitable arrangement of water-tight drains provision can be made for the speedy and effective removal of the whole of the sewage of the house without annoyance, nuisance, or detriment. But there is no doubt that many defects exist in house drains which cause much evil. They should be constructed so as to be water-tight and gas-tight, protected from the sewer by a disconnecting syphon, thoroughly ventilated by air inlets as well as air-outlets, and never taken inside the house. Where these are obtained the evils referred to do not arise. To secure efficient house drainage for this parish, I, as engineer to the Commissioners, drew up the following suggestions:—

In order to prevent as far as possible the evil effects arising from badly designed, constructed, or otherwise inefficient house drains and connections, the Commissioners recommend:—

1st. That the drain-pipe leading from the house to the main sewer should be as short as possible; and (especially in the vicinity of the dwelling or actually under the same) absolutely watertight, constructed of glazed stoneware socket-pipes, with Stanford's patent joint, or jointed with Portland cement, and surrounded with concrete or puddle.

That no house drains should be less than 6 inches in diameter, or have an inclination of less than 1 inch in 10 feet.

No right-angled junction should be permitted under any circumstances whatever.

2nd. That only water-closets should be connected directly to the house drains, and that the soil-pipes from such water-closets should be ventilated by means of a cast-iron or zinc pipe (or other suitable material), at least 3 inches in diameter, leading up outside the house or premises, and above the dormers or other windows.

3rd. That all wastes from sinks, lavatories, overflows from baths, &c., should be tapped underneath, and carried, wherever practicable, outside the houses, and be made to discharge themselves over open sink covers, to gullies or receivers tapped from the house drain.

4th. That means of complete disconnection of the house drain from the main sewer should be employed by an effectual trap and air inlet, the ventilating pipe or opening to the said air inlet to the drain being on the house side of the trap.

NOTE.—By the adoption of the 2nd and 4th recommendations, provision is made for the escape of the foul air from the drain, and for the admission of fresh air to replace the foul air removed. On no account should any trap intervene between the air inlet and the ventilating pipe.

There are drains in the district which have not been constructed in accordance with these suggestions, which are on a satisfactory principle. I refer to the system known as Norman Shaw's, used on the Bedford Park estate. It will be of interest to the members to know that the Commissioners have, after much consideration, framed new bye-laws, in which these suggestions are made law, so that when they come into force they may be insisted upon in their entirety. Where drains are directly connected to the interior of the house, the sewer gases escaping from them often cause disease and death. It is very questionable whether exhalations from drains or sewers can directly cause typhoid fever, which is a typical instance of the class of diseases most effected by them. It has been asserted so in many cases, but not one has ever stood the test of examination. Mr. R. Rawlinson, the Chief Inspector of the Local Government Board, says:—"The philosophy of the question of good drainage seems to be that stinks in the open air do a minimum of injury, but that gases of decomposition within rooms and in stagnant air become dangerous to health." When house drains are badly laid, they are almost as great an evil as cesspools. The duty of seeing them well constructed rests with the local authority of each district; but until local authorities are prepared to appoint more inspectors, the drains will be more or less defective. The perversity of builders in making bad drains is beyond saying. If an absolute guarantee is desired of well-constructed drainage, it is necessary that the inspector should see every pipe laid. To attain this very desirable end more inspectors would have to be appointed. On the question of water supply there is very little to be said, so far as this neighbourhood is concerned, there being but few wells in it. A well is the counterpart of a cesspool, and the risks of its pollution in populated parts are very great. But even in Chiswick, where we are supplied by water-mains, there is cause for serious complaint. The water companies give an intermittent supply only

to the majority of the houses. This causes a supply cistern to be necessary for each house, which is filled when the water supply is on, and from which the supply of the house is drawn. These cisterns are an evil, for even the purest water supplied by the companies contains a small amount of organic and inorganic impurities, which adhere to the sides and bottom, and which, unless constant cleansing is resorted to, will accumulate until they prove a source of danger. It is also to be borne in mind that there are many cases where the service-pipe to the closet is connected directly with the cistern, which is frequently in the scullery, where the atmosphere cannot possibly improve the character of the water.

### THE GROWTH OF PARIS.

A MAP has been prepared by M. Durand Claye, the French Ingénieur-en-Chef des Ponts et Chaussées, representing by means of shading of varying depths the increase of population in the Department of the Seine, proved by the census of December 1881, as compared with that of 1876. It appears that the growth reached its maximum to the north, north-west, and north-east of Paris, the two communes of Colombes and St. Ouen presenting maxima (55 per cent.). There have, indeed, been large building operations between Asnières and Colombes, at Bois-Colombes, and in the plain of St. Ouen. Gennevilliers and Epinay share the movement; and it is interesting to note that the agricultural transformation of the plain of Gennevilliers, by irrigation with sewage-water, has been accompanied by a considerable growth of population in the adjacent communes, and even at Gennevilliers, where it reaches 34 per cent. The poor plateau of Sartrouville, the dry plain of Montesson, and the environs of Achères and of the forest of St. Germain, all in the west and north-west, are conspicuous for a small growth of population. In the environs of Paris, Chatou, Bougival, and La Celle St. Cloud, on the west, present high figures. The growth is also considerable on the east side, except at Romainville. The south and south-east seem less favoured. As to Paris proper, the development is small, *nil*, or even negative in the central arrondissements. All the disposable surface there, indeed, has long been built upon, and the cutting of the Avenue de l'Opéra and the Faubourg St. Germain has even diminished the density of the population in the second and seventh arrondissements. In approaching the fortifications, on the other hand, one meets with growth, this effect being especially sensible in the 17th to the 20th arrondissements, on the north side, and in the 12th and 15th on the south. Montrouge shows 30 per cent.

### DECORATIVE ART.

IN the lecture delivered on Tuesday last by Mr. J. H. Chamberlain, at Birmingham, he told his audience they ought to remember that decorative art, as its name implied, was a subordinate art—that it was the art of decoration applied to something or other, and was not an independent art by itself. He had shown them, and it might be proved by a multitude of examples, that the effect of ideas of beauty, the moment they were entertained, was to exalt and refine the use, and that the effect of them upon the ordinary workman was that he made his work, as far as mere ability went, a great deal better than it was before he began to entertain or understand those ideas, the result being a certain perfection of form, a certain beauty of detail, ending in what the world had long called “proportion.” They could not take anything away from an object thus refined without interfering with its usefulness. In decoration they added something to the object which did not contribute to its use, but at the same time did not take away from the use. This addition was ornament, and consisted either of form, or colour, or an admixture of both. When that ornament was rightly placed so that it was seen to the greatest possible advantage, and when it lifted what it was placed upon out of the range of ordinary handicraftship into art, then, and not until then, ornament became decoration. Recognising that ornament was something added to use, the lecturer said they were on the threshold in the present day of a great danger—namely, an excessive division of labour, wherein one person made the object and another put the ornament to it. The idea of the factory, he contended, was fatal to art; and if there must of necessity be some division of labour, he urged that the decorative artist should not be far removed from the workshop. He must, at any rate, understand what was done in the workshop. Mr. Chamberlain went on to explain how decorative art had suffered from the painter and the sculptor stepping away from it to cultivate their particular arts by themselves. He next spoke in greater detail on the subject of ornament, and pointed out certain considerations bearing upon the question of what was right and wrong in relation to it. Right ornament ought to be derived from, and was that which delighted in, the full development of health, life, and form to the utmost possibility; while he held that to be bad ornament which delighted in deformity and interfered with the full development of life. Right ornament obeyed Nature with respect to any of her laws, while that was wrong ornament which

despised and discarded those laws. The law of growth, represented in various kinds of forms derived from plants, was generally upwards; but this was violated in an ornament which represented a leaf or spray growing both upwards and downwards at the same time, as had been done in thousands of instances. That was bad ornament which was vague and formless, and in which all sorts of ideas were mixed together in a kind of artistic mud. In conclusion, the lecturer explained the true meaning of “conventional” ornament, showing that the material the artist had to decorate frequently forbade a close imitation of Nature, and he was obliged to abstract the more essential features of the natural object from which his ideas were taken. He instanced as a good example the Egyptian porphyry lions in the British Museum, in which, although the hardness of the material allowed but few lines, those which had been used were unmistakably those indicating lion-like majesty, strength, and repose. It is much easier to carve a block of wood or soft stone with an actual representation of a group of hawthorn leaves than it was to abstract from them the quintessence of their character and arrange them in an ornamental or decorative form. In his next and final lecture Mr. Chamberlain promised to say something about one or two practical methods which art students ought at any rate to know in order to give themselves facility in attempting to design.

### GREEK PAINTING.

THE second lecture of Professor Newton's course at University College on Ancient Greek Painting treated of the painters who followed Polygnotus, between B.C. 430 and B.C. 336. The first of these in order of time was Apollodorus, who was the first to represent the effects of light on the local colour, and thus painted objects as they seemed to the eye, discarding the conventionalities of the earliest styles. He was followed and surpassed in this new development by Zeuxis, who is said to have reduced *chiaroscuro* to a system. According to Lucian he was distinguished for daring invention of new and fantastic forms. His most celebrated pictures were a group of male and female Centaurs graphically described by Lucian; his *Helen*, painted at Crotona, for the temple of Juno Lacinia; and his *Hercules Strangling the Snakes in his Cradle*. He also painted the house of Archelaus, King of Macedon. He rose to such celebrity that he became rich enough to give his pictures away, and appeared at Olympia with his name embroidered in letters of gold over his mantle. It may be inferred, from all that we are told of Zeuxis, that, in representing gods, he did not try, like Polygnotus, to awaken religious or ethical associations so much as to please the eye by beautiful form and attractive colouring, and by daring invention of new types and combinations. In his mythical personages he sacrificed their ethical character to the dramatic situation in which they were introduced. In this respect his innovations in the treatment of myths may be compared to those introduced by Euripides in tragedy. His great contemporary, Parrhasius, was a native of Ephesus. He excelled, we were told, in refinement of drawing; above all, in the outlines of form. In the treatment of the hair, the mouth, and the expression he was greatly admired. Among his most celebrated works was an ideal portrait of the Athenian Demos, in which he appears to have expressed or suggested the combination of many characteristic qualities or moods, some of which seem hardly compatible with the others. Like Zeuxis, Parrhasius was exceedingly arrogant, showing Asiatic luxury in his dress and manners. In his picture representing the contest of Ulysses and Ajax for the armour of Achilles he competed with his contemporary Timanthes, but failed to get the prize, on which, in his indignation, he compared his case to that of Ajax, whose rival was unjustly preferred. The most celebrated work of Timanthes was the *Sacrifice of Iphigenia*, in which, after having represented various phases and tokens of grief in the spectators, the painter introduced, by way of climax, Agamemnon veiling his head, as if a father's grief should be left to the imagination. Parrhasius and Zeuxis represented what the ancients called the Asiatic or Ionic school of painters. Eupompus founded at Sicyon another celebrated school. To this Sicyonian school belonged Pamphilus and Pausias. Pamphilus, like Leonardo da Vinci, was a learned artist, studied arithmetic and geometry, and taught drawing, charging at the rate of about 20*l.* a year for twelve years. From his time drawing became a part of a liberal education in Greece. Among his pupils was Apelles. The Sicyonian school was greatly praised by Plutarch. His pupil, Pausias, seemed to have perfected encaustic painting, which, like the invention of oil-painting in the fifteenth century, must have given richness and depth to colouring. Pausias painted a bull, which was thought a masterpiece of foreshortening. He applied his encaustic painting to ceilings and also to the painting of flowers. A third school of painters arose at Thebes. The most celebrated of these were Aristides, Euphranor, and Nicias. Aristides, though harsh in colouring, seems to have been a great master of dramatic expression. His *Dying Mother and Child*, an incident at a siege, seems to have been, like the contemporary statuary group of *Niobe and her Children*, by Praxiteles, a masterpiece of pathos. Aristides painted also a battle with Persians, in which

there were 100 figures. He is said to have been paid at the rate of about 40*l.* for each figure. Euphranor, who was also great as a sculptor, was a learned and laborious painter, who painted the twelve gods, a battle scene, and the feigned madness of Ulysses. He seems to have further developed historical painting. Nicias, like Polygnotus, painted the *Descent into Hades*, *Perseus and Andromeda*, and various mythical heroines. He was said to have been a great master of *chiaroscuro*. In conclusion, the lecturer stated that the characteristics which distinguished these several painters were very difficult to be made out from the meagre notices in Pliny and other ancient authors. In some cases it has been assumed by Brunn that descriptions of some of the most esteemed works of the great masters might be recognised in Philostratus, but this was an hypothesis not capable of proof, and therefore not too strongly to be relied on.

### THE ROYAL SCOTTISH ACADEMY.

THE fifty-fifth annual report of the Royal Scottish Academy has been issued. It states that the last exhibition contained 1,017 paintings in oil and water-colour, and 28 works in sculpture, selected out of a total of 2,475 works of art sent for exhibition. The attendance of visitors was good, being, in comparison with several past years, fairly an average. The past year has been marked by the losses sustained in the deaths of the president, two honorary members, and an associate. As a mark of respect to their recently-deceased president, Sir Daniel Macnee, it was resolved to dispense with the annual dinner given prior to the opening of the exhibition.

At the statutory meeting of the Academicians held on February 10, Mr. Robert Gibb was duly elected an Academician to fill the vacancy caused by the death of the late secretary, Mr. William Brodie, R.S.A. This election, along with the vacancies which occurred by the resignation of Mr. John MacWhirter, A.R.A., and the death of Mr. John Crawford Wintour, A.R.S.A., caused three vacancies in the rank of Associate. On February 10 next the Academy will be called upon to elect an Academician in place of Sir Daniel Macnee. At the general assembly held on April 14 it was unanimously resolved to transmit to the Queen a congratulatory address, humbly expressing the thankfulness of the Academy at the providential escape her Majesty had made from the recent attempt on her life. At the same meeting, on the motion of the President, Mr. John MacWhirter, A.R.A., who had resigned his associateship, was unanimously elected an honorary member. The librarian and curators of the library report that there has been an average attendance of the members in the library during the past session. The librarian has classified and arranged, in 10 vols. folio, 900 of the curious and valuable collection of drawings bequeathed to the Academy by the late David Laing, LL.D., Honorary Professor of Ancient History to the Academy. A large number of books, prints, &c., have been added to the library. The visitors of the Life School report favourably with regard to the progress made, and the healthy state of work produced, by those attending during the session; and also bear testimony to the diligence and good conduct of each student. The session of 1881-82 commenced on November 7 and ended June 30, the average attendance being thirteen per night. The morning class commenced November 8 and ended July 3, the average being eleven. The Council are glad to observe the generally high quality of the students' work, and are also gratified to find that the Stuart Prize has on this occasion called forth more earnest and varied effort than for several years past. It is with much pleasure that the Council again record the liberality of Mr. John Leng, of Kinbrae, whose warm interest in extending the education of the students of the Life School the Academy cordially appreciates. The recipient of Mr. Leng's prize this year is Mr. J. Coutts Michie, who is at present availing himself of the opportunity thus generously afforded him by travelling and studying on the Continent. The collection of works of art, &c., belonging to the Academy has received the following additions during the past year, viz.:—*The Sea King*, diploma work of Mr. Robert Gibb, R.S.A.; cabinet portrait of Mr. W. L. Leitch, painted by Robert Scott Lauder, R.S.A.; study in chalk of an ecclesiastic, by Annibale Caracci—these two latter works presented by Sir William Fettes Douglas, P.R.S.A.; "Herculanéum et Pompei: Recueil général des Peintures, Bronzes, Mosaïques," &c., presented by Mr. John R. Findlay; "Ten Proofs of Illustrations to Charles St. John's Natural History and Sport in Moray," presented by Mr. George Reid, R.S.A.; "Memoir of the late Andrew Jervise, Esq., F.S.A. Scot.," presented by Mr. John Hutchison, R.S.A.; "The Life and Works of Thomas Bewick," presented by the author, Mr. David Croal Thomson. A legacy of 100*l.* has been bequeathed to the general funds of the Academy by the late Mr. W. T. Sinclair, of London. The unconditional character of this legacy, the first which has been thus placed at the free disposal of the Academy, cannot but be viewed with satisfaction. Intimation was made in the report for 1878 of a bequest by the late Mr. Andrew Jervise, F.S.A., Brechin, to endow a prize for the most deserving student or students of the Academy. An interim payment of 150*l.* to account has been received, pending a further sum to be paid when

the residue of the estate shall have been fully realised. Until this shall be declared, however, the Council refrain from carrying out in a partial manner the terms of the bequest. The opportunity which occurred at the close of the past year, after the completion of the cleaning and repainting of the galleries, was taken advantage of to thoroughly inspect, clean, and rearrange the Academy's collection of works of art deposited in the National Gallery, library, council-room, and vestibule. As a fitting sequence to this, a printed catalogue of all the works of art in the possession of the Academy is in preparation, and will shortly be placed in the hands of members. The report proceeds to refer to the death of Sir D. Macnee, and states that at the general assembly of the Academy on January 24 the following minute was adopted:—"The members of the Academy desire to place on record their sense of the heavy loss sustained by the body in the death on the 17th inst. of its venerable and esteemed President, Sir Daniel Macnee, whose eminence in the branch of art which he professed, whose urbane and equable temper in the chair, and whose active interest in all that concerned the welfare of the Academy and the general progress of art, had won for him the respect and confidence of the whole academic body, and of every member of the profession in Scotland. But it is not as their President only that they deplore the loss of Sir Daniel Macnee. His rare geniality of nature, his wide sympathies, and the unwavering kindness which characterised his intercourse with his brethren, made him no less beloved as a man, and his removal from amongst them all regard with a deep sense of personal loss." A brief notice of Sir Daniel's career is then given, and the Council give the terms of a letter in which the Queen's regret on hearing of his death was expressed. The report next alludes to the death of W. Miller, honorary member of the Academy, in regard to whom the following minute was adopted on January 24:—"The general assembly desire to record their sincere regret for the loss of a member of the Academy so much beloved as a man and so highly esteemed as a citizen, and who, at a time when Scotland had but begun to assert its position in the republic of art, had achieved a pre-eminent and widely-recognised place amongst British engravers." A notice of Mr. Miller is given; and it is stated that, at the same meeting, the Academy recorded their sense of the loss which art had sustained by the death of Mr. John Linnell, also an honorary member. The death of Mr. J. C. Wintour, A.R.S.A., is next alluded to, the Council remarking that his name may well claim an honourable place on the roll of Scottish landscape painters. The report proceeds to say that a general assembly was held on January 30 to elect a successor to the chair of the President, and Mr. William Fettes Douglas, R.S.A., was elected to be the head of the Academy. The secretary was thereupon instructed, in acknowledging the receipt of her Majesty's gracious reply to the intimation of the death of Sir Daniel Macnee, to communicate the election of Mr. Douglas as his successor. In reply, a letter was received signifying her Majesty's approval of the selection. In further testimony of Royal approval of the choice made by the Academy, her Majesty graciously conferred the honour of knighthood on the President at Windsor Castle on May 17.

### GLASGOW ARCHÆOLOGICAL SOCIETY.

THE twenty-sixth annual general meeting of the Glasgow Archæological Society was held last week in the rooms of the Society, Bath Street. Professor Lindsay presided.

The report by the council for the past session states that in every way the Society has during the last twelve months made gratifying progress, and it has been conclusively shown that the Society has only required opportunity to claim for archæological research its proper place in the West of Scotland. The Marquis of Bute, who has throughout shown very great interest in the Society, has intimated that he will defray the cost of publication of Mr. Anderson's paper on Paisley Abbey, which will therefore, with illustrative drawings and photographs, be presented to the members by Lord Bute as an extra publication. The council regret that Mr. George Watson and Mr. Cluny Macpherson, both members of the Society, have been removed by death since last report. During last session—i.e. to April 20, 1882—fifty-four new members were admitted, this large increase justifying the confidence last year expressed that the number of members would very considerably be enlarged as the work of the Society became better known. The council have throughout the past year received and considered many suggestions and proposals with a view to the organisation of research in the city of Glasgow and the counties of Lanark, Renfrew, Dumbarton, Argyle, and Bute. A further proposal for enlisting the aid of the parish clergy throughout the country by their enrolment as honorary corresponding members is still under the consideration of the council. The council recommend the re-election of the vice-presidents, and the reappointment of the honorary secretaries and honorary treasurer. To fill the four vacancies in the council (under the provisions of rule 4), the council would suggest the re-election of Professor Robertson, Mr. Guild, and Mr. St. John V. Day, and the election of Mr. R. W. Cochran-Patrick, M.P. The council again congratulate the members upon the satisfactory state of the Society's finances.

Mr. Joseph Irving read a paper on the subject of "Philosophy in the Study of Things Old." He said it was difficult to define when an object became antiquarian. In illustration of this statement he referred to the address of Principal Caird at the opening of the University, and remarked that they had all been astonished to learn that Bishop Butler might be classed among the antiquaries of this world, and that the great "Analogy" itself was only a sort of survival of the fierce theological disputes of the last century. This showed how difficult it was to tell when a thing was old enough to be considered an antiquity, and when it was fresh enough to be considered something new. Speaking, in passing, of the Hamilton Palace treasures, he said he did not care for the dispersion of the pictures, jewels, and works of art; but the disposal of the national papers, of which there were more than 300 at the palace, he characterised as a disgrace, and, as Mr. Cochran-Patrick had said, this country ought to have had the option of purchasing them.

In the course of the conversation which followed the reading of the paper the belief was expressed that the better portion of the Hamilton manuscripts were still in this country. Very valuable works, no doubt, had gone abroad, but those relating particularly to Scotland were still retained.

### ORDNANCE SURVEY OF SCOTLAND.

THE Ordnance Survey of Scotland, including the adjacent islands, which has been going on for the last thirty-seven years, has now been entirely completed. The Edinburgh division of the surveying staff, which has been stationed in the city for thirty-two years, leaves for Clifton, where it will be located with a view to work in the western counties of England and South Wales. This division has been for over five years under the command of Captain Kirkwood, of the Royal Engineers, who, with the headquarters of the 13th Company R.E., moves south with the division. For the purposes of the survey Scotland was divided into three sections; and during the last few years from eighty to ninety men, on an average, have been employed upon the work. The superintendents of the survey were officers of the Royal Engineers, but the bulk of the surveyors were civil assistants. With the exception of the counties of Edinburgh, Kirkcudbright, Wigtown, Haddington, and Fife, which were surveyed and published on the 6-inch scale before the larger scale was adopted, the whole of the agricultural districts have been surveyed, and the results are now published, on the scale of 1-2500, or about 25 inches to a mile. The plans on this scale give a number to every enclosure, of whatever size or nature—this number having reference to the area book, also published by the Ordnance Survey—of the parish to which the enclosure is situated. In this book is given the actual area of each enclosure, and these areas being totalled at the end, the actual acreage of each parish is shown. The total acreage in each parish is also detailed under the respective heads of land, public roads, and water. These maps have proved of the very greatest use to the public, particularly in all questions of land transfer, where they are unhesitatingly accepted by the Law Courts. Towns, &c., are done on the scale of 10 feet and 5 feet to a mile, and show even the lamp-posts on the streets. The uncultivated districts of the Highlands and Islands are done on the 6-inch scale—the publication of the island portions, by the more rapid process of zincography, being now quite completed. In these maps the height of every hill is given, and its contour drawn; and, as showing the careful nature of this important work, it may be mentioned that all antiquities are noted, and, by the employment of different styles of lettering, their Roman, Druidical, Saxon, or Norman character indicated. The engraving of the 1-inch general map, which, from the nature of the processes employed, is necessarily much slower, is now proceeding apace, and the sheets are being quickly published.

### THE ELECTRIC LIGHTING ACT.

THE following resolution was passed at an adjourned Conference of Local Authorities held in Birmingham:—After hearing the report of the deputation to the Board of Trade, and considering the position of local authorities both as regards the interest of the ratepayers in the event of such authorities themselves working the electric light, and in the event of its being worked by trading companies, this conference is of opinion that the science of lighting by electricity is not yet sufficiently developed to justify local authorities expending the ratepayers' moneys in becoming undertakers for the supply of the light; but that every facility should be given by local authorities to trading companies to enable them to develop and work the discovery, and that local authorities should content themselves by making proper provisions for the protection of the ratepayers in regard to the following amongst other points:—1. Retaining full control of the streets. 2. Suitable situation of the works, so as to secure freedom from danger, nuisance, or annoyance to the inhabitants in the immediate neighbourhood. 3. Regulations as to the wires and lamps, so as to secure freedom from danger. 4. Supply at reasonable prices. 5. The right of purchase by the authorities from the undertakers

at a shorter period (if possible) than that provided for by the Act. 6. To endeavour to limit the area over which provisional orders are granted, so as to confine it within such reasonable limits as will enable the local authority to purchase the undertaking with facility, and not have cast upon the ratepayers the burden of purchasing the monopoly over a large and extended area, and also so as to permit co-existent experiments to be made by other companies in other parts of the districts, providing an authority decides to concur in the grant of provisional orders to competing companies. 7. To secure from time to time on the board of management of the electric lighting company direct representation for the ratepayers, by stipulating that at least two members of the local authority shall be *ex-officio* members of such board of management."

### THE EMPLOYERS' LIABILITY ACT.

SOME cases have been heard during the week in the Queen's Bench Division which arose under the Employers' Liability Act. In *Moore v. Shaw* the plaintiff was the widow of a workman killed by a fall from a scaffold at the new church of the Oratory at Brompton. The action was brought against the contractor under the Act. His defence was that it was not an accident arising from "any defect in the condition of the way, plant, or machinery." The case was tried at the Westminster County Court, and it appeared that the man had not gone on the way provided and intended for the use of the workmen, but had gone on another part of the scaffolding, between which and the secure part was a gap, in stepping across which he stepped on a "putlog," which gave way and he fell and was killed. The Judge decided in favour of the widow, who obtained a verdict and judgment for 275*l*.

Counsel moved on the part of the contractor to set aside the verdict, as given against the evidence, and also as grounded on an erroneous view of the meaning and application of the provision in the Act as to a defect in the condition of the "way." He urged that in truth the accident had arisen from the man's misuse of the part of the scaffolding on which he had gone and of the "putlog."

The Court granted a rule *nisi*.

The case of *Bevan v. Trow* involved the relative liability of contractors and sub-contractors. The defendant is a builder, who had contracted to repair the roof of a church at Walsall, and he had contracted with one Williams to find labour for the work for the sum of 66*l*., Trow finding plant and material. Trow's foreman told Williams that he (the foreman) would send him proper tackle, but Williams did not wait for it, and himself chose a chain which turned out to be bad. After that the foreman told the plaintiff, a labourer, "to go and work for Williams," and he went, and while engaged in work at the church he sustained an injury through the breaking of a chain which had been chosen by Williams. The plaintiff sued Trow, the builder, for the consequences of the accident, and the question was whether he was responsible for it. The County Court Judge found, as a fact, that the plaintiff was in the service of Trow, the defendant, and that Williams had been negligent in choosing the chain, which had not been tested and was defective in strength, and so he gave his judgment for the plaintiff for 60*l*.. The question now raised was whether that judgment could be supported in law or on the evidence.

The Court said that no doubt the plaintiff was in the service of the defendant Trow, but if Trow was liable in this case it would certainly be hard upon him and a very extreme application of the law, for it appeared that his foreman had offered to supply the proper tackle, and that Williams did not wait, and took it upon himself to choose a chain which turned out to be bad. There appeared, however, to be obscurity as to the facts with reference to the relations subsisting between Trow and Williams, and so they sent the case to the Judge to have the facts on that point more clearly ascertained.

In Scotland an action has been brought against a building owner. The widow of a labourer sued Robert Taylor, shipowner and coalmaster, for 500*l*. in name of damages, on the ground that he is responsible for the death of her husband. Fenton was in the employment of Messrs. Lawson & Son, builders, Newburgh, who were erecting a factory for the defender; and in September of last year, while he was removing some battens which had been used in the construction of the gable wall, the upper part gave way and fell upon him. It was sought to hold defender liable, in respect he made several alterations on the construction of the factory, which had destroyed its stability, and, further, that he supplied defective material in the shape of bricks. Defender denied fault, and pleaded that, having employed competent contractors, he was not liable.

Lord Adam, in summing up, said the jury could have no doubt that the husband of the pursuer met his injuries in consequence of fault on the part of Taylor or of the Lawsons. Whatever fault there might be with the latter, if the jury were of opinion that the defender had contributed in an essential and material degree to the fall of the gable, they were perfectly entitled to find him liable

in damages. No doubt the defender used due caution in employing responsible contractors; but the question was, whether there was such interference, such giving of orders, on his part that he must be regarded as being responsible. He undertook to supply material, and he was bound to supply it of suitable quality, and the fault of the contractors in using unsuitable material would not relieve the proprietor of the consequences of supplying it. In law, his Lordship laid it down, the defender was responsible; but before concluding he mentioned to the jury that though the pursuer had two children depending on her, they could bring separate actions for damages.

The jury returned a verdict for the pursuer, and assessed damages at 300*l*.

### THE MANCHESTER SHIP CANAL.

THE Parliamentary notices for this undertaking have been issued. The promoters ask for leave to introduce a Bill for the following amongst other purposes, namely:—To enable them to incorporate a company to whom shall be transferred all or some of the easements, rights, powers, &c., of the Mersey and Irwell Navigation Company, and of the Bridgewater Navigation Company, Limited, so far as the same "relate to the maintaining, improving, and keeping navigable the rivers Mersey and Irwell between Hunt's Bank in Manchester and Liverpool"; also the branch canals connected therewith; and all the estate, rights (including the right to levy tolls), powers, &c., of the said proprietors and company in or over the the said river and waterways. Power is sought to enable the new company to acquire, either by virtue of their Bill or by subsequent contracts and agreements thereunder, the undertakings, or any part of the undertakings, known as the Duke of Bridgewater's Canals, the Runcorn and Weston Canal, and the Manchester and Salford Junction Canal, with their branches; and all lands, warehouses, wharves, &c., thereto belonging. Further power is sought to enable the company in the counties of Lancaster and Chester to construct a ship canal navigable to Manchester, and for that purpose to exercise certain powers, including the dredging, &c., of the navigable channel below Runcorn; the dredging, widening, &c., of the Mersey and Irwell up to Manchester; and the construction of a new navigable channel between certain points specified, with a dock in Salford, to be constructed partly on lands the property of the Manchester Racecourse Company, Limited, and partly on lands adjoining thereto, all which lands are included between the river Irwell, Cross Lane, the northern boundary of the racecourse, and the Salford Cemetery. Besides the great works above specified, power is sought for the construction of certain necessary conduits, locks, weirs, culverts, &c. The difficulty of the railway bridge at Walton, near Warrington, is to be met by the diversion of the main lines of the London and North-Western and the Birkenhead, Lancashire and Cheshire Junction Railways, and the carrying those lines over the river by a high-level bridge. The Warrington and Stockport Railway and the railway of the Cheshire Lines Committee at the points where they intersect the proposed ship canal are to be similarly treated. Due provision is to be made in the bill for the levying of tolls, the making of bylaws, and all other things necessary; and it is also sought to empower municipal corporations and local authorities in the counties of Lancaster and Chester "to apply their respective corporate funds, and to borrow further moneys by mortgage, debenture stock, or annuities," for certain specified objects, including the holding of shares in the capital of the Company; such local authorities to have power to nominate and appoint directors. Provision will be made for the transfer to a body of trustees or commissioners of the undertaking, rights, privileges, &c., of the Company, in such circumstances and upon such terms and conditions as may be prescribed by Parliament.

At the meeting of a Committee of the Manchester City Council which was held on Monday, Alderman Harwood said he trusted that the Parliamentary Sub-Committee would report as early as possible on the canal scheme. At present some members of the committee were placed in a rather awkward position, as, although favourable to the scheme as a whole, they might possibly have to oppose the private bill now being pushed forward by the promoters. He was quite certain, from the discussions which had taken place in the Council chamber on previous occasions, that the Council would not be prepared to allow a private bill in that form to pass. Whenever this bill was obtained, the undertaking must be either in the form of a public trust or such as to enable it ultimately to assume that form, because he was convinced that a private company could not succeed. He thought it would be well if the mayor were to convene a meeting of the mayors of Oldham, Bolton, and other towns interested in the Ship Canal scheme, and confer with them as to the desirability of the corporations doing in this matter what the various nations did in regard to the Suez Canal. They were empowered then to take shares to a certain amount, and it seemed to him that the corporations now affected might take shares in the ship canal to a limited extent, and thus encourage the scheme and

secure its success. It was desirable that the Mayor should have the discretion to spend such money as was necessary for this object, so that the people outside who were pushing the scheme might know that the Corporation were thoroughly in sympathy with the movement. He proposed—"That the Mayor be respectfully requested to make such arrangements and incur such expense as he may think desirable for the purpose of ascertaining the views of and conferring with the mayors and other representatives of municipalities and local authorities affected by the proposed ship canal."

Mr. Stewart seconded the resolution. He said the bill as framed by the promoters included powers enabling corporations to contribute to the capital of the undertaking. Supposing that the Manchester Corporation were to subscribe a million of the capital proposed, the liability on that would not amount to more than 2*d*. in the pound on the ratable value of Manchester, and the benefit which would be derived by the city from the establishment of the canal would be vastly in excess of 2*d*. in the pound.

The resolution was carried.

### EXCAVATIONS AT EPHEBUS.

A MEETING took place on Saturday afternoon in the theatre of the South Kensington Museum for the purpose of promoting the resumption of the excavations at Ephesus on the site of the Temple of Diana, by Mr. J. T. Wood. Presumably in consequence of the review of the troops, so small a number of visitors were present that it was decided not to attempt the transaction of any formal business on that occasion, but to call a further meeting at a subsequent date, and a notice to that effect was given by Professor T. Hayter Lewis. To prevent the complete disappointment of the few who had assembled Mr. Wood gave a short account of the excavations already made by him at Ephesus. He explained that the object of the meeting that day, had it been successful, was to obtain sufficient subscriptions to clear the outer court of the temple, a labour which would cost 5,000*l*., and would, he estimated, yield at least 20,000*l*. worth of frieze. Professor Newton, addressing the meeting, expressed a hope that the money required would be forthcoming, and the proceedings soon afterwards closed.

### METAL AND WIRE GAUGES.

THE report of the trade upon the proceedings under the Weights and Measures Act, 1878, has the following remarks:—

On the subject of standard metal and wire gauges the report says:—In the last report it was stated that the Board had accepted an offer made by Sir Joseph Whitworth to deposit at the Standards Office sets of his well-known external and internal gauges. Such gauges were consequently so deposited, and they were subsequently verified and approved as Board of Trade standards by an Order in Council, August 26, 1881. In a circular communication, dated October 23, 1881, this Department called the attention of all local authorities to these standards, and pointed out that with a view of promoting accuracy in workmanship, and of preventing disputes as to sizes, it appeared desirable that all gauges used by engineers, manufacturers, and others should be made to agree with the standards. In consequence of representations made to this Board by Chambers of Commerce and others as to the loss and inconvenience which also arises from the variety of sizes of wire gauges now in use in trade, the question of legalising a standard wire gauge is under consideration.

The attention of this Department has also been recently called to the want of a standard system of screw threads. Although in large screws, such as those used in the ordinary operations of engineering and carpentry, the want of a uniform system of screw threads has been practically overcome without legislative intervention, by the gradual adoption by manufacturers of the Whitworth system of threads, it would appear that in many manufactures where screws of a less size are used, particularly in the construction of scientific and optical instruments and in the watch trade, the variety of threads now in use by different makers leads to inconvenience and increased cost of production. The consideration which is now being given to this important question by those practically interested may, it is hoped, result in the adoption of a standard system of screw threads applicable to the requirements of all manufactures.

**Malvern.**—Radnor House, the residence of Mr. C. D. Barker, has been altered and enlarged by the addition of new dining-room and billiard-room, principal and secondary staircases, young ladies' room and bedrooms, servants' offices, &c., at a cost of between 3,000*l*. and 4,000*l*. Mr. E. W. Elmslie is the architect, and the work has been carried out by Mr. Everall, builder, of Malvern, Mr. W. H. Sheppard, being clerk of works.

## LEGAL.

## Queen's Bench Division.

Before Mr. Justice FIELD and Mr. Justice STEPHEN.

THE LONDON, CHATHAM, AND DOVER RAILWAY COMPANY  
v. BULL AND FRANCIS.

This was a case of some interest to purchasers of land, as illustrating the obligations and restrictions to which they may become subjected. In 1867 the company sold to one Quatermass a piece of land adjoining the railway at Penge, with a covenant from him and his assignees not to build within 10 feet of the railway. He conveyed to one Hobday, whose conveyance disclosed, by reference to the title-deed under which he purchased, the restrictive covenant in the company's conveyance, and which he might have known of so as to affect him by what is called "constructive" notice of it, although he had no actual notice of it. Hobday had erected the Alexandra Tavern on the land, and part of the building he erected was within 10 feet of the railway. He did not ask their leave, nor did they, on the other hand, interfere. In 1871 he let the tavern, taking a covenant not to make any alteration on the premises without his leave. In February 1879 his lessee assigned the premises to one Francis (one of the defendants) for the residue of the term, subject to the covenants in the lease. Hobday died in December 1879, having devised the premises to Bull (the other defendant), his executor, in trust. In March 1881, the sub-lessee, Francis, commenced certain building operations at the Alexandra Tavern, being "alterations and additions," obtaining from Bull, the lessee's executor, a licence, for which he was paid 52*l.*, and under that licence the sub-lessee, Francis, erected a building within 10 feet of the railway, and of a greater height than the building already erected by Hobday, the first purchaser's assignee. The company did not interfere until April 1881, when the new building was nearly completed. They now contended that the building was a breach of the contract, and claimed damages and a "mandatory injunction" to pull the new building down.

The counsel for the defendant strenuously contended that, whatever might have been originally the obligation on the ultimate assignee, the company were now too late to take advantage of it, having "stood by" and allowed the purchaser to expend his money in building until the edifice was nearly completed.

The Court intimated that they should infer, in the absence of any statement to the contrary, that the company had not interposed simply because they had not known of the new building—that is, that they did nothing earlier because they knew nothing about it. On the other hand, they thought that Hobday—the purchaser from the company's vendee—had notice of the restrictive covenant, as it was in a deed which was one of his own title-deeds, and at which, therefore, he or his solicitor must be taken to have looked; and as Hobday had notice so had his executor, the defendant Bull, who had taken upon himself to authorise the new building and had taken money for it. The rule of law laid down many years ago in the Leicester Square case, as to restrictive conditions imposed on purchasers by notice, applied in this case. Francis, the co-defendant, had purchased the premises subject to the restrictive covenant imposed by the company and with notice of it. On the whole, therefore, as the building was clearly a breach of the covenant, the railway company were entitled to judgment.

## CHURCH BUILDING AND RESTORATION.

**Machynlleth.**—A new church, designed in Early English style, has been opened on the Maengwyn Road. The work has been carried out under the direction of the architect, Mr. H. Kennedy, of Bangor and London, by Mr. Richard Meredith, of Llanidloes. Messrs. Macfarlane supplied the gates and railings for boundary walls. Messrs. Burnett Bros., of Liverpool, furnished the warming apparatus.

**Gloucester.**—The church of St. John the Baptist has been reopened, after works of reparation and alteration carried out by Mr. Fream, jun., of Gloucester, under the superintendence of Messrs. Waller & Son.

**Hereford.**—The church of St. Devereux, near Hereford, has lately been restored from the plans of Mr. Cheiake, County Surveyor. The dangerous state of the building necessitated the rebuilding of the south wall and re-roofing nave and chancel.

**Derby.**—A Wesleyan chapel has been opened at Rosehill. It is built of red brick with Derbyshire stone dressings. Mr. J. Wills, of Derby, is the architect, and Mr. T. Bakewell the builder. Accommodation has been provided for 734 at a cost of about 3,400*l.*

**Glasgow.**—The foundation-stone of the new Free Church at Whifflet was laid by Sir William Collins on Saturday. The building occupies an excellent site in the centre of the village, and is designed in thirteenth-century Gothic. The end elevation, in which is the entrance, fronts the street, the main gable being flanked by massive buttresses, between which on the ground-floor is a row of narrow cusped-headed windows, lighting the area under the gallery. Above this the gable is filled with a

large four-light window, with a cusped wheel window over, the gable terminating with a carved stone cross, and immediately behind is the flèche or belfry, rising to a height of 60 feet from the street. The main entrance and staircase is in a semi-octagonal transept, giving access through a tiled vestibule to the interior of the church. The internal dimensions are 70 feet long, by 34 feet wide, with a ceiling height of 32 feet, and accommodation is provided for 460 sitters, each having the full allowance of 20 inches per sitting. There is also in connection a small hall or classroom for fifty persons, vestry, lavatories, heating-chamber, &c. The church will be heated throughout with hot water, the windows glazed with tinted cathedral glass, and the fittings and finishings generally of an excellent description, and it is anticipated that, inclusive of heating, painting, gasfittings, &c., the church will be completed for the comparatively low cost of 1,300*l.* The building is being erected from the designs and under the direction of Mr. John B. Wilson, A.R.I.B.A., 112 Bath Street, Glasgow. Mr. J. Thomson is clerk of works, and the work is being executed by the following contractors:—Mason—Mr. Robert Paterson, Airdrie; wright—Mr. Robert Paul, Whifflet; slater and plasterer—Mr. William M'Ouat, Coatbridge; plumbers—Messrs. Phillips & Bruce, Glasgow; painters—Messrs. A. & J. Scott, Glasgow; gasfitters—Messrs. Spence & Sons, Airdrie.

## NEW BUILDINGS.

**New Town-hall for Battersea.**—The foundation-stone of a new town-hall for Battersea has been laid. The site is at the corner of Lavender Hill and St. John's Road. The building is being erected by the Battersea and New Wandsworth Public Halls Company; the ground floor on the two frontages is laid out for shops, while there is a suite of rooms behind, on the same floor, for the accommodation of a club, including, reading, coffee, smoking, and billiard rooms; winter garden, club-hall, and kitchens and servants' offices in the basement. The public hall is on the first floor; 106 feet in length, 40 feet in width, and in height 32 feet. It is entirely fireproof, as are also the staircases and approaches. Adjoining the hall are several apartments, intended for retiring, cloak, and supper rooms; and there are offices for the secretary, and caretaker's apartments. The building will be Queen Anne in style, with facings of steel-coloured bricks, the dressings being of red brick, as are also the moulded cornices, &c. The ornamentation will be carved in rubbing bricks. The design has been prepared by Messrs. Morris & Stallwood, architects, of Reading, and was selected from six submitted in limited competition.

**Asylum for the Blind, Glasgow.**—The new building in Castle Street, which was designed by Mr. William Landless, has been opened by the Earl of Rosebery. An illustration of the buildings lately appeared in *The Architect*. The new building consists of front and back sections, the former containing shops and warehouse accommodation, and the latter the dormitories and school-rooms. To the south of the back-section a rope-walk has been built. The whole buildings are heated by the mild hot-water system, and the arrangements for washing, laundry, and kitchen are very complete. Externally the chief feature is the tower at the south-west angle, semi-detached and hexagonal in form, with balconies and tablets of armorial bearings. There has been introduced a statue of Christ represented in the act of restoring sight to the blind, being the gift of Mr. Charles Tennent, of the Glen, M.P. The north division, yet to be built, is intended to be used for the manufacturing department. A new building is very much required, as the existing workshops are much dilapidated; but want of sufficient funds alone prevents the managers from undertaking its erection. The cost of the division which is so soon to be opened has more than exhausted the funds at the command of the managers, and as they have no borrowing powers under their charter of incorporation, they have no recourse but to appeal to the liberality of their wealthy fellow-citizens to furnish funds not only to pay for that portion already finished, but to complete the northern division, and to equip both the educational and industrial departments in a manner suitable to the wants of a sorely-afflicted section of the community.

## ARCHÆOLOGY.

**Scottish Text Society.**—The following report has been issued by the proprietors of this Society:—Before bringing the proposal under the notice of the public, means were taken to ascertain the opinions of a number of scholars and leading men, both in Scotland and in England, as to the probability of the success of such a society. Answers highly favourable were received from many, and promises of co-operation were given by several. Inquiries were made as to the number of members which would be necessary to maintain in efficient working order a society like the Early English Text Society; and it was found that with 300 members subscribing a guinea each the society would be able to publish annually from 300 to 400 pages of carefully-edited and handsomely-printed

matter. Prospectuses were drawn up and issued, and advertisements inserted in the literary papers and the leading Scottish journals; and by means of these, and by personal exertions and the help of others interested in the success of the society, about 200 subscribers have been secured. A hundred subscribers at least are thus still wanting, but it is believed that these will readily come forward as soon as the success of the society is assured. It is now proposed to issue another prospectus containing two specimen pages, the one of prose and the other of verse; and this it is hoped will be the means of securing the adherence of many subscribers who have hitherto held back. The society is being established purely in the interest of the Scottish literature and language, and it is not too much to hope that Scotsmen, both at home and abroad, will give their hearty support to an undertaking that at once appeals to their patriotism, and would tend in no small degree to foster the national life. The value of such undertakings has already been recognised in foreign countries, where similar societies are working with marked success. Mr. Furnivall, Professor Skeate, Dr. Murray, editor of the Philological Society's new dictionary, and other prominent members of the Early English Text Society, have expressed their wishes to assist; and from both America and the Continent letters have been received indicating the interest which is felt in the objects of the society.

### ART SCHOOLS.

**Godalming.**—At the distribution of the prizes in this school an address on art was delivered by Mr. C. F. Hayward, F.S.A. He said it was not necessary for every one to be both a teacher and a practical worker in art, nor, on the other hand, to be an artist to have some knowledge of art itself; and however desirable it might be for those who attended art schools to know something of art as well as to practise it, it was not easy to carry out, unless with much more elaborate means and assistance than we had at command. Such a development of their own school was hardly to be expected yet, though indeed it was an end to be desired, "a consummation devoutly to be wished." The lecturer alluded to Giotto and the Renaissance period of art, and observing that years ago men did better work than we could do, and had left such footprints on the sands of time that we could not if we would efface, and certainly should if we could retrace, instanced the wall decorations discovered at Pompeii, illustrations of which were displayed on the walls; but this art of Pompeii was, after all, only a Renaissance, a revival of ancient Greek art. Speaking of the wall paintings at the east end of St. Mary's, Guildford, he said the hard and crude and ineffective style of these works could not be at all admired as paintings, but only valued as historical curiosities. He remarked that science was having her day, and they would do all to encourage her, and art also was doing things it never did before; but still when we looked back we saw triumphs which we could not look for, and glories which we could not attain unto. In that public hall they were content to have around them, when they came together in groups for art purposes, meaningless forms and patches of colour mixed in mud and water, inartistic benches, tables, chairs, and everything out of harmony with a proper state of public feeling for art and artistic surroundings. The one redeeming feature was their art schools, their aspirations for something better, their desire to develop such talent as they found they possessed, their hope for better things, and their appreciation of what was good and artistic around them, with, he wished he could add, their abhorrence of what was mean, shabby, and inartistic. The very fact of the false and absurd æstheticism of the day was a hopeful one, as it was a protest against much that was bad, though itself leading to much the same thing in another direction; but the bend must be the other way to get the thing straight, and, Mr. Hayward continued, this false and spurious art, this show of taste in the dress and furniture of the period, however bad, was but the homage paid by bad to the good, a compliment to the value of something which was not otherwise appreciated. The lecturer drew a favourable comparison between the development of real art in the present day with that existing years ago, and pointed out the facilities, inducements, and encouragements to the cultivation of science and art. In conclusion, he asked if it was absurd to hope that they might have in that locality something more to help on the cause of art and good taste, science and true progress, such as a public library, a museum, a hall for lectures, and lectures or readings themselves, a small laboratory, and at least classrooms, where the science and art of Godalming might have local habitation, if it did not eventually gain a name as well?

**Mr. J. A. Gotch**, architect, of Kettering, at the last meeting of the Kettering Literary and Philosophical Society, gave a lecture on "Our Countryside and its Ancient Worthies," which referred to various places of interest in the neighbourhood, including Rockingham Castle and the picturesque residences at Drayton, Kirby, Rushton, and Boughton, including interesting particulars regarding the early possession of those places.

### GENERAL.

**Mr. Gibbins**, of Easington, and Miss Gibbins, are the donors of a sum of 6,000*l.* for the new infirmary at Stratford-on-Avon. The building will be commenced forthwith.

**Messrs. Eastwood & Co., Limited**, ask us to say that the Shoebury paviors used for facing the large building, St. Mary Overy's Wharf, illustrated in *The Architect* of November 18, were supplied through them from the fields of the late Mr. Dale Knapping, of Shoeburyness.

**Mr. Burnard**, the ex-Mayor of Plymouth, has offered the painting of the opening of the new Eddystone Lighthouse, by Mr. H. Luscombe, to the late Banquet Committee.

**Mr. Ruskin** will lecture at the London Institution upon "Cistercian Architecture," instead of on "Crystallography," as announced.

**Dr. Schliemann** has completed the erection of his residence in Athens, which has cost more than 20,000*l.*

**Mr. T. Arnold** has been appointed architect for the new Congregational Church in George Lane, Woodford.

**Mr. Ewing**, who was professor in the University of Tokio, has been appointed Professor of Engineering in University College, Dundee.

**The Memorial** to the late Sir Wyville Thomson, who was Professor of Natural History in the University of Edinburgh, is to take the form of a bust for the University, and a stained-glass window in the church of St. Michael, Linlithgow.

**The Education Department** have after much correspondence recognised a new school erected by the Kingston School Board, although the accommodation is only 80 cubic feet and 8 square feet of area for each child.

**The Plans** of Mr. E. Pincher, of West Bromwich, have been selected in competition for proposed Board schools at Black Lake, West Bromwich.

**The Prefect of the Seine** has advertised that the materials of the Tuileries will be sold by public auction on December 4. The upset price will be 10,000 fr., and the biddings are not to be less than 25 fr. The ground is to be cleared within six months.

**The Electric Tramway** from Portrush to Giant's Causeway has been completed, and at the private trial on Tuesday a speed of ten miles an hour was obtained.

**Paintings**, supposed to be of considerable antiquity, have been discovered, hidden by plaster, on the south transept wall of Northallerton Church.

**A Classic Case** has been designed by Mr. W. H. Dunn, architect, of Newcastle-on-Tyne, for the organ of the Durham Road Baptist Chapel, Gateshead.

**The College of Physicians, Dublin**, will on December 1 hold an election for an examiner of candidates for certificates in sanitary law and sanitary engineering.

**The Ancient Perpendicular Tower** of Stoke River Church, North Devon, is being restored under the direction of Mr. Edwin Dolby, architect, of Abingdon.

**A Polytechnic Exhibition** was opened in the Corn Exchange, Alnwick, by Earl Percy, on Tuesday.

**The Sandbach Local Board** have been threatened with dissolution for neglecting to take action towards supplying the town with pure water, as suggested by the Local Government Board.

**Plans** by Mr. W. Owen have been adopted for a proposed school of art at Warrington.

**An Exhibition**, illustrative of art and industry on an extensive scale, was opened last week in Liverpool.

**The Madras Pagodas** have now been put in a state of security. The work undertaken consists chiefly in the removal of drift sand from the immediate neighbourhood of the monolithic *raths*; in cutting off the drainage, which was seriously affecting the sculptures at the Krishna Mundapam, and the great rock carving known as the Arjuna's penance, considered to be probably the largest and most important single work of ancient art in India; the restoration of the Naga Rajah's head and of the elephant's tusk to their proper places in the latter tableau; the securing as far as possible of the insecure stones of the Stone Temple; and a few minor works.

**Manchester Cathedral.**—In order that the work of restoration at the Cathedral may proceed as rapidly as possible, it has been decided to effect a separation between the nave, or body of the cathedral, and the chancel, with its adjoining chapels. This will be done by means of a temporary partition of wood, which will prevent the sound from passing, and enable the daily and occasional services to be carried on in the chancel without interrupting the work in the nave. It is not intended to interfere with the Sunday services in the nave. Mr. James Chadwick, of High Bank, Prestwich, has undertaken the restoration of the most westerly bay in the south arcade, and his gift will include a stained window in the clerestory. It is expected that the north arcade will be completed about Christmas, and preparations will at once be made for beginning the work in the south arcade.

# The Architect.

## THE RENEWED STUDY OF GREEK ARCHITECTURE.

HERE seems to be a considerable probability that before long the higher order of architectural investigation may turn again in the direction of the ancient Greek remains. It is not only in the excavations of Dr. SCHLIEMANN and General DI CESNOLA that we perceive the continuance of the old antiquarian spirit, but when we are reminded that the Trustees of the British Museum sent Mr. WOOD to Cyprus so promptly in 1878 to report to them upon the prospects of an exploration of the suggestive masses of ruin which are found on that island, and still more when we have unpretentious vacation tourists like Mr. L'ANSON wending their way to the same spot to see for themselves whether anything can be seen, the question will naturally arise in the minds of many whose leanings of taste are towards the classic modes of antiquity, whether there is not beginning to appear, as a reaction from the romantic movement which has so long, and no doubt in so interesting a manner, possessed England, a disposition, even if unconsciously manifested, to return to the grand field of classical study which once so well repaid the exertions of refined and generous intellects.

It may be said that we already have in our libraries all that can be desired of the most minute information respecting Hellenic architecture; and certainly this need not be disputed. There are men still living whose names are historical as Greek antiquaries; and indeed the work of one of the greatest of them, Mr. PENROSE, is that of a man still, happily, in middle life. But, as it seems to us, the mine of ancient design which is constituted by the books is scarcely sufficient now. In other words, there is in our day so decided a demand for something quite new in all matters of learning, that such a thing as a new Greek movement is probably not to be looked for at all on the old lines, or at any rate not to be expected to assume any special character of public interest unless upon the basis of some novelty of discovery. Therefore, so soon as the change of taste is ripe for the resumption of the antique, no matter how sincere may be the groundwork of admiration, there must be provided something more than the folios of the Society of Dilettanti for an English public to admire.

An illustration of this—no matter if it may perhaps be thought a little far-fetched—is to be observed in the way in which the authorities of the military world have recently been glorifying the successful little army which has returned from Egypt. Not for a moment would we disparage the merit of the achievement in question, but what we take leave to make use of in our present argument is the necessity which evidently lies upon those in whose good hands such matters rest to awake a special impression upon the public mind. The reader may have noticed also, amongst other things, how the hawkers are selling reprints of old newspapers reporting such incidents as the victory of Waterloo and the death of NELSON. This particular stimulant to patriotism emanates of course from the Seven Dials or Whitechapel; but suppose it, for the sake of argument, to have come from higher quarters. The flatness with which such an appeal would fall if not supported, and indeed led, by something belonging to the passing moment, may be taken as a pretty good indication of what would happen in our own artistic case if the Dilettanti were to attempt to stir up enthusiasm for the antique by merely republishing, for instance, their excellent books. The mind of the day is perhaps a little less solid than it ought to be, or a little more anxious to be amused; or it may be only that we are a good deal more in a hurry than we were a short half century ago; but as we happen to be, so must we consent to accept ourselves.

It is in pursuance of this train of thought that we very much wish something could be brought about to procure for Mr. WOOD the means of resuming his excavations at Ephesus in a manner worthy of the occasion. It cannot, we apprehend,

be regarded as otherwise than, so to speak, mathematically certain that the remains of the entablature of the great temple of DIANA are to be had for the digging in the immediate site of Mr. WOOD's successful discovery of the remains of the columns. Not only so, but the remarkable skill which the discoverer brought to bear upon the calculation of chances in his former search ought to justify the hope that the same ingenuity would in his further operations effect similar results with the same scientific economy of effort. The enthusiasm also with which he has devoted his life to the cause is all that could be desired in an explorer. The only remaining consideration is the money requisite for his further work; and this would be such a bagatelle, we do not say to our Government authorities, but even to any one of a good many of our wealthy connoisseurs, that the difficulty experienced in obtaining it seems almost a jest. A builder, for instance, or a brewer, to say nothing of a stockbroker or a banker, might write a cheque at any moment for the five thousand pounds required, and never know, except by a line in his pass-book, that virtue had gone out of him. And yet, if this reminder could be made to take practical effect upon any one of a hundred gentlemen who could readily be named, the consequences to the world of art at this moment might be beneficial to a degree which no one can venture to predict.

At any rate, it is, as we think, some act of this kind that must be done, and some kind of corresponding results that must be accomplished, before any revival of the finer Greek taste can be expected to be brought about in England. The process of revival in such a case is something like this. The hitherto prevalent taste having in time run its course, the insatiable appetite for novelty, which increases in intensity as one generation succeeds another, does not so much seek out another model as unconsciously demand its discovery and introduction. It is then supplied by two agencies. One is reaction from the former taste, now the subject of satiety. The other is generally some fortunate accident. According to the degree of reactive force—which depends largely upon the former vigour of that which causes the reaction, namely, the declining mode—so will be the strength with which the rising mode takes possession of the public mind; and according to the importance of the requisite accident, when at last it comes to pass as an influence in the right direction, so will be the additional interest thus conferred upon the novelty which the public mind is waiting for. Our present position, therefore, being one of inevitable reaction from the revived Gothic school, it seems very certain that the reactive force cannot expend itself upon anything short of an almost equally powerful impulse; so that the probability that such an impulse must speedily find its way to the Greek seems to be matter of course. It is not merely in the art of Italy, that is to say, whether modern or antique, that reactive artistic taste in such circumstances as ours will seek satisfaction, but in that fundamental Hellenic spirit in which the Roman had its wonderful origin.

One circumstance in particular which points to this result is the adherence of the French to the Greek spirit throughout the whole of that later period of modern Classicism which commenced with the great Revolution, and still continues. In all that concerns Mediævalism England has been, and is, wholly independent of all other countries, having its own Romance in complete form and in full force; but as soon as England ceases to be Romantic, and begins to be truly Classic, it must turn, we think, in the same direction as French taste, as it is in fact already doing. No doubt the general style of practical everyday work will embrace more than one form of the Renaissance; but when we remember how much the refinement of this style depends upon detail, it seems to be clear that as the coarse mouldings and slipshod proportions which so often characterise Italian work come to be superseded by more refined detail, it is the Greek spirit that must be introduced. Recent designs of an ambitious or prominent order have indeed shown this tendency very distinctly; and we may certainly say that classic criticism, so soon as it makes its appearance—which it has not yet done—will necessarily accept the Greek type of features as its ideal and model. Even in the common Queen Anne work it will be seen on close inspection that this promise is being fulfilled. Some of its true Dutch features are clownish to the last degree, but wherever the *finesse* of a thoughtful pencil has come to be communicated to the proportions and details, it cannot but be seen that the Greek motive is exercising its influence already,

and that the more definite the attempt at refinement the nearer is the approximation to Greek motive.

We need not scruple to say, therefore, that the resuscitation of criticism upon quasi-Greek principles may be expected in England as soon as some sufficient force is by accident communicated to architectural taste; and although it is useless to say that endeavour can promote the advent of accident, we may at any rate express the opinion that the encouragement of enterprise in a classical direction is what may be strongly recommended to those in whose hands the power to help the progress of art happens to lie.

## IN THE SOUTH OF HUNGARY.

BY A CORRESPONDENT.

THE ramifications of the Iron and Steel Institute's excursion this year were so numerous, and the distances so great, that those who carried out the complete programme soon found that a month was quite insufficient for the purpose. We propose in the present article to follow those few members who penetrated to the old province of Banat, in the extreme south of Hungary, almost bordering upon Serbia, where an influential company in connection with the French *Crédit Lyonnais* owns a domain of more than 300,000 acres of land rich in minerals. The company is styled—to give its full title—the “Kaiserliche Königliche Privilegirte Oesterreichische Staats-Eisenbahn Gesellschaft,” because in 1855 the directors bought a portion of the Austrian State Railway connecting their domain with Vienna and elsewhere. A notion may be formed of the magnitude of the concern when it is stated that the capital of the company is 16,000,000*l.*, the value of the property 3,200,000*l.*, and the number of persons employed about 40,000. The company possesses seigneurial rights over its domain, and even nominates the Greek and Roman clergy. The nearest approach in the United Kingdom to such an organisation was the former “Governor and Company of Copper Miners in England,” who were all-powerful in their valley near Swansea. The population of Banat consists of several nationalities, Roumanians being the most numerous. They are descended from the old Romans who came with the Emperor TRAJAN in the year 105 A.D., conquered the Dacians, and remained in possession of the soil. The Bulgarians, who are next in importance, were colonised under MARIA THERESA. Then come the Servians, Slavonians, Hungarians, Germans, Bohemians, and a few gypsies. The president of the company is Baron MAURICE DE WODIANER, and the Director-General M. LÉOPOLD BRESSON.

Leaving the handsome new terminus at Buda-Pesth, which, with its shrubs and parterres inside, looks as much unlike the English railway station as possible, we proceed by the *courier-zug* to Bogsan, where there is a gigantic poplar tree, 20 feet in circumference. Here is also the junction with the railway, of small gauge on account of the sharp curves, that leads up a beautiful valley, with hanging woods clothing the slopes, to the town of Reschicza, which may be regarded as the capital of the district. It is divided into Deutsch and Roman Reschicza, as the German and Roumanian populations, numbering together about 10,000, remain each in its own district. The streets are long and straggling, with such painful uniformity that it is difficult to distinguish one from another. A portion of the water from the little river Bersava is diverted through the streets to carry off the refuse in an open channel; and it is almost superfluous to add that diphtheria is rife. With few exceptions the houses are on the same plan, having no upper storey and with the entrance invariably at the side. As is generally the case in Hungary, the brickwork is pointed so that the mortar joint is recessed, which produces a good effect; and the guttering is placed over instead of under the shingles which form the general covering to the roof. The windows are of the casement type, with *persiennes* outside; and in winter these latter give place to additional window sashes. No wall-paper is used, on account of the harbour it affords to insects; but the walls are lime-washed with a ground tint, over which various designs are stencilled in one, two, or more colours.

One of the two doctors engaged by the Company to attend their men in Reschicza kindly conducted us through the town, in order that we might observe the Roumanian house industries. All the houses were open to the doctor; and the women brought out their festival costumes which are made entirely by them-

selves. They spin with distaff and spindle as they walk along, often carrying baskets of fruit or vegetables on the head; and this gives them a remarkably good carriage. The thread is woven in a rude loom, gold and silver threads being often incorporated in the stuff.

The costume is most picturesque, the colours being, as a rule, gorgeous. The Roumanian wife wears a large white under-garment of a form which resembles the alb of the Roman Catholic clergy. This garment reaches to the sole of the feet, but is looped up by means of a girdle, so as to fall slightly below the knee. The sleeves are very full, and are ornamented with embroidery at the wrists. A square apron is worn tight in front, the pattern varying with each village; but the prevailing colour is red. A similar garment, decorated with fringe, is worn behind; and in some localities a long wool fringe of various colours completely surrounds the figure to the exclusion of the apron. A tightly-fitting jacket—of silk in summer, and sheepskin variously ornamented in winter—with a handkerchief of some bright colour for the head, completes the costume. Bare feet are the rule in summer, but leggings and sandals protect the feet and ankles in winter. On holidays the newest and richest dresses are worn, and are often supplemented by a necklace of large silver coins, generally ducats. The carpets and blankets, red, with an Oriental striped pattern, are also woven at home, and handed down from mother to daughter. The bedstead is of wood; and a kind of settle with railed back is placed against the side that is away from the wall, serving admirably for keeping children from falling out.

We enter the Greek Church, the turret of which, like many others, is resplendent with tin-plate, and notice the names of the occupants of the stalls for men. They include that of FORTUN, which is quite old Roman. A copper collecting-bowl, almost worn through, has probably been in use for the last 800 years. An old book of Psalms, printed in ancient Slavonic characters, contains an entry in the fly-leaf, dated 1789, that the Emperor JOSEF II. is dead; while the office-book bears the date of 1758.

The principal streets of Reschicza on a market-day present a very animated appearance, while the great variety of nationalities, and therefore of costumes, affords a rare opportunity for the artist. While the Roumanian women affect the more showy colours of red and yellow, the Bulgarians adopt the quieter tints of blue and white. The handkerchief of these colours, worn on the head, is distended in a singular manner on either side. Rude waggons, lazily drawn by mouse-coloured oxen, bring in fruit, vegetables, and Indian corn; and the drivers, with their tanned Oriental faces and conical fur caps, form splendid studies.

The ironworks were founded in 1771 by MARIA THERESA, and have continued in the possession of the Imperial House of Austria until they came into the possession of the Company. At the present time there are four blast furnaces, one fired with coke in the usual way, and the rest with charcoal. There are four BESSEMER converters, which produce steel of almost as uniform quality as the SIEMENS-MARTIN furnace. A capital view of the works is gained from the Kreis-berg, whence also may be seen in the distance the Transylvanian Alps, the highest peak of which is Mundja. A place of public enjoyment, called the Josephinen-Park, has been set aside for the people; and a portion of the beech-clothed slopes of the hills has been enclosed, and a pretty villa built in the French style for the directors when they visit the works. It is here that the members of the Iron and Steel Institute were lodged; while the hall of the Norvotny Hotel was specially decorated for the banquet, bearing the inscription “Hoch die Eisen-Industrie!” The architect of the Company, Herr CSERVENTRA, had also designed a triumphal arch for the station, bearing the following inscriptions in Hungarian, “ISTEN hozott” (God hath sent you), and “Aldás utatokra” (a prosperous journey).

Leaving Reschicza, not without regret, we return to Bogsan by the small-gauge railway, and thence walk, over the hills and through a pine forest gay with colchicums, to Moravicza. This is the centre of rich and extensive mines which produce brown hæmatite and magnetic iron ore, the former containing 38 per cent. and the latter 65 per cent. of metallic iron. The production is at present from eighty-five to ninety thousand tons yearly; but it can be increased by one-half if required. We also came upon a hill consisting entirely of limestone spar in remarkably regular rhomboid crystals. At one of the

colliery villages, we had met with the salutation of the Early Christians "Gelobt sei JESUS CHRISTUS!" to which the orthodox reply is "In Ewigkeit"; but here, and still further south, children, and even grown women, say in passing "Ich küsse die Hand," while the invariable salutation of the miners is "Glück auf" (good luck). From the highest point of the range of syenite hills enclosing the iron and limestone we have a fine view of the Siebenbürger Carpathians, a prominent point of which, the Daniele Kuppe, is 607 meters above the level of the Adriatic Sea.

From Moravicza we drive through a beautifully-wooded country to Dognacska, where there are two charcoal-fired blast-furnaces, and also smelting-works, for reducing the silver, copper, zinc, and lead ores by a long and tedious process. Here we pass the night at a combined inn and farm; and in the morning we start for Krassova, the nearest station, in a "wagen." This "wagen" is the only possible vehicle in such a mountainous country. The sides are open, and there are no springs; but, fortunately, the leather seat is well stuffed, and there is plenty of hay in the bottom. The owner and driver, with a sprig of rosemary in his hat, is of German extraction, but speaks more or less of four or five languages. We pass through mountain gorges, with the hills towering high up on either side, generally clothed with oak and beech, the rich autumnal tints of which throw into strong relief the few firs and spruces that are dotted about here and there. The distance is only eleven miles as the crow flies; but the necessary windings make it at least three times as long. As the time approaches at which the only train in the day may be expected, and there is still a considerable distance to traverse, the driver forsakes the road, or rather track, and boldly makes a short cut across the mountain. The pair of small but splendid horses do their work admirably; they climb any obstacle, even rocks, and the "wagen" must follow. The honest fellow well earns the stipulated three gulden, and on receiving a trinkgeld to boot, he actually wants to kiss the hand that gave it. This, of course, is not permitted; but a hearty shake of the hand is given instead.

The "bummel" train—one composed of both goods and passenger carriages—is not very regular as to hour, so there is ample time to watch the quarrying of the limestone and cement rock, which are burnt on the spot in a Hoffmann continuous kiln with fourteen compartments, capable of burning twenty tons a day. Between Krassova and Anina stations is the junction, with a tramway leading to the Predett Steinbruck, whence is obtained a remarkably fine-grained limestone, nearly marble, of which large blocks are obtained without a flaw. Its colour is almost white when rough hewn, but light brown when polished. This valuable quarry belongs to Herr JOHAN VON BIBEL, of Oravicza. The men are paid from 90 kreutzers (1s. 6d.) to 2½ gulden (4s.) a day.

Krassova station is the highest point of the *Montan-Bahn* of the K. K. Priv. Oester. St.-E. Gesellschaft, being 548½ meters above the sea-level. The necessarily slow speed in ascending the gradient of one in fifty, with sharp curves at the same time, affords time to enjoy the grand scenery; and, in descending, the brakes are screwed hard down on every sixth or seventh waggon. It is necessary to stop occasionally and throw water over them to prevent the blocks from firing. In one instance the line passes along both sides of a beautiful valley, crossing the stream by a bridge, and entering the hills by tunnels on either side of it, in order to obtain a curve of sufficiently large radius.

At Oravicza the cement burnt at Krassova is ground and prepared for the market, when it resembles Roman cement. Here also is the mineral oil factory, where, until lately, the raw oil distilled from the bituminous shales of the coal measures were subjected to a further process of distillation and refining, being then sent off in American oil barrels for illuminating purposes. At the present time, however, the works are kept going with raw oil from the wells in Roumania, which can be bought more cheaply. As an illustration of the remarkable extent to which the English language is cultivated in Hungary it may be mentioned that the wife of the director has learnt English, and amuses herself with DICKENS' works. She spoke English fluently and with surprising correctness, although for the first time conversing with Englishmen. Oravicza, however, is a little centre of civilisation in the midst of a wild, mountainous, and thinly-populated district. It possesses an elegant little theatre, where performances are given in German, combined with the casino or club. The "Kaiser

von Oestereich" is a remarkably comfortable and well-managed hotel, though possessing the strongly-marked individuality of the country.

Here, too, is the corn-mill, an imposing brick building of six or seven storeys, erected by the Company in the interest of their employés at a cost of 175,000 fl. (14,000*l.*). The six pairs of stones, and seven roller mills by GANZ & Co., of Buda-Pesth, are driven by a 75 horse-power horizontal engine, and are capable of producing 5,000 tons of flour yearly. This large mill, with its elaborate appliances—separators, lifts, "creepers," &c.—affords a strong contrast to another primitive mill near Reschicza, in which the upper stone is driven direct by a turbine keyed on to the same spindle, the speed being regulated by admitting more or less water into the race.

About five pounds weight of gold is obtained yearly from the ore found in the neighbourhood of Oravicza, and is reduced by a primitive process. Formerly 50 lbs. were obtained yearly, and during the last twenty years 1,250 lbs. have been extracted; so that the present poor result is only due to inactive working. Malachites, copper pyrites, and ochre earth are also met with. Here, too, is the mineralogical museum, rich in good specimens, and also the central laboratory of the Company for the whole of their domain.

At Anina, the terminus of the Mountain Railway, is an extensive coal deposit in the lias formation, the most valuable in Hungary. This led to the erection of two blast-furnaces for smelting the blackband of the coal measures, mixed with the magnetic ore brought from the nearest mines. One of these furnaces is fired with part charcoal and part raw coal, giving a very good result. The finished iron turned out is of remarkably good quality, as manifested by the collection of "fractures" and "cold tests," and is rather too valuable a product to be used for making rolled joists like that of Belgium. There is also an extensive foundry for making stoves and ornamental castings for building purposes, of which these works have a specialty. The blast-furnace manager and the head of the rolling-mills are both most appropriately named, the former being Herr RINKEISEN and the latter Herr SCHMIDT.

Those who joined this extensive excursion to the south of Hungary had abundant reason for congratulating themselves, as there were so many and varied points of both general and professional interest. The extreme beauty of this part of the country warrants the quaint sentiment of PETÖFI SANDOR, the most noted Hungarian poet:—

Hu a föld ISTEN Kalapja  
Akkor a mi hazánk a bokréta rajta.

(If the world is the hat of God, then is Hungary the posy thereon; or, to render the phrase more reverently, if less literally—If the world is God's crown, Hungary is its richest jewel.)

## HISTORIC WINCHESTER.\*

IF an inquiry could be instituted among English towns to ascertain which is the most memorable, Winchester need have little fear of the result. In its poetry and prose, fact and romance intermingle so closely that the historian runs the risk, when narrating annals of the Hampshire city, of allowing his imagination to supplant research. Winchester crops up in the very earliest English records. It may have been a Celtic settlement, and it was a Roman station of some importance. Did not King Lucius, the last King of the Britons, found a church there, as well as in Cornhill in London?—that martyr Lucius, whose effigy, according to Mr. Thackeray, is to be seen at Coire, with tight red breeches, a Roman habit, a curly brown beard, and a neat little gilt crown and sceptre. Where but at Winchester are we to seek for Camelot? and does not the mystic Round Table still exist to confute all sceptics who may doubt of Arthur's residence in the palace? The axe which belonged to Colbrand, the Danish giant, is unhappily no longer among the treasures of the city (it was abstracted a couple of centuries ago); but as there is no doubt that it existed, there need be no hesitation in believing in the combat at Winchester between the renowned Guy of Warwick and the giant, in which the great nursery hero was victorious. The wooden chests in the cathedral have for generations been supposed to be the caskets wherein the bones of the West Saxon kings have reposed, and who can testify to the contrary? It was to Winchester

\* "Historic Winchester, England's First Capital." By A. R. Bramston and A. C. Leroy. Longmans, Green & Co.

Cathedral that Canute turned when he rebuked his courtiers and there deposited his crown. But if we were to refer to the legendary history of Winchester our article would be interminable. It is the history of Winchester, for which evidence of another kind is forthcoming, that is related by the Misses Bramston and Leroy in the book which we have now to notice.

At the time of the Norman Conquest, Winchester was a place of great importance, but as it was held by the widow of Edward it was not seized by the politic William. After a time he erected a palace which was his resort in spring. It was in Winchester that he was crowned for the second time; there the last of his Saxon opponents, Waltheof, the son of Sigurd, was executed; and it was there the great Domesday roll (from which Winchester was exempted) was approved by the king, and the curfew was first heard. One of William's chaplains, Walkelyn, was consecrated Bishop of Winchester, and he lost no time in undertaking the erection of a cathedral:—

Bishop Walkelyn must have looked with some contempt on the Saxon cathedral, grand and massive though it was for the times in which it had been built, notwithstanding its being considered small in Norman estimation, and doubtless disfigured by the rough usage of the Danes. He therefore determined to build a new cathedral worthy of the capital of the great conqueror, and accordingly set about doing so at his own cost, using stone from a quarry in the Isle of Wight, whence, years after, William of Wykeham also brought his material. As time went on, however, finding that he required a great quantity of wood, he begged the king to give him as much as he could take from the forest of Hanepinges (now Hemptage Wood) in four days and nights. To this William consented, and the Bishop having collected all the men he could, the whole wood was cut down in the prescribed time. When the king found that his wood had disappeared, he was at first very angry, but eventually forgave the—we may almost call it—practical joke which had been played him.

The first services were held in the cathedral on April 8, 1093, six years after the death of William. His successor was not zealous in church building, and on the death of Walkelyn he appropriated the revenues of the see. When the corpse of the Red King was carried to Winchester from the New Forest, it was received in silence, for prayers were supposed to be unavailing after so much sacrilege. The tower of the cathedral fell in 1107, and it was interpreted by some as a judgment for the permission given by the clergy for the burial of Rufus before the lectern in the choir. During the reign of Henry I. the city prospered, and we may judge of the value of the see in those days from the fact that the king's nephew and namesake, Henry of Blois, was consecrated bishop in 1029. This prelate at one time aided his brother Stephen and at other times opposed him, but amidst his treasons he was not neglectful of building. He founded the hospital of St. Cross in 1136, from which bread and beer continues to be dispensed to wayfarers. The late Mr. Carlyle once accepted the dole, and in return we are told he pronounced a malediction on the priest, who received 2,000*l.* a year that was meant for the poor, and spent a pittance on small beer and crumbs. Bishop Henry appears to have been something of a collector, for Thomas A'Becket, as archbishop, on one occasion remonstrated with him for having alienated a certain silver cross from Hyde Abbey, which he was ordered to restore within forty days. The relic is supposed to have been Canute's cross. It was returned, and restitution made for the offence.

The bishop whose name is most associated with Winchester is William Long, commonly known as Wykeham, from his birthplace. Froissart says that the bishop was so much in King Edward's favour that everything was done by him and nothing was done without him. He was as munificent a churchman as Wolsey, and the statutes of the school he established at Winchester are enough to indicate that he was in advance of his age in educational matters. His motto, "Manners makyth Man," would suggest that his success was owing to his agreeableness about the Court; but, however this may be, he had better qualities. As one of his successors, the Roman Catholic Dr. Milner, said of him, "he performed so many great actions that we are at a loss whether to admire him most as a statesman, a bishop, or a Christian." His work at the cathedral is thus summarised in "Historic Winchester":—

Wykeham, on October 3, 1394, set about the definite continuation of that undertaking begun by his predecessor, probably with his assistance, which during the greater part of the last twenty years had been in abeyance. This may briefly be described as the transformation of the whole nave of the cathedral (with the exception of the part altered by Edington) from Norman into that Per-

pendicular which we now see; pillars, arches, windows, and roof being so entirely changed as to bear no trace on the surface of the former style. The cloisters adjoining the south side of the cathedral are thought by Dr. Milner to have then probably been taken down and rebuilt so as to correspond with his other alterations. The work went on without intermission, and it was by no means finished before the bishop's death; yet the design and plan of it was so entirely his, that the whole may with perfect justice be attributed to him. "Master William Winford" was architect or mason, "Dominus Simon Membury," clerk of the works, and "Brother John Wayte," controller on the part of the prior and convent, by whom the scaffolding had to be provided.

Wickliffe suggests that Wykeham was more of a castle builder than a theologian, but in those days it would seem that a bishop of Winchester must be concerned in secular affairs, and they were not often engaged on work that was as harmless as building. Wykeham was a worthy of whom any country might well be proud. Few men were less disposed than Mr. Carlyle to admire a Catholic bishop, but it is recorded how when at Winchester he took hold of the hands of the statue of Wykeham and patted them affectionately. "He rightly values," said his companion on the visit to Winchester, "the brave man who built Windsor, and this cathedral, and the school here, and New College at Oxford." Wykeham was succeeded by Henry Beaufort, the half-brother of King Henry IV., but he was too engrossed with the troubles in England and abroad to give much thought to Winchester until he retired from the Court. Then we are told "he employed some of his riches in continuing Wykeham's work on the cathedral, as we see by his device of the white hart chained, carved in the nave high up below the triforium. And in the choir his motto, "In domino confido," points to additions or restoration in that part as well." Beaufort died at Winchester, although in the play of "Henry VI." his death is represented as occurring in London, and it is needless to say that the circumstances attending his death which have been introduced in the play are without foundation. Soon afterwards Winchester seems to have lost its prosperity. In 1452 the citizens sent a petition to that King for aid towards repairing the houses, and the annual grant of forty marks was restored.

Some of the prelates who ruled at Winchester during the latter part of the fifteenth century expended a part of their revenues in additions to the cathedral. Richard Fox, the founder of Corpus College, heightened and finished the altar screen, replaced the side aisles of the presbytery, added the flying buttresses on the outside of the cathedral, and built the beautiful chantry, which his college still repairs. "One may picture the old man—blind for the last ten years of his life—led daily for prayer and meditation into the little inner vestry of this chantry, which ever since has been known by the name of 'Fox's study.'"

Wolsey was Bishop of Winchester, but to what extent he carried out the duties is not known. He dissolved some monasteries in the diocese in order to endow his colleges at Oxford and Ipswich. It was to Esher, one of the houses belonging to the see, that he was ordered to retire after his fall. In the play of "Henry VIII." it is suggested that he was not the bishop. Norfolk says:—

Hear the King's pleasure, Cardinal: who commands you  
To render up the great seal presently  
Into our hands; and to confine yourself  
To Esher House, my lord of Winchester's,  
Till you hear further from his Highness.

This is incorrect, for Gardiner, who may have been referred to as "my lord of Winchester," did not obtain the bishopric until after Wolsey's death.

Fox may be considered to be the last of the bishops who were gifted with an enthusiasm for building. It is astonishing how little has been done for the cathedral or the other buildings of the city during three hundred years, although for a great part of that time the revenues have been very large. Under Henry VIII. the most valuable of the cathedral treasures were appropriated. The site of the Abbey of Hyde was assigned to Wrothesley, and as he was eager to have it cleared, in the course of a year Leland could record "in this suburbe stode the great abbay of Hyde." One of the Elizabethan bishops, Robert Horne, was so orthodox that he was described as "a man that could never abide any ancient monuments, acts, or deeds that gave any light of or to religion." Accordingly, he "heartily entered into the work of defacing his own cathedral," and supplemented the work of Henry Cromwell's commissioners. In the reign of Charles I. there was a reaction,

and the cathedral was partly repaired; but when the Civil War broke out Winchester was one of the first places on which the visions of Colonel Francis Quarles, poet and parliamentarian, were realised:—

Whate'er the popish hands have built,  
Our hammers shall undoe;  
We'll break their pipes, and burn their copes,  
And pull down churches too.

These words might be said to describe what was done in Winchester in 1642 by Sir William Waller's Puritans. One passage from a contemporary record will suggest the frenzy of the time:—

"And now having Ransacked the Church, the Troopers (because they were most conspicuous) ride through the streets in Surplices, with such Hoods and Tippets as they found, and, thus clad in the Priests Vestments, rode carrying Common Prayer-books in one hand, and some broken Organ Pipes, together with the mangled Pieces of Carved Work but now mentioned, containing some Histories of both Testaments, in the other."

We have no space to follow the history of Winchester in more recent times, but we recommend the excellent volume by the Misses Bramston and Leroy to the attention of our readers. If the publishers could secure a series of local histories corresponding with it, they would deserve the gratitude of Englishmen. Too little attention has been paid to the subject; and there should be a demand for books which, while containing all that was noteworthy in the annals of a town or country, yet dispensed with the twaddle of guides and guide-books.

### SUNDRY WORKING DRAWINGS.\*

By J. P. SEDDON.

WHEN I was asked to read a lecture to this Association I did not like to refuse, and yet I felt that I really had but little to say beyond what I have already said at one time or another in these rooms, either with regard to the general principles or the practice of the art of architecture.

It is true that a very tempting list of subjects suitable for architectural essays was kindly submitted to me by your officers, from which I might have selected a theme whereon to discourse; but I thought that the task of working up the necessary materials for such a lecture might fairly be left to some of the rising younger men in the profession, who have both more time and ambition for such a purpose than I now have.

It struck me, however, that there must be, or at least ought to be, stored in the folios and memory of one who has been so long in architectural practice as I have been, drawings and incidents which, though doomed to ultimate and speedy oblivion, might be temporarily revived for the advantage of his younger brethren upon such an occasion as this.

I chose, therefore, the title of "Sundry Working Drawings" simply as a convenient peg whereon to hang, as it were, some gossip which might suffice to occupy one of the evenings of your session. If this should prove, as I cannot but fear it will, to be of questionable taste, as partaking somewhat too much of an egotistical nature, I still venture to hope that, though it may lay me open to censure on that account, it may not be altogether a waste of your time and attention to listen to it.

Should I not have been entirely mistaken as to this idea, it is possible that my effort may serve as a hint to other architects, whose stores and reminiscences are of greater value than mine, and lead them to follow my example. Then, if such could be induced to look over the contents of their shelves, and to dip into the pages of their diaries, and extract thence for the benefit of their juniors some of the details and particulars of their professional experience of greater value for instruction than mine can pretend to have, I shall feel more than rewarded for the little trouble that the preparation of this paper has cost me.

The first impression that I received upon my addressing myself to the task I had set myself, was, I confess, one of considerable depression; for I found, after searching into my portfolios, that the majority of the drawings contained in them had apparently been begun, at the commencement of the several works, perhaps rather too elaborately, in an excess of zeal, but that during the progress of the buildings pressure of time and other circumstances seemed almost always to have compelled a gradual contentment with less degrees of finish. The result was that there were in fact very few of the drawings that had ever attained the character that in theory I had aimed at, or that were in a condition fit to be exhibited.

Nevertheless, by the zealous assistance of the gentlemen in my office, I have been enabled to complete a moderate number of these working drawings—sufficient at any rate, I hope, to convey

to you the principal of the points that I wish to bring before your notice. To the editors of the several professional journals also I owe sincere thanks for the courteous and liberal manner in which they met my proposals that they should reproduce on a reduced scale some of these drawings to serve as illustrations to the reports of my lecture in their respective pages. It may also be noted that it is but recently that this could have been done to the extent and in the manner it has been, but for the great advance in the means for such reproduction that science has rendered possible.

"Working drawings" being the nominal subject that I have now to deal with, I shall commence by making some few remarks upon their features and characteristics.

Working drawings may be subdivided into what may be termed, for the sake of distinction, *general working drawings* and *detail working drawings*. The former of these are usually drawn to the scale of one-eighth of an inch to a foot, except in cases in which the buildings are very extensive, when the scale of one-sixteenth of an inch to a foot is frequently used. Neither one nor the other of these scales, however, is in my opinion the best adapted to set off to advantage a design, the detail of which is of a character at all elaborate. Then the scale of one quarter of an inch to a foot is altogether too large for general working drawings, and it makes the drawings quite too cumbersome in size. In my opinion the scale of three-sixteenths of an inch to a foot is the one which gives the best effect for such general drawings as it may be thought worth while to take some exceptional pains with, although it is true that it is somewhat troublesome, and is objected to by builders on account of its being unusual.

For detail working drawings the scale of one-half inch to a foot is the one that is the most suitable for brickwork and stonework, and that of one inch to a foot for woodwork generally; but for roofs, and such like designs in wood of large size, the half-inch scale will suffice. Mouldings and the like should, however, be always drawn out full size; as it is not safe to allow workmen to enlarge them for themselves from drawings to smaller scales, there being considerable risk of the delicacy and essential features becoming more or less spoiled during the process.

The term "working drawings" distinguishes those which are intended to direct the actual execution of the work from either probationary drawings, for which less accuracy and more artistic effect is necessary, or from drawings of executed work, such as may have to be done by students for exercise or in competition for medals and prizes. The minute and painstaking character expected in the latter cannot be maintained in ordinary actual practice.

For working drawings therefore the primary essential is clearness rather than technical excellence or beauty of draughtsmanship. For this reason the representation of shadows is to be avoided in them, and I need hardly say that backlining, once so fashionable, and which is but an affectation of proper shadowing, is quite inadmissible. Colouring to working drawings should be used simply for the purpose of distinguishing the different materials, and the same colours should always be used for the same materials. The printing and writing should be distinctly legible, though of course it is desirable that it should at the same time be somewhat characteristic.

Economy in the preparation of working drawings is a most important point for consideration, both as regards the labour and cost. For though an architect is only supposed, according to the regulations for professional custom of the Institute of Architects, to be obliged to supply one set of drawings and one set of tracings, these fall far short of the usual demands in practice; nor is it often, according to my experience, politic, if possible, to seek or obtain additional remuneration for further copies, although fairly chargeable. My own custom in this respect is to keep my working drawings in pencil, so that I may be able at any time to make any alterations required therein. From these pencil drawings I have tracings made, in strong black ink upon white tracing-paper, whence other copies may be taken and multiplied by means of photolithography. I am thus enabled, at a comparatively small expense, to supply as many sets of the working drawings as may be called for by employers, surveyors, builders, or societies. By the same means also, especially in the case of old buildings destroyed, restored, or altered, the folios of the Institute and this Association may and should be enriched.

You are aware that it is upon the character of his working drawings, rather than upon that of his preliminary sketches, valuable as an able and artistic treatment of those undoubtedly is, that the ultimate reputation of an architect depends. It is those only that actually affect the work itself. Upon the clearness and accuracy of the working drawings alone do the employer's interests and immunity from disputes and extra charges depend, so that they require, and should receive, all the care and attention that can be bestowed upon them. Doubtless, therefore, you have often determined that, come what will, these at least should have your own personal work, and that they should represent you, as it were, and all that is in you, and that their study and completion should precede the execution of the contract. But, alas! man proposes, but fate and circumstances too often dispose otherwise, and you frequently find to your disappointment and regret that after complete and elaborate sets of both general and detail working drawings have been prepared, it has proved that it has only been to be

\* Paper read at the meeting of the Architectural Association, November 24, 1882.

set aside in consequence of some change of purpose, with or without reason, on the part of your employers, and then that the whole work has to be done over again. You thus get to learn by experience that circumstances compel some compromise between the perfection of working drawings that you would yourself desire, and such comparative imperfection as may just suffice to secure the work being properly carried out. This it need hardly be said will not reach that standard of excellence which is so often attained by the student competitors for the medals and prizes of the Institute and this Association.

Sometimes, instead of letting the preparation of the detail working drawings follow that of the general ones, so as to be simply explanatory thereof, I reverse the process, making my designs at once, after mere preliminary sketches, to the scale of a half-inch to a foot. This plan reduces the working-out of the smaller-scale general drawings completely to a mere mechanical operation, so that it can be done without any personal supervision on my part, and yet with certainty that the character intended for the detail will be preserved throughout. By this means my own time and attention is able to be concentrated upon those parts of the work which alone demand thought and design; the rest being left to be done entirely by others. I was able by this means, in the case of the competition for the Law Courts, to dispense with any increase of my staff, and not to disarrange at all my ordinary practice; whereas I remember to have heard almost all my competitors complain of having suffered severely in both those respects.

It is time now to descend from generalities and to speak of particulars, and I think that the most convenient way of arranging the matters I propose to bring before you will be in what may be termed brief, isolated, autobiographical passages, placed in chronological order, which will admit of occasional divergence as subjects appear to suggest themselves. My excuse for these must be that in reality an architect's life is represented in his works, and his works constitute all that in his life is worth any record at all.

Most of my early professional experience was obtained in the diocese of Llandaff, in connection with its diocesan work. In the year 1851, the period of my apprenticeship to Professor Donaldson having expired, I spent three months in a rapid sketching tour upon the Continent, in companionship with the late Mr. Thomas Hill. Immediately after my return I was fortunate enough to receive a commission to build an hotel at Southerndown, a small watering-place on the coast of South Wales, near Bridgend in Glamorganshire. After my first visit to that neighbourhood to inspect the site, I stopped on my way homewards to see the cathedral at Llandaff, which was just then emerging from the condition of ruin and spoliation in which it had lain, in picturesque confusion, ever since Mr. Wood's unfortunate effort to convert it into the semblance of one of his favourite assembly-rooms of his own town of Bath had happily been but partially carried out. I was then courteously shown over the works in progress by Mr. John Prichard, the diocesan architect, under whose immediate charge they were. Shortly afterwards I received an invitation from that gentleman to join him in partnership, an offer which I accepted, and this led to my going down to reside with him at Llandaff.

The cathedral of that little city (which is in fact only a suburban village in the neighbourhood of the town of Cardiff), with its lovely and refined Early English proportions and detail, thus became my constant study and source of inspiration. Its beautiful western front in particular, the exterior and interior of which form two distinct compositions in perfect harmony the one with the other, roofless and festooned with ivy when I first knew it, seemed, as it still seems, to me to be a model for graceful proportion and refined treatment of mouldings. I quite revelled in its loveliness, thinking it to be one of the choicest examples of that style which England has made specially its own, and of which it may be fairly more proud than of any of the others which it shares in common with other countries of Christendom. The carved foliage of the interior of the cathedral was to me a continual source of delight. It is most sparingly used, as if it were jewel-work; and indeed it is as precious as if it were so. It is of the finest type of Early English foliage, the flow of the lines of which have remarkable grace and freedom; the stems are clear and vigorous, and the trefoil-shaped leaves are excellent in outline and surface modelling. I sent up a collection of casts taken from them to the Architectural Museum, and there is nothing to my mind among their treasures to surpass or even to equal them. This carved foliage of Llandaff is, in my opinion, the perfection of that particular class of work which is seen in its very earliest stage, budding out as it were of the simple Norman cushionwork of the capitals of St. David's Cathedral, and which is to be found revelling in its richest and wildest profusion in that of Wells, but nowhere with such developed fulness and power, and yet with refinement and constraint, as at Llandaff. Very noticeable also are the simple but noble piers of the main arches, with their alternately wide chamfers and groups of triple shafts. The effect of these piers is not improved by the access of richness that is seen in those which have been imported into the church of Llanidloes, in Montgomeryshire, which has just been restored by Mr. Street. They were removed from the now destroyed but once marvellous Abbey of Cwm Hir, in the same county, the number of arches in the main arcades of which are said to have reached the unprecedented number of twenty in

succession. In these piers the triple group of shafts occur on each face of their octagonal piers, and their capitals are all united in one rich band of foliage of the character of which we are speaking, but of inferior excellence to that at Llandaff.

The ordinary diocesan work, in which I became at once fully occupied, consisted largely of church restorations, and to my share fell principally those works which were situated in the archdeaconry of Monmouth, under the able and vigorous direction of its energetic archdeacon, whose habit it was to map out his district, and to appoint a visitation to various churches, the dilapidated condition of which acquired immediate attention, and to take me with him on those occasions. Upon our reaching one of these, possibly some few minutes later than it had been intended, he would first ask me to note its deplorable state, which I could not but admit was tolerably obvious. He would then inquire of me what could be done with it, premising, however, that there was no money to be found. To this problem I would reply that its solution and the course to be pursued was far less clear. Nothing daunted, he would then explain to the assembled vicar and churchwardens that he had brought me there simply in my capacity of diocesan architect; which meant that they might set their minds at ease, for the present at any rate, on the subject of fees; but that, as I happened to be there, I might as well take the plans and particulars of the church, so that in case I should be sent for upon some future occasion I might be prepared. He would then allot me about half-an-hour, proffering me his own assistance, when wanted, as a tapeholder. Under such pressure I soon learned to systematise proceedings, first sketching in succession the plans, elevations, sections, and details, and then noting down the necessary dimensions; this having done, we proceeded to perform the same task at the next church upon our list. On my return home I plotted out these several sketches, and though of course, when actual work was contemplated at any of these places, it became necessary perhaps to make another and more careful survey, much time had been saved, and the opportunity given for preliminary consultations.

I soon got to love these modest Monmouthshire churches, discovering that their extreme simplicity was completely in harmony with their surroundings, and preferable there to the comparatively greater pretentiousness of modern work generally, and even old work in richer districts elsewhere. I have often in consequence attempted to work on the same general lines under similar circumstances, particularly in cases where commissions have been linked to like cautions as to there being but little money to expend; and though the working drawings of such structures may look somewhat bare and uninteresting, one often has the satisfaction of finding the result not altogether as bald as had been feared.

Now, the normal condition of these churches was that their roofs had become decayed, their pins had drawn, and the ties from wall to wall generally removed altogether. The walls had consequently yielded to the outward pressure of the roof, and having been originally built with mortar made with the loamy sand, the only material of that nature formerly procurable in the county, the lime had been killed, and the mortar had become little better than dust. They were usually rent at all the angles and elsewhere, and were in such a condition that a vigorous push would have overturned them. The general character of the roofs of these churches was that known as half-barrel or waggon-shaped: that is, constructed of framed and braced couples, without principals or purlins. The braces were usually curved, and served as cradling for boarded ceilings of segmental, semicircular, or slightly pointed form, and were decorated beneath with moulded ribs, with carved bosses at the intersections, and there were usually moulded cornices of considerable depth. Most of these churches had doubtless once had massive tie-beams spanning from the opposite wall-plates, which had in course of time become decayed at the ends, and been removed and no others replaced; hence the perilous condition into which the whole of these structures had fallen.

Some of these roofs had certain of the pairs of couples wider and deeper than the rest, to serve as principals; these were moulded on the underside and carried moulded purlins. A good example of this class of roof exists at St. Lythan's, in the county of Glamorgan. It was not ceiled, but may have been intended to have been so, panelwise, between the purlins. I remember admiring the refined effect of this particular specimen, which had somewhat peculiarly curved but elegant braces, so much that I followed its type in designing a new roof for the chancel of Lampeter Velfry, in Pembrokeshire. Another interesting roof existed in the last stage of decay at Oldcastle, in Monmouthshire. As it was absolutely necessary entirely to renew this, I reproduced the general character of the old principals, which were peculiar in form. This was an example of an open roof with principals and purlins. The collar was very high up, and arched braces supported it and connected it well with the principal rafters.

There are now so many different theories on the subject of restoration that I cannot hope to have satisfied all. Mine, then, was to replace matters as nearly as possible as I found them; and I have considered it a compliment when I have been told, as I was by the late Sir John Harding in connection with the restoration of Rockfield Church in Monmouthshire, that had he not been informed he should not have known that anything had been done

to it. I was but recently told, however, by a zealous member of the Society for the Protection of Ancient Buildings, that I am only one of the more destructive members of my craft in consequence of the confusion thus wrought for future archæologists. There are in truth so many and grave questions that continually arise in dealing with old buildings, and so many ways in which each of these may be viewed, that an architect's position in relation to such matters is a difficult one. He has to decide what should be done, and that with the certainty that, whatever his decision may be, it will please few and be disputed by some. His only consolation is, that if his censors be asked how they would have acted under the circumstances, they would either have done nothing, which he was not in a position to do, or that each would have done something different to the rest; so that therefore their criticisms neutralise one another. In self-defence I can certainly aver that these village churches then stood, as it were, on their last legs, and that the newly-arisen zeal of the Church would not brook their total loss. After all, an architect is but the servant of the public, and though he may be able to, and, if so, should, influence the opinion of his employers, he is bound to defer to that in the end.

I have referred above to the subject of roof tie-beams, the essential necessity of which our forefathers frankly accepted, as was their wont, and tried to make the best of. The modern mind, however, seems to abhor ties, and one of the problems that I have continually had to endeavour to solve has been how to construct church roofs without any visible ties, and that often to cover walls of less than mediæval thickness, and of more than ordinary spans. In Kent and some other of the south-eastern counties half-barrel shaped roofs are not infrequent, but they are generally provided with efficient supports in the shape of tie-beams with king-posts and braces. There is one of early date, well moulded, at Salmestone Grange, near Margate. At Eythorne, near Dover, I succeeded in reproducing all these features in the new roofs, which I found it was absolutely necessary to substitute for old decayed ones. But at Great Kimbale, in Buckinghamshire, when I put a similar roof to the chancel of the parish church, it is even now in contemplation to cut away and dispense with the obnoxious tie-beam and king-post, because it happens, from some points of view, to appear to cross the upper part of the eastern window. This leads me to notice and to utter a protest, however unavailing it may be, against the absurd modern craze for an undisturbed vista from one end to another of our cathedrals and churches. All mystery and effect is thus sacrificed, and the interiors of our ecclesiastical buildings become as bald and as bare as those of barns.

In the church of Great Kimbale, to which I have alluded, I met with the worst example in my experience of walls having been thrust outwards by the spreading of their roofs, but I succeeded in restoring them bodily to their proper upright position, without having them rebuilt, as at first appeared necessary. This I was able to accomplish by the simple expedient of having them hauled up by ropes attached to windlasses outside passing through the opposite openings, after having previously disengaged the bases of the several columns of the arcades, and subsequently underpinning them.

It is noticeable that all these old church roofs were constructed, however rudely, in oak, and that they have owed their duration to the extreme tenacity of that timber, in spite of all the adverse circumstances to which I have called attention. They have in very many cases been renewed or altered at a far later date than the ages of good church architecture, probably in rude imitation of the former ones, but with inferior construction; or perhaps the timbers of the old roofs had become decayed at their feet only from contact with the damp walling, and their ends having been cut off, they have been reused and reframed, and so made to do duty again for a roof of lower pitch than the original. This may generally be discovered by finding the marks of the previous roof against a tower or the end gabling, and I lately found this to have been the case at the parish church at Betchworth, in the county of Surrey. In this case, also, disused and displaced mortice-holes betrayed the fact, together with the construction being inferior to any real mediæval work, the struts having been only nailed to, and not housed into the rafters and collars. The roof had been covered with exceedingly heavy stone slabbing, which had been improperly bedded completely in mortar, which by capillary attraction had rotted the lathings of the tiling and the ceiling between the rafters; these, again, being too close to each other, had left but little intermediate air space (another frequent cause of similar disaster). The roof timbers had in consequence sunk under their weight, and become dislocated at their points of junction, and the walls had yielded to their pressure, and so the complete restoration of the whole had become imperative.

The present almost prohibitive cost of oak, and difficulty of getting it seasoned, import another element for consideration into this already sufficiently vexed question of restoration; for the character of construction, what was suitable to that denser material is not so when fir has to be used instead. As an example, therefore, of the manner in which I have endeavoured to solve this problem in connection with that of the non-tolerance of ties, I may call your attention to the working drawings which I have just prepared for this particular case at Betchworth. In the first place, I relinquished the use of the framed couples alone, which I consider is

only desirable when oak can be obtained. For this treatment I have substituted one in which principals are introduced at moderate distances apart; and, to avoid the intrusion of ties, I have had to place the collars high up. I have made continuous curved braces to sustain them, and by connecting them thoroughly to the principal rafters reduced their thrust to a minimum.

I find, however, in looking over my folios, that in general I seem to have preferred to adopt, whenever I could, roofs with half-barrel shaped ceilings rather than those left open to the ridge, as in the last case described. The reason is, that I consider the former the better adapted to maintain an equable temperature within buildings, and to give greater facilities for ventilation by means of the space that is left in them between their outer covering and the ceiling below the collars and braces, and also that they transmit better to a distance the sound of the voice. Then, again, the distance between the covering and ceiling gets rid of the danger of dry rot, already spoken of as very likely to occur when the covering is of tiles bedded in mortar or cement, and there is but little space for air between it and the ceiling, which, if of plaster, is impervious, whether this be between or below the rafters themselves.

And yet the outer covering of roofs should be made impervious, or else it is but of little use to attempt to warm by artificial means the interior of a church. With the ordinary coverings used for the sake of economy, the heat evaporates through them almost as fast as it is generated, and the air of the interior, getting rapidly cooled by contact with the cold covering, descends, and causes the draughts so bitterly complained of by congregations. The least that ought to be done is to cover the rafters with stout boarding, ploughed and tongued, with asphalted felt laid upon it, and above them battens about 2 inches by 2 inches should be placed diagonally to brace the whole roof, and to allow any rain driven in under the tiles or slates to pass down to the eaves. The tiling or slating battens should be fixed upon these. I should even advise the boarding to be doubled, and to have plain felt between the two thicknesses, as well as the asphalted felt above them. Then the outer covering can be laid, as it should be, without mortar or cement.

The construction of this class of roof will be that in which principals are used with purlins to support the rafters, and cradling to carry the ceiling; and I shall call your attention to the working drawings of several of such roofs in connection with some of the buildings I am about to mention. Some of these drawings are to be reproduced.

At Great Yarmouth I have had considerable experience in connection with half-barrel shaped ceiled roofs of large spans. It was in the year 1862 that I received the commission to undertake the restoration of the noble Church of St. Nicholas in that town. This, as you are doubtless aware, is one of the largest, if not the largest, simple parish churches in existence. The special peculiarity of it is that all its aisles have the immense internal width of about 40 feet. This commission was the more gratifying to me as I had been entirely unacquainted with the place and its inhabitants until I was informed that the committee had decided upon offering the work to me. I mention this fact because, although for very many years my relations with this work were of the pleasantest, and I was permitted to control all that was done at the church, in order that one mind might guide the whole, after a time that rule became relaxed, and I resigned in consequence. I am glad, however, to learn that it has lately fallen into the able hands of Mr. Pearson, under whom I trust that the work may be satisfactorily completed.

Some of the roofs and walls had fallen into a similar state of dilapidation to what I have been describing in other cases, and from the like causes. The first of the roofs that I had to replace there was that of the chancel, which has a span of only 25 feet. For this it was desired that I should, and I was able to, follow the old construction of framed couples, and to employ the same material as before—that of oak. But when, later on, I had to undertake that of the vast south aisle of the nave, I found that practically neither were admissible, nor could I venture to introduce there any ties, as there had not previously been any. I therefore worked out the problem afresh, with fir for the material, and with principals and purlins and cradling for the ceiling, the result of which was entirely successful.

This church of St. Nicholas, though very impressive from its great scale, is not satisfactory, in that its nave and chancel are less in width than their respective aisles, the former having about 25 feet span and the latter 40 feet. In the new church dedicated to St. James, at the southern extremity of the same town, which is now in course of erection from my designs, I tried, while keeping somewhat to the same scale, to correct this disproportion, and so made the width of the central compartment about 35 feet and that of the aisles 25 feet. The site that I had to deal with in this case was almost square, and I therefore adopted the Greek cross as the type for its plan. There are but four columns in the interior, and the central crux compartment is covered by a segmental dome of concrete carried by the four large arches and four smaller ones spanning the angles of the crux in place of pendentives. This it is my intention to have decorated with Rust's mosaic, as I have

shown in a view of the interior of this church, which has been reduced by Messrs. Sprague, by their new photographic process, for the journal of *The Architect* as an illustration to my paper in its pages, from a large coloured drawing of it by my friend Mr. Howard Gaye. In the pulpit, seen in the drawing, I used the same material of mosaic in connection with decorative stoneware from the Fulham potteries, resting on a base of polished serpentine. Such materials, some specimens of which have been sent by Messrs. Belham for your inspection, I have found to give facilities for the introduction of constructional and durable colours into buildings, the want of which I had long previously felt and deplored. The interior of this church is lined with buff-coloured brickwork, diapered with red, and its exterior is likewise constructed with considerable variety of colour in flintwork and red and black brickwork and stone dressings. The roofs are of the character of those described at St. Nicholas'; and indeed in the general size and scale of the parts I have tried to adapt in St. James's Church such of the characteristics of its mother-church as had impressed me with admiration, and had appeared to me to be desirable to introduce into the ecclesiastical architecture of our own time.

(To be continued.)

## THE MOSAICS OF RAVENNA.\*

By PROFESSOR J. BALDWIN BROWN.

THE Mosaics of Ravenna have several points of interest for the student of art and of architecture. There is first the interest of their subject. They are the finest existing examples of a period of Christian art which has a special character of its own. They are also interesting from the point of view of style, as exhibiting an attempt to create a new manner of treatment in art based upon the classical, but developing into forms suited to the special circumstances of the time. Thirdly, there is their connection with architecture, and their general effect as a decoration for the interior of large buildings.

The subjects of these mosaics, and to some extent the style in which they are executed, can be determined by the excellent photographs which are now to be obtained of them, but their general decorative effect is a matter which can only be judged of by actual observation, for there are no works which have a more close relation to their surroundings or have been more specially designed for a particular place and use. It will be my endeavour in the present paper to touch upon these three aspects of the Ravenna mosaics—their position in Christian art history, their artistic style, and their character and merit as examples of grand architectural decoration.

The works we are considering belong to the second period of Christian art, after Constantine the Great had formally recognised Christianity as the religion of the Empire. Previously, during the first three centuries of our era, Christianity, if not actually persecuted, had not been sanctioned by authority, and had no worldly position. Christians might and did erect churches by the side of the Pagan temples—we read of forty such at Rome—but all open monuments of the time were destroyed in the Diocletian persecution of the year 303; nor do we possess any certain remains of above-ground Christian buildings before the time of Constantine. All that remains to us of the art of the earliest period is to be found below ground in the catacombs of Rome, Naples, Alexandria, and other places, and consists mainly in the painted decoration applied to the walls and ceilings of the small sepulchral chambers. This decorative art of the catacombs answers exactly to the temper and the outward circumstance of the Christian community. The spaces to be adorned were of a very small size, the tomb chambers or cubicles seldom measuring more than 10 or 12 feet square; and the light was either artificial or admitted through long square shafts running to the upper air. A few figures and devices on a limited scale, and hastily though often skilfully executed, are all that these underground chambers have to show; and their interest for us resides rather in their spirit than in their form, tasteful though this may often be. The spirit of these paintings is an interesting testimony to the temper of the early Christian Church. They are of a uniformly bright and cheerful tone, without a single trace of either the solemnity or the sadness of the representations of later Christian art. The form of the art is Classical, and the system of decoration very much the same that we find in the wall-paintings of Pompeii and Rome. Nor is this merely a case of borrowing; the feeling is in both cases to a great extent the same. The Pagan was familiar with the idea of the Divine manifesting itself in outward form, and with the joy which was in this way shed abroad. The Christian artist in like manner had his mind filled with the gladness resulting from the Divine manifestation, a gladness which pervaded all things, and could not be denied expression even in the chamber of the dead. Hence the decorative forms of the Classical painters, wreaths of flowers, fruits, gaily-feathered birds, figures of the seasons and symbols of all the varied life of nature, appear as if in their natural place

upon the walls and roofs of these cubicles. For all that lay beyond this simple joy, all that was serious and distinctly Christian in their habits of thought, the Christian artists had no means of expression ready, and had to content themselves with symbols. The artist of the catacombs was unwilling or unable to depict Christ as an historical personage, or to portray scenes from the life of the past. Thus art, when it entered these regions, became symbolic. Christ's existence and presence were figured by the well-known symbol of the fish; His attractive power by the angler who draws a fish from the water; the healing stream of salvation by water from the rock that Moses is striking; or, again, the homage of the world by the adoration of the Magi. Scenes from the stories of Daniel and of Jonah are used to shadow forth Divine truths; but the most frequent representation of all is that of the Good Shepherd, often with the lamb on His shoulder, typical of Christ and of His care for His flock.

Works like these are full of charm and graceful meaning, but are not serious attempts to deal with Christian themes in an artistic spirit. This attempt was reserved for the time when the first paradisiacal days of simple Christian fellowship were at an end, when the Church stood forth as a regularly-constituted power in the world, and had organised itself on a complete hierarchical system. We then find an entirely new style of art on a grand monumental scale and of a thoroughly public character, suitable to the altered conditions of the times after Christianity became the State religion. The aim of this art is to exhibit the forms of Christ and of the saints in all the majesty which art would lend to them before the congregation, and to display on the walls of the churches some of the more solemn scenes from the sacred narrative. The difference between this art and that of the earlier time is much the same as that between the lyric song and the epic. The art of the catacombs is like a song, the simple expression of the Church's joy and contentment, with poetic allusions to the Christian doctrines. The art of the period after Constantine is like the epic in that it is directed to an audience, and aims at bringing before the people the grand, heroic forms of the past age for all to reverence and to imitate. But if the art of this period, which is the one represented by the Ravenna mosaics, differs from that of early Christian times, no less strongly does it contrast with the art of the succeeding period, that of the Middle Ages proper. We find ourselves then in what may be called the dramatic age of Christian art, the age when representations of an intense and tragic kind become frequent, and the sympathies of the beholder are invoked by paintings which depict with the utmost dramatic force the sufferings of Christ or the future retribution of the wicked. It is very significant that though Christ, either enthroned in glory or living and working upon earth, is the foremost subject in the great mosaics of the period after Constantine, we find no representation of His crucifixion or of those scenes from His passion in which His actual suffering is portrayed. Such scenes were alien alike to the childish temper of the early Christian paintings and to the solemn dignity of the mosaics, in which classical dislike to represent the pain and humiliation of the great is still very apparent. The Crucifixion and similar scenes do not come into fashion, at any rate in Italy, till about the eighth century, and it is not till the eleventh that the artists try to unfold all the tragic horror of the situation. The Last Judgment, again, one of the most impressive subjects of the later mediæval artist, is not known till the latter half of the eleventh century, and it is only then that the religious artists descend to depict those scenes of horror from which the painters and mosaic workers of the earlier time would have shrunk in disgust.

What now was the origin and character of this new artistic movement of the days after Constantine? Some notices in the literature of the time, as well as existing remains, enable us to answer the question. It was an age of the utmost architectural activity: one of the great building ages of the world. The emperors from Constantine onwards vied with each other in erecting magnificent temples for the Christian faith. Many of these remain to this day, though often stripped of their splendid adornments. We can still wonder at the colossal proportions of the restored basilica of St. Paul's without the walls at Rome, with its five aisles, its eighty columns, and its 400 feet of length; or admire in a smaller but well-preserved basilica, like St. Sabina on the Aventine, the beautiful proportions and the air of convenience and fitness of the churches of this age. Or, again, we can study the system of circular and polygonal churches, with their bold cupolas and ingenious divisions of space, of which St. Sophia at Constantinople is the masterpiece, and San Vitale at Ravenna and the stately and beautiful San Lorenzo at Milan are more accessible and better-known examples. Could we see before us now the interior of the church of St. Sophia as it left the hands of the architects of Justinian, we should have before us perhaps the most beautiful and splendidly adorned temple ever raised to the service of religion. These numerous and extensive buildings must of course have led to a great demand for decorative art of the finest kind. Literary notices tell us that provision was made for supplying it by the grant of special privileges to artists. A law of Constantine states that "leisure is required for learning the arts, and if this is granted, artists will become more skilful, and will teach their sons their profession"; and

\* Paper read at a meeting of the Edinburgh Architectural Association on November 22, 1882.

proceeds to announce certain exemptions in favour of artists, first architects, then painters, sculptors, and mosaic workers. So popular did this profession become, that we hear from a writer of the fourth century that in his time the young men forsook the schools of the rhetoricians and philosophers, and streamed in crowds to the studios of the painters. If we ask what models were set before these students, we find the answer, so far as the school of Constantine is concerned, in the fact that Constantine collected together in his new capital a vast number of the finest statues of antiquity out of Athens and the other Greek cities, and the influence of these fine models is unmistakable in the mosaics of the time.

This new development of art is generally called Byzantine, for it was in the new capital of Constantine that it attained to its utmost splendour. There can be no doubt, however, that the same style of art flourished in the other great towns of the Roman Empire, where fine architectural monuments were constantly erected. Rome had a school of mosaic workers that lasted on throughout the Middle Ages, and the mosaics of Ravenna may as well have been the productions of local artists as of imported talent from Rome or from Byzantium.

Imperial patronage then, and the study of good antique models, gave the necessary impulse to this new style of art, which we may call Byzantine. The spirit of it was determined equally from within by the condition of the church of the time. Even here the feeling among ecclesiastics was for a style of art which should answer to the present greatness of the church, and impress the minds of the worshippers with the grandeur of the Christian legend. A few words from a writer of the middle of the fifth century convey well the ideas of church decoration of the time. The old system of ornament, with a miscellaneous multitude of representations, must, he says, be done away with. No more birds, quadrupeds, insects, and plants, together with a crowd of small crosses. This is a silly and a childish style. What ought to be seen in the sanctuary at the eastern end is a single cross, as one cross only brings salvation to men. The inner walls of the church must be covered with scenes from the Old and New Testament, from the hand of a first-rate painter, in order that—and this is the significant point—"those who are not able to read may be reminded of the Christian virtues of those who have served aright the true God, and be inspired to try and imitate them."

This somewhat lengthy introduction has been necessary in order that we may understand what there is to be looked for in these Ravenna mosaics, which are, as has been said, the most complete example of the style of art called by the general name Byzantine. We shall find in them no graceful playing with the symbols of the faith, but the presentation in epic simplicity and breadth of the historic forms of the heroes of Christianity. We shall find no attempt on the other hand to excite dramatic interest, or to harrow the feelings by the sight of the sufferings of thirst, or the torments of the condemned, but a desire rather to chasten and elevate the minds of the beholders by the spectacle of Divine majesty and of humanity triumphant over evil and in the repose of victory.

In the style of these works again we shall see the result of an intelligent study of antique models, which enables the artist to create types differing from anything we find in the antique, but posed and draped in a way at once natural and dignified. Thirdly, we shall note in them examples of what has been well called the "unerring mediæval instinct of style." However faulty is the drawing of the decorative artist of the Middle Ages, he seldom makes mistakes in what is after all the most important part of his work—his general effect of tone and colour, and still more the suitability of his forms to their use and to the place they occupy. There are certain qualities in decorative work in which the instinct of artists in early times like these seems to have led them infallibly right, while the highly-trained painter, sculptor, or architect of the present day is constantly liable to go wrong. It seems as if the decorative instinct belongs in its perfection to the unsophisticated workman, and becomes weakened in proportion as he gains mastery over form and is able to express more and more in his work of an intellectual kind. At any rate (though this may be somewhat too broad a statement) there is no doubt that the most accomplished artists of to-day may learn a good many useful lessons in decoration from the mosaic workers of Rome and of Ravenna.

Ravenna lies on the east coast of Italy, at the upper part of the Adriatic. In the time of Augustus it was an important seaport and possessed a suburb—Classis—connecting it with the harbour, but the sea is now nearly five miles away, and the only relic of the harbour-town is the old basilica of St. Apollinare in Classe, three miles outside the walls. The historical importance of Ravenna belongs to the 250 years during which it took the place of Rome as the seat of empire in Italy. The Emperor Honorius removed his court to Ravenna in 405, while Italy and Rome fell under the power of Alaric and his Goths. For nearly a century the rulers of the Western Empire remained in safety amidst the marshes of Ravenna, the government during the first part of the time being in the hands of the great daughter of the Emperor Theodosius, Galla Placidia. At the close of the fifth century Ravenna, with the whole of Italy, passed under the power of the Ostrogoths, whose famous King Theodoric ruled in Ravenna for three-and-thirty years, till

his death in 526. In 539 Ravenna again became the seat of Roman Imperial power, when Italy was reconquered by the generals of Justinian, the head of the Eastern Roman Empire at Byzantium. It was now the seat of the exarchs, or viceroys, of the Eastern Emperor, who exercised from here a nominal rule over Italy till the time of the establishment of the Frankish power in the eighth century.

The artistic history of Ravenna is closely connected with the foregoing facts. It has three great epochs answering to the dominion of Galla Placidia, of Theodoric, and of Justinian, under all of whom grand churches were erected and adorned with mosaic decoration. Latins, Goths, and Byzantines have thus all had a hand in the Ravenna mosaics, but we do not find any striking difference in the works they severally are responsible for. All were alike Christians, though the Goths adopted the heretical form of Christian belief called Arianism; and all alike took for their subjects the grand Christian themes suited to the taste of the times. In the artistic merit of the works a difference is to be discerned, due to the fact that the art, like all the forms of art in the Early and Middle Ages, was an art of decline. Both in the catacomb paintings and the mosaics the same law is apparent—that the earliest work is the best, and the style gets dryer and more conventional as it goes on. Not till the rise of the Florentine and Siene painters of the thirteenth century do we find a really progressive form of Christian art.

Each of the three periods of Ravennese art noticed above is represented by two important cycles of mosaics; that of Galla Placidia by the so-called Catholic Baptistry, or S. Giovanni in Fonte, dating about 430, and the tomb of the princess herself about 440; that of Theodoric the Goth by the Arian Baptistry, or S. Maria in Cosmedin, 500, and most of the mosaics in S. Apollinare Nuovo, 504; while from the time of Justinian we have the splendid series in S. Vitale, 547, and some examples in S. Apollinare in Classe, 549. Of somewhat later date we have other mosaics in the two churches dedicated to S. Apollinare, and mosaics of various periods in the chapel of the palace of the archbishop.

(To be continued.)

## DRAWINGS FOR PATENTS.

THE following regulations respecting the drawings which are to accompany specifications for patents have been prepared by the Commissioners of Patents:—

The drawings accompanying provisional specifications shall be made upon a sheet or sheets of parchment, drawing-paper, or cloth, each of the size of 12 inches in length by 8½ inches in breadth, or 12 inches in breadth by 17 inches in length (but on one side only), leaving a margin of 1 inch on every side of each sheet. The drawings accompanying specifications, in pursuance of the conditions of letters patent, shall be made upon a sheet or sheets of parchment, each of the size of 21½ inches in length by 14½ inches in breadth, or 21½ inches in breadth by 29½ inches in length (but on one side only), leaving a margin of 1½ inch on every side of each sheet. The drawings accompanying complete specifications shall be made upon a sheet or sheets of parchment, each of the size of 21½ inches in length by 14½ inches in breadth, or 21½ inches in breadth by 29½ inches in length, leaving a margin of 1½ inch on every side of each sheet. The copy or copies of the drawings which are to be supplied must be made on good white smooth-surfaced drawing-paper of the same dimensions as the parchment drawing. All the lines must be absolutely black, Indian ink of the best quality to be used, and the same strength or colour of the ink maintained throughout the drawing. Any shading must be in lines, clearly and distinctly drawn, and as open as is consistent with the required effect. Section lines should not be too closely drawn. No colour must be used for any purpose upon this drawing. All letters and figures of reference must be bold and distinct. The border line should be one fine line only. The drawing must not be folded, but must be delivered at the office of the Commissioners, either in a perfectly flat state or rolled upon a roller, so as to be free from creases or breaks.\*

In all cases where the original drawing on parchment is coloured, there must be left, in addition to the above copy, another copy coloured.

**Broadclyst.**—The parish church of St. John the Baptist has been re-opened, after repairs and improvements carried out by Mr. R. Mitchell, contractor, Exeter, under the direction of Mr. Ashworth architect.

\* N.B.—The Commissioners of Patents having decided that the drawings accompanying the provisional, complete, and final specifications of 1876, and subsequent years, shall be copied by the process of photolithography, this regulation must be strictly observed, in order that correct copies may be made. Specifications and drawings filed in pursuance of letters patent should be left at the office of the Commissioners at least six days before the expiration of the time for filing the same, in order that the officers may examine the extra copy of the drawing, and ascertain that it has been prepared in conformity with the rules.

## NOTES AND COMMENTS.

IN consequence of the numerous accidents that have lately occurred, and especially of one at Plaisance a few weeks ago, where several workmen were killed, the Building Department of the Prefecture of the Seine has decided that for the future every time a private individual demands official authorisation either to erect a new building or add storeys or make other additions to a house, the site and soil, as well as the existing edifice, shall be carefully examined by the Municipal Inspector. By the new regulations the inspector must visit the works on alternate days and see that the proper measures of precaution are being taken. This inspection will be gratuitous and obligatory upon the proprietor. Walls showing the slightest sign of weakness are to be pulled down, and the police authorities will be immediately called in to enforce the decision of the inspecting architect, in case the owner either refuses or delays to obey his order. This is a most important decree, for, except as regards frontage, height, &c., each contractor or private owner can at present follow his own devices in the erection of a building.

THE "United Arts Gallery," in New Bond Street, has become the property of Messrs. GOUPIE. They will enter into possession at Christmas, and will no doubt conduct the galleries upon the principle which gave it character. The late directors say that they were loath to abandon their interest in the undertaking, but they failed to discover persons sufficiently competent to assist them in carrying it on. All the works which have been lately exhibited in the Gallery are to be sold on Thursday next and following days, for account of the artists and to liquidate the different interests concerned.

THE managing committee of the French Commission for the International Amsterdam Exhibition, after hearing the report of Comte de SAINT-FOIX, Consul-General of France at Amsterdam, has decided unanimously that, in order to secure a brilliant display of French products, a grant of 300,000 francs shall be demanded from the Chambers as a minimum sum towards the expenses of their section. It may be remarked that this is but another instance of the ever-increasing tendency of the French to an almost helpless dependence upon Government, without whose aid no one seems willing to take the initiative even in matters of the highest importance to private and commercial interests.

THE Birmingham Corporation have resolved to apply for powers in their Consolidation Bill to take over the School of Art and all its property and funds. It is proposed that the cost of maintenance in excess of students' fees, Government grants, and endowments, shall be defrayed under the Libraries Act, which in consequence is to be amended so as to allow of levying a larger rate than one penny in the pound. It will be seen that Glasgow proposes to follow the example of Birmingham. In some towns it might be an advantage for a Corporation to control an art school, but when the character of the majority of the local authorities is considered, we do not think that there would be any gain by a general transference of the powers of existing committees to town councillors. It has yet to be discovered how far the South Kensington authorities approve of the proposed revolution.

THE Managing Committee of the Society of French Artists have held a meeting under the presidency of M. BAILLY. The financial report upon the 1882 Salon was submitted to the meeting, and showed that the profits of this year's exhibition were even greater than those of 1881. The committee elected the officers and directors for the 1883 Salon. M. BAILLY was unanimously re-elected President, and the following nominations were then made:—Vice-Presidents, MM. GUILLAUME and W. BOUGUERAU; Secretaries, MM. CH. GARNIER, THOMAS DE VUILLEFROY, and YON; Treasurer, M. BRUNE. Members of the Conseil d'Administration:—Painting: MM. HUMBERT, TONY-ROBERT FLEURY, BUSSON, BONNAT, JULES LEFEBVRE, GUILLEMET, CABANEL, HECTOR LE ROUX, MAIGNAN, HEBERT, and LALANNE. Sculpture: MM. MATHURIN MOREAU, ETIENNE LEROUX, CAVELIER, and FREMIET. Architecture: MM. BALLU and QUESTEL. Engraving: MM. BRACQUEMOND and DIDIER. This board is absolute in all matters relating to the Salon and its management.

THE exterior of the Paris Hotel-de-Ville is now almost entirely completed, and the decoration and fitting of the interior is being rapidly pushed on. The only scaffoldings that now remain standing are those in the Cour Louis XIV. and round the Tourelles, which have been kept up in order to finish the sculpture. All the rest of the exterior decoration is completed, as also are the decorative carvings and sculptures on the ceiling of the Municipal Council Room; and the statues have all been hoisted to their places on the outside of the building. From the last report issued by the architects it appears that the money spent hitherto amounts to 17,006,574 francs, thus leaving a balance of 8,023,794 francs to be expended.

CONTRARY to general expectation, the post of Director of Fine Arts for France, vacant by the resignation of M. PAUL MANTZ, has been filled up by the appointment of M. KAEMPFEN, an Inspector of the Department. The staff of the Ministry, the theatres, and the accounts will remain attached to this office; while civil buildings will for the future form an independent section, under the immediate direction of M. LOGEROTTE, the Under-Secretary for Public Instruction and Fine Arts.

A "NOTE" which lately appeared in *The Architect* contained a summary of the objections to the proposed Forth Bridge which were raised by Sir GEORGE B. AIRY. A defence of the principle of the design has come from Mr. CHARLES SHALER SMITH, of St. Louis, who has designed several of the colossal American bridges. Mr. SMITH, after examining the objections in order, says that the opinion of those American engineers with whom he has discussed the subject is uniformly to the effect "that the design of Messrs. FOWLER and BAKER is well digested, perfectly practicable as to execution, and thoroughly permanent in character when finished." With regard to cantilevers Mr. SMITH says he adopted them for a bridge 900 feet span and 750 feet above the river after an investigation of the various systems. The cantilever system is less liable to be affected by wind and thermal changes, and decidedly more economical.

FREQUENT instances of subsidence of the surface soil having occurred in several quarters of Paris, the municipal authorities are bestirring themselves with a view to consolidating the sub-soil of the capital. A plan of the great subterranean quarries that extend under the Bois de Vincennes and the neighbouring districts has been prepared, and the necessary work to be undertaken has been settled. The first portion, which consisted of strengthening the quarries under various public thoroughfares in the 13th, 14th, 15th, and 16th arrondissements, over a total length of 2,000 yards, is already finished. In many places it was found absolutely necessary to construct piers, and fill in the spaces between them with ballast, &c. No less than 6,280 cubic metres of masonry and 10,700 metres of earth and sand were used, while the cost of this comparatively small section amounted to about 10,000*l*. It is expected that the complete execution of the work will necessitate an expenditure of many millions of francs.

THE following resolutions have been adopted by a Parliamentary Committee of the Manchester Corporation in regard to the proposed Ship Canal:—"That the hearty approval and strenuous support of this Corporation be given to the project for improving the rivers Mersey and Irwell to the extent necessary to enable ocean-going ships to have direct access to Manchester. That the undertaking and administration of the canal should be so constituted as to be a trust for the benefit of the public in general. That, subject to satisfactory provisions being introduced into the Bill, it is, in the opinion of the Committee, desirable that Manchester and other municipal bodies and local authorities in the neighbourhood of the proposed Ship Canal should be authorised to contribute to the cost of the undertaking, and to take part in supervising the execution of the works, and also in the general management of the Canal, to such an extent and in such manner as may be sanctioned in Parliament." The promoters of the scheme will be glad of the support of the Corporation; but they are likely to consider that too high a price will be paid for it if the Corporation has the power to interfere with the execution of the works. The subscriptions towards defraying the Parliamentary expenses already amount to 38,000*l*.

## ILLUSTRATIONS.

ST. JAMES' CHURCH, GREAT YARMOUTH.

THIS illustration is referred to in the paper by Mr. SEDDON, on page 344.

MISSION HALL, HAMMERSMITH.

THIS building is about to be erected in St. John's parish, Hammersmith, from the designs of Mr. HUGH ROUMIEU GOUGH, F.R.I.B.A., of Queen Anne's Gate. The hall, which will be 109 feet long by 30 feet 9 inches wide, will have frontages to two streets, with entrances from each, one end having platform and retiring-room or vestry, and the other cloak-room and lobbies. Beneath the hall a working-men's club, classrooms, and a kitchen for dinners given to the poor, will be provided. The two principal fronts will be faced with red bricks, with Box ground Bath stone in windows, strings, weatherings, &c. The estimated cost of the building is 2,000*l*.

SAN ISIDRO.

TO borrow a term from the political arena, this is a type of house which may be described as conservative in its principles and general character—a fact probably to be attributed to the irony of circumstances, as few opportunities would slip its owner for displaying an opposite bias. No eclectic promptings have moved the pencil of its author, and the most sceptical might peer in vain for any indications of a gentle penchant for some of the pretty conceits of his favourite queen. Its surroundings are all of an equally familiar kind: the garden and drive in front, the tennis courts behind, the south sea aspect, the views from the flat at the top, with the pines in the foreground and the bay and ships in the distance, are all mirrored as soon as touched upon. In accommodation it is very complete: there are the regulation size dining, drawing, and morning rooms, with the usual complement of kitchens and offices, &c., on the ground-floor. A fine billiard-room is entered from the landing of an imposing two-way staircase immediately opposite the entrance, and four best bedrooms, two dressing-rooms, bathroom, and seven secondary rooms go to make up the rest of the family requirements. The heating arrangements have been effected by hot-water coils in the hall and open fires in the rooms. The walls are all constructed with a 3-inch cavity, and that comprising the front, given in the illustration, is executed with Fareham red bricks, with stone dressings, and portico; Messrs. LAWSON & DONKIN, of London and Bournemouth, being the architects.

HEATHSIDE, WILMINGTON, KENT.

THIS house, the residence of Mr. JOHN BAYLEY WHITE, junior, stands close to Dartford Heath, and considerable additions have recently been made to it from the designs of Mr. ARTHUR J. STYLE, architect, of Westminster Chambers. The external facing of the walls is rough-cast in Portland cement. The staircase and most of the joinery are in pitch pine, and were supplied by Mr. G. HEWITT, builder, of Leicester.

BUSINESS PREMISES, BIRKENHEAD.

THESE buildings have been erected in Hamilton Street, Birkenhead, for Messrs. PRYCE & SON, cabinet-makers and upholsterers. They are specially adapted for this business, all the showrooms and workrooms being well lighted and ventilated.

The frontage to Hamilton Street is 64 feet, whilst at one side the buildings run back 116 feet to William Street, the whole including showrooms, workrooms, and storerooms, all connected by a central "lift," counting-house, stabling, and packing-room, with spacious yard and gateway from William Street. The storage space is equal to 16,000 superficial feet.

The buildings have been so constructed as to have large open floor spaces without obstruction, the beams in most cases being of 30 feet bearing. Patent red bricks and EDWARDS'S terra-cotta have been used for the front, whilst the inside walls are faced with local machine-made bricks, coloured buff.

The total cost is 3,250*l*. The works have been carried out from the designs and under the superintendence of Mr. ALEX. BLEAKLEY, of Birkenhead and London.

## THE ARCHITECTURAL ASSOCIATION.

THE second ordinary meeting of the Association was held on Friday evening, the 24th ult., Mr. E. G. Hayes, President, in the chair. The following gentlemen were elected members:—Messrs. A. Kent, A. R. Manby, G. D. Oakeshott, T. B. Rutherford, F. W. Macey, A. B. Johnson, H. H. Hughes, H. W. Collins, T. R. Clemence, A. Gordon, S. Strudwick, A. Roberts, E. T. Boardman, S. H. Seager, J. W. Stonhold, E. E. Brooks, T. E. Watkins, A. H. Hart, H. Satchell, W. F. Cave, W. J. W. Ferguson, C. W. Wright, H. S. Perkins, W. W. Short, J. Short, P. Thompson, W. E. Potts, H. H. Mew, A. H. Freeman, A. R. Wright, T. Leadbitter, H. Baker, W. G. Nicol, A. W. Bentham, G. W. Knight, C. T. Hornabrook, W. Leek, H. Hutchings, J. A. Whichcord, A. Clark, H. J. Westell, F. Williamson, C. H. Bedells, J. H. Goodman, H. L. Whitley, F. A. Steer, J. E. Still, W. Sheen, junr., W. F. Kelsey, M. Fawcett, E. A. W. Barnard, A. S. Tayler, H. F. Massie, H. H. Flowers, F. M. Elgood, G. L. Strutfield, W. A. Moull, A. B. Atkinson, A. E. Anscombe, and A. J. Ward.

On the motion of the President the annual report was adopted.

On the motion of Mr. J. D. Mathews, seconded by Mr. James Smith, the annual balance-sheet was adopted.

Mr. J. P. SEDDON then read a paper on

## Sundry Working Drawings.

On conclusion of the paper, which is reported on another page,

The PRESIDENT said that such egotism as Mr. Seddon had spoken of in his paper was a kind of egotism that the members of the Association would thoroughly appreciate. It was most obliging in an architect of Mr. Seddon's large experience to come and speak to them and show them the drawings which formed so important a feature in connection with his paper. Mr. Seddon had insisted on clearness and accuracy in making working drawings. This was a point that could hardly be dwelt upon too much. An immense amount could be learnt by the study and inspection of good drawings.

Mr. R. E. POWNALL, who proposed a vote of thanks to Mr. Seddon, said that the applause he had received would fully show that his kindness had been appreciated. Mr. Pownall observed that the recommendation of adopting a scale of three-sixteenths of an inch to the foot in making sketches for working drawings was to some extent a novelty, and open to the objection that it could not be easily read off the ordinary builder's rule, which did not give that scale. Alluding to some of the drawings showing examples of roof construction, he said he was not close enough to them to see how the thrust was met, but he admired the plucky way in which Mr. Seddon had dealt with spans which were evidently some 30 feet to 35 feet wide. It appeared to him that each layer of bricks had been turned in voussoirs, and not in rings, as was general.

Mr. JAMES SMITH, in seconding the vote, said that clearness and accuracy together represented all that was requisite to constitute a good working drawing. Superfluous lines, which students were fond of introducing, should be scrupulously avoided, as the drawings were simply intended for the guidance of working men, and a lesson was afforded in this respect by Mr. Seddon's drawings, in which all superfluous lines were absent. He could not help feeling gratified that Mr. Seddon had at last condescended to make use of iron in the church at Hammersmith. He thought it was a misfortune to have used Bath stone on the exterior, when marble was used inside, because the Bath stone would not stand the London atmosphere.

Mr. A. B. PITE said he wished to support most heartily the vote of thanks to Mr. Seddon for his kindness in showing them so many excellent specimens of his practice. If he might say so, it was easy to see from them that Mr. Seddon loved his work, and had devoted himself constantly to one style, and thus in an extended professional career had acquired the facility which so nearly approached perfection. If as students they devoted all their energy to the development of one truthful principle, they would be following Mr. Seddon's example as well as the advice the President had lately given them, and when they got older they also might have an opportunity of showing their juniors examples of good work of their own.

Mr. TURNER asked Mr. Seddon whether the plain barrel vault was not injurious in churches on acoustic principles. He thought he had noticed that Sir Gilbert Scott in his later churches had taken steps to prevent acoustic faults resulting from them in the way of echoes, &c. Mr. Seddon, he believed, had once said that he had never used an iron girder in his life. Did he hold to that now? because the use of girders seemed nowadays almost indispensable. It might be said to be a sort of Nemesis that he should now have had to use iron as a roof truss at Hammersmith. With regard to the use of Ancaster stone in London, it had been used in Lincoln's Inn Buildings pretty generally.

The PRESIDENT then put the vote to the meeting, and it was carried by acclamation.

Mr. SEDDON, in replying, said, in regard to the barrel roof, that he had never met with trouble or heard any complaint with regard to echo. His roofs at Great Yarmouth were only repro-

ductions of what was in general use there before. He thought rather that they were good for purposes of sound, and that they helped to send sound well forward. It was just possible that where a church had this roof that faults existed in other directions. For instance, the building might be too lofty, and then steps might be adopted to break the echo, by ties and king-posts, braces, &c. He had never heard of a case in which the roofs, where the intrusion of ties had been dispensed with, had spread or shown signs of weakness, and this he attributed to the arched ribs being well connected with the rafters and collar, which latter was placed high. Mr. Seddon concluded by observing that Mr. Gough had entered, and he would perhaps give them some remarks.

Mr. H. R. GOUGH had noticed that a gentleman had said he was sorry to hear of the use of Bath stone at St. Paul's Church. He regretted himself that they had had to use it, and as far as possible he would avoid the use of it. St. Paul's was the only church in fact of any importance where he had allowed any Bath stone to be used. The reason why they used marble inside was because they were getting it for nearly the same cost as Portland stone—viz. 8s. 6d. per cube, delivered in London, which included a good deal of moulding in caps and bases. Bath stone would not carry the weight inside, for which a hard stone was required. It had been their wish to use Mansfield stone, but the difference in the cost was over 2,000%, and would have made an actual difference in cost of between 4,000% and 5,000%. He was glad to find that one gentleman present was in favour of introducing the use of iron. At St. Paul's Church the ironwork used was not in sight, but he supposed the time would come when iron would be used in sight. At St. Paul's he thought it had been quite legitimately used, and by it they had avoided the introduction of ties and got rid of the thrust of the roof on the walls, and in addition they had been obliged to study economy in building the church. Ancaster stone no doubt had been used hundreds of times before in London, but brown Ancaster had certainly not been used before for walling in London. It was thin, and laid deep in the quarry; there was none in the London market, and but little in Lincolnshire. The rich brown and yellow tints were much admired, and its effect in the mass was so good that they had made use of it for the internal walling, and, besides, it was a cheap walling stone. Mr. Gough, in conclusion, said he hoped he might some day have the pleasure of showing the members over the church.

The proceedings then terminated.

### PRE-HISTORIC REMAINS.

**A** LECTURE on the neolithic remains found in Switzerland, France, and the Isle of Palmaria was lately delivered by Mr. Marr in Carlisle. The most remarkable found in Switzerland were, he said, the so-called lake dwellings. Lake dwellings were by no means unknown at the present day, there being several tribes of people who inhabit dwellings in sheets of water. They were not confined to neolithic ages. They were found in the bronze age and in the Roman period, some of them having been inhabited as late as the first century A.D. It was not till 1854 that their true significance was discovered. In that year the lakes of Switzerland were unusually low, and the inhabitants, digging out the mud for their gardens, came across wooden piles, deers' horns, and implements, and the remains of lake dwellings. These dwellings were built upon platforms, sometimes on piles and on bundles of brushwood, and were connected with the land by causeways. He illustrated the structure of the lake dwellings by drawing attention to that of the Robenhausen house, situated in a peat bog. The platform was composed of timbers and roughly-hewn boards, which were fastened to each other by means of wooden pegs. On this was a number of huts, about nine yards in length by seven yards in width, and between these huts were pens for cattle or domestic animals. The huts appeared to have been generally of oblong shape, but some of them were of circular shape. Most of these dwellings had been destroyed by fire, and underneath the piles themselves, in the lake deposits, they found relics of lake-dwellers in a mass of sediment mixed up with numerous ashes, showing that lake dwellings had been built and destroyed, and others built on the area of the former ones. It was said that the newer dwellings were situate farther from the shore than were the older ones. This had been suggested as due to the fact that in the bronze age the missiles were of a much more perfect character than in the stone age. The weapons, implements, and domestic animals were of a similar character to those already described as occurring in Denmark. So far they had not come across any people who could be proved to have been acquainted with agriculture; but they had undoubted proof that these lake dwellers were acquainted with several cultivated plants. They found several cereals, two or three varieties of wheat, barley, millet, peas, flax, carraway, apples, pears, plums. Mixed up with these were remains of other plants which then grew wild in Europe—chestnut, walnut, acorn, raspberry, strawberry, &c. Without doubt, it was said, the cultivated plants were not derived from wild plants now growing in the same area, but were derived either from some in Europe or else from some in Central or Western Asia. This bore out the suggestion that the domesti-

cated animals were also brought from the same area. The seeds of the cultivated plants found in the lake dwellings, especially the cereals, were very much smaller in size than the seeds of the cereals and others of the similar plants at the present day, showing that we had improved very much in the means of producing the plants as compared with neolithic men. Calculations had been made of the time that had elapsed since the neolithic age, Morlot putting it at 6,700 years. But the basis of the calculations were not strictly trustworthy; and, as in the case of the palæolithic deposits, they found they could get no clue as to the exact number of years, or even to an approximation to the exact number, since the lake dwellings were inhabited by the neolithic people. In Switzerland the bones of the hare were almost altogether absent from the remains, suggesting the idea that a superstition existed with regard to the animal which prevented it being used as food. In France, however, they had proofs that no such superstition prevailed there. He alluded to the neolithic remains in France, the interments in caves of people of the stone age and the *dolmen tumuli*. In the isle of Palmaria a bone, cut and charred, supposed to have been that of a child, had been found amongst the remains, suggesting that the horrible practice of cannibalism, evidence of which was found nowhere else in the European area, had prevailed at this place. He reminded them that in the Victoria Cave at Settle a bone was discovered which was said to be human, but which turned out to be that of a bear. It was just possible in this case that the bone was not the bone of a child or a human bone, but the bone of a monkey; and it was also just possible that as a matter of fact the practice of cannibalism did not prevail in this area.

### THE EMPLOYERS' LIABILITY ACT.

**I**N the Queen's Bench Division on Monday an important case was heard before Lord Coleridge and Mr. Justice Stephen, which raised an important question as to the liabilities of parties for injuries caused by the negligence of persons in their employ who at the time are working for them on piecework. The Gas-Light and Coke Company were having some work done at a place in Essex which required piles to be driven, and they had contracted with a man in their employ named Pearson to do the pile-driving as piecework or jobwork at certain rates or prices. Pearson engaged the plaintiff Cooper to work at the pile-driving, and was actually working with him and others, Pearson being above, sending down the instrument called the "monkey," by which the piles are driven, and the plaintiff below, putting the piles in position; it being his duty to cry out "All right" just before the "monkey" was let fall, and Pearson's duty being on that signal to let it fall. Somehow or other Pearson let the "monkey" fall (as he said, after hearing the signal; and as the plaintiff said, without it), and it fell on the plaintiff's thumb and crushed it. The question as to negligence, at the trial before the County Court judge, was whether or not the plaintiff had given the signal; and the jury found he had not. Then arose the question as to the liability of the company for the consequences of the accident; and on their part it was contended that Pearson was an independent contractor, and that therefore he, and not the company, was liable; while on the other side it was contended that Pearson was in their employ, and was only paid for piecework instead of by wages, and that therefore the company were liable. The County Court judge was of the former opinion, and therefore directed a nonsuit. The question was now raised whether that view could be sustained.

Lord Coleridge asked whether, if the company's engineer who engaged Pearson saw that he was doing the pile-driving wrongly, he could interfere; to which the company's counsel answered that he could not.

It was urged that Pearson was paid by the company, and that he paid the plaintiff; but

Lord Coleridge said that was always so when "gangers" were employed.

It was urged strenuously on the part of the company that pile-driving was work quite distinct from their own, and which, therefore, they contracted for; and it was a matter of great importance whether they should be liable for the negligence of their contractors.

Mr. Justice Stephen said no doubt it was a question of great importance, and there were dangers and difficulties both ways. On the one hand, it might seem hard that a company should be liable for the neglect of contractors; on the other hand, it would be easy for employers always to get rid of their liability by having work done by piecework.

Lord Coleridge added that here Pearson had been in the company's employ for years, and paid by them, and it could hardly be said that the company's engineer could not control him if he was pile-driving in the wrong way.

Mr. Justice Stephen said it appeared to him that it was a question, on the evidence, for the jury, and that there were considerations and facts tending both ways; and

Lord Coleridge observed that the company desired to retain control, and also relieve themselves from responsibility, which raised the difficulty.

The Court, after fully hearing the counsel for the company, came to the conclusion that the judge was right at first in leaving the case to the jury, and wrong in afterwards directing a nonsuit to be entered.

Lord Coleridge said that the question was not whether the verdict was right, but whether there was any evidence for the jury; and they thought that there was, and that the question was for the jury to decide. The question was whether the person whose negligence caused the accident was in the employ of the company and intrusted with the superintendence of the work, and the jury found that Pearson was in that position. The Act of Parliament, which was sometimes said to have imposed so heavy a liability upon employers, merely extended the common liability which already existed as to others—to persons in their employ—under certain circumstances. The question, no doubt, was important, and employers could not be entitled to evade their liability merely by paying their workmen in a particular way. The law must not be allowed to be evaded, and the employers who retained control over the work must, under such circumstances, remain liable. There was ample evidence here that the company had retained a control over Pearson, who was described only as a "foreman" or a "leading hand." He was merely employed to do certain work, which he was to do as piece-work instead of day-work. The principle was that if control was retained over a man he was a servant, and not a contractor. There was such control here, and therefore the nonsuit must be set aside, and the verdict entered for the plaintiff for 75*l*.

Mr. Justice Stephen concurred, observing that the Act was important, and should be construed as clearly as possible, and the question was important whether the employers could escape liability in this way. If the work to be done was really put out of their hands into the hands of an independent contractor as a builder, then the employer did escape liability. But it was not so where the employer only paid his own men by piece-work. If control was retained over the workmen, then the liability remained. It was often supposed that a contractor could not be a servant or a workman, but that was not so, and a person doing work under a contract might still be a servant, so that the employer would be liable.

The judgment, therefore, was given for the plaintiff.

In the Glasgow Sheriff Court a curious case has been heard. The pursuer or plaintiff, Charles Duffy, mason, was working at the Royalty Buildings, Sauchiehall Street, Glasgow, and in the course of his work on November 9, 1880, he alleged he was instructed by the master of works employed by the defenders, the Central Halls Company (Limited), to fill up some holes in the well of the hoist in the buildings, and in order to do so to go up by the cage, taking with him what materials he might require for the job. Pursuer did as he was instructed; but while at work at a height of 52 feet the cage of the hoist gave way, and pursuer was precipitated to the bottom, receiving such severe injuries that he has not since been, and will not likely again be, able to do anything for his own support or that of his wife and family. He further alleged that the accident was caused by one of the wheels of the hoist being defective. The defenders denied pursuer's statements, and averred that the hoist had not at the time of the accident been taken over as finished from the engineer who had erected it. They further pleaded contributory negligence on the part of the pursuer. The Sheriff-Substitute on July 11 last gave judgment against the defenders for 300*l*. and expenses, in respect that the hoist and its machinery were proved to be defective, and the defenders had for their own purposes chosen to take the use of it with its risks, treating it as if it were theirs, whether it had been formally taken over from the engineers or not. He therefore held that whatever might be responsibility as between the defenders and the maker of the hoist, they were liable to third parties for its defects. The case was appealed to Mr. Sheriff Clark, who has issued his interlocutor adhering to his substitute's decision, and giving additional expenses to the pursuer.

### ITALIAN ART EXHIBITION, GLASGOW.

A LIST of the objects to be lent by her Majesty to the forthcoming exhibition has now been received from the Lord Chamberlain's department. Among the loans will be the famous Cellini shield, a magnificent sword and a dagger, two statuary groups in bronze, and two bronze plaques illustrative of Summer and Winter. Sir Robert Hay, of Haystoun and King's Meadows, has also consented to lend two pieces of Italian armour, one of which—a shield—is by the best authorities considered to be by the same artist as the so-called Cellini shield; and the other—a helmet with oreilletes—is by the famous Milanese armourer, Negrolì, and forms a portion of one of the most exquisite suits known. A series of remarkably beautiful shields, swords, and other arms is also to be lent by Mr. David Currie, of London, and there will also be shown reproductions of a few magnificent dress shields from the historical armoury of Prince Carl of Prussia.

### THE VENTILATION OF PUBLIC BUILDINGS.

A MEETING of the Architectural Section of the Philosophical Society of Glasgow was held on Monday. Mr. James Sellars, jun., presided. Mr. John Hay read a paper on "Ventilation considered in Relation to the Opposite Seasons of the Year." Mr. Hay, in the course of his remarks, observed that although ventilation was now a popular subject of consideration, it was nevertheless treated with more or less dogmatic assertion rather than patient and attentive study. In summer, he pointed out, the main question, especially in public buildings, was not so much the purity or impurity of the atmosphere, but rather that in proportion to the increase of temperature the air should be moved to obtain comfort. This motion, he said, could be obtained by difference of gravity, and where this could not be obtained or created by artificial heat, mechanical power should be resorted to. In winter ventilation was most easily effected by utilising the heat apparatus for the admission of fresh air, this arrangement being of still more value in mansions than in public buildings. At the conclusion of Mr. Hay's remarks a discussion took place.

### PROPOSED ART GALLERY IN GLASGOW.

A MEETING has been held in Glasgow, on the invitation of the Hon. John Ure, Lord Provost, to consider a project for the purchase of a site and the erection thereon of an Art Gallery, Museum, School of Art, and Public Library.

The Lord Provost said: Gentlemen, I have taken the liberty of asking you to come here to-day, believing that you all feel as much interest as I do in the different objects that are put before you in the circular I had the pleasure of sending to you—that is, as regards an art gallery, a museum, a public library, and a school of art. For myself, I have long felt that Glasgow was not in the position it ought to be as regards these institutions, and that, contrasted with very many provincial towns, we are very far behind. No one can travel in England and come back without being impressed with the fact that there is a different class of people there altogether from what we have in our Scotch towns. And yet we should not altogether condemn our Scotch towns when we think of our near neighbour Paisley, that has so many of these institutions. Quite recently they have got a museum and public library, and if not a school of art, they have got at least an observatory that is extremely creditable to them. Then they have also had presented to them that which we are to have by a public rate—namely, municipal buildings, the gift of the Messrs. Clark. I have often heard it said that if proper places were provided in the city we should soon almost be deluged with works of art and fine pictures. I cannot tell whether it is that, not having asked the citizens for such, we have not had them in the past, or whether it is that they trust to the general public doing it by way of assessment; but certainly it is the case that hitherto we have not had them. As regards the Corporation Galleries, we have three rooms in them that are very suitable for hanging pictures, and other accommodation for conversaciones and such like; yet these rooms want what I consider to be indispensable in connection with any picture gallery—a fireproof construction. I have only to bring to your recollection the report that was given to us by Mr. Robinson a short time ago as regards the art treasures we have in these rooms for you to see the force of the remark I have made as regards fireproof construction. We did not think it needful to ask him to look at the more modern pictures that are in our possession. We know ourselves pretty well the value of these. I believe they may be computed to be a very great number of thousands of pounds. I have only to remind you that the last gift we got of a very valuable picture was from the late Mr. John Mc Gavin. Indeed, I believe if we had had a proper building for more of that gentleman's pictures we would have got them; but even the one he bequeathed to us cost himself upwards of 2,000*l*.; and I have no doubt that, but for the want of accommodation, other gentlemen would have given us valuable pictures. Besides these modern pictures there are those valuable presentation portraits, which are in themselves of great value. I do not think it is right that all these treasures should be housed in a building where there are ordinary dwelling-houses and shops in connection with it, and I have often felt very deeply that those in authority undertake a great responsibility in having those valuable treasures housed as they are at present. Then, as regards our museum, you all know how we stand in that matter. We have only that small affair in Kelvin Grove Park, which may be very good as a branch of a great museum in the centre of the city, but certainly cannot be regarded as such a building as Glasgow ought to be contented with for such a purpose. My view of it would be that it should be utilised as a branch from a central museum, and that in the east end of the city and on the south side we should have at least equal accommodation to what we have in the West End Park. Then, as regards our Public Library, you who have visited the building in East Ingram Street which is used for that purpose, in near contiguity to where we are now met, know how inefficiently the library is housed. Surrounded as it is by other buildings, and works of various kinds

going on in the neighbourhood, no one can tell the hour when a fire may occur and that valuable collection of 30,000 or 40,000 volumes be consumed. I feel also the responsibility of having that institution placed as it is at present, and hope that others will take the view that I do—that the library ought to be in a very different position. Then there is another matter, and it is the last I shall call your attention to—I mean the School of Art. You know the position in which it is in the matter of being very inefficiently housed. One of the directors of the School of Art has put into my hands extracts from the last report of the inspector who visited it, and, if you please, I will take the liberty of reading some of them. They are to this effect: "The measurements which I have taken of some of the rooms, and of the windows which light them, prove that they are ill adapted for the purposes of a school of art. In the elementary classrooms the lights are so placed as to throw a confused or uncertain half-tone, instead of positive light and shade, upon the casts. It is not too much to say that, with the aggravation of the grey dull atmosphere prevailing here for half the year, the students labour under a positive disadvantage in executing works for national competition. The room for painting still-life and other groups is the worst of the series. It measures 16 feet by 23 feet, with light far overhead, besides a side light. In this area the two bookcases, which are continually being overhauled by students, further cramp the room, and are a source of interruption. The best room is that containing the antique figures, at first impressing one by its ample size, but the light, being high up, obviously gives undefined shadows on the casts, and moreover beguiles the student into the belief that his work is more complete than it would or does appear in the stronger glare of the examination-room. The result, therefore, is altogether unsatisfactory to masters and students. The modelling-room and lecture-room are terribly cold in winter, and the reverse in summer. Owing to the heat the lectures have to be broken off in April each year. In winter they are afraid of introducing proper heating apparatus, inasmuch as, being entirely constructed in wood, it would burn like tinder. For these and other causes it becomes quite necessary to replace this makeshift abode by more efficient galleries at the earliest opportunity." I have heard from the teachers, and I have heard it from the students, that they are working under the greatest disadvantage at the present time, and the wonder to me is rather that they should have taken the position that they have done. There was a time when Glasgow stood high as a seat of the cotton manufacture. I believe in a large measure that has fled from our district altogether. I cannot tell whether it is that the necessary art education to keep ourselves in the front of the times in regard to the more ornamental fabrics has not been cultivated here, and that therefore the trade has left the district, but it is a fact all the same that the cotton manufacture is more largely developed in some of the small provincial towns in England than we have it in this large city of Glasgow. I am told also that as regards our iron manufacture the ornamental departments of it are leaving our city. Whether that may be attributable to a want here of that artistic skill which is to be found elsewhere I cannot tell, but the great district of Middlesborough is attracting some kinds of manufacture in iron which used largely to prevail in Glasgow. The want of the necessary artistic skill is said to be the probable cause of this decline. Well, gentlemen, this matter has been precipitated upon me at the present time by the circumstance which was brought to my knowledge, that a site which I think is extremely suitable can be had for a comparatively small outlay of money. The site that I propose is the vacant space of ground in Sauchiehall Street. It is bounded by Dalhousie Street on the east, Scott Street upon the west, Sauchiehall Street upon the south, and Renfrew Street upon the north. The ground consists of 9,000 odd square yards, and I have asked Mr. Carrick to prepare a plan showing the way in which the ground can best be taken advantage of. The proposal would be to allow the present buildings to remain until the vacant space was built upon, and when the new buildings are in working order the articles that are housed in the present galleries can be transferred to the new buildings.

Mr. Carrick explained the sketch-plan that had been made. It was proposed to utilise the ground on the west side of Dalhousie Street for the museum, fine art school, and fine art gallery, leaving the present buildings to the east as they are at present. After the transference of the art treasures at present in the Corporation Galleries the present building would form a central reference library. The street which at present existed between the galleries and the vacant ground would be retained for foot passengers. The whole erection would form one mass of building, having a frontage to Sauchiehall Street of 560 feet, and by keeping Dalhousie Street open in the manner shown in the plan they would be enabled to solve the difficulty of dealing with the unequal level of the ground.

The Lord Provost stated that a letter had been received from Sir Philip Cunliffe Owen regarding the scheme, and expressing his unqualified approval of it. His Lordship then said the project before them was the purchase of the site, and to give it to the city. If they did that he thought he could almost undertake that the buildings shown on the plan would be erected thereon. No doubt he would require to go back to his fellow-citizens, and he believed

he would get in smaller sums what was needed to complete the proposal.

Mr. George Jackson, as chairman of the Galleries Committee, gave some information as to what had been done in other places in reference to the formation of art galleries. In Liverpool, Mr. Walker had gifted 40,000*l.* for the erection of an art gallery; in Birmingham, recently 10,000*l.* was asked in subscriptions, and the citizens gave them 16,000*l.*; in Salford, one gentleman gave 10,000*l.* for an art gallery; in Derby, 50,000*l.* had been received by public subscription for a school of art, public library, and art gallery; the Manchester School of Art had been erected at a cost of 50,000*l.*, obtained by subscription; in Chesterfield subscriptions and donations to the amount of 25,000*l.* had been received for a museum, &c.; in Aberdeen a museum and art gallery had been furnished by public subscription at a cost of 10,000*l.*; and in Dundee the Albert Institute and Museum had been erected at a cost of 30,000*l.* He suggested that the Corporation, Hutcheson's Hospital, the Merchants' House, the Trades' House, and other public bodies who had given subscriptions for the erection of the University, might be induced to do the same for the proposed scheme.

A committee was afterwards appointed, consisting of the Lord Provost, the Lord Dean of Guild, Mr. James White, of Overtoun; Mr. James King, of Levernholm; Mr. J. B. Fleming, and Mr. J. Wyllie Guild, with power to add to their number, for the purpose of obtaining the support of prominent citizens to the scheme.

## MUNICIPAL REGULATIONS IN BIRMINGHAM.

THE Birmingham Town Council have been engaged during the week in considering the draft of the new Birmingham Corporation Bill for consolidating and amending the various Acts and Parliamentary Orders affecting the powers of the Corporation. These powers relate to sanitary matters, the regulation and control of the parks, municipal buildings, free libraries, and other property of the Corporation, the bylaws affecting porters and drovers, hackney carriages, and marine store dealers, the police regulations, the sale of coal, the duties of the fire brigade and the prevention of fires, the employment of children in factories and workshops, the conduct of the gas and water departments, the Closed Burial Grounds Act, and the finances of the borough, together with a number of miscellaneous regulations and provisions.

The third part relates to streets and buildings, and reproduces existing powers. It provides that trees which overhang roads or streets must be lopped by owner, or Corporation may do it in default. The re-erecting of any building of which the front has been pulled down to the street level shall be regarded as a new building. New buildings may be required to be set back seven yards from the centre of a street, under a penalty of 50*l.*; owners to be compensated for land given up, or make provision to compel "ample and convenient means of ingress and egress" to and from any building used as "an hotel, refreshment-room, church, chapel, school, or theatre, or other place of public amusement or entertainment, or for holding a large number of persons for any purpose." Penalty, 50*l.* Coal-shoots in or under footways are not to be constructed without leave of the Corporation. The Corporation may make bylaws as to all matters relating to the building of houses, &c.; drainage, ventilation, closets, &c.; but such bylaws to affect only new buildings. The Corporation may close buildings unfit for human habitation, and may prohibit the use of sleeping-rooms extending over ashpits, middens, &c. A new code is provided, rendering the terms of executing and paying for private street works, drains, footpaths, &c., easier to owners.

It is proposed to give power to maintain the Council House, Town Hall, and other municipal buildings; to secure the use of the Town Hall, as at present, for the musical festivals; to give power to the Corporation to buy the Town Hall organ; to provide that "any act or thing" required by Act of Parliament to be done in the Town Hall may be done in the Council House; and to place the letting of the Town Hall wholly in the hands of the Corporation or of its committee. Provision is made for the erection of Assize Courts, "either within or without the borough," and either for the borough alone or for any assize district which may include it. The money for the purchase of land and provision of building to be borrowed with the sanction of the Local Government Board.

The Bill also provides for the erection of a school of art on the site given by Mr. Colmore, and with the donations of 10,000*l.* each given by the Messrs. Tangye and an anonymous donor. It provides for the transfer of the School of Art and all its property and funds to the Corporation. It provides for the management of the school and of the Public Museum and Gallery of Art by a committee, in the first instance partly nominated by the Corporation and partly by the existing School of Art committee, but afterwards by the Corporation alone. The cost of maintenance, in excess of students' fees, Government grants, and endowments, is to be defrayed from the free libraries rate; and for this purpose, and the general execution of the Libraries Acts, the limit of the rate to the sum of one penny in the pound to be removed.

HOSPITAL CONSTRUCTION.

AS a large number of plans for hospitals are from time to time submitted for the approval of the Local Government Board by Boards of Guardians, it was considered desirable that the experience of foreign countries as regards the arrangement and construction of such buildings should be utilised. With this object the architect of the Local Government Board, Mr. P. G. Smith, was instructed to visit certain hospitals at Heidelberg, Strasburg, Paris, and St. Denis, which are stated to present good examples of various types of improved hospital construction. Mr. Smith's report of the short inquiry which he was able to make on the subject, together with some notes by our inspector, Dr. Mouat, who accompanied him, is printed in the appendix to the report of the Local Government Board. Hereafter we may be able to print it. The following are the conclusions arrived at by Mr. Smith:—

The general result of my observations at the several hospitals visited leads me to believe that much advantage is to be gained from an insight into the most recent hospital arrangements adopted in other countries. My inspection of the hospitals referred to in the foregoing remarks was necessarily brief, and therefore did not allow me to form as complete an opinion upon some points as a more minute examination of them would have permitted; nevertheless there are several particulars wherefrom I think we may usefully take hints, even if we may not find it always expedient or convenient to wholly adopt similar arrangements in this country.

1. One of the most important points I have observed is the large extent of site compared with the number of patients occupying the buildings erected thereon. The following table shows the particulars in this respect of each of the hospitals named in the first column:—

Name of Hospital.	Number of Patients.	Approximate Area of Site.	Square Feet of Site per Patient.
		Acres.	
Heidelberg . . . . .	382	10	1,140
Strasburg . . . . .	122	1½	530
Bichât (Paris) . . . . .	180	2 nearly	480
St. Denis (Paris) . . . . .	166	6	1,570
Bourges (Military—not visited) . . . . .	270	10	1,760

It is right to observe that the ten acres at Heidelberg includes space for the medical and surgical schools; while at Strasburg, where the hospital is a portion only of one large institution and stands on a comparatively small site, the administration and the kitchen and laundry offices, &c., are elsewhere beyond the actual site. The Hôpital Bichât, again, is only partially a new building. A comparison of some modern hospitals in England is of interest as showing that the patients are much more crowded on a given area in each instance:—

Name of Hospital.	Number of Patients.	Area of Site.	Square Feet of Site per Patient.
		About	
Marylebone Parish (Notting Hill) . . . . .	744	3¼ acres	188
Holborn Union (Highgate) . . . . .	617	3 "	220
Central London Sick Asylum at Highgate . . . . .	523	3½ "	300
St. George's Union (Fulham) . . . . .	840	2½ "	140
Croydon Union (now erecting) . . . . .	636	7 "	535
Salford Union . . . . .	874	54 "	296
Manchester Township—Crumpsall . . . . .	1,400	9 "	285

2. The tendency in the modern hospitals described in this report is to subdivide each institution itself into a number of detached ward-blocks containing comparatively a small number of patients in each. This is specially noticeable at Heidelberg and St. Denis, where the separation so far as atmosphere is concerned is absolute; while at Strasburg and at the Hôpital Bichât the separation is not nearly as complete as would seem desirable. As regards the Heidelberg Hospital it has been in active operation through five entire winters without any unsatisfactory results arising from the separation referred to. At the recently-built Frederichshain Hospital at Berlin which I have not yet seen, I am given to understand that the ward-blocks are wholly detached, there being no covered ways between them at all.

3. The several blocks of building occupied by patients are spread about the site so as to allow ample space between them to insure perfectly free circulation of air and access of light to all parts. In connection with this particular it is to be observed that the separate blocks are invariably of much smaller size than is commonly the case in England, and the number of patients in them is proportionately small. Thus, with the exception of the older portions of the hospital at Heidelberg (which were commenced twelve years ago), no single block contains more than two

storeys of sick wards nor more than fifty beds, while the one-storey blocks for severe cases have as few as fourteen and twenty beds in them.

4. It is customary in England to arrange the several blocks of a building in such a way that they shall not be directly connected together at a right angle, as such an arrangement is held to interfere with free circulation of air about the building. Not only is this excellent custom fully recognised in most of the hospitals that form the subject of this report, but in each of them, in one form or another, it has been further sought to get rid of the enclosed angle that is usually formed by the vertical sides of a building with the ground on which it stands. Thus it has been regarded as an essential in each hospital (except the little puerperal wards at Lariboisière) to raise the ward-blocks from the ground and to so arrange them on arches, piers, columns, or otherwise, that there remains an open clear space beneath them, 6 or 8 feet high, through which the external air can have free access. This is held, and justly so I think, to be of much importance to prevent stagnation of air about the wards and beneath the windows and ventilators.

5. In all the new hospitals described in this report arrangements have been made for getting the patients, or some of them, into the external air wherever possible. Thus the open space beneath the ward-blocks is sometimes (as in the hospital at St. Denis and the Hôpital Bichât) adapted to this purpose, the covered ways and arcades are so used at Heidelberg; and at all the hospitals, terraces or verandahs, opening immediately out of the wards, are provided to a greater or less extent, on to which the patients, in beds, wheeled chairs, or otherwise, may occasionally be removed, with, it is said, the most satisfactory results.

6. In all the hospitals that I have visited the means of warming the wards and buildings is far more powerful than is usually deemed sufficient in England, and thus the wards are able to have the air in them changed much more completely and frequently than would otherwise be the case, thereby improving the aëration of the wards to a most advantageous extent. Hot air from calorifères is very generally used for this purpose, and though it may be questionable whether this is the most satisfactory way of providing the requisite warmth, the expediency of the increased warming power is indisputable.

WARMING BUILDINGS BY STEAM.

AT the meeting of the Institution of Civil Engineers held on Tuesday last a paper was read on "American Practice in Warming Buildings by Steam." It was by the late Mr. Robert Briggs, of Philadelphia, U.S.

Originating about 1840 with the late Mr. Joseph Nason, the application of steam to the warming of buildings in the United States extended very rapidly, the apparatus being constructed of small and comparatively inexpensive wrought-iron welded tubes, which combined a large extent of heating surface with great strength, and with facility for transmitting heat in any direction from a central source. For securing durable steam-tight joints the tube-ends were made with tapering screw-threads, and a paste of white and red lead was applied in screwing up. The couplings or sockets were made of cast-iron, and were tapped taper to fit the tube ends, excepting only the straight couplings for connecting tubes in the same straight line, which were of wrought-iron and tapped parallel.

The steam was supplied either by boilers of the horizontal tubular or Seguin type, or else by the Badcock & Wilcox water-tube circulating-boiler with horizontal steam-drum overhead; either kind was practically safe from disastrous explosion. The steam circulating through the warming apparatus was either live steam direct from the boiler, or exhaust steam; the two were frequently used in combination, the latter being rarely employed alone. When using live steam, the circulation was either closed throughout from communication with the atmosphere, or was open to it at certain places. In the former case the distribution of the heat was effected either by separate supply and return mains, or else by a single main for both supply and return, either with or without a longitudinal partition inside it for separating the outward current of steam-supply from the return current of condensed water. In open circulation a supply-main conveyed the steam to the radiating surfaces; whence a return-main, suitably trapped for preserving the steam-pressure, conducted the condensed water either into an open tank for feeding the boiler, or into a drain. These two systems were most generally combined in any extensive warming apparatus. The steam stop-valves, known as "globe" valves, were disk or poppet-valves, worked by a screwed spindle; this construction was introduced by the author in 1849, and was immediately followed by all makers.

In respect to the radiating surfaces for diffusing the heat, three distinct classes of apparatus were in use. Firstly, apparatus for warming rooms by direct radiation from surfaces exposed in the rooms themselves. Secondly, apparatus for indirect warming by currents of air; the heated surfaces were placed in a chamber, through which a supply of air passed on its way into the room. In neither of these two methods was the warming accompanied by

any systematic ventilation. Thirdly, apparatus for both warming and ventilating, arranged so that the warming should take effect upon the whole of the air admitted for ventilation. The temperature comfortable to Americans in cold weather was about 70° Fahrenheit on the Atlantic coast, rising to 80° or 85° for inland localities. In warming by direct radiation the practice for many years was to arrange the steam-pipes in lines or groups along the bottom of the outside walls or under the windows. But the most recent practice, for rooms in mills, was to suspend the direct radiating pipes in rows overhead. Although the heat would here apparently be expended in the top of the room, yet very satisfactory results were thereby obtained, both in equability of warming and in efficiency of radiating surface.

The radiators for warming by direct radiation consisted usually of so-called "coils," composed of  $\frac{3}{4}$ -inch and 1-inch steam-pipes, arranged in parallel lines and coupled to branch tees or heads. Sometimes short lengths of pipes were coupled by return-bends, doubling backwards and forwards in several replications one above another, and forming "return-bend coils"; when several of these sections were connected by branch-tees into a compact mass of tubing, the whole was known as a "box-coil." In vertical-pipe coils a number of short upright 1-inch tubes were screwed into a hollow cast-iron base or box, and were either connected together in pairs by return-bends at the top, or else each tube stood singly with its top closed, and had a hoop-iron partition extending up inside it to nearly the top. For getting rid of the air a trap was provided, having an outlet controlled by metallic rods; as soon as all the air had escaped and the rods became heated by the unmixed steam, their expansion closed the outlet. For indirect radiating surfaces, the box-coils were the forms most used. The chambers containing them were made either of brickwork, or often of galvanised sheet-iron; the coils were suspended freely within the chambers, which were themselves attached to the walls containing the air inlet flues.

Where systematic ventilation was carried out in conjunction with warming, these indirect radiators and chambers were employed. The warming could be most effectually controlled by so arranging the chamber containing the radiator, that the whole or any part of the fresh air entering could be made either to pass through the radiator and be warmed, or to "by-pass" it and escape heating. The warmed and unwarmed currents were then mingled in a flue, whence a supply of fresh air suitably tempered flowed into the room, the occupant of which could thus regulate the temperature as comfort might require, while obtaining a constant supply of a definite quantity of fresh air.

Where a blowing-fan was employed for impelling a current of air through a building, a large auxiliary coil, placed at the entrance of the flue leading from the fan into the building would be an improvement for extensive apparatus, and would save about 10 per cent. of surface, while supplying a constant volume of fresh air raised to any temperature between 50° and 120°.

An example of warming on an extensive scale was afforded by a large office building in New York, containing nearly 2,000,000 cubic feet; and by the State Lunatic Asylum at Indianapolis, containing more than 2,500,000 cubic feet. Both of these buildings were heated by steam. But such instances failed to convey any idea of the very general prevalence of warming by steam in the commercial cities of America. There appeared indeed no limit to the future extension of systematic steam-supply for warming and for motive power.

## DRAINAGE AND VENTILATION OF HOUSES.

At a meeting of the Society of Medical Officers of Health held at 1 Adam Street, Adelphi, on November 17, the President, Dr. J. W. Tripe, in the chair, a paper was read by Mr. Rogers Field, M. Inst. C.E., on "Certain less recognised but highly important points in the Drainage and Ventilation of Houses," of which the following is an abstract:—

Three sanitary principles govern house drainage. These are—  
1. All refuse matter must be completely and rapidly removed from the house. 2. There must never be any passage of air from the drains or waste-pipes into the house. 3. There must be no connection between the drains and the domestic water supply. These, although so simple, are very frequently neglected; the first goes absolutely to the root of sanitation, for, were it strictly complied with, there would be no leaky drains, no polluted subsoil, and no production of foul gases in the drains from decomposing organic matter. There cannot be a greater mistake than to assume, as is commonly done in investigating drainage, that if water runs away with freedom, this is all that is required. Numerous cases are on record where the sewage from houses has apparently run away freely for years, but where the greater portion of it has really been leaking out of the drains into the ground under or close to the house. In illustration of this point the author quoted two cases in his own practice, one in which the connection with the sewer was actually found to be blocked with shavings which had been left in when the house was built, three years before; the other that of a school in which the drainage from the

lavatories had leaked through disused drains under the floor of a large portion of the building, and where, although there was a mass of filth in some places seven feet deep, no leakage had been suspected. If the drains are exposed and found clean and jointed with cement, this is not sufficient; the tops of the joints may be good and the bottoms bad. The only safe method is to actually test the drains by plugging them at the lower end and filling them with water; very few house-drains indeed stand this test. Even if the drains are outside the house, it is a mistake to assume that it is unimportant whether they are sound or not; not only may sewage leak out of faulty joints and percolate under the house, but foul air may be drawn into the house.

It is important to realise how small an amount of deposit will create mischief by decomposing and generating foul gases; a mere irregularity of the joints, even when the drain has a good fall, is sufficient to cause this. There is no better test of the condition of the drains than the amount of smell emitted from a ventilating opening; for if drains be properly laid and in thorough working order, practically no smell should exist. Examples were given. Faulty forms of traps and water-closet apparatus were strongly condemned by the author, and diagrams descriptive of good and bad closets were exhibited.

The principle that there should never be any passage of air from the drains or waste-pipes into the house was then considered; and the means of isolating the house drains from the public sewer, the necessity of keeping the drains outside the house, their ventilation as well as that of the soil-pipes, the position of the water-closets, and the disconnection of the sanitary fittings inside the house from the drains were referred to. It was insisted that the danger should be guarded against of trusting too much to those parts of the drainage of a house which are visible as an index of the condition of other and important parts which are concealed, and an instance was mentioned of a house the drainage of which had been recently reconstructed and where all the sanitary arrangements appeared at first sight to be perfect, but where a subsequent examination of the drains, which were under the house, showed that the joints were in many places defective, and at one point the pipes were not jointed at all, but a space left large enough to put a hand in, though it was stated that special care had been taken to make the drains water-tight. Old drains which had no outlet connected with gullies were found beneath the passages and rooms. The housemaid nearly died of typhoid fever, and beneath the room she occupied was found an old drain with a large amount of foul deposit. A long list of other defects was described, leading to the conclusion that the drainage, instead of being very good, was really so radically defective throughout, that it was necessary to reconstruct the whole of it.

Another instance was given in which a lady and her cook were attacked with erysipelas and blood-poisoning shortly after occupying a house. Various alterations were made in the drainage during the absence of the family; but on their return the lady was again attacked with erysipelas, and shortly after other members of the household. Again alterations were made, and again the lady was attacked with erysipelas and the housemaid with typhoid fever. An examination of the house by the author showed that an old stoneware drain in the scullery, into which the sink formerly discharged before it was disconnected, had not been removed, and though stopped with cement the stopping was imperfect, thus allowing the air of the drain to enter the house.

The author next considered the various ways in which foul air from faulty drainage inside the house passes to different parts, and pointed out the opportunities which were given for the passage of air from one part of a house to another depending chiefly upon windows and fires; the latter of course mainly acting by drawing air through passages, staircases, and doors. But other channels must also be borne in mind, and an interesting account was given of the passage of foul air along bell-wire tubes, the proximity of the bell-pull to the fireplace giving an increased opportunity for air to be drawn from a distance to this part of the room. Channels for gas-pipes and for hot-water pipes also not uncommonly give facility for the admission of foul air. In connection with this part of the subject a remarkable instance was given of a particular bed in a school, the occupants of which were constantly the subjects of slight attacks of pneumonia, with tendency to typhoid. In this case the foul air was conducted from a lavatory where there was defective drainage, up a staircase, and, impinging on the ceiling of the dormitory, was reflected on to the bed where the sickness occurred.

An interesting account was given of the cause of the Duchess of Connaught's recent illness. Defective drainage was found in the basement of the house, and after numerous experiments the means by which the foul air entered the Duchess's bedroom were discovered. These showed that it was only when occupying certain positions in the room that she would be exposed to the influence of the foul air, while in bed she would escape. As a matter of fact, in twenty-four hours after sitting on a sofa in one of these exposed positions, her Royal Highness's symptoms fully developed themselves. These two cases were illustrated by diagrams. The necessity of a thorough disconnection between the drains and the domestic water supply was then dwelt upon,

and the mistakes most commonly made in this particular pointed out.

In the discussion which followed, the president, Dr. Buchanan, Dr. de Chaumont, Dr. Corfield, Mr. E. C. Robins, Dr. Bate, Mr. Jacob, Dr. Rogers, Dr. Poore, and Mr. Shirley Murphy took part.

### THE EDINBURGH ARCHITECTURAL EXHIBITION.

THE following are the regulations for sending drawings to the Edinburgh Exhibition:—1. Works sent in for exhibition from Edinburgh to be delivered at the exhibition rooms, Royal Academy National Galleries, Mound, *unpacked* and ready for hanging. Those from a distance will be unpacked and repacked at the Galleries free of charge; but all the expenses of carriage must be defrayed by the exhibitors. All works must be removed from the Galleries before January 6, 1883. 2. All works to have (1) the title of the subject; (2) the name of the architect or artist; and (3) the name of the exhibitor, inscribed upon them, so as to be easily read when hung up. 3. All works to be accompanied by a letter, directed to the acting secretary (Mr. Alfred Bryson, Royal Academy, National Galleries, Mound, Edinburgh), containing the full name and address of the exhibitor and a list of the works sent by him. 4. Works may be either framed and glazed or upon stretchers, or in loose sheets in portfolio, but not rolled. Every care will be taken of the works sent for exhibition, but the Association will not be responsible for injury or loss. 5. All works sent for exhibition are submitted to the judgment of the Council, who may reject such as they consider unsuitable.

#### Waltham Abbey.

SIR,—Having known this church for some thirty years, I am glad to be reminded by Mr. Reeve's recent notice in your columns of his very careful and minute illustrations of its more important features which you published in January and February 1876. Work of that kind—so well done—is always of very high value as regards the relative ages of different parts of a building, apart from the correctness of the reasoning founded on it. But the question of special interest in Waltham Abbey is as to the *actual* date of its oldest part, and at the threshold of this question the evidence of Mr. Reeve breaks off.

Mr. Burges, though willing to admit that it is "within the range of possibility that Harold might have built it," and that "there is no distinct proof to the contrary," fairly owns that "it can scarcely be denied that the architecture more resembles the work of Henry I. than that of the very few remains of buildings contemporary with Harold." I think most architects will consider this guarded language the very utmost that could be said on the side of those who think this to be Harold's church; but when Mr. Reeve assumes this as a fact, I should like to ask him how—even if we grant the earlier age of the western bays—he can carry them back some two generations, or sixty years, at a single bound?

In order to do that we must assume some such conditions as the following:—Harold, having begun his work in 1056, finishes a complete church of these massive proportions by 1059 or 1060, not less than three nor more than five years. In that time the design probably had to be prepared and the financial arrangements made. The workmen had to be brought from Normandy, and much of the material also. But all the solid materials had to be fetched from long distances—quarried, felled, or mined—carried over such rudimentary roads or ill-regulated water-ways as then existed, and run up into such a building as we now see in part, on such foundations as would have to be made.

Though the design was obtained from Normandy, and though Harold, in order to be struck with the beauty of the Norman buildings must have seen some which had been in progress for years—immediate forerunners of a numerous class—not one of these can now be traced as having existed at or about this period in France or England, but such buildings as are known to be contemporary are in an earlier manner. Moreover, the workmanship, particularly as to the jointing of this early work at Waltham, is better than that which is close to it, of more sumptuous design, and some half-century later in execution. I confess that, compared with such improbabilities as these, the least probable theory I have heard from the opposite side on this question seems fairly reasonable.

Looking at it from that side which it is admitted that the architectural features indicate, it seems reasonable to suppose that Harold did build such a church as his foundation of secular canons required, and as could be built in the time stated—that this, being designed in the Norman manner, was a wonder to the

English, though the story of his visit to Normandy can add but little weight to this theory. The canons were, as we know, ruined by the Conquest, and their church, having suffered such changes from weather, and perhaps from faulty construction, as were common enough, was found by their successors, fifty or sixty years later, to be no longer the object of pride and satisfaction which it had formerly been, and was wholly rebuilt by them out of the benefactions which they had from the two queens of Henry, out of the greatly-increasing revenues of land in that day, and from the ordinary sources of clerical income. It was a time when nearly every church in this country was being rebuilt, and if the foundation of any part failed, the work would be likely to show the failure as soon as the load was brought upon it, and be rebuilt as soon as was necessary or convenient.

The printed matter bearing on this question has grown largely of late years and is scattered through different publications. I cannot pretend to have re-read the whole of them so as to see what weight it ought to have as against this theory. If, however, Mr. Reeve, who has not so far dealt with it at all, but is no doubt familiar with the whole subject, will look at the alternative propositions, I cannot help thinking he will see cause to doubt the evidence of Harold's work in the existing fabric.

I am, yours &c.,

THOS. BLASHILL.

10 Old Jewry Chambers, London, E.C.  
November 28.

#### Dublin Museum Competition.

SIR,—As your columns are at all times open, in the interests of the profession, to assert rights and redress wrongs, perhaps you will permit me to call attention to the jobbery at present going on in Dublin connected with the above competition.

I notice the *Irish Times* of Thursday last contains leading articles and letters—all tending in the same direction—to overthrow the present competition and change the site, which has been chosen after due consideration; and we read of meetings at Dr. Lyon's house to receive and consider any design that may be submitted, and this, too, going on whilst the Select Committee are engaged upon plans already submitted. It is satisfactory to know that Dublin architects are not willing to be connected with this jobbery, and have unanimously refused to endorse the views of this self-appointed committee, and it has been reserved for a civil engineer to submit plans.

The drawings of the chosen competitors are now on view, and they have to be thankful that the Select Committee is composed of gentlemen, who seem determined to do their duty, and who will doubtless ignore the pretensions of men whose motives and actions tend only to confusion and discontent, and whose ideas as to site are indeed late and fruitless.

Yours obediently,

JUSTITIA.

### NOTES ON NOVELTIES.

#### New Automatic Electric Speaking-tubes.

Shortly before his lamented death, Mr. George Jennings, of Stangate, Lambeth, completed a patent (Jennings & Brewer's) for the above noted very useful appliances, that has since been effectually carried out by the firm, and the new tubes are being constantly fitted up in different parts of London and the provinces. We had recently an opportunity of testing the success of the invention in a large business establishment in the City, where the automatic tubes are carried over a great extent of area and into about twenty different departments, the use made of them being almost uninterrupted, and the testimony of the principals (who courteously offered us every facility for inspecting and testing their efficiency) being unqualified in their praise. The difference between the "ordinary" speaking-tubes and Jennings & Brewer's electric ones, and the greater simplicity in application of the latter, are very marked. It will be remembered that in setting up a range of the common tubes a separate one and connections must be provided for each room or place to which it is desired to establish communication; and as the pendant has to be constantly removed from mouth to ear, the conversation is, to say the least, disjointed, and not always so satisfactory as may be wished. In Mr. Jennings' patent one mouthpiece at the different points of communication only is required. In connection with a central tube carried over the building, with branches into the various rooms it is desired to hold communication with, the act of lifting the mouthpiece, ringing a bell at the point to be spoken with, which bell continues to ring to call attention until the mouthpiece at the point in question is raised, when it ceases, and by means of an earpiece connected with the tubes an uninterrupted conversation can be carried on. A detailed description of the entire working arrangements of this system of communication cannot be made so clearly apparent in the absence of diagrams, but we may remark that an electric battery (Léclanché's is the one adopted by Messrs. Jennings) is fixed in the basement, and from this the tubes and wires are carried to each room. Between each floor and cutting

of the central tube is a box containing a valve for opening or closing communication with the various rooms. The cross tubes start from a point close to the valves into the different rooms, whence they finish with the mouth and ear piece and the bell or gong before mentioned. In the head office the usual dial is fixed, with the "pushes" for each room. When desiring to speak to any of the departments the "push" is actuated; this opens the valve, which acts obliquely, and, closing communication on the one side, opens it direct to the required room. Then the mouthpiece is raised, which sets the gong vibrating at the desired point; and as soon as the attendant there raises his, the gong ceases to vibrate, and the conversation goes on. But the gong will continue to ring if one mouthpiece is dropped but the other held up. The usual index figure is also applied to the dial, and can be utilised for the working. We may add that in every instance where the electric current is set in motion the circuit is made complete. In addition to the automatic electric speaking-tubes, Messrs. Jennings have now entered extensively into all kinds of electric apparatus, such as bells, lightning-conductors, burglar alarms, &c., and this new addition to their business promises to be as successful as that of their sanitary engineering, with which the name of the late Mr. George Jennings was so long and honourably associated.

### TOWNS IMPROVEMENT.

**Mid-London Market.**—A new project is set on foot for constructing markets in the neighbourhood of the Thames Embankment between Waterloo and Charing Cross bridges, on some low-lying land behind the public gardens, and very near to the Savoy Theatre. The authors of the project claim unusual advantages for this site, the railway, the river, and the wide roadway of the Embankment being at the very doors of the contemplated market. Notice has been lodged of a Bill applying for powers from Parliament to construct a new street from the corner of Savoy Street and the Thames Embankment to Villiers Street, with intervening outlets to the Strand by way of Buckingham Street and York Buildings, and for the formation of a loop line of railway, partly beneath this new street, from Charing Cross (District) Railway Station, and passing under some of the market buildings and rejoining the Metropolitan District Railway at a point near the bottom of Savoy Street. The project also seeks for powers to erect on the north side of the new street the markets, in four divisions, separated from each other by the streets intervening, but connected together by glass awnings. These markets will be built to a height of about 30 feet above the embankment roadway, but over their rear parts will be raised on columns lofty blocks of buildings, for the market hotel and for offices and chambers, with a high level terrace in front, a continuation of Adelphi Terrace. This terrace will cross over the streets dividing the market into sections by means of iron bridges having staircases at intervals down to the market floor, and the blocks of lofty buildings will fill up the gap between Somerset House and Adelphi Terrace, and will give to the architects an opportunity of making a respectable-looking riparian façade. Each section of the markets will have a basement underneath, with railway sidings; also inclined cart roads leading to the street-level, lifts, and staircases. These basements will be connected with each other by subways, and will be used as markets and stores, and, according to the notice in the *London Gazette*, refrigerators and vaults on a large scale will be provided. The landing-stages at Waterloo Bridge are proposed to be used for landing sea-borne fish, which may be brought up by the river Thames. The Metropolitan District Railway (being in connection with the general railway system of the country) will deliver all kinds of produce direct into the market, and the new street approaches, together with the wide roadway of the Thames embankment, will give ample facilities for removing away the goods bought and sold in the market. Messrs. Benison & Bargman are the architects to the scheme, and Mr. E. Wilson is the engineer.

### CHURCH BUILDING AND RESTORATION.

**Fulmer, Bucks.**—This parish church was reopened on Saturday last by the Bishop of Oxford, after being enlarged and re-seated. The works executed consist of a new south aisle in the Perpendicular style, with open timbered oak roof. The old seats from the nave have been removed; the organ has now been placed near the chancel; and by removal of the gallery at the west end, the tower has been thrown open to the church. All the new seats are executed in English oak, those in the tower being raised for the children; the aisles, &c., have been paved with Minton tiles, and the whole has been thoroughly heated. Some old memorial windows had to be preserved, and some old glass adapted to the new windows, which has been done by Messrs. Egan & Fletcher, of Regent Street; and all other works have been executed by Messrs. Fassnidge & Sons, of Uxbridge, under the superintendence of Mr. Alex. R. Stenning, F.R.I.B.A., of 27 Fenchurch Street, E.C.

**York.**—Mr. Fisher (Messrs. Gould & Fisher) has prepared plans for the proposed restoration of St. Crux Church. The clerestories will be taken down and rebuilt, also most of the nave arches and some of the pillars, which have lost their proportion. The decayed tracery of the windows will be restored, and the timbers of the roof replaced by new ones. It is intended to lay the foundation of a tower, the bells being fixed in a temporary chamber, the tower to be rebuilt in its entirety as circumstances permit.

**Glasgow.**—The foundation-stone of the new Broomloan Hall and parochial buildings, now being erected in Broomloan Road, Govan, was laid on Saturday. The front of the new building is of a simple character, rusticated in the lower part, while the upper part is plain and surmounted by a bold cornice. At the south corner of the front is a wide, deeply-recessed doorway, with coupled shafts on either side. Through this doorway access is had to a large entrance vestibule and staircase, from which the large hall is entered. The area is divided into three parts, the two side divisions being separated from the centre by arcades of three arches each. Altogether the hall will accommodate about 640 persons. Fronting the road, on this floor, will be a large classroom for about 120 persons, lighted by four large side windows. On the upper floor there will be three classrooms—two with open timber roof, partly glazed for lighting, and one with side windows—capable of accommodating about 180 persons. The classrooms will all be heated by open fireplaces and the large hall by hot-water pipes. The whole works will be executed at a cost of over 2,000*l.* The architect is Mr. John Honeyman.

**Chadderton.**—The foundation-stone of the church of St. Luke has been lately laid. Messrs. Stott & Sons, of Oldham, are the architects. The church is to furnish accommodation for 750 persons, being in general plan a parallelogram, comprising nave and aisles.

**Manchester.**—The new parish church of St. George at Mossley has been opened. The church has been built from the designs of Mr. A. H. Davies Colley, and consists of nave with aisles and chancel, and tower, which, when completed, will be 90 feet high. The chief contracts have been carried out by Messrs. Edward Marland, J. Robinson & Sons, and J. Pickford, of Mossley, and by Messrs. Butters & Carson, of Manchester.

### GENERAL.

**Mr. James Sully** on Monday delivered a lecture on "Colour in Relation to Art" at Newcastle-on-Tyne, to the members of the Literary and Philosophical Society; the title of a second lecture on Wednesday being "How the Eye Interprets Pictures."

**Mr. J. F. Christy**, of the Knole, Springbourne, who founded and endowed St. Clement's Church, is about to present to that church a reredos costing about 2,000*l.* It is being executed by Mr. Seale, from the designs of Mr. J. D. Sedding.

**Mr. W. H. Kendrick** will deliver an address at the meeting of the Birmingham Architectural Association on Tuesday.

**Mr. J. Watt Sandeman** has prepared the first section of a plan for the construction of a fishery harbour at the Green Haven, Berwick, which is to be proceeded with at an estimated cost of nearly 25,000*l.*

**Mr. T. Longridge Gooch, C.E.**, has lately died at Gateshead, aged seventy-five. Mr. Gooch was apprenticed to George Stephenson, and was his chief draughtsman in the construction of the Manchester and Liverpool Railway, and his principal assistant on the London and Birmingham Railway.

**The Bishop of Worcester** has defrayed the cost of the erection of a mission chapel to the parish church of Hartlebury. The chapel is a specimen of the half-timbered style of the county.

**A Diploma** signed by the Queen will henceforth add to the distinctions of members of the Royal Society of Painters in Water Colours.

**The Stoke-on-Trent Board of Guardians** on Wednesday decided to erect a new workhouse hospital, at a cost of 13,000*l.*, according to plans prepared by Mr. C. Lynam. Accommodation will be provided for 176 patients.

**The Municipality of Paris** have decided to erect in prominent places posts for signalling to the police offices in case of an alarm of fire, robbery, riot, or other mishap. In a box at the top of the post eight buttons are fixed, and directions given as to their use.

**A Portrait of the Earl of Dalkeith**, painted by Mr. W. W. Ouless, R.A., was on Saturday last publicly presented to Lady Dalkeith.

**The York Architectural Association**, now constituted, held a meeting last week under the presidency of Mr. W. Brown, architect, when rules for the society were submitted by the committee. Mr. J. Perry will read the first paper.

**The Liverpool Health Committee** have decided not to allow the further adoption of the electric light for shops in the town until the matter has been dealt with by the Council.

# The Architect.

## THE ROYAL PALACE OF JUSTICE.

If we ask leave, within our circle of art, to regard the demonstration of last Monday in the light of an act of homage to the late GEORGE EDMUND STREET, no generous heart will refuse us permission. One of the greatest architectural works of the Victorian age has been successfully completed for occupation and use, and publicly inaugurated by the Sovereign. One

of the most important and most dignified of all the professions, that which has charge of the administration of justice, has taken possession of the edifice with imposing ceremonial and effusive enthusiasm. Add to these considerations the peculiar circumstance that the building as a work of art represents the crowning effort of a long and honourable revival of a most interesting and romantic style of design, which has now exhausted its historical function and in this very work expended all its force, and it is easy to feel that the occasion is one which would undoubtedly have placed the architect, had he not died in harness on the eve of the completion of his task, in a position singularly proud and meritorious.

Seeing that revival is the order of the time in English architecture, there are very few, we should suppose, who would grudge to the revival of mediævalism the opportunity of displaying, as it has done, all its glories in such a building as the Law Courts. Next to the Church, and not excepting Parliament itself, the Law may well claim at the hands of Englishmen all the traditional influence which belongs to the most complete identification with the earlier history of the country; and even the most classical taste may therefore be invited on the present occasion to concede the propriety of our having a Gothic edifice in which to accommodate the venerable business of Law. If as suitors we must still walk up and down a *Salle des Pas Perdus*, it seems better that it should be under the vaulted roof of a "Romantic" hall, than amidst the dainty decorations of a pseudo-Greek or Roman gallery. If we are still to lose our actions, or occasionally to win them, they may be more appropriately lost or won in Courts where the surroundings are suggestive of the impress of dim and even grim antiquity, than in chambers whose features would carry nothing to the eye but one or another kind of prettiness, perhaps an affectation after all. Our Royal Palace of Justice, imitative as it is, will at least tell future generations that in the latter half of the great nineteenth century the heart of England was still beating in unison with the old times which may in those days be somewhat forgotten. Our Cathedrals are Gothic; our Legislative Chambers are Gothic; and our Courts of Law are now Gothic; and so far so well.

Granting this, we may certainly be permitted to go on to say that, if the new Palace was to be designed in the mediæval mode, the late Mr. STREET was, perhaps before all others of his school, the right man to design it. The contest of architects is still vividly remembered by all but the very young: how Sir GILBERT SCOTT put forth his strength in dainty but somewhat emasculated grace; how Mr. EDWARD BARRY won high honour by careful work, only too mechanical and metallic for the style; how Mr. WATERHOUSE, foremost in the race at the first, fell out at last because advanced criticism, if it rejected such a rendering of Gothic as SCOTT'S or BARRY'S, could still less tolerate the reading of a "Manchester man"; how Mr. GARLING'S polish, Mr. SEDDON'S adventurousness, Mr. LOCKWOOD'S courageous provincialism, and Mr. ABRAHAM'S matter of form, all attracted attention in their several ways; how confusion of opinion sprung up and became worse confounded; and how at last somebody cut the knot that could not be untied—rumour said it was Mr. GLADSTONE himself—and the project of Mr. STREET, which nobody had ventured to admire, unless very much in private, was suddenly brought to the front and declared the winner. Nor do we yet forget the unsuccessful demand of Mr. BARRY for a partnership share, on the ground of a certain preference accorded to his plan by mere compensation surveyors who had singularly but characteristically enough been called in by the Government to report

on the designs. The terrific troublousness of Mr. AYRTON, also, and the little vagaries of Mr. LOWE, we have not yet forgotten in the calm that came so welcome to the architect at last, and gave him heart to pursue his gigantic enterprise, as he did with infinite labour, but with infinite delight, until one day he was struck down by the sheer fatigue of an indomitable soul, and died of the hard work that he had so long and so resolutely done.

STREET was, every inch of him, a downright Englishman, and this work of his has been done in that thoroughly robust English spirit which all over the world confronts difficulties and dangers as incentives only to greater effort, greater self-confidence, and greater endurance. A more courageous man in his way never lived in England, or out of it. If we provoke a smile, no matter; but every line of his pencil was a blow. His work was fighting work from his boyhood till his death. He was the perfect embodiment of the Romanticism militant of his generation. In a Gothic age he was wholly Gothic, the most Gothic of all the Goths. In a Classic age he would have been no matter what or where, but he could never have been Classic. If the simile be worth anything, we would say he was emphatically the square man in the square hole, the round man in the round hole has a certain freedom to move, which to his temperament would have been insufferable licence. He knew his fate and he knew none other, and he was master of his fate therefore.

His great work now in question was wholly like himself. If we were at this moment called upon to criticise it, or even to describe it, we could not, after what we have said, attempt to do either. We prefer—and here we venture to speak for a large body, both of his adherents and of his opponents in taste—to look upon him as a great artistic shadow of the past, whose noble monument stands before the world to-day, without fear as without favour, criticism out of place, description needless: "The man rises before us amidst contradiction and debate like a granite mountain amidst clouds and winds; wit of the best may be tried against him, but it cannot avail; what is the wit of a thousand wits to him?"

Whether the Royal Palace of Justice is destined to be a popular work or an unpopular it is not possible to foretell. More will depend upon non-artistic considerations than upon anything else in the settlement of its appreciation in respect of art. Such is the way of the world, and in England especially. The handy manner in which Mr. WATERHOUSE contrived his Law Courts at Manchester did more than to popularise secular Gothic architecture than would now be readily believed; and if it should turn out that Mr. STREET has provided for the occupants of these Law Courts in London equally acceptable conveniences and comforts, the credit of this will be assigned to the admirable qualities of Gothic plan, and a corresponding admiration of Gothic construction and decoration will be the certain consequence. It is too late now, as mere matter of fashion, to expect another great edifice to follow suit, but what we may look for, if all should go as well as we are supposing, is at least that negative kind of honour to an exhausted mode which supplies contempt and derision for its successor. But, on the other hand, it is to be feared that if the lawyers should happen to take a dislike to the arrangements of their new home, no amount of poetic sentiment will tie their tongues, or induce in them the toleration of a style of high art which has failed to produce the perfection of common convenience. To discover which of these destinies is to attach to Mr. STREET'S magnificent work we must wait on time.

Although we consider the present occasion unsuitable for criticism, this at least we must say—that as an artistic production, every Englishman who, whatever may be said of sweetness and light, is proud of English muscularity of mind and work, may be called upon to regard the Palace of Justice, quite dogmatically if he pleases, as the extreme of artistic vigour and manly virtue. What gives to this proposition especial force and especial interest is the circumstance that the architect designed everything with his own hand, and with a profusion of variety which might seem incredible until it is proved by actual examination. No problem was too great for him to attack at once, and at once to solve. None was too small for his plodding perseverance. The amount of work that was in the man day and night was stupendous; the degree of patience equally incomprehensible. The same indomitable readiness of pencil, the same unconquerable love of his work, the same inexhaustible store of knowledge, the same perfect assurance of faith, one day would conquer the construction and effect of

the grand Central Hall, and the next condescend to the design of a keyhole or a button. Those of his brethren who followed him the summer before last in the well-remembered excursion over the great edifice, will never forget the impression produced upon their wondering minds by his modest acknowledgment of the vast amount of his personal draughtsmanship displayed in the hundreds upon hundreds of elaborated sheets of design and detail which were partially displayed for their inspection. Some may have thought for a moment that the pace was too fast to last. So it has proved to be. May he rest in peace—one at least amongst the greatest and truest artists of the modern world.

### THE GROSVENOR GALLERY.

THE managers of the Grosvenor Gallery follow up the scheme, first initiated on a large scale by them, of exhibiting the gathered works of a living artist; while this winter season they have added a collection of pictures by the young landscape painter, CECIL LAWSON, recently deceased, to whose immature but powerful performances no tribute could be expected from the Academic body, such as it has paid to distinguished members within its own circle or to such outsiders of indisputable mark as the two painters to be honoured in the forthcoming exhibition. The choice of Mr. ALMA TADEMA, R.A., as the contemporary artist to be "illustrated," proves both interesting and instructive in many ways. The pictures of this painter are so individual in mannerism, so supreme in executive skill, and so novel in subject within English exhibitions, that he is likely to obtain a position and an influence out of proportion to the absolute worth of his work taken as a whole. Freshness is a factor of great strength in the forming of public favour, and although Mr. ALMA TADEMA has now been working amongst us for a considerable period, the novelty of his subjects and his manner has not had time to wear off, and he has not suffered the misfortune of such a following of feeble imitators as in the case of popular masters often serves to sicken the public with the imitations of theme and method. The assemblage of one hundred and eighty-four pictures and studies in oil, water colour, and black and white, taken from this point of view, thus offers the first opportunity of judging this distinguished artist quite fairly in his full maturity; gives that test which, in the recent exhibition of the works of a painter in a diametrically opposite school—Mr. WATTS, R.A.—resulted in so remarkable a tribute of opinion. It would be absurd to draw comparisons, and such is not our purpose; but it is worth noting how differently these two artists, whom, measured by our modern levels, we must both call great, bear this test. While the painter whose strength lay in imaginative and intellectual energy, and in the possession of that manner, the expression of æsthetic power, which constitutes style, gained to an astonishing extent by the assembling of his collected works, Mr. ALMA TADEMA on the whole certainly loses, in spite of the remarkable display of his talent set forth in the collection before us, in spite of that command of the technicalities of art in which he is almost without rival on this side of the Channel.

The reasons for this falling short of such full meed of applause as might have been expected are not far to seek. Mr. TADEMA's invention hardly ever, if at all, steps over the line which separates invention from the higher creative gift of imagination; his aspiration and his success are not after the ideal, but in the real and the superficial or physical. His sense of beauty seems confined to the placing of harmonious colours, the suggestion of pleasant thoughts, the imitation of graceful gestures; and within a range of art bounded by such limitations, and further restricted by a deliberate choice of antiquarian subjects, a painter, be he never so strong in art faculty, loses rather than gains by a display of his sole work. Nevertheless, a collection of this painter's pictures and a summary of his art was well worth striving for, and the result gives ample pleasure and profit. The gathering is very complete, ranges over thirty years in time, and offers, so far as we know by experience in international exhibitions and elsewhere, ample illustration of Mr. TADEMA's range of subject and scale. Not Professor EBER's himself, whose archæological novels are the counterpart in literature of his friend Mr. TADEMA's art, could revive for modern enjoyment with greater detail and actuality the private and public life of the degenerate Romans, the manners and customs of Egypt, or the aspect of early mediæval times. His interiors present a very inventory of "historic

remains"; his *dramatis personæ* enact their parts in appropriate costumes, with the dexterity of the most perfectly-contrived marionettes.

"There's the rub!" Despite the accuracy of studied expression and aptly-conceived attitude, Mr. TADEMA's men and women, be they Roman, Egyptian, mediæval, or modern, do for the most part remain not human creatures, but cunningly-devised puppets. On a small scale this is not so evident, but when those clever little scenes, which are so truly enjoyable and so singularly complete in all narrative material, are treated on an enlarged plan, then the unflesh-like flesh and the inflexibility of the painter's human creatures become obvious, the dryness and curiously enamel-like technique become pronounced as unfit for the artistic representation of that uniquely vital thing—the human form in life and action. The most important pictures here will be found to confirm this statement, namely, *A Roman Emperor*, the episode of the Pretorian Guard and the coward Claudius, almost the strongest in dramatic conception of the many dramatically devised scenes; *The Death of the Firstborn*, Mr. TADEMA's most impressive effort; *The Education of the Grandchildren of Clothilde*; *A Sculpture Gallery*, an ingenious portrait group; *The Vintage*, *A Picture Gallery*, *Fredegonda*, and the portraits of *Herr Barnay* and *Mr. Whichcord*. In certain female nudes—*A Sculptor's Model*, *Tepidarium*, *After the Dance*—in the exquisite group of profile heads of girls called *An Audience*, also in the portrait of *Herr Hans Richter*, Mr. TADEMA appears to make some deliberate effort after the qualities of true flesh-painting, and there are certainly passages of brilliant quality in the second and fourth named of the above group of works. The head of *Cleopatra* (129) has also some mellow and flesh-like aspects. These are, however, all exceptions to the rule. Yet how much is left to enjoy, after all limitations are accepted, in an art so individual!

Realism of still life—when carried to perfection of imitative skill, as in the forms, the materials, and the illusive perspective before us—has enormous power of appeal from a dramatic point of view, and produces, in fact, the same impression of unity as the appliances of the modern stage, while the art employed is of course real and legitimate. The inventiveness of "situations," the sly often caustic satire, the rollicking fun, and the occasional tenderness which Mr. TADEMA puts into his subject pictures, are perhaps all the fresher and more interesting from the archæological dress in which he arrays the sentiment. If we were asked to name the pictures in which a pulse of real feeling and of poetic significance beats most tangibly, we should name, not the imposing canvases which impress by the square foot, but such gems of the artist's skill as the two Flemish interiors, *The Nurse* and *Sunday Morning*, *A Pastoral*, *A Harvest Festival*, *Departure*, and *A Hearty Welcome*. The work which brings the realism of things strange and long ago into closest connection with a powerful dramatic motive is still *The Death of the Firstborn* (1872), while the best composed design and the finest study in figures in action by far is *The Pyrrhic Dance* (1869).

The water-colour drawings gathered in the small room are chiefly studies for the oil pictures, or replicas of them on varied scale in the water-colour medium, in the use of which Mr. TADEMA attains a singularly fine quality of tone and manipulative delicacy.

We had reserved to a last paragraph the only picture in the gallery which will be new to a majority of the public, and, to some degree, to all, inasmuch as the artist continued to work upon it after the opening of the exhibition, when only an empty frame greeted disappointed expectation on the days of the press and the private view. Even as we go to press, *Cleopatra* (1882) still remains in the artist's hands, and the frame yawns open on the gallery wall.

The gathering, together at the Grosvenor Exhibition of the pictures and drawings of the late CECIL LAWSON is a kindly and deserved tribute to an artist whose brief career was marked by something more than promise of distinctive talent. The sudden popularity which befell the painter after his first success in this gallery was as little just as previous repulse or subsequent indifference, and the present occasion may seem an opportunity for unprejudiced readjustment of opinions. The verdict of "those who know" is likely, however, to be of somewhat doubtful bias. That the interpretation of nature by CECIL LAWSON had a certain power of generalisation and a largeness of motive it were unfair to deny. In the drama of the heavens he was an observant student, and his pictures of

cumulus cloud rolling through the blue over the Yorkshire moors or lying in piled lustre above horizons of rich woodland, of weird effects of moonlight illuminating the river mists or struggling with drifts of storm cloud, together with many other such records of atmospheric effect, show no common intelligence and power of artistic expression. Throughout all his work, however, even to the last, defective training was patent; he never got right about perspective relations in any complex subject, and what his admirers called the "manner of the impressionist school" was oftentimes simply incapacity of the artist to carry out with solidity and precision his own conception. That Mr. LAWSON struggled to attain greater accuracy of form and coherency of artistic expression is certain, and if life had been granted him, his industry and enthusiasm might possibly have won him a high permanent position among English landscape painters. Although his scheme of colour was artificial, he painted and studied out of doors, and the brilliance of his atmospheric effects, in spite of a certain opacity of palette, was the reward. It must now for ever remain an unanswered question whether an art which aimed at large generalisation and dramatic unity of effect, without having the superstructure of close and exact knowledge, could ever have had a healthy development and maturity; but an examination of the work this clever young artist has left behind him—there are 106 pictures and drawings in this exhibition, by no means all he executed—has impressed us with the conviction that, like many another painter, having attempted to run before he could walk, he would never have obtained firm footing in the way that leads to lasting fame.

#### BISHOP WORDSWORTH'S "GREECE."\*

WHEN the Rev. CHRISTOPHER WORDSWORTH, M.A., Head Master of Harrow School, published his "Athens and Attica," there was less interest in the topography of Greece than there is at present. "Classical Geography" was taught in some schools and colleges, but the books on the subject were the dreariest of compilations, and would seem to have been prepared for the torture of students. All this arose from ignorance of the countries, and especially of Greece. The Grand Tour which was followed for some centuries was limited in its extent. In the early part of the century GELL said: "We are at present as ignorant of Greece as of the interior of Africa," and half a century ago few Englishmen ventured so far as Athens. Although the fate of BYRON and the War of Independence gave a new interest to Greece, there were many districts of the country which remained unknown to Western travellers. It was impossible at that time to obtain a map of Greece that was even approximately correct, or one in which ancient and modern names of places were not jumbled together. That excellent scholar, the late GEORGE LONG was, in consequence, not able in those days to decide whether Olympia stood on the north or the south bank of the Alpheus. There were the volumes containing the travels of GELL and LEAKE, and the older books of DODWELL and CHANDLER; but somehow they were not utilised for students. The credit for the first attempt at producing a description of Greece which was at once popular and scholarly must be given to Dr. WORDSWORTH. The small book on "Athens and Attica" was followed by "Greece, Pictorial, Descriptive, and Historical." This volume has hitherto not obtained the success it merited. The beauty of the illustrations may have been obnoxious to some people who consider that archæology resembles mathematics, and that a book on the subject is not adapted to a drawing-room. But unless we are mistaken, the principal objection to it has been that it was the work of an Englishman. By some fatality we have come to regard German scholars as the only acceptable authorities on questions connected with classic archæology, and if Dr. WORDSWORTH'S book had been printed in a German town and bore the name of a German professor on the title-page, a translation of it would have been before now in use wherever the English language is spoken. Let us hope that in the new form in which it has been published by Mr. MURRAY, Dr. WORDSWORTH'S "Greece" may secure that attention which it deserves.

\* Greece: Pictorial, Descriptive, and Historical. By Christopher Wordsworth, D.D., Bishop of Lincoln. New and Revised Edition. Edited by H. F. Tozer, M.A. With 400 Illustrations of Scenery, Architecture, and Fine Arts: London, John Murray.

A book of the kind could only be produced by a scholar who has ancient history and the classics at his finger-ends, besides a power of summoning historical associations on seeing certain natural or artificial objects. This is a power which is not possessed by all. COLERIDGE, for instance, confessed that if he walked over the plain of Marathon it would be to him no more than any other plain of similar features, although he could take an interest in the description of the battle in a book. It is possible to go prepared to a country with a stock of quotations, and to seek for places to which they may be adapted. ADDISON adopted this plan for his classical tour in 1701. "Before I entered on my voyage," he says, "I took care to refresh my memory among classic authors, and to make such collections out of them as I might afterwards have occasion for. I must confess it was not one of the least entertainments that I met with in travelling to examine these several descriptions, as it were, upon the spot, and to compare the natural face of the country with the landscapes that the poets have given us of it." In the same way GIBBON prepared himself for his Italian journey by a study of the "Italia Antiqua" of CLUVERIUS, "a learned native of Prussia, who had measured on foot every spot, and had compiled and digested every passage of the ancient writers," and this work was supplemented by the descriptions of Italy by STRABO, PLINY, and others. Dr. WORDSWORTH does not inform us of the preliminary labour that he undertook before writing his book. But the allusions in his book suggest that, like CLUVERIUS, he merely tested by travel what he had before drawn from ancient authors.

The arrangement which would serve for an ordinary book on geography would be ill-adapted for a literary work of the character of "Greece: Pictorial, Descriptive, and Historical." An ingenious plan has been followed by Dr. WORDSWORTH. He conducts his reader first to the heights of Zygo, from whence, as a point of vantage and by the aid of imagination, a panorama of the entire mainland may be beheld. By following the mountain ranges and the rivers which are connected with Zygo we are enabled to understand the physical conformation of the country. A knowledge of the mountain systems of Greece is almost as necessary for the student of history as is a knowledge of the skeleton to an anatomist. The character of the people was in a great measure the result of those natural barriers which separated the states and allowed of various degrees of development.

After describing Greece as a whole, Dr. WORDSWORTH takes up the different states, and begins with Attica. Matter-of-fact people are often disappointed on visiting that part of Greece, and cannot understand how a country which has nothing to compare with the Thames can have held such a position in the world's history. Cardinal NEWMAN, with gentle sarcasm, suggests what kind of report a man of that class would prepare after travelling through the triangular Attica. He would note the unsatisfactory soil, the narrow streams which are not always full, the limestone hills, the pasture for sheep and goats, and such products as figs, oil, and olives. Attica would be to him a commonplace country, as it is to many others. But to those who are in search of beauty this part of Greece can offer much on sea and land which will not be found elsewhere, and no other land with so limited an area possesses so many sites which are hallowed by noble deeds. Taking his stand on Mount Agaleos, Dr. WORDSWORTH reminds his readers that it was from thence XERXES beheld the battle of Salamis, where the invader's hopes of a mastery of Greece were frustrated. In the "Persians" the scene has been described by ÆSCHYLUS, who was one of the combatants:—

Deep were the groans of XERXES when he saw  
This havoc; for his seat, a lofty mound  
Commanding the wide sea, o'erlook'd the hosts.  
With rueful cries, he rent his royal robes,  
And through his troops embattled on the shore  
Gave signal of retreat. Then started wild  
And fled disordered.

Two of the Persians heard the hymns which were chanted in the procession of DIONYSIUS from Athens to Eleusis, and in relating the incident Dr. WORDSWORTH takes the opportunity to tell us something about the Eleusinian Mysteries, and how ÆSCHYLUS was once summoned on the charge of revealing them. Another of the great dramatists is introduced when describing Mount Parnes, which separated Attica from Boeotia, and, it may be said, dulness from brilliancy. It was from Mount Parnes that ARISTOPHANES represented the goddesses

as being summoned to Athens in the burlesque of the sophistry of which SOCRATES was supposed to be a type. We are reminded that one of the characteristics of ARISTOPHANES was the introduction of allusions to local scenery :—

With the "Chorus of Clouds" the audience might suppose itself looking down upon the objects of which they speak as then visible to themselves—to see the land of PALLAS stretched out below them, and the lofty temples and statues of Athens at their feet ; to trace the long trains of worshippers in festal array traversing the hills to the Sacred Mysteries of Eleusis ; to follow the sacred processions winding through the streets to the Acropolis of the Athenian city ; to witness the banquets and sacrifices on solemn holidays ; to behold the crowds seated in the theatre at the beginning of spring, witnessing the dances and listening to the melodies which there give an additional charm to that season of festive joy.

In another part of the volume it is explained that the tragedians, on the contrary, ignored the local scenery. In this respect they resembled the Greek painters. Allusions to the streams and to Hymettus are to be sought in Roman rather than in Grecian writings, and "if our knowledge of the geography of Attica were to be gathered only from the extant works of ÆSCHYLUS, SOPHOCLES, and EURIPIDES, we should not be acquainted with the name of a single mountain on the Athenian soil."

One of Dr. WORDSWORTH'S maxims is, that "much historical ore may be smelted from mythological minerals," and accordingly he interprets the legendary contest between NEPTUNE and ATHENE, which was sculptured in one of the pediments of the Parthenon, as indicating the rivalry between two sections of the inhabitants of Attica. One sought after the wealth which was to be gained by commercial enterprise on the seas ; the other inhabitants, being less ambitious, were satisfied with agricultural and pastoral pursuits. In the legend of the marriage of CRANAUS and PEDIAS he recognises the trace of some primitive effort to unite the inhabitants of the hills with those of the plains of Attica. The importance attached to the tradition that ERICHTHONIUS was the first to yoke four horses to a car is said to have arisen from the fact that in the barren land of Attica a horse was reared with difficulty, and was expensive to maintain. The possession of four was an indication of the greater diffusion of wealth consequent upon the successful cultivation of those arts and manufactures which began to flourish at that period.

It is shown by Dr. WORDSWORTH that the legends connected with places exercised much influence on the affairs of the Greeks. Both Marathon and Thermopylæ were associated with the mythic deeds of HERCULES. At Marathon his daughter offered herself as a victim for the liberty of her people ; it was there his sons routed the army of EURYSTHEUS, and it was there the Athenian hero THESEUS had destroyed the Cretan monster. The Spartan kings were supposed to be descendants of HERCULES, and at Thermopylæ it is not too much to imagine that LEONIDAS believed that the battle-field, which was overlooked by Mount Ceta, where HERCULES died, had been fixed by the favour of the gods. "The Spartans," says Dr. WORDSWORTH, "while they saw the countless hordes of Persia in their front, and while the Immortals of XERXES were rushing to the charge in their rear, had above them the summit of Mount Ceta ; and then, in the last hours of their life, they drew courage and hope from the reminiscences which it supplied of their great ancestor—of the labours which HERCULES had undergone, of the death which he had there suffered, and of the glory which he had won." If BONAPARTE could appeal to the forty centuries which looked down from the Pyramids upon the adventurous Frenchmen in a strange land, it is not improbable that in Greece the past could likewise be united with the present and made to inspire great deeds.

The interest of Attica reaches its height in the capital. "Where'er we tread 'tis haunted, holy ground." Dr. WORDSWORTH says truly that to describe Athens aright the writer should be an Athenian. However great may be his enthusiasm, the ruins can never suggest to a modern what the city was in the days when it attracted men of all nations. Dr. WORDSWORTH describes what is left of ancient Athens, and, as in other parts of his book, explains the relation of the conformation of the place itself to the events which have been transacted there. Let us take one example—the Pnyx, or place of assembly—where all that was done by art was the excavation of the rock at the south side and raising the north wall :—

To form an idea of an Athenian assembly in the flourishing

times of the Republic we must imagine this open space, consisting of about twelve thousand square yards, occupied by nearly six thousand citizens seated in groups within it. In the presence of this vast multitude, one man arises ; he ascends the stone steps, and takes his station on the pedestal which is called the Bema, at the centre of the perpendicular rock. He has before him not merely these six thousand Athenians, but the city of Athens. Lying at a little distance beneath him, he beholds the Agora, filled with statues and altars and temples, and he is thus brought into the presence of the great men of old, the heroes and deities of Athens. Beyond it he sees the Areopagus, the most ancient and venerable tribunal of Greece ; above it, on the right, is the Acropolis, presenting to his eyes the wings, the portico, and the pediment of the noble Propylæa ; towering above them in the air, and looking towards him, is the bronze colossus of ATHENA PROMACHUS, armed with helmet, spear, and shield, appearing from her proud eminence to challenge the world in defence of Athens. Rising in severe and stately splendour to the right is the Parthenon, exhibiting its front of eight huge marble columns, surmounted with sculptured metopes and pediment filled with marble figures of horses, men, and gods, dazzling the eye with painting and with gold. Visible to the north, beyond the city and its walls, are the plains and villages of Attica, its cornfields, its olive-grounds, and its vineyards lying in rural quietness, made more peaceful by its contrast with its stirring scene. Farther in the distance are the castellated passes of Phyle and Decalea, and in the horizon the high mountain ridges of Parnes and Pentelicus.

Such are the objects which the Athenian orator sees *before* him from the pedestal of stone. To his left is the road to Eleusis, the Sacred Way which, passing through the beautiful suburb of the Cerameicus, and by the groves of the Academy, and crossing the stream of the Cephissus, climbs over the western heights of Mount Ægaleos ; visible from the higher ground in the rear are the two long lines of wall which, running along the plain for nearly five miles, unite the city with the Piræus. There are the masts of vessels riding in the harbour—merchants bound for Pontus, Egypt, or for Sicily : fleets which have gained for Athens empire and glory in distant lands—in the islands of the Ægean, in the peninsula of Thrace, and on the coast of the Euxine. Farther to the left is the glorious Gulf of Salamis : on one side of it is the hill on which XERXES sat to view the battle fought beneath him ; and on the other is the cape where stands the trophy of THEMISTOCLES.

Such is the scenery of the Pnyx ; such are the objects which surround the Athenian orator as he stands on its Bema. In *their* presence he speaks. In dread, therefore, mixed with delight, inspired by such a spectacle, he proceeds to address his vast audience, like a general going to a battle, when he sees the flags and banners of his country's glory unfurled and streaming before his eyes.

When we read a passage like the foregoing we can scarcely wonder that among the Greeks so much attention was given to place, or that "where" formed one of the ten categories. The passage suggests the manner in which Dr. WORDSWORTH imparts information, and if it is compared with the corresponding description in "Athens and Attica," the toil undergone by the Bishop will be apparent. He does not write as a mere topographer or a traveller ; from his acquaintance with the past, as it is found in books, he is able to project himself into old Greek life, and what would be in many hands little more than an itinerary, becomes picturesque in the best sense of the word.

From Attica Dr. WORDSWORTH passes to the island of Ægina. The position of the temple (which he believes to have been dedicated to ATHENE) suggests the remark (which may also be found in the "Handbook for Greece") that "the religionists of Greece knew how to avail themselves of two things most conducive to devotional effect—silence and solitude." Then follow descriptions of the remaining states ; and it is needless to say that on almost every page there is something which is interesting. In speaking of Delphi, Dr. WORDSWORTH declares his belief that the Evil Spirit was permitted to utilise the Oracle in order to vent his influence on the world. But, happily, conclusions of the sort are not often found in the book. At Platea it is of course stated that the Asopus and Oëroë are two small rivers—(a fact which was ascertained by LEAKE and STANHOPE)—although in the common translations of HERODOTUS it is said that Oëroë was an island which the Greek captains had resolved to occupy as a protection against the Persian cavalry. The Copaic Lake, which is the largest in Greece, abounded in reeds, and to them Boeotia may be said to owe its reputation for musicians. "The reed," we are told, "furnished instruments for the periodical contests of flute-players in the games in honour of the Graces at Orchomenus, where it grew in the greatest perfection, in the musical festivals of Love at Thespiae, and in those of the Muses at Libethra."

Dr. WORDSWORTH in his travels did not attempt any explorations to identify ancient sites ; but in one case at least he was able to anticipate archæological excavations. BYRON expressed the universal ignorance when in describing ZITZA he exclaimed :—

Oh ! where, Dodona ! is thine aged grove,  
 Prophetic fount, and oracle divine ?  
 What valley echo'd the response of JOVE,  
 What trace remaineth of the Thunderer's shrine ?  
 All, all forgotten.

Colonel LEAKE supposed it to be at Jannina. Dr. WORDSWORTH, conjectured that Dramisus, near Jannina, was Dodona ; and the excavations of M. CARAPANOS are accepted as a confirmation of the theory, but the remains of the buildings are disappointing and the bronzes are of an inferior kind.

It is astonishing how well all the illustrations look, although they are no longer new. The engravings on steel are by eminent artists. For the woodcuts English and French artists made drawings. The majority of the landscapes are by the late Mr. G. F. SARGENT, a draughtsman whose merits were not sufficiently recognised during his lifetime. He never surpassed the sketches in "Greece."

One of the features of the volume is the excellent History of Greek Sculpture, which was written and illustrated with exquisite outlines by Mr. SCHARF. For this edition it has been extended, and refers to the latest discoveries. It may be said with truth that all students of Greek art or Greek literature should possess the Bishop of Lincoln's book. It is unique in English literature.

#### THE DUBLIN MUSEUM COMPETITION.

MR. RUSKIN, in a lecture which he delivered in Dublin some years ago, endeavoured to describe the Irish character, and the defect in it which arrested the national power in other things besides art. "The form of failure to which it is most liable," he said, "is this, that being generous-hearted, and wholly intending always to do right, it does not attend to the external laws of right, but thinks it must necessarily do right because it means to do so, and therefore does wrong without finding it out, and then, when the consequences of its wrong come upon it, or upon others connected with it, it cannot conceive that the wrong is in any wise of its causing or of its doing, but flies into wrath, and a strong agony of desire for justice, as feeling itself wholly innocent, which leads it farther astray, until there is nothing that it is not capable of doing with a good conscience." We have given this passage at length, because it explains some strange doings in Dublin in regard to the competition for the proposed museum. If Mr. RUSKIN were to search through the whole recorded history of Ireland we doubt if he could discover anything more corroborative of the theory which he expressed than the conduct of the Irish architects within the last year. It will not be difficult to show the applicability of Mr. RUSKIN's theory. In the first place, is it not the fact that the Irish architects did not attend to the external laws of right from the very beginning of the competition? The characteristic defect of the Irish designs was that little or no attention was given to the planning. The architects did not seem to have studied the arrangements of any existing museum ; they were not aware of the space which would be required for the collections which existed in Dublin, and consequently, although it is alleged that the premiated plans do not provide for the accommodation of the antiquities belonging to the Irish Academy, we believe it to be a fact that not one of the Irish competitors would be able to state in figures how much space the Academy's collections now occupy. The committee to whom the designs were submitted consisted of five members, and four of them were Irishmen. It could not be suggested that the committee was incompetent or unjust. Mr. McCURDY is one of the best known of the Irish architects ; Colonel McKERRIE is a Commissioner of Public Works ; Dr. MOYERS is, we believe, the son of a builder, and is, or has been, connected with the building trade. Surely these gentlemen ought to be able to decide upon the relative practicability of a number of designs. Then Sir ROBERT KANE, who has been a director of museums for many years, must know what is needed by the public and officials ; while Lord POWERSCOURT, as an amateur, could be trusted to secure that a meritorious elevation was not set aside without some reasonable cause. Yet this committee, which might be supposed to

be favourably constituted for Irish interests, were unable to select a single Irish design. If such a result had followed a competition in any other country but Ireland, it would be said that the architects had not understood the requirements of the proposed building. But, as Mr. RUSKIN says, the people in that unhappy land cannot conceive that a wrong is in any wise of their own causing. Instead of manfully accepting the decision of the committee, and, as is constantly done in England and Scotland, resolving to do better whenever another opportunity arrives, the Irish architects, true to their national character, fly into wrath, and, judging by what has been spoken and written during the last few months, it may be said with Mr. RUSKIN that there is nothing they are not capable of doing with a good conscience. Considering the condition of the professional mind in Dublin at present, Mr. COURTNEY could well say a few nights ago in the House of Commons that "the opinion of Dublin architects on this subject must be received with much reserve." In the statement of their wrongs as well as in the preparation of their plans "the external laws of right" have been disregarded, and it is not to be wondered at if the architects are rebuked from the Treasury Bench. Indeed, the "bother" which has attended this competition has been so wearisome that the officials who maintain the advantages of handing over buildings to Government draughtsmen can rejoice. They may say that if the original arrangements of Mr. LOWTHER had been adhered to, and if plans had been prepared at South Kensington, the museum might by this time have been erected. The Dublin architects are working hard to convince the authorities of the danger of giving commissions to civil architects for public buildings.

The question arises, Do the Dublin architects really desire to have a new competition instituted? They know that in such a case (besides the affront to the committee) the five authors of the second series of designs must be compensated, and that, under the circumstances, the total sum would be several thousand pounds. What Government would venture on a second competition with the chance of such another expense or failure before them? Is it not more likely that the erection of the museum would be postponed for many years, or, if the building is a necessity, that the plans which were drawn at South Kensington would be utilised? In either case the gain to the profession in Ireland is not to be coveted. But what is remarkable about the agitation is that the five designs are not all condemned. It is generally acknowledged that the design by Mr. FREEMAN has qualities which distinguish it from the others. This agrees with what was announced some time ago, that the Committee of Selection had assigned the first place to the same design. If this be true, we may enquire why the design has not been adopted? It can hardly be imagined that the five designs are equal in merit, and so long as there seems to be a difficulty in judging between them, the unsuccessful competitors will make themselves heard. It is needless to say that there is no limit to eloquence in Ireland.

We do not advise the Dublin architects to suspend their agitation, however unworthy it may be of professional gentlemen, for we doubt the influence of reason just now in Dublin. But we are of opinion that it would be politic for the Government to determine the competition without delay. If alterations of the arrangements are required they can be made when the working plans are being prepared. To judge from some of the criticism it would seem that people were of opinion that the selected design is to be handed over forthwith to the builders. In few competitions would that course be advisable. If one of the designs should be superior to the others in arrangement of plan, good lighting, and dignity of appearance, and if these qualities can be secured without extravagant cost, it deserves to be selected. The author's success in dealing with the given site is a guarantee of competency, even should another site be selected.

**Tynemouth.**—The church of the Holy Saviour, which is the church of the Priory parish, was built forty-two years back, and is noted for its want of architectural beauty and the discomfort of its internal arrangements. The vicar, being well supported by the parishioners, called in Mr. F. R. N. Haswell, architect, North Shields, and, under his advice, contracts were entered into for re-seating the church throughout in oak, cleaning, decorating, &c., together with the erection of a new choir vestry, and certain alterations to the small and incommensurate one already existing. The church was reopened on Sunday.

## SUNDRY WORKING DRAWINGS.\*

By J. P. SEDDON.

*(Concluded from page 344.)*

I NOW propose to lead you right across England to the opposite coast of Wales, where it has fallen to my lot to carry out some of the most important works that have been entrusted to me. My first introduction to that neighbourhood was in the year 1863, during which I received a commission from Mr. Thomas Savin, of Oswestry, to whom the principality of Wales owes a great part of its railway accommodation. That gentleman asked me to make a survey at Towyn, in North Wales, where he contemplated laying out for building all the land lying between two of the stations of his coast line. When that was finished he desired me to proceed to Aberystwith by a morning train, so as to be able to advise him in the evening of the same day as to some additions he proposed should be made to the building in that town known as Castle House, in order to convert it into an hotel. This was, as I found it, a large and complicated collection of buildings, of which the nucleus was a triangular structure with an octagonal tower at each corner. This central portion had been built by Nash, to whom London owes Regent Street. Having taken a rapid survey, I made a sketch design for a wing to be built southward of the above-named structure, along a narrow strip of land lying between the road and the cliff. This was intended to contain a large saloon, to serve as a dining-room, about 100 feet long, having eight bay windows overlooking the sea, and at the further end of this was another octagonal tower. Mr. Savin approved this design at once, and desired me to lay out the foundations of it on the following morning, ordering some thirty men to be on the spot to receive my orders. This I accordingly did, after which I proceeded to town to complete and send down the requisite drawings. In order to provide as many bedrooms over this saloon as possible, without interfering with its area by any supports except those afforded by its external walls, I projected the outer face of the first floor to the front of the bay windows by means of arches spanning from one bay to another, and constructed the partitions with queen truss framing, which permitted of openings in the middle of the transverse ones for a central corridor. The longitudinal ones again rested upon these latter, and were framed likewise with openings for doorways in the middle of each of the rooms so divided off. These trussed partitions provided also the strength requisite for a flat roof over the whole, proposed to be covered with asphalt upon concrete, and to serve as a belvedere, whence any number of visitors congregated on it might enjoy the extensive coast and sea views obtainable from it.

This flat was approached by three circular staircases within turrets, from the saloon and bedroom floor and waiters' rooms. Since the conversion of the building into a college this space has been enclosed, and provides a large recreation apartment for its students.

My employer, acting as his own builder, decided to my regret to execute this wing in brickwork, to be covered with cement. This being the case, I designed the upper portion in timber-framed construction, with brick panels to be cemented and ornamented with incised work and coloured so as to produce effect.

During the progress of this southern wing I one day received a summons by telegram from Mr. Savin to go down to consult with him in the evening about the construction of another wing northward of Mr. Nash's building. I was again allowed no time for the preparation of working drawings, but was instructed to proceed then and there to carry out my approved sketch, 500 men being told off to execute the work, the whole of whom I had to keep well employed. This time, however, I was permitted to have my own way as to material, and I consequently selected Bath stone for the dressings, relieved by blue Pennant stone from Hanam, near Bristol, for the columns, and a local cinnamon-coloured stone from a quarry belonging to Mr. Savin for the wall-work. The principal entrance was arranged in the centre of the building at the back, where, there not being space sufficient for any porch of an ordinary rectangular form, I designed the triangular one, which was erected, and gave every facility required. Adjoining the entrance lobby on one side was the principal staircase within the tower, the plan of which is trefoil-shaped, next the street. On the side is a special staircase to what was intended as the billiard-room and its appurtenances. The billiard-room is of an oval form, and capable of holding three tables with bays on either side for spectators. Underneath this apartment, on the ground floor, is one which was intended as the bar, and whence the approaches to nearly all parts of the building could be commanded. The intermediate floor was required to be of great strength, so as to obviate all danger of vibration to the billiard-tables; to accomplish this purpose, being indisposed to use girders, I designed a special system of flooring, in which, although the span is 25 feet, no piece of timber deeper than 9 inches was used. The joists,

9 by 3, were strengthened by struts underneath, disposed in such a manner as to carry a cradling for boarding ceilings, with moulded ribs, which were, in fact, shallow vaultings in woodwork, and possessed of very great bearing power. This same method of flooring I afterwards used for several of the other large rooms in this building, as well as in a mansion at Abermaide, near Aberystwith.

For the large saloon, about 80 feet long, intended as a drawing-room, and a smaller adjoining one in this north wing, I adopted trefoiled shapes for the plans of the bays next the sea, and utilised an irregular piece of ground on one side of the former for a series of vaulted recesses, separated from the room by a stone arcade with marble columns, and at the end of the room is a segmental apse with a range of traceried circular windows in stone, to be filled with ornamental glass.

Some of the details of this northern wing, with a perspective view showing the manner in which it should be finished at the north end facing the town parade, are to be illustrated. This design has been prepared at the request of the committee of the University College of Wales, who now are the proprietors of the building, and are hoping to complete it.

At the mansion of Abermaide, which I built shortly after this college, I adopted generally the same character of detail, and in particular I may call attention to the entrance porch, the lintels of which, of considerable span, are of Douling stone carried on columns, the shafts of which are of polished Shap granite.

Very recently I was requested by the directors of the North and South Wales Bank to erect for them a bank at Birkenhead, in which I was specially requested to use the same general style and character of detail as that I had employed on this college and at Aberystwith, and it was carried out accordingly.

Somewhat similar also, but with round instead of pointed arches, is the addition that I made about the same period to the mansion of Barrells Park, near Henley-in-Arden, in Warwickshire, the seat of Mr. T. H. G. Newton. This erection consists of a winter garden conservatory, filling up a court between two wings of the mansion. Its enclosing screen walls are built of Camden freestone, which has a deep yellow tint, and the supporting columns of the roofing, which is of timber and glass, and divided into square compartments, have shafts of Devonshire marbles, with richly-carved capitals. The whole of the flooring is of alternate dark bluish-grey and white marble squares within the moulded stone margins of the several flower-beds.

Before, however, leaving the neighbourhood of Aberystwith, I may mention some particulars in connection with the restoration of the noble cruciform church of Llanbadern, which originally was a cathedral, and is situated about a mile from that town. This has been a work which has extended over a very considerable portion of my professional career. It has been carried out in successive portions, as the collection of the necessary funds has permitted. It commenced with the restoration of the nave and the rebuilding of the porch in the year 1868. The tower and transepts were restored in 1878, and the work to the chancel is now in progress.

The first portion was begun before the establishment of the Society for the Protection of Ancient Buildings, which at the second stage in the proceeding, though they did not honour me with any notice of their intention, sent a protest to the committee against the further prosecution of the work. Other antiquaries, however, of equal zeal and ability and greater courtesy, had at the very commencement interested themselves on behalf of the venerable fabric, in particular the Rev. Mr. Petit, to whom Llanbadern church had always been dear, and who has given one of his characteristic sketches of it in his work entitled "Petit's Church Architecture."

That gentleman, anxious to learn what was proposed to be done to the structure, asked Mr. F. Penrose, the architect, to confer with me on the subject on his behalf. Recognising at once the propriety of the feeling which had dictated this step and the courteous manner in which it was conducted, I addressed myself to furnish sufficient accurate particulars to enable a fair judgment to be formed. I directed measurements to be taken at distances of 10 feet apart the whole length of the church, from lines plumbed from the base, and these showed the precise amount that the thrust of the decayed roofs had pushed the walls outward. This in fact was found to be not less than 13 inches in a height of 19 feet. The consequence was that Mr. Penrose intimated to me that it was obvious that the condition of the fabric was as dangerous as I had reported it to be, and that the work proposed was necessary.

I shall not weary you with any minute description of the state in which I found the church, and my working drawings, which are to be reduced as illustrations to this paper in the journal of *The Architect*, will show what I have done to it. It will suffice to say that the walls forced out, as above described, and with perished mortar, were on the point of falling; the roofs had been much lowered, or else later debased ones had been substituted for the original; the ceiling came down below the points of the crux arches, and a huge timber cage was hung from the tower half-way down these arches to serve as a ringing stage, and the furniture of

\* Paper read at the meeting of the Architectural Association, November 24, 1882.

the church was rotten with the damp which the roofs had failed to exclude.

The special characteristics of this church are extreme simplicity in combination with the grandeur that results from largeness of scale, each arm and the tower being 40 feet wide externally. The only place where any richness of architectural detail had been indulged in was in the southern doorway, where the jambs were in three orders, shafted with rudely-carved capitals, and the arch was richly moulded, the details being of the characteristic Early English work of the district. All the original windows had been simple narrow lancets. These were rather curiously grouped in the west end of the nave and end of the south transept as triplets, one light smaller than the others being raised much higher. Those of the eastern end had been superseded, with an advantageous effect of concentrated light in that part, by a large Perpendicular window, with a smaller one of the same style on either side of the chancel. These, which are still dilapidated—the former having its mullions and tracery of wood, and the latter being blocked up with masonry—I propose to restore and reglaze. The original levels, or in some cases slopes, of the floors were sought for, and when ascertained were replaced. The floor of the nave was to slope upwards very considerably from the western end to the tower.

In the new roofs which I had to design I adopted that character which my previous experience at Great Yarmouth had convinced me to be the best for such a span—32 feet; that is, with principals and cradling for the ceilings. The ceilings I have varied, increasing them in richness eastwards; and in that under the tower floor I have adopted wooden vaulting to support and make rigid the beams that existed before. In the same manner, in the chancel its ceiling is made to serve the same purpose for its old but rude oak roof, which it proved possible to retain. In my designs for the flooring or paving and furniture, which were all necessarily renewed, I have introduced an increasing amount of richness of detail eastward, with the view of enhancing by contrast the effect of the extreme simplicity of the architectural features of the stone structures of the church, which I have not ventured to alter in any way. I may call attention to the working drawings of the pavement under the tower as being composed of the mosaic of Mr. Rust's manufacture in combination with tiles executed by Mr. Godwin, of Lugwardine, from special designs of my own representing subjects from the Apocalypse. In the chancel of Holmer Church, near Hereford, and in some other places, I have also used this same series of tiles, but without mosaic.

All the working drawings of Llanbadern Church, both general and detail, are about to be reproduced in the illustrations of *The Architect*.

The remaining drawings that I propose to lay before you on this occasion belong to works which are now in course of progress or on the point of being commenced. Mr. Hugh Roumieu Gough is associated with me in regard to that of the important church of St. Paul's at Hammersmith, for which we are joint architects. In order to obtain the lofty proportions particularly desired by my colleague and the committee, it was necessary it should be dignified but simple, and devoid of ornate detail, as the funds at our command were strictly limited. Such being the case, we have given great study to the question of the materials, and have reason to think that we have been somewhat exceptionally fortunate in that respect. The stone for the exterior wall masonry is of red Mansfield, laid in horizontal courses, with the facework hammer-dressed. This is being supplied from Mr. Robert Lindley's well-known quarries at a price which competes favourably with that of the far colder and less pleasant-looking Kentish ragstone with which Londoners are, in our opinion, unfortunately too familiar. Then the stone for the facing of the walls internally is brown Ancaster, of a rich warm colour, but beautifully varied. This is, we think, the first time that this has been used in the metropolis, although in mediæval times it was extensively used in the churches of Lincolnshire; and indeed the quarries, which also belong to Mr. Lindley, were worked by the Romans. As regards the stonework for the dressings, we have been less fortunate; we had hoped to have had all the dressings executed in red Mansfield, but owing to the great cost of working, we have been compelled to content ourselves with Box ground stone for the exterior and Corsham Down for the interior, the blue bed of which has been selected by us generally for the aisles, in order that they may harmonise with the marble of which I am about to speak. The whole of the columns and responds, with their bases and capitals, are of a Belgian marble, known on the Continent as "Belgian granite," and much used in old Flemish churches, as well as in those of parts of France. The quarries from which we are obtaining this material are situated at Soignies, near Brussels, and are so extensive as to be practically inexhaustible. This marble can be obtained in blocks of almost any size, and the isolated columns in this church are of single stones 2 feet 2 inches in diameter and about 10 feet long. Its appearance is very similar to our Purbeck marble, though for richness and beauty of colour, in our opinion, this Belgian marble is superior. It has also the advantage of being exceedingly cheap, owing to the comparatively low rate of wages paid in Belgium. This is being used for the first time in England for this work. Mr. Gough, who has visited the quarries, will, I am sure, be happy to give you any

information regarding this excellent material, with which, I may add, it is the intention to line the inside walls of the church up to the string-course below the sills of the aisle windows. The whole of this marble that I have mentioned, with the exception of the capitals and bases of the columns, will be polished.

Before passing on to the next set of designs I would call attention to the construction of the roof as being novel in ecclesiastical architecture and different from any of those I have previously described. Iron for structural purposes has been hitherto rather the friend of the engineer than of the architect; indeed, to the latter, and I must own to myself, it has been almost held as an enemy. We should not have used it from choice in this instance, but the necessity for economy, and the desirability of avoiding all lateral thrust upon the lofty clerestory walls, and any visible ties which would have to cross under the vaulted ceiling, led us to its adoption. Mr. Gough's engineering knowledge, acquired many years ago whilst in the Government service, has, I think, well solved the difficulties of the problem, though in a different manner to that in which I have attempted to do so. Each of the latticed wrought-iron principals is, in fact, a girder, exerting no outward thrust whatever, except, of course, what may be due to wind pressure, which is felt in every roof, no matter what its construction may be. In this respect the report of Mr. Bidder, the engineer, so entirely confirms Mr. Gough's opinion as to disarm further criticism, since æsthetic considerations are, in this instance, outside the question. No portion of the ironwork of the roof will be left visible, as there will be a ceiling with groining ribs below it, which it is intended to treat with coloured decorations.

In the work of building the new church of St. Andrew at Redruth, in the county of Cornwall, I am associated as joint architect with Mr. James Hicks, of that town. I call your attention to the drawings of this structure, as it has some special features, and *The Architect* journal has undertaken to reproduce the whole of them in an unusually complete manner, as illustrations to accompany this lecture in its pages. The plan is that of a very wide nave with exceedingly narrow aisles, intended to serve as mere passages; beyond are north and south transepts and the chancel and chancel aisles. The east end of the nave is polygonal below and rectangular above. The site is on the slope of a steep hill, and thus space is obtained underneath the western portion of the church, and this is utilised for vestry accommodation and for Sunday schoolrooms. The approach from the basement storey to the church is arranged so that the choir may file upwards by two staircases around the font, and then uniting, pass in procession down the central passage of the nave to the chancel. The district of Redruth possesses many striking varieties of building stone, most of which we propose to make use of in the following manner.

In the first place, granite will be used for all the quoins of the main angles of the building and for the buttresses. The chief element of expense in its use is that of the labour of dressing it, and not of the material itself, for the hills surrounding the town are chiefly composed of granite of the finest quality, samples of which may be seen in the balustrading of the Thames Embankment. The cost of working mouldings, undercutting, or tracery, however, render it inadmissible for such purposes. Box ground Bath stone, from the quarries of the Messrs. Pictor, has been chosen from among the west-country oolites, in consequence of its excellent weather quality, for the finer dressings of the outside, and Corsham Down for those of the inside of the church. But Bath stone will be used as sparingly as possible, and only for the finest of the dressings. The secondary quoins and bands shown on the drawings are of a local stone of a deep-brown colour, which when used alone for large masses of walling has a very sombre effect; but it forms an excellent bordering to enclose panels of brighter and more cheerfully-coloured stones, such as white and red granite spalls, spar, Alvan, and other waste stones obtainable there at almost nominal cost.

The above stones, which are of light grey colour, will be used for plain arches. We hope thus to show in solid and picturesque construction the adaptability of the several varieties of the peculiar building stones of the immediate neighbourhood, and I am assured by Mr. Hicks that this result will be obtained at less cost than if any one particular kind of stone had been selected for use throughout, for while all those mentioned can be easily obtained in moderate quantities, no one sort can be had in sufficient amount without special quarrying.

I have now exhausted the list of what I had proposed to show you, with the exception of some drawings by Mr. George Frampton, architectural sculptor, of some incised cement work that he has recently executed for me in panels for wooden construction at Birchington-on-Sea, in the Isle of Thanet. Mr. Frampton is prepared to explain to you himself the method of their execution. They are, I think, very suggestive of what may be done to make that class of structure interesting and picturesque. The buildings consist of one-storeyed residences, which we call there bungalows, and blocks of two-storeyed stabling attached to them. A series of these designs has been carried all round the latter upon a ground-work of black cement, but those on the main buildings are upon red, the figures in both instances being left in the natural colour of the cement, tracked here and there with yellow. I had hoped to

have had some photographs of the building to show you the general effect, and have not had time to make any special drawing instead.

In conclusion I have only to apologise for the very desultory nature of these notes and for the anachronism of the designs exhibited. Of this latter I am painfully conscious, and know that in all probability they will appear very like the last dying speech and confession of a dodo, in these days of eclecticism, lacking all that piquancy which a concession to the fashionable mixture of styles would have given them. It is, however, too late for me to learn any other language of art than that I have learnt; I must be content, therefore, if from any of the fossils that I have unearthed, you have been able to glean either instruction or amusement.

### DECORATIVE ART.

THE concluding lecture in the course on "Decorative Art, Ornament, and Design," was delivered by Mr. J. H. Chamberlain in the new Lecture Hall at the Midland Institute, Birmingham. He said that in his last address he spoke of conventionalism in art, and tried to show how it was forced upon them. One reason for this conventionalism was the fact of position and distance. If a figure was taken down from one of the mediæval cathedrals it would possibly be found that the neck of the saint or the sinner, as the case might be, was developed, and the reason for this was that the object was set up at a distance of perhaps some 60 feet, 70 feet, or 80 feet high, and was only intended to be looked at from a long distance. A very important thing for consideration was the kind of conventionalism which was to be introduced when they had different kinds of treatment of the same kind of decorative object. A great deal of confusion and considerable amount of bad work was seen in the productions of the casting-furnaces, because those engaged there would, in making cast ornaments, attempt to reproduce something beyond their proper range, and forget the use of the conventional. The proper conventional was that which regulated the limits in which a designer moved, and caused him resolutely to set his face against attempting any kind of other work except by other and greater means. With regard to the question of material—and this was a much wider question than some people thought—it was no use attempting to do in stone that which could only be done in marble, and a great mistake was commonly made by persons attempting to do with small means that which could only be performed by great ones. During the past few years a great change for the better had taken place in the stained-glass windows placed in our cathedrals and churches, but the general feeling was that if the whole of the abominations of some thirty years ago seen in some cathedrals could be ground to powder, it would be a desirable end to them. All this arose not from any excess of original sin on the part of the stained-glass designers of that time, for they did the best they could with the knowledge and means in their power, but from the common mistake arising out of people confusing stained glass with painting. He had been asked hundreds of times why the figures on stained-glass windows were so absurd, and why there was not a better kind of drawing introduced, and the windows made more pictorial. The reply to this was that the stained-glass window-makers, with all their faults, were wiser than to do that, for no work in stained glass could at any time be a picture. The essential nature of a stained-glass window was that the light should come through it, and, as it were, be partly held by it for a time, giving the figures a charm and a quaint effect; but the moment the pictorial idea was introduced, the figures required to be placed, not in a straight line like soldiers, but some behind the others, and this was impossible in stained-glass windows. Another but a comparatively small matter to which he wished to direct attention was painting on china, and with reference to this he pointed out that, according to his idea, there could be nothing worse than making a picture on a plate. It could be much better made on a panel or canvas, and therefore it was a waste of time and throwing away an opportunity to paint on china. Nobody ought to be allowed to touch a piece of china who was not a master of the brush and the pencil. Many people were puzzled where to stop in finishing a design. There was not the least use in adding details so as to obscure the idea, or in putting on ornamentation so as to cover up the outlines. All that the designer required to do was to carry the finish so far as he felt it was illustrating the idea he wanted to instance. He frequently saw an idea good in itself, and of some power and grace, lost altogether in the profusion of ornamentation with which it had been overloaded. Another reason was that this carrying the finish to an excess interfered with the imagination, which was seldom aroused by anything that was perfect; imperfect art was the most imaginative. The way to design was one of the difficulties of present art, and the problem, "Can we teach design?" had never yet received a satisfactory answer. He did not think they could teach design in the way in which some people thought they could. He believed the only thing that could be done was to take a student to the great master of all, and show him what his necessities were, and where he could find food with which to supply those necessities; then show him what use meant, and the application of beauty to use;

and set him in the right path, just as a mother did when she taught her infant to walk, and sweep needless difficulties and stumbling-blocks out of his way. Mr. Chamberlain then proceeded to illustrate on a black board several easy methods of using natural forms for the purpose of design; and, continuing his remarks, said it had been assumed throughout the series of lectures that they did not doubt the good of art. It would be strange if they did, but he wanted them not to be satisfied with their own knowledge, nor to keep it to themselves. Let them, as far as they could, do a little proselytising among other people with the consciousness of what good art could do them. If the world only knew how much men might be helped and strengthened by a knowledge of art, they could show people, without fear of any sort of contradiction, that art was a revealer, a joy-giver, and a healer—that it could make them acquainted with things with regard to which they would otherwise be absolutely blind, and would open to them a world full of grace, glory, and beauty, which would otherwise be dull, barren, and sterile, and teach them to enjoy some of the truest and best delights which were open to the human breast, and which had the merit of not robbing or depriving anyone of any possession, whilst adding to one's own riches. Art, he was sure, could not only add to the joys of life, but could take away a great deal of its sorrows. A great advance had been made in art, for now, instead of it being regarded as a useless pastime, it was looked upon as a worthy occupation, and people wanted to know something about it, and esteemed those who practised it. He hoped, however, that the world would go a little further, and be prepared to make some sacrifices on account of art. At the present time people had no objection to their buildings being beautiful and decorated so long as it did not cost them any money. If it would cost them anything they at once set about seeing if they could not do without it. He wanted to see this remnant of the old heathenism swept away, and the time arrive when it would be as dishonourable for a man to say that he would as soon be without art as it was at the present day for a man to say he would as soon be without education. He thought that people who would not now make any sacrifice for the cause of art would make some, and permit it in others, if all of them could only teach them the lesson that without art life was incomplete, and shorn of its strength; that it only had a small part of the power which was possible to it; and that with art it became rich and beautiful, and made them happy, and gave them the still greater privilege of adding to the happiness and satisfaction of others.

### THE LATE MR. CHARLES HENRY MITCHELL.

THE death is announced, at his residence, Charlotte Street, Fitzroy Square, London, of Mr. Charles Henry Mitchell, a former well-known Manchester artist, and member of the Manchester Academy of Fine Arts. Since the deceased gentleman took up his residence in London, some seven years ago, says the *Manchester Guardian*, he has done little in his profession. Mr. Mitchell was the son of Mr. Thomas Mitchell, a surgeon at Birstal, near Leeds, where the artist was born about 1821. After receiving a liberal education he was articled to Mr. Chantrell, a distinguished Leeds architect. After completing his articles he came to Manchester in 1842, and entered the service of Mr. John Edgar Grogan, the well-known architect, of Princess Street. Remaining some short time with Mr. Grogan, he next practised independently as an architect, principally for the then leading firm of contractors and builders in Manchester, Messrs. Bowden, Edwards & Forster, of Brook Street. His earliest and closest acquaintances when he first came to Manchester were the late Mr. Selim Rothwell and Mr. William Percy, the portrait painter. To these two artistic and bosom friends he owed much of the inspiration which marked his subsequent professional life as an artist. In fact, it was with Mr. Percy he made, in 1844, his first sketching trip in the neighbourhood of Bolton Abbey and Bolton Woods. Among his earliest examples exhibited at the Royal Institution were three water-colour drawings at the Exhibition of 1850, one being a view of Cornelian Bay, Scarborough, and the others architectural subjects. In 1851 he showed a capital oil picture of Scarborough and a very chaste drawing of Loch Katrine. Subsequently he exhibited some excellent examples in water-colour, notably *Heysham Church*, *Derwentwater*, *Morecambe Bay* (in 1853); *Ullswater* and *Naworth Castle* (in 1856); *Rydal Park*, *Alderley Church*, and *Holford Hall* (in 1857); *Cookham Bridge*, and other views on the Thames (in 1859). At the exhibition of 1864 he exhibited a fine drawing, *The Force on the River Kent*, *Westmoreland*, in which the cattle introduced were drawn by his then talented young protégé, Mr. Basil Bradley, who subsequently assisted him in the same way in most of his landscapes. It may be further mentioned that in some of his architectural drawings, in which perhaps he showed the most artistic powers, Mr. Mitchell sought the assistance in the introduction of figures of another Manchester artist who has since become eminent, Mr. Fred. J. Shields. For some years past Mr. Mitchell's work has been absent from the autumn exhibition at the Royal Institution, partly for the reason that his health has not been robust, but chiefly doubtless because he was possessed of a fair competence, which rendered him independent of either art patrons or picture dealers. Mr. Mitchell was, with Messrs. Hammersley,

Wilson Dyer, G. W. Anthony, Robert Crozier, H. H. Hadfield, William Percy, Charles Ward, and H. Clarence Whaite, one of the executive committee of the successful local Art Exhibition held in the new wing of Peel Park Museum in 1857. In that collection he exhibited about a score of his powerful drawings, notably a very beautiful drawing of *Kenilworth Castle from the Green*, and one of *Lanercost Priory*. Upon the formation of the Manchester Academy of Fine Arts Mr. Mitchell became a member, and was, with Messrs. Hammersley, Henry Calvert, J. Lamont Brodie, John Bostock, Robert Crozier, William Hull, W. K. Keeling, and W. Percy, one of the original Council of that body. Though not taking any active interest in the Academy for some years, he retained his membership until his death. Nothing pleased him more than to give his old Manchester brothers of the brush a hearty welcome when they visited his quarters in London. Mr. Mitchell was one of the founders of a now popular institution, the Brasenose Club, of the first committee of which he was a member, and within whose walls he was wont to pass away many—very many—hours of pleasant chat and gossip.

## TECHNICAL EDUCATION IN BELGIUM.

A LETTER has been received in Bradford from Mr. Swire Smith (who is at present in Antwerp as a member of the Commission on Technical Instruction), from which the following are extracts:—

We are apt to think lightly of a country like Belgium, because on the map it seems somewhat insignificant, and has only a comparatively small population. Yet it is to the continent of Europe what Lancashire and Yorkshire are to England, and no part of Europe contains the same population for the area, or can compare with it in wealth of resources or industrial importance. In bygone times, centuries ago, the material resources of Belgium were developed side by side with the intellectual resources of the people, until the Flemings became the leading manufacturers of the world. In their struggles for political and religious freedom they were persecuted in a terrible manner, their industries were broken up and destroyed, and it is said that hundreds of thousands—the best of the people industrially and those most useful at home—were driven to seek refuge mostly in England, asking for nothing but freedom to worship and labour. They became missionaries of skilled work, settling in the small manufacturing towns, and imparting new vigour to the manufacturing industries in all directions. Their merchants infused new life into London business 300 years ago, just as, we must admit, the Germans and other foreigners have into the merchant business of Bradford and Manchester more recently.

In a great measure we have inherited an industrial supremacy established by the Flemings, and in our journeyings now we see and hear indications everywhere that the Belgians are striving to regain the supremacy that they boast England alone holds over them. A generation ago it was their custom to import English workmen to resuscitate their dormant industries, and English capital also came freely to their aid. One is not surprised to hear of long hours and low wages, for both conditions were absolutely necessary in order to render competition even possible. Having obtained a foothold, they turned their attention to education, and now, with the two factors in full operation—low-priced labour and effective schools—the best men everywhere are showing greater interest and faith in the latter than in the former.

Near to Liège we visited the gigantic iron and steel works of the Cockerill Company at Seraing, founded in 1817 by Mr. John Cockerill, a Lancashire man. In the several departments of mining, smelting, forging, and machine-making about 10,000 operatives are employed, with engines working at about 12,000 horse-power, while the wages paid amount to 400,000*l.* a year. The whole establishment is a marvel of completeness, efficiency, and labour-saving appliances. About 100 draughtsmen are employed, of whom twenty-five are Germans and Swiss from the polytechnic schools of those countries; but there are no English. There are free night schools, attended by boys and adults from the works, numbering nearly 2,000; an Industrial or Technical School, attended by about eighty fitters, boiler-makers, and the clever young men in all the departments: and a mining school, with 200 students. The director of the steel department informed us that he requires all young men under eighteen in his department to attend the night school; a monthly register is furnished to him, and he even punishes by expulsion from the works those who wilfully absent themselves without sufficient reason. Such is his faith in the industrial value of education. A similar state of things exists at the great zinc works near Liège, the *Vieille Montagne*, employing 7,500 men, and where intelligence in all the operations is so much insisted on that the apprentices are required to attend evening schools. "I am not prepared to say," remarked the director, "that attendance at the night schools makes the youths better workmen, but it trains them to habits of thought and reflection, it keeps them from worse places, and tends in all respects to make them better men." Time-breaking through drink at these establishments is almost unknown.

At the great glassworks at Val St. Lambert, which we visited, 1,800 workpeople are employed, and the same firm have other works at Namur, employing 1,200. The overwhelming proportion of the iron and steel products of Seraing, both in raw material and finished machinery, is imported. The zinc works export four-fifths of their produce, and one-fifth comes to England; the glass company export three-fourths of their manufactures, of which more than one-sixth comes to England. I am told that the national resources of Belgium for the production of these commodities are not greater than those of England. Surely those facts furnish material for reflection.

We have visited evening schools in almost every town that we have seen, and nothing has surprised us more than the large attendance of artisans, the high character of their work, and the spirit with which they are pursuing their studies under difficulties.

The town of Liège, which is not so large as Bradford, has 1,300 University students, and is about to spend 160,000*l.* on new buildings. Its out-school has long been crowded with evening students, and a new building with very superior accommodation, at a cost of over 15,000*l.*, will shortly be opened. The evening classes in the several subjects are attended by upwards of 5,000 students. Ghent is following Liège with new University buildings, and its technical school is attended by over 1,000 students, who come after their work in the evenings. Then, without including the wonderful drawing schools of Brussels, I may say that above all these institutions, in its influence upon industrial and fine art, is the Academy at Antwerp, giving the highest art instruction absolutely free to 800 students, of whom 60 are English. They tell us at this hotel that after the tourist season is over many of the hotels of the town have recently been quite full. Wool merchants and manufacturers from all parts of Europe have been attending the wool sales which have recently been held in Antwerp, and which are growing in extent and importance. Antwerp is nearer the Continental factories than London, and this fact is not lost upon the enterprising Belgians. I will not croak over these things, but we ought all to try and comprehend their meaning. The strong forces, to my thinking, are still on our side, but we cannot afford to allow them to be unused; and with this conviction I know of no higher duty than that of impressing upon the people of manufacturing England to look to their intelligence, tact, and effective labour as the most powerful weapons with which to meet our wants in every country.

## ARCHITECTURE AND MUSIC.

THE sixteenth annual meeting of the American Institute of Architects was held lately in Cincinnati. In the course of his address the President, Colonel Nichols, spoke of the relation between music and architecture:—"Some one," he said, "has entitled architecture as 'frozen music,' a figure of speech too far-fetched to be called even a poetic licence. It may be said that a point of union exists between these arts in the science of numbers, the vehicle by which both are born; but there is a yet closer alliance in the fundamental laws of symmetry—the necessity for just and harmonious proportion of all the parts. These laws cannot be violated in architecture without harm. They are often disregarded in music by composers of unquestionable genius. Wagner, Liszt, Berlioz, and a host of smaller men, indulge in frequent inconsistencies, sometimes building their temples of music upon the apex rather than upon the base; but the classical composers, such as Haydn, Mozart, and Beethoven, rarely violated the laws of symmetrical progression. With them the work of art is built out of the smallest parts, which grow in geometrical proportion up to a perfect whole. The smallest division of form in music is called a bar or measure. The symmetry of the composition of the masters of the Classical period may be made comprehensible to the eye. In the diagram before you, which has been kindly furnished me by Professor Singer, of the College of Music, is, you will find, a brief but complete example of this symmetrical construction. The smallest curves uniting two points indicate the single groups of two measures; the larger curves, groups of four; the yet larger comprise whole phrases of eight bars. The model which is here presented as an illustration of the laws of musical symmetry is a passage from Mozart's Symphony in G minor. I might easily multiply examples of exquisitely-constructed architectural forms in music. Out of Beethoven's masterly *Eroica* Symphony could be built a Gothic temple of majestic proportions, with decorations of infinite beauty, but the limits of this hour force me to resist the fascinating temptation. In the suggestions I have made for the instruction of the student of architecture the study of music has not been named, and I have no doubt Professors Ware and Ricker would hesitate before including that art in the curriculum of their schools; yet that study may be earnestly commended to the architect, the painter, and the sculptor. Of all arts it is the most ideal; more than the others it excites the imagination, refines the taste, and elevates the soul. It is one, at least, of the paths which lead to that high æsthetic plane where every true artist should aspire to stand. The true artist is not an egotist. He works not only for to-day—his creations are for the ages."

## NOTES AND COMMENTS.

It is understood that a gentleman, who is not a Roman Catholic, has offered to undertake the cost of erecting the Roman Catholic Cathedral in the Vauxhall Bridge Road. Some years ago sketch-designs were prepared for the building, but Cardinal MANNING considered that the erection of poor-schools was more urgent, and that the cathedral might be left to his successor. When the designs were drawn Gothic was in more favour than at present, and it remains to be seen whether that style will be now adopted. The reason given for so munificent a gift as a large cathedral is that the donor is an admirer of some of the great Italian churches, and desires to have his name associated with a building of the same class. Under these circumstances, it is not unlikely that the new cathedral may be in the Italian style. Unfortunately, the site for the building possesses few advantages.

NEXT week, at the Paris Chamber of Notaries, the two large strips of ground bordering on each side the new Parc du Champ-de-Mars (the site of the 1878 Exhibition) will be put up for sale in lots by public auction. The lots have been so planned as to permit the buyers to erect buildings in accordance with the plans and regulations of the City Office of Works, conformance with which will be compulsory. The new houses will thus on the one side border the Avenue de la Bourdonnaye, and on the other the Avenue de Suffren, while their façades, which, according to the plans, are to be of truly monumental character, will face the Park. The new buildings will form a link between the populous quarters of Grenelle and Gros-Caillou, at present quite separated from one another by the Champ-de-Mars.

AMONG the grants to be demanded by the Minister of Fine Arts will be one of 5,000,000 francs for the acquisition of the Hôtel de Chimay, adjacent to the Ecole des Beaux-Arts, for the enlargement of the latter. The Minister will also ask for a credit of 3,000,000 francs to purchase from the city of Paris the site of the annexe to the old Hôtel-Dieu, on which it is proposed to erect the new National School of Decorative Arts. Another grant will also be required for the purchase and demolition of the house intervening between the Boulevard des Italiens and the Opéra-Comique, so as to give the latter a frontage on the boulevard.

THE heavy rains that have prevailed of late in the French capital and throughout the valley of the Seine have swollen the river to such an extent that grave fears are entertained of serious inundations in Paris itself. The water has already risen to within  $1\frac{1}{2}$  metre of the top of the stone embankments, and as it must continue to rise for at least another week owing to the amount of water to come down from the upper reaches of the river, it is quite possible and even probable, in case the present bad weather continues, that it may overflow and lay a large part of the city under water. It seems almost impossible, but nevertheless it is believed that Parisians may see the Champs-Élysées converted into a lake. At both extremities of Paris—Bercy and Asnières—the paths and roads bordering the Seine are already flooded, and in the latter place the cellars of hundreds of houses are full of water.

THE exhibition of the plans and models in the architectural competition for the reconstruction and extension of the Sorbonne was opened on Thursday the 7th inst. in the Pavillon de la Ville, Paris, behind the Palais de l'Industrie. The competitors, upwards of thirty in number, have themselves elected the jury, who will designate in order of merit the ten plans that best fulfil the requirements of the competition. In case the architect who takes the first place should not be entrusted with the execution of his plans, he will receive a sum of 20,000 francs; while the authors of the four plans classed next will get 15,000 francs, 12,000 francs, 10,000 francs, and 8,000 francs respectively; and the remaining five 5,000 francs apiece.

HANS MAKART, the Austrian artist, is now exhibiting his five pictures, *The Five Senses*, at the Panorama de Reichsoffen, in the Rue St.-Honoré, Paris. They will remain on view until the 28th inst.

THE shop windows are now full of Christmas cards, and the varieties are so great that purchasers sometimes find it difficult to make a selection. The progress of the trade is surprising, and it represents the expenditure of much money on designs. Publishers find it necessary, in order to hold their position, to have recourse to artists of position. Mr. TUCK, for instance, has commissioned some of the members of the Royal Academy; but the results are not always successful. Messrs. EYRE & SPOTTISWOODE have produced designs by M. PRIOLO, which are reminiscent of the great Italians, and the largeness of style and academic system of colouring form a strange contrast to the namby-pambyism which is popular. It must be allowed that this year the greatest success in cards has been achieved by Messrs. HILDESHEIMER & FAULKNER, but such a result was to be expected after their liberality in dealing with artists, and from their experience. One of the novelties of the season is a series of Old English cards which have been published by Messrs. FAULKNER, of Manchester. They are in plain black and white, but the designs are beautiful; and as the verses have been taken from "Patience," there is more humour in them than is generally found on cards. They are almost the only cards of which it can be said with confidence that they have been entirely produced in this country. Most others are drawn and printed in Germany.

ON Monday last the ruins of the Palais des Tuileries, which for upwards of three centuries has been the abode of French kings, became the property of a Paris contractor. The sale, which was held in the auction-room of the Tribunal of Commerce, was attended by a numerous company, the upset price being fixed at 10,000 francs. The bidding soon became animated, a large number of contractors being evidently anxious to secure the work, with a view probably to the publicity or honour to be gained thereby, rather than the profit. The hammer finally fell to the bid of M. PICARD, who has lately demolished and removed the buildings of the 1878 Exhibition, for the sum of 33,300 francs. The clauses in the conditions of sale relative to the art or other treasures that may be found in course of the demolition are very stringent, and run as follows:—"Independently of the fragments of sculpture, which remain the property of the Fine Arts Department, the State reserves to itself the exclusive and entire property in all articles of gold or silver, moneys, bank-notes, or other securities and papers, documents (administrative or otherwise), medals and coins, statues, furniture, bronzes, strong-boxes, jewels, and every other article not originally belonging to the body of the building. This regulation applies equally to the workmen employed, and to everyone making any discovery among the ruins. The Government further reserves the right of making researches, through its own servants, in various specified portions of the building." Considering the stringency of these conditions, the price realised is far above what was generally expected. The ground must be entirely cleared within six months of the date of the site being handed over to the contractor.

THERE was an election at the Metropolitan Board of Works on the 1st inst. of a district surveyor for the district of St. James and St. John, Clerkenwell, and part of Islington. The following were the candidates:—Mr. A. ASHBRIDGE, Mr. C. W. BROOKS, Mr. W. J. BUXTON, Mr. E. CARRITT, Mr. H. CHESTON, Mr. J. S. EDMESTON, Mr. G. ELKINGTON, Jun., Mr. J. M. FERGUSON, Mr. W. GRELLIER, Mr. J. HAMILTON, Mr. P. HUNTER, Mr. G. INSKIP, Mr. G. JACKSON, Mr. L. KARSLAKE, Mr. G. A. LEAN, Mr. W. H. LEES, Mr. H. McLACHLAN, Mr. E. MARSLAND, Mr. T. E. MUNDY, Mr. R. E. POWNALL, Mr. O. RENTON, Mr. W. H. SCRYMGOUR, Mr. L. SOLOMON, Mr. W. L. SPIERS, Mr. A. R. STENNING, Mr. W. H. STEVENS, Mr. H. W. STOCK, Mr. E. STREET, Mr. A. W. TANNER, and Mr. F. TODD. This list was reduced to six at the first voting, viz. Messrs. ASHBRIDGE, CARRITT, ELKINGTON, HUNTER, STENNING, and TANNER. Finally Mr. CARRITT was elected by eight votes over Mr. TANNER.

By Ministerial decree the Académie des Beaux-Arts has been authorised to accept the donation, lately offered by the Duchesse DE CAMBACÈRES, of an annuity of 3,000 francs, to be distributed—1,000 francs to the second Grand Prix de Rome in painting, 1,000 francs to the second Grand Prix de Rome in sculpture, and 1,000 francs to the first Grand Prix in copper-plate or medallion engraving.

## THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE third ordinary meeting of the session was held on Monday evening, Mr. Horace Jones, in the chair. Messrs. Stevens, Murgatroyd, and Holden were present on the part of a deputation from the Manchester Society of Architects. The President, in addressing them, said it gave them no small pleasure to have received them and heard them on a matter which was a subject for serious consideration, and they would give the subject, to the best of their ability, consideration which should also be serious, and they hoped to meet the wishes of the deputation with prudence and propriety.

Mr. E. P. Warren and Mr. Percy Hunter, it was then announced, had just passed the examination in architecture.

The Ashpitel prize had been awarded to the gentleman who passed best in the three examinations—viz. Mr. T. P. Marwick, of Edinburgh.

The silver medal offered this year by Mr. Ernest Turner, to be bestowed on the candidate who passed best in sanitary science subjects in the examinations 1882, had been awarded by the Council to Mr. Charles Stewart Smith, of Reading.

## The New Law Courts.

The PRESIDENT said he asked permission to inform the members that he had had that day the honour of attending one of the most interesting and eventful occurrences which could occur in a lifetime, one of those incidents which would be a chronological era in the history of England, and he felt it was his duty, as well as a pleasure, to bring the mention of the record before them. They would get a better description of the ceremonial at the new Courts of Justice than he could give, in the newspapers. It must have been the regret of everyone that the presiding spirit and genius who had called forth those stones, timber, and metal, and placed them in order, was not there to receive the acclamations, praise, and rewards which were his due. As it was, the ceremony was most interesting, and very pleased he was to attend, and to attend as their representative, though he had the opportunity of attending also in another capacity. Before leaving the subject they must allow him to thank them for putting him in the position to attend as representative of the Institute.

## The late Mr. Ogle.

Mr. JOHN HEBB, in allusion to obscurity which hung over the death of Mr. Ogle, a member of the Institute, which took place in the spring of 1874 in Thessaly, said that the Government had reopened the question with the view of trying to get at the facts of Mr. Ogle's death, that gentleman having been suspected to have been murdered. He asked whether the Council of the Institute would take steps to inform the Government of their satisfaction with the course adopted.

The PRESIDENT said Mr. Hebb's remark had better be entered on the minutes.

Mr. PULLAN then read a paper on

## The Decoration of St. Paul's Cathedral.

Mr. PULLAN said that the warfare which for the last twelve years had been going on as to the decoration of St. Paul's had not advanced the question at issue to a settlement. It was unwise to bring party warfare to bear on a question on which depended their reputation with future generations. He hoped, therefore, they might approach the question in an unsectarian spirit, and he should be sorry that anything he said should offend any of the gentlemen who had the matter in their hands. The matter was in the hands of a sub-committee appointed by an executive committee, and decision in the question rested with the Dean and Chapter of St. Paul's. The public, who in the last instance would be judges in the case, ought to be informed as to the progress of affairs. Who, then, amongst the public were qualified to judge? Clearly not the uninstructed. What, again, was duly-qualified public opinion? Certainly not opinion that objected to any representation of figures on walls, nor opinion which objected to symbolical representations, such as angels, winged lions, &c., because such representations did not correspond with any system of anatomy with which they were acquainted. Nor was it public opinion as held by the multitude, who would be led by any critic, however incapable he might be, provided he shouted sufficiently loud. Duly-qualified opinion must be that of men of taste. There were two degrees of taste—the taste which was natural to some men, and which enabled them to observe the beauties of form and colour; there was also acquired taste, which enabled men to see the beauty and fitness of things. A combination of these two formed a man of perfect taste. If St. Paul's were decorated in the manner of the Alhambra, it would be

admired; the man of educated taste, however, would reject the whole as incongruous. This being the case, where would they find a body of cultivated men who could discern beauty of form and colour, fitness of purpose, position, or, except it were those who were accustomed to have pencil in hand, designing decorative and architectural works, who by study and observation had cultivated their taste so as to enable them to judge in matters of this kind—where, except among gentlemen such as composed the Institute of Architects, would be found the tribunal to decide on what would be one of the greatest works of the British architect? The Institute being therefore the proper representatives of public opinion, he would endeavour to put before them the facts of the case. He received great courtesy and kindness from those who formed the actual representative body when he brought a rival scheme before them. A rival scheme it was never intended to be, but was rather meant as suggestions which might be embodied in the Committee's scheme and which related to the framing of the pictures, which he thought was better than that devised by Stevens. The members of the Committee answered him, however, with a *Non possumus*. Therefore it might be called a rival design. They received the design with the greatest courtesy, and if he criticised some of their proceedings it was not as individuals but as a collective body. He feared, however, that committees usually arrived at decisions adverse to art, and Mr. Pullan, as an instance of this, adverted to decisions on some notable competitions. Wren, the great architect of the national Basilica, was not exempted from the worry of a committee, for Mr. Longman in his work on St. Paul's said, "there was nothing, however small, as to which they did not set up their opinion in opposition to his; there was nothing, however important, which they did not wrest out of his hands." After narrating the history of the decoration project, Mr. Pullan said that, having repudiated architects, the Committee sought for a design from other sources, and at last unearthed a model on which Stevens, a sculptor lately deceased, had left some rough indication of his notion about the decoration of the dome of St. Paul's. The discovery of this model at that critical juncture was most opportune for them. It was a tower of defence for them against their foes. And they further strengthened their position by forming an alliance with the two greatest English painters of our day, Sir Frederick Leighton and Mr. Poynter. With both of these eminent men they made a formal agreement, stipulating that Stevens' designs should be taken as a basis; that a full-sized coloured cartoon should be placed *in situ*, one portion of which was to follow literally or with some modification Stevens' design, the other portion being of a more conventional or architectural form; but in any case Stevens' arrangement to be worked out and the frame to be filled with pictures, the subjects of which to be taken from those suggested by Mr. Oldfield in a second letter to the Dean—namely, scenes from the Apocalypse. The Dean and Chapter sanctioned the experiment, reserving to themselves full power of discussing the matter and also of rejecting the cartoons if they should be unsatisfactory. Now what, asked Mr. Pullan, was Stevens' model? A half-dome, on which were sketched roughly Titans, Telamones, angels, and squatting figures, arranged to form something like ribs, with circular medallions on a plain gold ground to receive the cartoons. The design was without any architectural character, the dream of a man who had Michael Angelo on the brain, and who was thought a man of the greatest genius because he had executed a monument full of fine details, to be placed in a position where they could never be properly seen. This was the Wellington monument—a canopied tomb adorned with groups of figures so placed that little beyond the soles of their feet could be visible to the spectator. This tomb was to have been crowned with an equestrian statue of the great captain whom it commemorated, placed in such a lofty position that his nodding plumes would almost have swept the ceiling of the Consistory Court. This figure, however, the artist was compelled by public opinion to omit. The result was the leaving out of the crown of the design, which was thus made to finish in a plain table top. Neither in the Wellington monument nor in the model for the dome did we recognise that perception of the fitness of things which was wont to characterise the man of the highest genius. Sir F. Leighton and Mr. Poynter, Mr. Pullan contended, ought never to have been pledged to adapt their pictures to Stevens' crude frame-work, which, with whatever proposed modifications, would always remain unworthy of the productions of their pencils. The prescribed selection from the Apocalypse of the figures to fill the upper and lower circles was no less severely and sarcastically criticised. It was objected that a more mystical subject, one less fitted for popular instruction or less likely to inspire devotion, could not have been chosen than that whose study had been said either to find or leave a man mad. Unless it had been meant to divert people's minds at sermon time, to occupy their thoughts with paradox instead of orthodoxy, one was at a loss to conceive how Mr. Oldfield came to pitch upon such a subject. Mr. Pullan in conclusion described the design which had been prepared in Florence by the late Mr. Heath Wilson and himself, the subject being the "Te Deum." A large painting of the design was exhibited.

Mr. PENROSE, having risen in response to the President's request, said that Mr. Pullan had invited them to an academical

discussion on a style of treatment for a large domical church, and he considered the subject to be one most interesting for discussion. But if it were to be a discussion of a rival scheme of treatment, it was decidedly premature, as the Institute had not before it the materials and details necessary for its discussion. Only a part of the scheme had been seen at all, and that merely a partial indication of one phase of the decoration, while there was much more yet to come from Stevens' design, which was not now before them. There were three committees, viz. the executive committee, the sub-committee, and thirdly, the Dean and Chapter of St. Paul's, who were quite unprejudiced, and not in any way committed to anything the committee or sub-committee might recommend. Therefore it was altogether premature to consider the merits of one scheme against another as a question of carrying one or the other into effect. He did not think Mr. Pullan had been just in regard to Stevens. Having said these few words, however, before sitting down, he would ask the Institute as a body not to commit itself to any opinion on the subject.

Mr. STANNUS, observing that he had been a pupil of Stevens, said he had been commissioned by the sub-committee to prepare, in conjunction with Mr. Poynter and subject to the approval of the committee, a full-sized cartoon. He went to France and Italy, and spent October, November, and December 1878 in studying all the good dome treatments he could find, to fit himself still more for his work. When in Rome, towards the end of his journey, he made a modification of Stevens' design, which he brought back and worked out on the scale model. The design was submitted to the sub-committee, but Mr. Poynter was not ready with his version of Stevens' design, and consequently it was kept in abeyance till this year, when he (Mr. Stannus) was commissioned to prepare an experimental full-sized cartoon, to be fixed in the cupola simultaneously with the other. Thus, in the two designs, there would be the painter's interpretation of Stevens by Mr. Poynter, and an architect's—namely, his own—which was really only the combination of the characteristic portions of Stevens' design and of the rib treatment suggested by Mr. Penrose some years ago. Mr. Pullan had found fault with the sub-committee for repudiating architects; but surely Mr. Pullan would recognise Mr. Penrose as an architect. Mr. Pullan had left out the important part of the quotation in which the sub-committee said they would require professional assistance. Mr. Stannus did not consider Mr. Pullan had treated Stevens at all fairly. Stevens was pre-eminently an artist, and yet Mr. Pullan spoke of him as a lately-deceased sculptor, implying that he was not fitted to decorate St. Paul's. Neither sculptor solely, nor painter, nor architect, nor ornamentist, Stevens possessed the balanced mastery over all that made an artist. Of all Englishmen, living or dead, he was just the man fitted to design the work. Mr. Pullan further said that neither in the Wellington Monument nor in the model for the dome did he recognise that perception of the fitness of things which was wont to characterise the men of the highest genius. Mr. Stannus quite believed that Mr. Pullan did not, and his criticisms showed that he could not. Mr. Poynter, in a letter published last July, said, "I have never kept out of sight either the design or my immense admiration for it and for the magnificent genius who produced it;" but Mr. Pullan spoke of "rough indications of his notion," and said Stevens' "crude framework" will always be "unworthy of the production of their pencils," meaning Sir F. Leighton and Mr. Poynter. It was seen from the quotation and the manner in which two eminent artists were content to work out Stevens' design what they thought. Was Mr. Pullan prepared to say the framework in the design exhibited by him at the Egyptian Hall was worthy? Mr. Stannus exhibited a sketch on the blackboard, and said it would have been decorous on the part of Mr. Pullan to have shown them a sketch at least of Stevens' design. An unflinching test of the architectural fitness of superadded work was whether it fitted on to what already existed. Considering Stevens' design in this connection, there was a peristyle below the cupola, consisting of thirty-two pilasters, spaced equally, with voids at the axial points; there were windows between the pilasters arranged in eight groups of threes, each group being axial with the eight arches of the dome, and between these eight groups of windows the other interpilaster spaces were occupied with niches. Mr. Stannus showed how he had arranged an attic balustrade proportioned to the supporting order, how the balustrade was broken over the pilasters, and how this expedient tied the design together and fitted the superadded to the existing work. The adaptation of the circular frames, which Mr. Pullan improperly termed medallions, was also a distinct invention of Stevens. Every section of a sphere was a circle, a fact taken advantage of by Stevens. These large circular panels were the most characteristic feature of Stevens' design. They gave opportunity for storiated panels without lines, which sag in the centre as all rectilinear panels on a concave surface must. It had been objected that they would form ellipses, owing to the perspective; but this distortion, through foreshortening, happened to all visible objects, and the eye was accustomed to allow for it. Another advantage of the arrangement of the circles was that they made a pattern all over the dome, and gave a marvellous unity which did not exist in any other treatment, and was another proof of Stevens' subtle feeling that the cupola was a roof which covered, and not a ribbed

transparency to be looked through. Mr. Stannus then referred to the gradual unfolding of the cupola to sight, to anyone entering the western door, as one of the data of the problem which Stevens' design satisfied. He was not concerned to defend the ribs in which the Telamones occurred, which Mr. Pullan had criticised, the design being merely a sketch.

Mr. C. HENFREY said that if he was to make any remarks it would only be to express his disappointment, as a subscriber, at the manner in which the committee had devoted the whole of their attention to the decoration of the dome of St. Paul's. He would wish to see St. Paul's a beautiful building like St. Peter's at Rome. Would any one on entering St. Peter's walk right up the building without stopping and turn his head at right angles with his body to look at the dome? Why should not the Committee give their attention to the nave and aisles, which could be decorated at a comparatively small expense? 40,000*l.* spent in mosaics for the dome would be thrown away as no one could see them, and he defied any one to tell whether the decoration was in polychrome or in monochrome.

Mr. EWAN CHRISTIAN said he did not believe, from what he had seen of St. Paul's—and he had seen it often enough to know it and to learn to admire it—that Wren, if he were now alive and had seen the attempts at polychromatic decoration, would ever have wished to put a bit of colour on the stonework of the building he so ably designed. Wren had used plaster upon the brickwork, all the rest was of stone construction, and where Wren used stone he believed that he meant stone to remain. The objection to Mr. Burges' scheme for the use of marble was that Wren had shown in his original design where he had intended to use marble; for instance, in the entrances, &c. It would be monstrous if Wren's grand design were taken in hand and destroyed, as he believed it would be destroyed, by the general introduction of colour. No doubt it could be done cheaply—he was mistaken, it could not be done cheaply, for it cost between 6,000*l.* and 7,000*l.* simply to clean the walls of the building. He would express no opinion on the designs before them further than to say that he thought the sketch on the blackboard suggested the right treatment.

Mr. ARMITAGE, R.A., observing that it was quite premature to pronounce an opinion on the comparative merits of the designs, said that if he was not in love with Stevens' design, he was still less so with Mr. Pullan's. He agreed with Mr. Christian's views as regarded colour, and considered that the dome required no decoration, as it would be lost in gloom. Figures would require to be of enormous size, or such decoration would be thrown away. He would rather, as a painter, see the decoration applied to portions nearer the eye, in the shape of a frieze below, with a simple dome or canopy indicated above, though architecturally perhaps it would not be proper. As regarded choice of a subject for the dome it mattered little whether the subject were taken from the Apocalypse or the Te Deum. Whatever the story, it could not be told, for it would be simply a succession of riddles. He held his colleagues, Sir F. Leighton and Mr. Poynter, in high esteem, and had no doubt they would do their share of the work well; but before expressing an opinion he would like to see what they had done and what they proposed doing.

Mr. J. P. SEDDON said he admired the dome of St. Paul's as it was, and he could not conceive how it could be better. Quite as much of the dome was to be seen as was necessary, and he thought it looked very beautiful when dimly seen through the hazy atmosphere. He would like experiments to be made first on portions nearer the eye—not on the stonework, but on some of the shallower domes of the chancel, which seemed to lend themselves and appeal for decoration.

Mr. RALPH NEVILL, F.S.A., said that the mosaics of St. Mark's at Venice had been spoken of as rude work. He had studied these mosaics, and he thought it was the general conclusion of everyone that they were the mosaics that were to be taken as examples of what to aim at, and the later mosaics and the mosaics in St. Peter's as examples of what to avoid. Blue and white figures never looked well perched up above one. No doubt Stevens' scheme could be carried out with success if not loaded with heavy colours. He considered what was required was a broad treatment, so that the eye should be caught by nothing, which was the essential principle in the treatment of a dome.

The PRESIDENT, in putting the vote of thanks to Mr. Pullan to the meeting, said that after all they had heard they would be agreed as to the wisdom of waiting before pronouncing an opinion, but he was sure that in waiting their desire to see what eventually would be done would be much greater than if Mr. Pullan had not brought the question before them.

Mr. PULLAN in reply, said that Mr. Penrose had said that the discussion was premature. It was three years since the design was made, and when he brought it to England he was told that the design of the Committee would be ready in a year. He waited a year, and there was no sign of it; he waited another year, and then began to get a little impatient to see the other design, and what it was like; his design, it must be remembered, was merely intended as suggestive. He had subsequently seen the Stevens model, and notwithstanding all Mr. Stannus had said in explanation of the circular panels, it still struck him that the ribs were the principal things, and he still persisted in the opinion that the ribs were any-

thing but architectural or suitable for a building like St. Paul's. With regard to the Wellington Monument he had no fault to find with Stevens; the fault was the absurdity, which Stevens himself would have seen, of cramming a monument of such dimensions into the inadequate space allowed for it.

## THE MOSAICS OF RAVENNA.\*

By PROFESSOR J. BALDWIN BROWN.

(Concluded from page 345.)

**B**EGINNING with the Catholic Baptistry, I will describe shortly some of the principal Mosaics of Ravenna, of many of which there are photographs.

The baptistry is a small building of octagonal form, covered by a hemispherical dome constructed ingeniously after the fashion of the period, with earthen vessels inserted into each other, and holding together like a pile of garden pots. The wall spaces are effectively divided by two rows of round arched blind arcades, the upper of which enclose eight windows, and were covered from the summit of the cupola to the floor with decoration in mosaic in stucco, and in coloured marbles. The last have almost disappeared, but the two former remain. The floor, the level of which has been considerably raised in process of time, contains in the centre the ancient marble font. Directly above this, in the centre of the dome, is a mosaic picture of the appropriate subject, the Baptism of Christ. The undraped figure of Christ stands up to the hips in the transparent waters of the Jordan. For the first time in Christian painting he is represented bearded, and his long hair falls on to his shoulders. The Baptist stands on the bank, with one foot raised on a stone and with his body draped only in a skin; he holds in his left hand a cross and with his right empties a cup of water upon the head of Christ. On the other side of the principal figure we see the river-god Jordan, breast high out of the water, holding in his hands a cloth, and looking up to Christ with an expression of adoration. A dove descends from the dark gold ground of the sky.

This is of all the Ravenna mosaics the most pictorial, and shows the artist triumphing over the greatest difficulties of his technical process. The nude is well rendered, especially in the figure of John, and not only in drawing but in colour. Nothing surprises one so much, in coming in contact for the first time with mosaic work of this kind, as the facility with which the artist models his forms and faces with his intractable material. The warm transparent shadows and the fine variety of the greys in the flesh tints are most painterlike. The high lights are not white, but light reddish yellow; the outlines are pleasantly rounded; the details of the features carefully rendered with small cubes chosen or cut exactly to fit their places. The colour of the water is a milky white, which sets off admirably the bronzed weather-stained form of the river-god, with his dark grey matted hair and streaming beard, and his expressive upturned eye. The antique may claim the credit of the good rendering of the nude, and has also furnished the river-god, while the excellent composition, surpassed by no representation of the subject in religious art, and the quiet dignity of the whole scene, are the artist's own.

Round this central medallion there is another circle tenanted by figures of the Twelve Apostles, who are marching round to a point under the feet of Christ in order to lay at his feet the crowns which they hold in their hands. There we have examples of those monumental figures of Christian heroes which have been spoken of as being the favourite subjects in this style of art. They are all very much alike in form, drapery, and action, and are dressed alternately in white tunic with gold-coloured mantle and gold tunic with white over-drapery; but there is considerable contrast in the faces, which are firmly designed with excellent portraiture character. Classical beauty has, however, departed from these as from similar representations of the time; and the theory has even been broached, that, owing to mixture of races and other causes, there had come about an actual degeneration in the beauty of the human countenance. Peter and Paul, with the distinctly-marked physiognomies which can be traced back to so early a date that there is some likelihood that they are based on actual portraits, head the two companies of six who meet beneath the feet of Christ. The others, all with their names inscribed in Latin characters, follow in order. It is interesting to see how the artist has arranged his design in the space he had to fill, which is in shape like a wheel, with the figures of the Apostles for the spokes of it, and the medallion with the Baptism for the nave. He has first divided his figures by conventionalised plants, which rise from the dark grass-green ground with spreading leaves, while above they go off into slender stems. Then he has given a striding action to the figures, and allowed their mantles to flutter out at the bottom behind them, while it falls in front from their outstretched arms. In this way a pyramidal shape is given to them which is still further marked by the excessive smallness of the heads, a characteristic feature of Byzantine art. A difficulty occurred when the two lines of six

came together at the back at the starting-point. It would have been awkward to show two figures turned back to back, and still more so to mark a division by an ornament where none was required by the subject. The designer has managed the point with admirable tact. We see that the three figures on each side who follow Peter and Paul respectively are shown as striding forwards in the way described, though with differences in their actions, but that the four who remain out of the twelve are arranged as follows:—Behind the striding figures on each side come two who are not moving in either direction, but stand facing the spectator with their crowns held in front of them. Then the last pair are seen to be gently moving apart in positions just between that of striding to each side and standing motionless in front view; one of them is even represented as looking back in order to reduce to a minimum the sense of a division or separation. In this way the eye is made to follow round the circle from Peter back to Paul without any sudden break or change of direction in the figures being at all noticeable. This piece of good judgment is one well worth noting. It may be compared with the arrangement of the Pan-Athenaic frieze on the Parthenon, where a similar division has to be made, and where the designer has made it occur at a corner instead of in the middle of a side. The background of the Apostles is a bright, clear blue, which occurs again but seldom in the Ravenna mosaics.

Below the Apostles comes another circle containing very curious designs, which seem to represent views of the section of a basilica of the time, in which we see the three aisles with their columns and their roofs, the altar, the thrones of the bishop and the emperor, with other objects which it would take too long to describe, but which are interesting to those who care to see an original contemporary picture of a fifth-century church. These architectural designs, which are separated by well-designed acanthus ornaments, complete the decoration of the cupola. In the upper row of arcades occur those decorations in stucco to which reference has been made. These, though of great archæological interest, do not come within our present subject, so we will pass to the lower row, on the arches of which mosaics again occur. The decoration here consists of single figures placed between the arches above the capitals of the columns from which they spring, and in graceful foliage ornament on a dark blue ground. The designer has got over the difficulty of starting his foliage by making it spring up out of a vase placed just above the capital of the column, from which it spreads itself on each side of the standing figure and terminates over the top of the arch in elaborate volutes.

The walls below the arches were once encrusted with coloured marbles which have now perished.

Let us now glance at the second of the monuments which illustrate this earliest period of the mosaics, the mausoleum of Galla Placidia. This is a small chapel, built so as to resemble a subterranean crypt. It has the form of a Latin cross, of which the arms are covered with tunnel vaulting, while the middle space is built up above the roofs of these, and is finally crowned by a cupola. The dimensions are only 46 feet in length by 39 for the length of the transepts. The interior is dark, and the massive walls give the impression of a solemn chamber of death. The adornment is, however, cheerful and of the most sumptuous kind. The floor is paved with costly marbles in geometrical patterns, and the walls to the height of the shoulder had originally the same decoration, which has now disappeared. The whole surface of the interior, besides, is clothed with mosaics, which vie with, if they do not surpass in excellence, those of the Catholic Baptistry. The ground is everywhere of a deep indigo blue, which is relieved on the vaulting by golden rosettes, and on the cupola by multitudes of stars. Bands of ornament, of the most surprising richness in design and colour, follow the architectural lines of the vaulting. Conspicuous among these are some compact wreaths of fruit and flowers, in which no pains have been spared to reproduce the most intense hues of the pomegranate and other fruits; while the taste of the artist, aided by an immense assortment of greens of every hue, has known how to keep the whole in perfect harmony. It will be noted that the wreaths spring from vases and baskets, which gives them at once the *raison d'être* which the mosaic-worker of the best time was careful to obtain for his decorative forms. Borders of scroll-work are also much favoured, and here we cannot but admire the patience and skill of the designer, who has drawn and coloured with absolute accuracy these twisted scrolls. Not only are the lines correct, but the shading and the colours, even down to the reflected lights, which can be seen in their proper places on the edges of the rounds as they turn over.

At the summit of the dome we see a golden cross surrounded by the familiar symbols of the Evangelists. Standing figures of the Apostles occupy places below, and the decoration of the central space is completed by the well-known classical device of the doves perched on the edge of a vase of water, which had become the Christian symbol of the soul drinking from the living fountain.

The most important mosaics in the chapel are, however, those at the two extremities of the nave. In the lunette over the door of entrance we have the finest single picture in the whole cycle of the Ravenna mosaics. The subject represented is one familiar in the art of the catacombs, *The Good Shepherd in the midst of his Flock*, symbolising Christ and his care for his Church. The treat-

\* Paper read at a meeting of the Edinburgh Architectural Association on November 22, 1882.

ment is, however, of another kind. In the catacombs the figure is that of a simple shepherd of the day, standing clad in the short tunic and the leg bandages of the common folk; a lamb was commonly borne upon his shoulders, and the shepherd's crook or the pastoral pipe completed his attire. Here, on the contrary, we have a monumental figure of classical dignity and beauty, in golden tunic and cloak of purple, seated in a green meadow with his sheep about him. A golden nimbus round his head and a cross of gold in his left hand stamp him at once as something different from the earlier time. The action of the left arm upon the cross, the pose of the head, have something lordly about them; while in the gesture with which the right hand is brought across the body to caress the sheep by his knee, as well as in the position of the feet, we see the deliberate choice of a pose for artistic effect by a designer who thoroughly understood the human form.

Early Christian sentiment has given here the subject, but Byzantine art feeling has taken it up into the region of the imposing and the grand. It has been well said that this composition is the most perfect achievement in the range of early Christian painting. The splendour of the colours joined with the elevation of the design gives at once the impression of a visionary appearance, while at the same time the character of an idyllic scene is not broken with.

A curious picture faces this upon the opposite wall. In a lunette of a similar size, broken into, however, by a window, we see in the midst on the ground an iron frame like a gridiron, under which flames are fiercely playing. To the left of this stands a cupboard or case, with three books in it marked by inscribed letters, as the Gospels of Luke, Matthew, and John. To the right hand of it we see a draped male figure striding forwards with vigorous action towards the fire, with an open book in his left hand, and in his right a cross. This last, and the nimbus round his head, seem to suggest that the figure is that of Christ, and he has been supposed to have in his hand the writings of some heretic that he is about to cast into the flames. A recent writer has, however, urged that we have here a figure of St. Laurence, the famous martyr, who is marching to his death as to a triumph, armed with a book of the Scriptures. If this be accepted, we have an interesting instance of the spirit in which such a subject is dealt with by the artists of this time. The humiliation and suffering are not thought of, and we only see an heroic figure sweeping on to assured victory. In any case, however, whatever be the interpretation, the figure itself remains to us, and we have in it one of the finest in the art of this period. The swing of the movement seems irresistible. The countenance is stern in its resolution, the drapery simply cast and showing well the action of the limbs, while the fluttering end adds to the impression of movement.

Glancing now again at these two sets of mosaics, we are struck by their pictorial merit in drawing, colour, and composition. The flesh tones especially are to be commended for their variety and fine gradations from high light to local colour, and then through greys to warm-tinted shadows. The actions are well studied, and the arrangement of the work well thought out. There is no blundering or patchwork. The artist has his problem clearly before his mind, and solves it by the most direct method. The actual colours employed are rich and varied; the dark blue of the grounds very deep and forcible and throwing up finely the red, orange, yellow, russet, and grey of the flesh tints, as well as the darkly-gleaming gold of the nimbi and accessories. The draperies are often white, but purple and gold also occur. The greens of the foliage and the jewel-like brilliancy of the flowers and fruits are pleasing in themselves and beautifully harmonised. Lastly, over all is that air of dignity and repose which is the special characteristic of this particular artistic epoch.

In going on now to the mosaics of the other periods into which the art history of Ravenna has been divided, we shall leave something behind us which we shall not find again. In drawing and composition hardly any of the other mosaics are equal to those just described. The power of giving monumental dignity without stiffness, and of repeating fixed types without their becoming conventional, belonged to the artists of the first and best time far more than to their successors; though in colour and in decorative richness of effect some of the later ones, notably those in S. Vitale, quite hold their own, and even in some respects surpass the severer works of the days of Galla Placidia.

Passing now to the period of Theodoric, we may omit from consideration the mosaics in what is called the Arian Baptistry, for these are similar in subject to those in S. Giovanni in Fonte, with certain differences of arrangement which need not concern us here. They are also very much restored, and were originally of far inferior artistic quality, and the general effect is very poor when they are brought into comparison with the similar works of the older age.

The mosaics, on the other hand, which we find in S. Apollinare Nuovo are of the highest interest, and are of special value as being unique examples of the complete decoration of the walls of the nave of a great basilica with mosaics. Unfortunately the decorations of the triumphal arch and apse have perished, or the church would be a still more valuable monument. As it is we find three courses of mosaics on the upper walls of the nave—the two upper ones dating from the building of the church, about 504, and

the lowest having been added about sixty years later. Highest of all, just under the roof, we have a most interesting series of mosaic pictures from the life of Christ, which are among the earliest existing works of a similar kind. The pictures on the north side of the nave depict the miracles and discourses of Christ, while those on the south exhibit scenes from His passion. True to the character of the art of the time, these pictures aim more at the representation of Christ as a majestic personage than at exciting dramatic interest in his doings. In the miracle scenes the figure of our Lord always faces the spectator, and His glance is always directed out of the picture, so that it meets the eye of the beholder. The action that is going on does not seem to have his attention, and an attendant figure of a disciple is always introduced to explain by his gestures what it is that is being done. A similar effort to represent Christ always as a figure of monumental dignity is seen in the scenes of the passion, where he is always a head taller than the other figures, and looks like a being of a superior race who is mingling with smaller and weaker men. He is depicted as of mature age, with long blonde hair and beard; and as he stands before Pilate, or moves nobly along the path to Golgotha, we seem to see the figure of some demigod of Gothic tradition, with the melancholy and at the same time the grandeur of the northern hero in his countenance and bearing.

Below these historical pictures we come to a row of saints, fifteen on each side, who stand between the windows of the upper walls of the nave. These are some of the finest figures in Ravenna for that monumental character which is so constant a quality in the mosaics. They are of heroic size, and stand facing the spectator, clad in white drapery and holding in their hands books and scrolls. They are forms of energy and power, with much variety in types of countenance, firmness of pose, and truth of action. The drapery is simply and naturally cast. There is here no falling off from the style of the best period, and these figures even surpass those of the Apostles in the Baptistry, through their greater comeliness of face. To see examples of the decline of the mosaic art at Ravenna we have only to turn to the lowest course of mosaics, just above the arches of the nave, which are, as has been said, of later date. The time that had elapsed between these two portions of the work had brought with it the change from the simple and monumental to the stiff and monotonous. These figures in the lowest course represent on the one side a procession of six-and-twenty male saints, who are advancing from the palace at Ravenna towards a figure of Christ enthroned between two pairs of angels at the east end of the wall, at whose feet they are about to lay down the crowns which they are bearing in their hands. On the other side, a like company of female saints is advancing towards the Madonna, who is similarly enthroned amidst angels. The figures of these ladies, though formal and monotonous, show some effort after grace and some variety in the types of face, while their dresses blaze with gold and jewels; but the male saints opposite are stiff and uninteresting to the last degree. Variations in type and action, where they occur, are on a stereotyped plan, and repeat themselves again and again along the row. The faces are hard and expressionless, the draperies are angular and liney, and show no attempt to indicate the form beneath. A comparison of these wooden representations with the lifelike forms above shows how easy it was for the art of the mosaic designer to degenerate, and what real artistic power was required to preserve monumental dignity without formality and stiffness.

The difference in this respect between the best works at Ravenna and those executed when the art had begun to decline is immense, and no one can judge of the capacity of the early mosaic workers to do really painterlike and artistic work without a study of the remains of the best time. It is necessary to point this out because the best known of the Ravenna mosaics, the two ceremonial pictures of the Emperor Justinian and his consort in S. Vitale, are entirely destitute of the qualities which give their excellence to the earlier pictures. The mosaics in S. Vitale, which only cover a small portion of that beautiful edifice, belong to the third period, that of the conquest and rule of the officers of Justinian. The pictures just mentioned are very familiar through engravings and photographs, and must have disappointed many who sought to find in them an example of the best that the Ravenna artists had to show. As a fact, they are of the stiff and formal kind, much more in the style of the procession in St. Apollinare Nuovo than of the pictures in the baptistry or mausoleum.

The other mosaics in San Vitale are specially interesting as introducing us to a somewhat new style of work. The altar stands in a square space apart, with a vaulted roof, which, with the two walls, is covered with mosaics. On the walls are some scenes from the Old Testament: on the one side the sacrifices of Abel and Melchisedec; and on the other Abraham entertaining the angels, and the sacrifice of Isaac. Higher up on the walls are seen Moses at the burning bush, and the receiving of the law. In all these scenes there is a considerable use of landscape, and attempts at perspective of the most extraordinary kind. Some of the figures are good, and show study of the antique, notably that of Moses loosening his sandal, but as a rule they are stiff and uninteresting. So unlike in character are these scenes to the simpler designs which are the rule in these mosaics, that it has been suggested that they are copies from some large historical series exhibited

elsewhere. On the whole these works do not make a satisfactory impression on the eye, but all the stronger for this is the pleasure with which we look up at the vaulting overhead. Here we have in the centre a medallion with the Lamb of the Apocalypse, which is upheld by four angels in the four fields of the vaulting. The action of these figures is exceedingly fine, and their drapery is so cast as to avoid giving the appearance which we notice in similar figures elsewhere, that the clothes are all hunched up by the uplifted arms. The forms of angels often appear in this style of work, to which they are exactly suited, and these are perhaps the finest specimens that we can point to. But the chief interest of this vault is the wonderfully rich ornamentation with which the whole of the rest of it is covered, and which, for delicacy and splendour combined, cannot be paralleled in these mosaics, nor, indeed, surpassed by any decorative work in the world. From the four corners of the base of the vault bands of fruit and flowers run up to the centre, where they unite with a similar band that encircles the medallion of the Lamb. Peacocks, with extended tails, stand in front of them at the base; birds are to be seen among the bunches of fruit and flowers. Brilliant but harmonious colours of the utmost variety are employed to give to the wreaths and birds the utmost gorgeousness of effect. The triangular fields, in the midst of which are azure spheres supporting the angles, are filled with foliage curling in scroll-like flourishes and volutes over the whole, and bearing at intervals pomegranates, apples, and pears. In two of the fields the ground is golden, and the scrolls of foliage blue-green; in the other two we see purple scrolls outlined with gold upon a ground of green. Birds and beasts of every kind are introduced amidst the foliage. An owl glares out at us with bright round eyes; an excellent stork, with a worm in its mouth, stands below; two peacocks peck at the fruit which has fallen down upon the grass-green ground. Above, we see leopards, deer, fishes, rabbits, and other animals rendered in the most natural way. A stork fishing in pool with a frog is a motive which occurs on the wall underneath. Everywhere we see evidence of the artist's love of nature in her lower aspects, and of his graceful fancy; while the taste which guided the selection and arrangement of the colours is beyond all praise. This is the most perfect development of that style of decoration which we found already in the lower mosaics of the Catholic baptistry.

The rest of the Ravenna mosaics need not detain us. Those in the archbishop's chapel are of various dates and minor importance. There remains St. Apollinare in Classe. The apse and triumphal arch contain mosaics of a somewhat miscellaneous character, and of different dates. The most effective object is a jewelled cross upon a blue ground of most brilliant hue, high up in the semi-dome of the apse. There we see the "one cross" exposed in the sanctuary which was recommended by St. Nilus as the fitting decoration for a Christian church.

A single remark suggests itself in conclusion. Everyone must be struck in considering these mosaics with the exact fitness of the material employed for producing the effects aimed at in the finer examples. A design, which is laboriously marked out on a wall by small coloured cubes of hard material fixed in cement, looks best when it is simple and large. There seems to be something out of character with the mosaic style in the attempt to represent distances of landscape, and all the accessories of a picture. The Old Testament scenes in San Vitale seem to originally belong to another style of work altogether, and to put the mosaic worker to a task not suited to his art. We might even find the same unsuitability to the mosaic style in the pecking-birds and the over-elaborate devices in the vaulting at S. Vitale. The taste displayed in the work is so fine that it seems impossible to criticise it as it stands, but the simpler forms of the wreaths of foliage and fruit, relieved in jewel-like brilliancy from the golden or dark blue ground, seem to suit the material better. The mosaic technique carries with it the notion of laborious application in the execution, and of a durability which is only to be measured by that of the walls themselves, and with these ideas nothing agrees so well as the statuesque monumental forms which are most favoured by the artists of the best period of the craft. Varieties of hue, broken colour, and all the painterlike effects of flesh tone and hair, can, as we have seen, be rendered with admirable success; but it may be doubted whether, when the mosaic worker goes beyond his few simple forms and his single plane, he is not stepping outside the limits of his art.

**Oswestry.**—The foundation-stone of a chapel for the workhouse has been laid. The style is late Perpendicular, the materials being brick and stone from Shelvock quarries. Mr. S. Pountney Smith, of Shrewsbury, is the architect, and Mr. J. Gethin the builder, whose contract for the superstructure is about 1,600*l*. Accommodation will be afforded for 250 persons.

**Kerry.**—A contract for the restoration of the parish church of Kerry, Montgomeryshire, according to the plans of the late Mr. G. E. Street, R.A., has been taken by Mr. E. Davies, of Newtown. The Norman and fourteenth-century arcade and the tower are to remain, and as nearly as is practicable the principal features of the old building will be reproduced. The restoration will be carried out by Mr. A. E. Street, M.A.

## THE ROYAL SOCIETY OF EDINBURGH.

THE first ordinary meeting of the session 1882-83 of the Royal Society was held on Monday—Lord Moncreiff presiding. The President said that, before the business commenced, he ought to call attention to a peculiarity of the present meeting, and to make one or two observations upon it; and that was, that this was the hundredth session of the Royal Society. Most cordially did he congratulate the Society and its members on having arrived at that distinguished period of its history. But it was right he should say that it would be a mistake to suppose that, although this was the hundredth session, they were absolutely centenarian. This was not the anniversary of the birth of the Royal Society. For some reason or other—he did not know how—the hundredth session began before the Society was absolutely a hundred years old. How it exactly came about he was not quite sure. The Royal Society's charter bore date March 1783; and he supposed, like other great institutions, they had an autumn session, and in that way, possibly, the difference was to be accounted for. But if it had been the real date, he need not say that a greater occasion for meditation and observation could not possibly exist. There might be a time for such a word, but on the present occasion he had not the material sufficient to do anything like justice to a theme so large as that. Only in a few sentences would he go back to March 1783, and look back upon the long course that the Society had run—a long and distinguished course, he thought they might all of them say, seeing it was to their distinguished predecessors they owed its glory and its present existence. There had been many speculations as to where the Royal Society came from, and, like a great and spreading organism, its feelers had been examined and searched for with great assiduity. There was a Rankinian Club in Edinburgh towards the beginning of last century, and it was claimed as the foundation of the Royal Society. Then there was a Select Society, a debating club—he thought it was somewhere about 1750—where Dr. Robertson and the great men of those days practised the oratory which they afterwards used with such effect; and they had been told that that to a large extent was the origin of the Royal Society. He had looked into the appendix of Dugald Stewart's Life of Robertson, and there he found a list of members of the Select Society—and undoubtedly it contained, he should say, many if not all of the names of the great men who were alive in 1783 among its members. The only distinctive thing he could gather from the notice was that Adam Smith and David Hume were both members of it, and that neither one nor the other ever opened their lips in the Society during the time they were members of it. But he rather thought the third had more claim, and that was the Philosophical Society founded by Colin Maclaurin, the great mathematician. Undoubtedly it did survive till the period when the Royal Society was formed. Colin Maclaurin, unfortunately for himself, was the engineer employed to defend Edinburgh at the time of the advance of the Pretender in 1745, and he had to leave Edinburgh. Observations had sometimes been made as if Maclaurin had made a somewhat precipitate retreat on that occasion, but the real fact was, he was the last man left there, for he found after all the fortifications were complete that there was nobody to man them, and no army to help in the defence; and it was to be feared he was not the only man who had to retreat, for he rather thought the Court of Session also took that course, and before the Pretender arrived the Judges had departed from their seats. He thought that, however, was the fair parentage of the Royal Society. In 1783 these streams all seemed to meet, and this institution was the result. They had originally a literary side and a physical or mathematical side. At the very first start they had 104 members on the physical side, and 114 on the literary side. He was looking back to an address by his much-valued and lamented friend, Professor Forbes, which was delivered in 1862, and he would go over a few names given there as belonging to the physical class and the literary class, and they would probably agree with him—there were many more who might go alongside of them—that it would be difficult to find in any part of Britain, or in any country out of Britain, an assemblage of persons more distinguished in their respective spheres. The physical side embraced Joseph Black, Clerk of Eldin, Lord Hailes, James Gregory, James Hutton, John Playfair, Dugald Stewart, Lord Bute, Lord Dundonald, Sir James Hall, James Watt, Dr. Small (Dundee), and Patrick Wilson. And on the literary side there were the Lord President, Chief Baron, the Lord Advocate, John Home, David Hume, Henry Mackenzie, Alex. Tytler, the Duke of Buccleuch, Archibald Alison, Dr. Beattie, Edmund Burke, Lord Morton, Lord Hopetoun, John Hunter, Thomas Reid Young of Glasgow, and Mr. Liston. That was a nucleus for a great Society; and certainly from that time forward it grew and prospered until to be a Fellow of the Royal Society of Edinburgh became one of the highest distinctions a man could aspire to. Now, it appeared, they had lasted for 100 years. Whether they all of them would come up to the mark of the great men whose names he had read he did not know. For one thing, we knew many men they did not know, although they possibly knew a great many that we did not know; but during the time that the Society had lasted, from 1783 till now, it was a wonderful retrospect in point of knowledge and

invention and progress—very much owing, to a large extent, to the labours of the very men whose names he had just mentioned. The literary class was presided over by Sir Thomas Miller of Barskimming, who held the office of Lord Justice-Clerk, the office the speaker had the honour to hold. He was a man of very great powers—a great lawyer and a man of very strong literary tastes. But he did not know that the literary class had quite made the progress they might have looked for during that time. It did last about twenty years with great vigour. He had the curiosity to see what the subjects were that were treated of. There were some very vigorous papers indeed, and among them he found a dissertation by John Maclaurin, the son of the mathematician, the object of which was to prove that Troy was not taken by the Greeks after all; and he sought to prove that with an amount of learning perfectly amazing. Perhaps he might be excused if he suggested that possibly some improvement might be made if in this respect also they followed in the footsteps of their predecessors. These observations he concluded by wishing the Royal Society all prosperity in the next 100 years.

### THE CHARING CROSS IMPROVEMENT SCHEME.

AN article entitled "How our Public Improvements are Carried Out," by Mr. H. H. Statham, is printed in the *Fortnightly Review* for December. The writer criticises the plan for the improvement of Hyde Park Corner, and objects to it as being "clumsy and inartistic to a degree"; and he says it "shows no higher sense of effect than we are accustomed to find in the ordinary type of plan drawn up in the office of an estate-agent." But this plan is being carried out; other improvements are only proposed, and objection is raised in order that they may be reconsidered. The first is at Charing Cross. Mr. Statham says:—

Let us turn now to the larger and most important of the impending schemes of improvement—that for the building of new Admiralty and War Offices, the suggested block plan for which has been for some time known to architects and those specially interested in the subject, and has been published by the First Commissioner in his article in a contemporary periodical. The history of the scheme for the rebuilding of these offices affords the most striking example of the unsatisfactory and unbusiness-like working of our Government machinery in dealing with these matters. The operation has been under discussion for more than a quarter of a century. Commissioner after Commissioner has had his schemes; committee after committee has sat, talked, proposed, and done nothing; and the affair now culminates in a feeble makeshift "economy" plan, the economics of which have been rendered necessary chiefly by the continual procrastination of any settled scheme for purchasing land and compiling the plan and design of the buildings. By far the best, finest, and most convenient site that has been proposed for the desired structures is that on the north side of Great George Street, parallel with the block of the India and Foreign Offices, and running up to Parliament Street, the present western boundary of which street, at that point, would of course have been set back so as to widen it, and carry out in this way a much-needed and long-promised improvement. Probably at the time when the idea was first mooted, the Great George Street site might have been acquired for half a million; now it is said to be worth more than twice that, and is to be abandoned from motives of economy, after nearly a quarter of a million has, however, been expended in a bit-by-bit tentative acquirement of property on the site, which, for any immediate purpose to which the Government can put it, seems to be now practically money thrown away. The present writer does not claim to be a financier, but it seems patent enough to any one that if there had been a permanent administration, combining the best surveying and architectural ability available, to look after these matters, instead of their being left to be the plaything of a succession of First Commissioners of Works, money and a fine architectural opportunity would have been saved. The Great George Street site would combine the public offices in one great group near the centre of Government, and would give the hint for a rebuilding of the south side also of Great George Street at no very distant date, thus furnishing a fine architectural climax to the boulevard of Birdcage Walk, and a noble approach to the Houses of Parliament from that quarter, the mean aspect of which at present contrasts sadly with the great towered building beyond.

The new scheme consists in squeezing in the new offices between the Horse Guards and Messrs. Cocks & Biddulph's Bank, projecting backward over a considerable portion of Spring Gardens, in such a way that the Whitehall elevation and the Park elevations must appear almost as different buildings, and no unity of architectural effect can be realised. Here again we see the result of the utter want of continuity in what may be called building politics. Had this scheme been contemplated for any length of time, it should have been the bounden duty of some one to negotiate for the sites of the Messrs. Drummond's and Messrs. Cocks & Biddulph's banks before they were built; the existing houses between them could then have been easily acquired at no exorbitant price. But now the banks in question are built, and the cost of disestablishing them

would be very great; though some of us may think that it would be worth while to pay a good deal merely to clear so poor and commonplace a building as the former off a fine site which it completely spoils. Had the whole frontage been secured, there would have been the opportunity of producing a fine mass of buildings in the new work, and of so arranging them as to run the line of the Mall through into Charing Cross, thus securing a beautiful effect as well as a much-needed new route.

The First Commissioner, however, tells us we need not mind that, as he can provide a road into the Mall by Drummond's Bank, with room for two carriages to pass; and, if we have a cab-route, what can we wish for more? Let architectural effect go; we need not trouble about that, for are we not going to save money? That is the whole of the argument that can be urged in favour of the new site; it is economical. Even if the banks were bought, however, and the entire site and its possibilities secured, it would not be such a desirable one as Great George Street on architectural grounds. It would involve the removal of the old Admiralty and its adjuncts, which are really of some interest in their way, more so than anything in Great George Street (except one or two of the old houses west of Delahay Street), and the new building and the Horse Guards would materially injure each other. Far better, on architectural grounds, to group all the new office buildings together, and unquestionably better on practical grounds; and it may still appear that the wiser economy will be to purchase the Great George Street site, and note down the increased price at the present day as one of those pieces of experience for which we all have to pay heavily. One of the practical objections which is urged against the site, that the street is largely occupied by the offices of professional men who are under the necessity of being near the Houses of Parliament, may easily be dismissed. As soon as it was known that this site would be used, new and superior offices would certainly be built on every available plot in the neighbourhood; the demand in such a case is always met by a supply. It is worth note that the block plan of the new buildings shows them arranged around quadrangles: this is one of the least sanitary principles of arranging large buildings, especially where their height must be considerable, unless the quadrangles are very large; even then the re-entering angles are apt to become receptacles of stagnant air. Wherever the buildings are ultimately erected, this should be reconsidered.\*

### ILLEGALITY OF CHANCEL GATES.

AN application was made at the Manchester Consistory Court on the 1st inst., by the Rector of St. Gabriel's, Hulme, for powers to erect a low stone wall and iron gates across the entrance to the chancel, to place the pulpit in a different position to that originally intended, and to alter the arrangement of the seats. No private rights were affected, and the parishioners by resolution had assented to the works. The estimated cost was about 120*l.*, to be defrayed by private donation. Mr. Christie, Chancellor, said the alterations which were proposed appeared to be very proper, excepting in one particular, and that was as regarded the erection of iron gates across the entrance to the chancel. He had on two previous occasions decreed the granting of a faculty for the erection of gates across a chancel, and he might say that he had no personal objection to gates, and if it were a matter in his discretion, or in the discretion of the Court, he would have no hesitation in granting it. But since the last faculty was granted his attention had been called to a decision of Lord Penzance, which decided clearly and distinctly that gates were illegal, and that faculties could not be granted for the purpose of their erection. The decision was in the case of *Bradford v. Fry*, reported in Law Reports, Probate Division, vol. iv. p. 93. There had been a decision, and there were some words used by Dr. Lushington, in the case of *Westerton v. Liddell*, which were an expression of disapproval of gates, but they had not impressed him with the idea that they amounted to a positive refusal to grant. He thought they were an expression of opinion which had reference to that particular case, and were not of general application. The Chancellor of the London Diocese, Dr. Tristram, in two cases—that of St. Augustine, Haggerston, and in the case of the parish of the Annunciation, Chislehurst—held that he was bound by the words of Dr. Lushington in the case of *Westerton v. Liddell*, and that he could not grant a faculty for the erection of the gates. Then there came this other recent case before Lord Penzance of *Bradford v. Fry*, where there had been erected, without a faculty, a screen and chancel gates, with other alterations, and the application was that they should be taken down. Upon that coming before Dr. Roberts, Chancellor of the Diocese of Rochester, he ordered the whole of the articles to be taken down and removed, on the ground that they had been erected without a faculty, and that no faculty had been applied

\* In cases where a quadrangle seems the only means for securing the necessary accommodation, it might be worth while to try the effect of placing the main staircases in the angles, leaving them partially open for a through current of air. This might be made to realise a new and picturesque effect, arising out of strictly practical requirements, which is just what we want to see more of in modern architecture.

for their confirmation. There was an appeal to Lord Penzance, and he decided that he could grant a confirmatory faculty for everything except the gates of the screen, and those he ordered to be taken down. He (Chancellor Christie) would not make a decree now, but if the parties desired he would adjourn the matter in order that they might consider it. Having regard to the decisions given, he was satisfied that it was not within his power or the power of the Court to grant a faculty for the purpose of erecting gates. It was clear that that Court was absolutely bound by the decision of Lord Penzance, who was not merely Dean of Arches, but was now Judge of the Court of Appeal at York, and his position was therefore stronger, although one would have always felt bound by appeal to the Court of Arches. He would, consequently, either as they might find the most convenient and preferable course, simply refuse the faculty, and as to that point they could appeal, and in regard to which, if they wished the matter argued in the Court of Arches, he would give every facility. He should refuse it, not on the ground that the erection of gates was in his mind inexpedient, but because he was simply bound in the matter. In the other case he would adjourn it until the next Court, so that they might consider whether they would like to take a faculty without the gates.—The Rector of the church (the Rev. W. Milner) said he could say nothing about it himself, but the gentleman who was doing the work felt very strongly with regard to the gates, and he was afraid if they were not allowed the whole thing would fall to the ground. He (the Rector) might point out that there were gates at the cathedral, and they had been told to make the cathedral their model.—The Chancellor said he had no personal feeling in the matter, but he was not aware that anyone was ever told to make any ornament or structure in the cathedral his model. After further conversation, the Rector and the parishioner who had undertaken the work, who was present, asked leave to retire, and ultimately they stated that they would accept a decree without the permission to erect the proposed gates. The parishioner said he wished to be allowed to express his deep regret that the Chancellor had not power to grant the application in its entirety. The decree was granted accordingly.

#### THE LEEDS ARCHITECTURAL SOCIETY.

THIS Society has entered its new rooms over the Liverpool and London and Globe Insurance Offices in Albion Street, which have been adapted to meet its requirements. On Monday evening a large number of the members assembled to hear an address by Mr. Edward R. Robson, F.S.A., architect to the London School Board, on "The Foundations of Art in Architecture." The President of the Society, Mr. James B. Fraser, F.R.I.B.A., occupied the chair. Mr. Robson deprecated the practice of copying, so prevalent at the present day. An architect wishing to be a true artist would endeavour to put some originality into his design. The young men in the profession should be carefully taught the proper use of every material with which they had to deal, as well as the science of construction. They should also be urged to cultivate an eye for colour. It was to be hoped that architects in the future, instead of copying old styles, would seek to establish a school of English architecture which would embrace all that was good in the old styles. He urged the importance of good form, proportion, and colour. Truth, intention, and rigidity were also of great moment. Truth was as essential to good architecture as to moral character in man; it lay at the foundation of all things in architectural art. As to intention, the absence of it was the cause of so much bad architecture. "Rigidity" was used to express a particular aesthetic quality or value opposed to easy softness, incoherence, or languid beauty, and having for result the stamping of the work with vigorous character. We recognised it in fine sculpture constantly, especially where it suggested imminent or actual action of the figures. Mr. Robson exhibited a large collection of beautiful photographs of early Italian architecture. A discussion on the subject followed, and at the close a vote of thanks was accorded to Mr. Robson, on the motion of Mr. J. W. Cannon, seconded by Mr. Thomas Ambler.

#### BIRMINGHAM ARCHITECTURAL ASSOCIATION.

LARGELY attended meeting of this Association was held at Queen's College on Tuesday evening last, the chair being occupied by the president, Mr. J. J. Bateman. Eleven gentlemen were proposed as new members, after which the vice-president, Mr. W. H. Kendrick, delivered an address. A discussion followed, in the course of which a vote of thanks to Mr. Kendrick was proposed by Mr. F. E. F. Bailey, seconded by Mr. W. G. Mantle, supported by Messrs. Norman Gething, Fred. G. Hughes, J. Wood, and the honorary secretary, Mr. F. W. Franklin Cross, and carried unanimously. The president, in putting the vote of thanks, touchingly alluded to the great loss the profession and the country at large had sustained by the death of George Edmund Street, whose monument, the New Palace of Justice, was opened on Monday last by the Queen.

#### THE WATER-COLOUR SOCIETIES.

THE following letter was addressed to the *Times* by the authorities of the Institute of Painters in Water Colours:—

The Council of the Institute of Painters in Water Colours have had their attention drawn to the able article in the *Times* of November 25, in which, while commenting on the honour which her Majesty has graciously conferred on the art of water-colour painting, you advocate the union of two societies representing that branch of art, and the establishment of an exhibition open to all water-colour painters.

They gladly welcome your powerful advocacy of a scheme which has long been a cherished project of theirs, and beg to thank you for your recognition of the Institute as a co-equal representative with the Royal Water-Colour Society of water-colour art. But they desire to point out that the responsibility for the present division which you justly deprecate does not rest with them, though one sentence of your article seems to imply it.

The foundation of the Institute fifty-one years ago was not the result of a "schism" in the older society. It was the only resource of men who had no place in that society, and had no other means of bringing their works before the public than by organising a separate exhibition. How little the Institute deserves the blame of the existing disunion may be gathered from the following facts:—

About two years ago the Institute, after long negotiation, secured a site in Piccadilly suitable in every way for the erection of galleries, which from their size and position would be well adapted for a representative exhibition of water-colour art, and as soon as the lease was in their possession made overtures to the then "Society of Painters in Water Colours" for an amalgamation. In these communications the advantages that would accrue from the union of the two bodies were set forth. It was pointed out that, commanding, as they would then, the confidence of all the artists in the country, they would be able to gather under one roof such a collection of water-colour paintings as would show the capabilities of which the art was possessed.

The first advance on the part of the Institute was met by a refusal, but after an interval the Institute renewed the negotiations, and in the course of them met in every possible way the difficulties that were raised by the other Society.

In favour of their proposals they urged that an opportunity not likely to recur was offered of putting an end to a division which you rightly describe as detrimental to their art, and suggested that if this fusion of the two societies took place the society so formed might receive a royal charter and diploma, and would then stand in the same relation to water-colour artists as that held by the Royal Academy to painters in oil.

Though many of the members of the Royal Water-Colour Society expressed themselves in favour of the scheme, the majority were satisfied with things as they were, and the negotiations closed.

Thenceforward nothing remained for the Institute but to carry out the plan they had formed for an open exhibition unaided by the Royal Society.

The relative position of the two societies may be described in a few words. The honours go to the Royal Society of Painters in Water Colours; the duties which, as you point out, should accompany them, are left to be fulfilled by the Institute, which is shut out from any participation in those honours.

#### THE BISHOP OF PETERBOROUGH ON CHURCH BUILDING.

THE annual meeting of the Northampton Church Extension Society was held last week, under the presidency of the Bishop of Peterborough. His lordship said that he was strongly in favour of building for the necessities of the present with capacity for the needs of the future. If they built too small a church, they did not do the work which was necessary to be done, and if they built too large and ambitious a church they chilled and depressed the small congregation which gathered therein. He urged the necessity of avoiding running into debt and extravagance, and said they should be careful in their work of building new churches, for he could not help thinking there was room for economy in church building. He did not in the least deprecate any lavish expenditure where there was an abundance of money, but he reminded them they must cut their coat according to their cloth, and they must do as others did. If they could not pay 20s. in the pound they must pay 10s. or 2s. 6d., as the case may be. In increasing the number of new churches they must regard quantity first, and then quality; and he could not help thinking that the numerous church building societies would make more use of their funds if they offered a handsome premium for a design of a useful, handsome church, with no unnecessary or expensive front ornamentation. He did not know that Gothic was by any means the cheapest form of architecture, yet every architect seemed to think it must be Gothic.

The Rev. C. T. Gordon said that cheap churches might, he thought, be associated with cheap morality; and, in building costly churches, he felt they were not merely gratifying some passing

vanity, but were doing something for the glory of God. His experience had been short, but he knew of one church, the appearance of which, if not a disgrace to the See of Peterborough, was certainly not such as would inspire people with feelings of religious awe.

The Bishop of Peterborough said that when he expressed a hope that they would build cheap churches, he did not mean shabby ones. His idea was that in cases where they had not sufficient money to build the church complete they should do so by degrees. If, however, they had money enough to build a magnificent church, by all means let them do so; but he thought the parishioners would be better pleased if they began and built them a church at once rather than keep them waiting seven years for a magnificent edifice. He did not regret one shilling spent on a church for the honour of God or its adornment.

### SOCIETY OF ANTIQUARIES OF SCOTLAND.

THE annual general meeting of the Society was held on November 30. The Earl of Southesk was admitted without ballot, and eighteen candidates were admitted Fellows after a ballot. The vacancies in the list of office-bearers were supplied by the election of Dr. Arthur Mitchell as one of the vice-presidents, and Dr. Robert Munro, of Kilmarnock, and Mr. John J. Reid, advocate, as new members of Council. Sir J. Noel Paton and Mr. Francis Abbott were re-elected as the representatives of the Board of Trustees, and Messrs. Robert Hutchison and James Macdonald, W.S., were re-elected auditors. The Secretary read the names of five Fellows deceased during the year, and announced that the number of Fellows added during the year had been fifty-six. The annual report to the Board of Trustees showed that the number of visitors to the Museum during the year had been 99,676, and that 439 articles of antiquity and 2,936 coins and medals had been added by donations, and 6,230 articles of antiquity had been added by purchase throughout the year. The report also stated that in consequence of the increasing number of objects thus annually added by donation and purchase the space allotted to the Museum had become quite insufficient for their classification and exhibition. The Treasurer's statement of the funds of the Society was satisfactory, and it was resolved that an abstract of the accounts should be printed and circulated among the Fellows. The Secretary reported that the annual volume of the Society's Proceedings would shortly be issued, and that the first meeting for papers would be on the 11th inst.

### ARCHÆOLOGY IN BIRMINGHAM.

AT the first meeting of the Archaeological Section of the Birmingham and Midland Institute, which was held last week, the President, Mr. S. Timmins, in his opening address referred to the loss the section had sustained during the year by the deaths of the senior honorary secretary, Mr. Allen Everitt, and of Mr. Charles Bayley, of West Bromwich.

Mr. J. A. Cossins read a paper on the excursions of the past session. The buildings and other objects of interest referred to in the paper were illustrated by a large number of very beautiful drawings and sketches by Mr. Cotton, which were displayed on a screen in the room. Mr. Cossins, after enumerating the very great number of cathedrals, churches, castles, and other objects of interest visited during the past twelve years, remarked that the time and money thus spent should by this time have produced very marked results in extending a knowledge of archæology, and in cultivating a love for and, as naturally would follow, a desire to perpetuate and protect the antiquities we still possess, restorations notwithstanding; and reminded his audience that the Midland Institute was not founded to organise pleasant picnics, but to promote education. He remarked upon the large proportion of mediæval buildings visited, and said the builders of the Middle Ages, with an utter absence of self-consciousness, each one, by imitating what had gone before, and by endeavouring to improve features or intensify effects that had impressed him, added his item to the progress of his art. And thus the architecture of the Middle Ages, from the first rude imitations of Roman architecture, advanced gradually to its culmination in the thirteenth century, and as gradually declined to what is known as the Elizabethan style. After that came the revival of Classic art and literature, and architecture ceased to be a living art. The excursions of the last year were marked by one of an exceptional character—namely, a visit to Stonehenge. As the interest shown in that mysterious monument on the occasion was so great, a large part of the paper was occupied by a short abstract of what has been written on the subject from Geoffrey of Monmouth to Inigo Jones, and in modern times by Dr. Guest and Mr. Long. The conclusion Mr. Cossins had gleaned from the above writers was that Stonehenge consisted of two monuments—the oldest, of a vast antiquity, consisting of the inner circle of unhewn monoliths of syenite, and the inner oval of a similar character; the outer circle, of large hewn stones with lintots, and the vast trilithons of local sarsen stones were of much more recent date, probably added by the Belgæ. He thought

there could be but little doubt of its having been a temple devoted to sun worship. Mr. Cossins then gave a short account of each place visited on the first three excursions of the year, referring to the illustrated drawings; after which Mr. Cotton described the last excursion—that to Harvington and Norton.

The President then proposed a vote of thanks to Mr. Cossins and Mr. Cotton.

Mr. Cossins, in replying, again called upon the members to assist in spreading a love for our ancient buildings, and in combating the absurd notion that unfortunately prevailed, that an ancient work of architecture or painting could be in any way renewed when once destroyed. He also urged the claims of the Society for the Protection of Ancient Buildings.

### GENERAL.

**Messrs. Ashton & Green, Limited**, supplied and fixed the whole of the slates for the roofs of the new Law Courts. The slates are Ashton & Green's "Permanent Green," and their pleasing colour contrasts well with the masonry and enhances the effect of the building.

**Mr. J. A. Gatch**, of Kettering, lectured at that town last week on "Art in Costume," the proceeds of the lecture being intended for the benefit of the school building fund.

**Mr. Quarrier**, the founder of the Orphan Homes of Scotland, in the neighbourhood of Glasgow, has received a gift of 1,500*l.* to build an additional one at Bridge of Weir.

**The Pictures** sold in the Dudley Gallery during the eighteen years of its existence amount to 98,000*l.* Henceforth it is to be known as the "Dudley Gallery Art Society."

**A School of Art** is to be erected in Warrington according to plans which have been prepared by Mr. W. Owen.

**A Prize of Fifty Guineas** is offered by the Liverpool Corporation for the best design for a wholesale fish market, the design to become the property of the Corporation.

**The Aberdeen Town Council** have decided to proceed with a Bill for the improvement of the city at a cost of 216,000*l.*

**Messrs. W. B. Wilkinson & Co.**, of Newcastle-on-Tyne, granite concrete paviors and general workers in concrete, have taken offices at 77 Great George Street, Westminster, where samples of their work can be seen, and information respecting it will be given. The granite-faced flags and fibrous slab plastering are becoming as well known as the paving for which the firm has long had a reputation.

**A Collection of Cloisonné Vases** and other work has been purchased from Mr. F. Elkington for the Corporation Art Gallery, Birmingham.

**The Homerton Workhouse** is being painted throughout with the Albissima Sanitary Paint.

**Messrs. W. Oliver & Sons**, of Bunhill Row, have supplied nearly the whole of the seasoned wainscot oak used in the fittings, of the new Law Courts.

**Messrs. Lindsay & Co.**, of the Paddington Ironworks, will furnish the ironwork, consisting of columns, riveted girders, roofing, &c., for the Great Western Railway Company's new stables at Paddington and their stores at Didcot, altogether amounting to over 500 tons.

**The Stoke-on-Trent Board of Guardians** have decided on erecting a new hospital at the workhouse at an estimated cost of 13,000*l.*

**A Sketching Club**, formed in connection with the Hanley School of Art, held this week an exhibition of the work executed by the members during their holidays.

**A Statue of Robert Burns**, which Mr. J. G. Crawford, a retired Glasgow merchant resident in London, intends to erect on the Victoria Embankment, will be entrusted to Sir John Steel, R.S.A. The cost is estimated at about 2,000*l.*

**The Manchester City Council** on Wednesday, by a majority of forty-six votes to six, decided to support the proposed ship canal scheme.

**The Edinburgh Town Council** have adopted the following resolution:—"That it be remitted to the Lord Provost's Committee to consider and report as to the most appropriate manner of recording the sense which the Corporation and people of Edinburgh have of the services rendered to the city by Dr. Wm. Chambers, especially from the Improvement Act of 1866 and the restoration of St. Giles's Cathedral."

**The Third Annual Exhibition** of Painting and Etching on China, &c., was opened at Leamington on Friday in last week.

**A Crystal Palace** is to be constructed at Ilfracombe, and a company, it is said, has been formed for carrying the project into execution.

**The Liverpool City Council** have agreed to a recommendation that a grant of fifty guineas should be made to Mr. W. Goldstraw, chief assistant building surveyor, for services rendered out of office hours in drafting the engineering clauses of the Improvement Act, 1882.

# The Architect.

## ARCHITECTS' WORKING DRAWINGS.

R. SEDDON, in choosing a subject on which to discourse for an hour to the young men of his profession a fortnight ago, characteristically selected what he indicated, equally characteristically, by the title of "Sundry Working Drawings"; and, we need scarcely say, found therein abundant opportunity for expounding a good deal of interesting pre-

cept and example. Amongst other things, he necessarily took up the question how the working drawings of architectural work ought to be drawn so as best to suit their purpose—a point seldom treated of, but one of the greatest possible importance, to all who are beginning architectural professional life in these days, when draughtsmanship, more than it ever has been before, is an element of great power.

Without pausing to point out how far we are following Mr. SEDDON'S argument, and how far we are taking leave to supplement it, we may observe that the drawings which an architect makes of his designs are, in one sense, of two distinct classes. There are those by which he aims at the representation of what he calls "effect"; and there are those by which he defines, quite prosaically, the work of the workman. Properly speaking, the effect-drawings are for the whole outside world, and the work-drawings for the initiated few. The effect-drawings—or, as Mr. SEDDON seems to wish to call them, significantly enough, *sketches*—have for their purpose the indication, in language pictorial and attractive rather than strictly and technically true to fact, of what the result of the building is: professed to be; the work-drawings, on the contrary, are only meant for the application of the foot-rule of the artisans whose tools are to shape the materials to the production of that result. The one style of drawing is all consciousness, the other all unconsciousness; the one is open to the introduction of not a little poetry, the other is pure prose. The less poetry in the effect-drawing the better, some will say, and best when there is none at all; but that is perhaps matter for argument. At any rate, a still greater number will maintain that the utter absence of all sophistication in the work-drawing is a principle never to be compromised; and we may as well acknowledge nevertheless at once, with whatever amount of regret, that compromised it often is in these days, and to an extent as remarkable as the consequences of such licence are mischievous.

In so far as the general public have of necessity to be allowed, as paymasters, to determine the choice of an architectural design before execution, it is manifestly desirable that a drawing-language should be used of such a kind as to be understood by all. Speaking *ex cathedra*, we are bound to say that the general public have no right of choice whatever, simply because they do not possess the skill whereby to choose aright. A member of Parliament, that is to say, or a member of the committee of a public institution, has no more architectural understanding by virtue of his office than the servant who opens his door. Not only is the effect of advanced artistic composition beyond his criticism, but the very draughtsmanship by which it is represented is unintelligible speech. It is notorious that this is the case to a degree which it would be impolite to press. The story goes that when a certain sufficiently intelligent aboriginal African was first shown a photographic portrait, he had great difficulty in determining whether it was the end of a house or the sail of a ship. Much more so, when a sufficiently intelligent merchant or manufacturer of our own country has presented to him the design for a town-hall or a church, we may take it for certain that, but for ingenious drawing, he could not tell the head of it from the tail, and even at the best has but a very dreamy notion of what it all means. Hence, by the way, the reliance which such an adjudicator is always inclined to place upon a knowledge of who the author is, and the special confidence which he has in the work of a personal friend, or the friend of a friend. Few, if any, who are not specifically trained architects, are acquainted with even the alphabet of architectural drawing. But still, as we have already said, the purse-master

must be design-master whether we will or no; and thus arises the necessity for employing such a mode of representation beforehand as shall convey to the ordinary observer, if not a knowledge of the subject technically, at least some sort of impression that shall be favourable. Leaving plan out of the question as we are doing, as well as construction, and confining our attention to the artistic superficiality alone, we need scarcely remind the reader of the various fashions which, during the last half century, have prevailed in this art of pleasing, not to say this delusive sophistication. There was the back-lined elevation; a very flat and futile presentment. There was the elevation sciographical, shaded in Indian ink or sepia, and "washed over" in burnt sienna, with indigo for the window and door openings; a mode which was not by any means untrue to fact, although always vastly inferior in England to the exquisitely delicate French manner which is still practised, and which is a proof remaining in full force of the unexpected superiority of the elevation to the perspective. Then there was the showy perspective itself, coarsely shadowed in some neutral tint, but most effectively "got up" by such artists as ALLOM; passing eventually into bright blue skies and purple clouds, yellow stone and green slating, red window draperies and half-drawn blinds, horses and carriages, fine ladies and their parasols, gentlemen pointing their canes towards the house, children with hoops and pet dogs, and, oh, such lovely trees! This fascinating manner went out in a great measure with Mr. EDWARD BARRY, who employed the most excellent "artists." There was also a kindred but much less objectionable style of "tinted perspective," which sought an effect more truly architectural and less flagrantly pictorial, by means of sober and sketchy tertiary colours instead of vulgar primaries, and which, therefore, pleased the more refined eye, and no doubt inspired a certain visionary admiration of whatever might be serenely graceful in the architectural forms. More recently, however, all has been etching. The rivalry between the elevation and the perspective is still maintained, but in both the peculiar,—and, let us boldly say, frequently most entirely deceptive—effect of scratch-drawing (*sgrafito* on paper) is pursued with reckless daring in whatever direction the subject may suggest, although, we do not for a moment wish to deny, sometimes with an exquisite power of draughtsmanship which, the less it is architectural, is only the more charming. At any rate, we have suggested the very considerable variety of ways in which the architect's drawing for the uninformed has been done amongst us, and it is plain enough that the work-drawing is something of quite another character.

Now it is surely equally plain that the architect ought never to allow himself to design by means of any of the sophistications we have been speaking of. And yet it is notorious that even the working drawings, nay, even the details to a large scale, are by many draughtsmen got up in etching with a delusive vigour which, if it were possible to say such a thing, can only be really intended to impose upon the designer himself. Of course it is easy to "design in beauty," if the mere beauty of a scratch-drawing is to be accepted as the aim and end of the design. But such easy work is in fact but the easy descent to the Avernus of building-art, and when the building itself displays at last, in contrast with the facile dressiness produced by the goose-quill, a nakedness and rudeness which take a plain man's breath away, is it to be wondered at that architecture should be pronounced a fallacy, and the Inspired Mason invoked to lend a helping hand?

To put the case very mildly, we should like to be permitted to say that, whatever more or less deceptive draughtsmanship may have to be used to tickle the eyes of the mere purse-master, the architect, for his own work of designing, ought almost never to employ any other mode of representation than the plain and perfectly truthful linear elevation. If others do not understand that kind of drawing, he does. If others are deceived by sophistications, so will he be. Exceptions excepted, and as seldom as possible, the simple elevation, drawn in the strictest geometrical form and severity, may always be relied upon. Even the critic, if he understands his business, will always prefer this plain elevation to anything else.

Another good rule in making designs, whether for the general effect or for the detail of the composition, is to carry on simultaneously two renderings of the subject, one to the necessarily small scale of the "plans," and the other to a large scale, besides doing the mouldings at full size. That is to say, the *ensemble* ought to have side by side with it the detail, each to guide and check the proportions of the other. Where the

art of proportion is disregarded—and it is so just now a great deal too much, by reason chiefly of certain delusive effects of draughtsmanship in which distortion serves the same purpose—then this simple expedient may go far to expose the evil and provoke correction; but where the designer is carefully manipulating the graces of harmonious forms, as the true architect is doing every moment, then the process of double composition is of the utmost service to his effects. To design by means of a small scale drawing alone is always unsafe, even when the pencilling is the most minute; to do so with rough “masterly” lines is generally fatal. Designing on a large scale is more difficult to do; but for that very reason it is always less open to error.

The profession owes its thanks to Mr. SEDDON for taking up this subject, however incidentally, and we commend it to the thoughtful practical consideration of all designers who would have the work of the builder turn out as well as that of the draughtsman.

## THE “CERCLE ARTISTIQUE DE LA SEINE.”

BY A CORRESPONDENT.

A NEW ART CLUB, styled “Cercle Artistique de la Seine” (3 bis, Rue de la Chaussée-d’Antin) was founded last winter, at the instigation of the ex-Minister M. LEPÈRE, and it bids fair to prove as attractive as are its older rivals, the Cercle of La Place Vendôme and of the Rue St. Arnaud, better known as “le Merltons” and “la Crémérie.” The new club has already 460 members, and among them are many able artists. M. EUGÈNE FEYEN is the presiding genius. His *Repos des Maïssonneurs* and *Marée Basse* attracted attention at the last Salon. To his initiative it is due that an annual exhibition of the works of the club members has been held, to the exclusion of the paintings and sculpture of men not belonging to the Cercle. To the courtesy of the committee the public are indebted for admittance to the galleries, which occupy part of the series of reception-rooms on the first and second *étage* of the club-house. Unfortunately these rooms are not lighted from above, and in consequence the pictures are scarcely seen to advantage. However, they are hung with considerable judgment, and do not suffer from overcrowding.

A clever statuette in terra-cotta, by M. GUIBERT, occupies the centre of the first room. The subject is EVE gathering the forbidden fruit. Her figure is thrown back against the trunk of the tree, from an overhanging branch of which she plucks the apple. The pose of the figure is graceful, and the modelling of the limbs strikingly beautiful. We prefer *Eve* to M. GUIBERT’S *Punition*, typified by a lad who, with his right hand, strangles a cat, while he shows it the bird it has killed with his left. The attitude of the figure recalls that of the boy in FOCARDI’S popular group, whereas the treatment of *Eve* is original and has great charm. M. E. GUIBERT is a young artist of promise.

In the first room we find a work by T. RIBOT, with the usual strong contrast between light and dark shadow, which perhaps becomes somewhat monotonous in the works of this master. A sick girl listens while a veiled sister reads to her, a hooded figure is seated opposite to the child. The modelling of the heads is admirable, and the solidity of the fustian garments of the women is unquestionable, but the lovers of brilliant colour will fail to perceive why so much genius should exhaust itself in producing a picture in which, save a dull red on the binding of the book the child holds, there is not a tint save brown, dark olive, and dull grey. The intense gloom created by M. RIBOT’S brush is in opposition to the sunny light of M. RAFFAELI’S *Le Retour du Marché*. Having met a gentleman returning from market taking his ease on a hot summer’s day on the edge of a grassy bank, straightway the artist painted him and his basket of fresh vegetables in the foreground of a landscape, on which the light is seen falling softly, but it is not improved by the ungainly aspect of the figure.

From Holland we have an orchard, painted by M. VAN DAMME-SYLVA, entitled *Matinée dans les Polders*, which fresh morning a girl is enjoying, as she leans against a tree whose overhanging branches throw her figure into half-light; her blue apron, tied back over a gown of dark serge, assumes a grey tint. She leans on her rake and watches a couple of geese, separated from the orchard by a sunk fence fringed by reeds, now in flower and most delicately green. Farm buildings skirt

the orchard, built in a grey stone, against which the girl’s figure is well thrown out.

Mdlle. DESBORDES contributes a charming panel, intended for the decoration of a boudoir, wherein use has been made of the tall hollyhock, with its faint yellow blossoms, and the pale lilac blossoms of the mallow, whose blue-green leaves are boldly drawn and fill the foreground. M. MATHON’S *Verger à Honfleur* is suggestive of spring. The orchard, on the slope of a hill, promises a yield of fruit. Beyond stretches the bay, calm and blue, in the clear light of a spring morning. M. MATHON is a young artist, a pupil of M. DAUBIGNY, whose style he has successfully adopted.

M. L. SERGENT’S sketches of mounted and dismounted Arabs are equally masterly. Near them is a charming and amusing scene, characteristic of the veteran M. MONGINOT, and, as usual, fascinating from its harmony of tone. The door of a cage has been left ajar: unluckily for its feathered inmates, a cat has seized the opportunity. Green-eyed and grey and fluffy, he emerges from the open wicket, a yellow-winged victim in his claw, while dead and dying lie on the old oaken table, a purple and crimson “cardinal,” and by its side, still quivering and gasping, a green parrot. The background, which is intensely rich in tone, throws out the brilliant plumage of the tropical birds, further shown to advantage by a deep frame of carved ebony.

It may be remarked that frames are a subject of preoccupation at present in Paris, and they are reckoned quite as much *objets de luxe* as blue china. The frame which encloses a trumpeter of the *chevaux legers*, by M. EDOUARD DETAILLE, is exquisitely carved—the dead gold tinting the grey tone of the paper on which he has drawn the young soldier, whose uniform of blue laced with white is partially concealed by the military cloak, which he has thrown open as he prepares to sound the *reveillé*. The artist has never surpassed this drawing, in which detail is expressed without loss of breadth.

It requires no small amount of courage to feel less than enthusiastic in presence of a work signed E. DUEZ. He possesses immense technical knowledge, but the tone in which he paints stretches of grass-land is invariably dull and heavy. His *La Falaise* shows verdure of this unattractive green. A gleam of light falls on the sea and turns its surface to silver; a flight of seagulls against a bank of clouds foretells a coming storm; and in the atmosphere there is the peculiar clearness which is so often observable before a storm. M. FEYEN-PERRIN takes us farther to the north of France, but on the same coast of which DUEZ has given us a view. In Brittany women share with their masters the toil of out-of-door work. *Ramasseuses d’Huîtres* brings this vividly before us. The celebrated *huîtres de Cancale* have been gathered by sturdy fishwives, who have piled the oysters in a roughly-built cart, which a strong peasant girl is dragging along. Her figure is bending all its strength against the broad leather strap which serves for harness. Two Cancallaises, clad in crimson and blue, their heads enveloped in snow-white handkerchiefs, push the cart from behind. The neutral tones on the shells and the grey of the stretch of wet sand in the background contrast well with the dark figures of the three Bretonnes. The sunny atmosphere in this picture increases the gloom which M. ROLL has thrown on the canvas hung next to it. On first glancing at the *Paysage* nothing but darkness is apparent; after careful study one discerns, emerging mysteriously from the gloom of a winter’s night, a figure making the best of its way along the road which crosses a vast plain towards a cottage etched against the horizon, from one window of which a light faintly glimmers. A single streak of salmon-pink still tinges the sky, the last lingering reflection of departed day. The genius which carried off the Prix du Salon in 1880 by the *Grève des Forgerons* has indulged a caprice when he painted darkness visible, but to prove that his palette is not always charged with Cimmerian gloom, gives us an old man’s head, entitled *Pochade*, the work perhaps of an hour, but marvellously rich in colour.

M. BENASSIT’S *Cavaliers (La Halte)* is characteristic of French military life. A couple of dragoons, well seated in their saddles, halt outside a wayside inn; the blues and crimsons of their uniforms are seen against the ochre of the old building; they inquire their route of three foot soldiers, whose kits, strapped over their grey overcoats, convey the impression one had during the Franco-German campaign that the French infantry is overweighted.

A sea piece, by the Belgian-Parisian, A. STEVENS, takes

people by surprise, for hitherto the painter's name was associated with brilliant portraits of the queens of the hour, but a caprice has induced him to depict with painful truth the sea of the Channel in a miserable day. A rift in the overhanging clouds allows a gleam of white light to fall on the grey sea, and reveals the *Calais-Douvres* steaming on. The subject, however rife with unpleasant memories to shore people, is most cleverly rendered. *L'Atelier* is in M. STEVENS' more usual style. M. VOLLON's fruit piece is good, especially in regard to the bowl of blue china, which pleasantly effaces the impression made by M. STEVENS' channel passage, and inclines one to look with interest on M. ROYBET's *Card Players*, gentlemen of the sixteenth century, who appreciate the beauty of Persian carpets, and cover the table on which they play with one we suspect to have been woven at Khorassin, so soft are the crimson and rose tints, and so velvety its texture. The players are clad in buff hose, and *just-au-corps* of dark cloth. A fair young page, his hand resting on the head of a greyhound, watches the game. A Venetian mirror of polished steel, set in ebony, hangs on the wall behind the gamblers. M. HARPIGNIES, always academically correct, marvellous in detail, and with a certain old-world charm, difficult to define, but essentially *sui generis*, contributes two landscapes, painted as carefully as an engineer's plan is drawn. The distance in one of these, bathed in the warm light of summer's evening, is exquisitely given. The sky has assumed a pale-orange hue, which is reflected in the pool in middle distance, and less in others, which appear here and there in the marshy ground, on the edge of which a poor cottage has been erected. The calm of nature has settled on the scene, in which we discern no trace of active life. Equally striking, as indicative of repose, is a figure JULES BRETON has painted as typical of rest after labour. A peasant woman, evidently a Bretonne, resting after a day of toil in the fields, is called *Repos*. Twilight has overtaken her; the sky is grey. A lingering sunbeam casts a quivering ray of light on the landscape. The woman's expression is resolute, but her attitude indicates fatigue. Her limbs are strongly defined beneath the folds of her heavy home-spun petticoat, and her hands and feet are superb in modelling. Full of life and play of colour, is M. BENASSIT's wounded duck. The movements of the bird in its last effort to fly at its foe are excellently rendered. Seldom have we seen a better bit of bird life.

Many good pictures must remain unnoticed. Some amongst them will be exhibited at the International Exhibition, which is to open on the 19th inst. under brilliant auspices. But we draw attention to two clever portraits in charcoal by M. BOETZEL, so delicate in execution it is difficult to credit that so rough a material was capable of producing such exquisite effects of shadow in half-light. In one instance the likeness is life-like, and in both the treatment of the head is successful.

#### WINTER EXHIBITIONS.

THE Royal Water-Colour Society has opened an exhibition which corresponds to the designation formerly given to the winter collection, but now omitted from the title-page of the catalogue, as consisting of "sketches and studies." Some rough designs in black and white have been admitted, notably certain spirited groups afterwards used in pictures by Sir JOHN GILBERT, the kind of thing which, as the Italians used to say, shows the artist's "hand." There are several painters in the gallery who impress far more by their outdoor sketches than by the more elaborate work of the studio. Mr. EYRE WALKER is an instance, whose sketch *Close of a Wet Day over Sherwood Forest* (58), with the sudden rush of golden glory firing rain clouds and drenched turf and wood, is one of the freshest and most masterly pieces of effect in the room. Mr. THORNE WAITE is also more happy in a crisp broad sketch like *Passing Showers* (142) than in the more ambitious scene with figures, the *Hayfield* (106). It should be noted, however, that not many men get an outdoor sketch of the scale of this last so well together. Amongst more poetic work is that of Mr. ALBERT GOODWIN, who sends several lovely Italian studies, delicately true, and having that peculiar quality of softened and bloomy colour which he appears sometimes to attain by the use of some specially prepared ground. Mr. GOODWIN sends also many studies of strange cloud form under dramatic accidental light and shade, and a study for one of his imaginative subject-pictures, *Through the Valley of the Sea*

(195). This artist has great skill in the use of opaque, which he shows to be compatible with the most ethereal truthfulness of atmospheric effect. Recently-elected members put in a brave appearance. Mr. C. GREGORY has a capital study of the river backs of a red brick *English Town* (107), in which he introduces a couple of foreground figures, and manages the rising perspectives of levels admirably. Mr. WILMOT PILSBURY is constant to his careful treatment of rural homesteads and quiet scenery, in which he embodies, not inaptly, the sentiment of TENNYSON's happily-expressed epithet, "homes of ancient peace." Mr. HOPKINS comes out stronger than before in two outdoor studies, *Trusted Friends* (165), a lot of anchors left to rust together on the grassy bank above the sea-beach; and *A Village on a Marsh* (224). Mr. S. J. HODSON sends a study of a tapestried chamber, where a little boy clammers into a big chair to look at his grandfather's portrait on the wall, and indulges in *A Boy's Day-dream* (90). There is not a better bit of work in the room than this, so free is the touch, so harmonious the colour, so well considered the whole thing.

Several of the older members are absent, but Mr. GLENNIE, one of the veterans of the Society, still sends his sunny Italian scenes; Mr. THOMAS DANBY is seen at especial advantage in eight drawings; Mr. BOYCE sends some genuine little sketches, not all of recent date; Mr. J. PARKER contributes abundantly and well; Mr. ALFRED HUNT has been in Northumberland, drawing at Warkworth; and Mr. HENRY WALLIS has travelled to Spain in search of sunshine, and found it, to judge by *The Moorish Fountain and Patio de Lindaraja at the Alhambra* (189). Among figure subjects the large study, by TOM LLOYD, of *Harvest Folk* (230) leaving the reaped fields as the moon rises, is beautiful in tone, and fills a large scale with simple and broad design. Mr. DU MAURIER and Miss CONSTANCE PHILLOTT may be welcome among newer associates, but are not likely to take the gallery by storm. A couple of large studies of *Poppies* and *Hollyhocks* (122, 123), by Mrs. ANGELL, show how the delicate manipulation which she applies to her small finished drawings is guided by the firm brush that has put in these blooms with such large freedom.

The honorary member, Herr ADOLF MENZEL, is more courteous in response to his electors than honorary members are wont to be, and has sent two drawings, a scene in *The Town Church at Innsbruck* (28), where a complacent preacher up aloft waxes eloquent from the gold and silver pulpit as the alms-bag goes round; and *Suspicion* (363), a study of a "ruffled gallant" listening, with upturned face, hand on sword-hilt, on a dark staircase. Opaque is freely used in both these drawings: the blacks are inky, and the tone rather dead; but of the splendid draughtsmanship and putting together there is no question. All the multifarious details and difficult perspective in the church scene at Innsbruck are managed after MENZEL's own masterly fashion; while the groups of peasants on foot and upper-class folk in pews are touched off with the satirical veracity of a chronicler of manners.

A last word must be given to note the screen devoted to studies and sketches by the late EDWARD DUNCAN, a tribute well accorded to an artist who helped to uphold the repute of the body through many long years of membership.

The proprietors of the *Graphic* some time since gave commissions to a number of artists to furnish for reproduction in their paper, by chromolithographic or other process, paintings illustrative of animals and their ways. The result—more than eighty oil pictures—is now shown in the Nelson Room of the Fine Art Society. The contributors are of various nationalities, and the worth of the works varies also. One or two great names stand against clever canvases—such as that of DE NEUVILLE against an episode of a soldier tending his lamed horse on a battlefield; Mrs. BUTLER against the study of *An Artillery Team in Action*, a broadly but rather crudely-painted little picture; while CATON WOODVILLE shows an officer, *Cruel to be Kind*, shooting a worn-out horse that has fallen on the snowy ascent. The best pictures of cats and kittens are undoubtedly the clever and sportive groups of Madame RONNER; while Mr. CHARLTON bears the bell for hunting dogs. Mr. BARTON BARBER combines in two good pictures the charms of childish beauty and of canine character under the titles, *A Mute Appeal* and *The Order of the Bath*. SAMUEL CARTER and ADRIEN MARIE undertake to paint the drolleries of the monkey tribe, and Mr. C. GREEN paints the cleverest

dog picture of the show, in his *Talented Troupe* of performing dogs and their audience, of which a water-colour version appeared in the last exhibition of the "Institute." On the whole, as illustrative of animal life generally, the exhibition is disappointing, some of the noblest types of dogs being omitted, and the motives of the subject pictures falling too much into lines of humour or pathos already worn threadbare by LANDSEER and his imitators. The pastoral groups are few and inferior, young Mr. CALDERON'S being about the best. We must not leave out the contribution of Mr. R. MACBETH, *The Veterinary's Shop*, wherein the incident of a fine lady holding her pet dog to have its hurt leg bandaged up is enhanced by costume, character, and picturesque surroundings.

### THE FIRES.

THE fire at Hampton Court Palace on Thursday is the latest addition to the remarkable fatalities which have occurred within less than a month. In Scotland and Ireland, as well as in England, buildings have been destroyed. Country mansions possessed of historic interest have suffered no less than houses of a humbler class, and the fire has not spared public buildings or churches. Two of the London fires indicate the danger attending modern cities, and, considering how much is involved, a Special Committee of the Institute of Architects might with advantage be appointed now to report upon the behaviour of the materials which were employed in constructing the Wood Street buildings and the Alhambra. It would also be advantageous to consider whether some improvement might not be adopted in the mode of construction ordinarily employed for buildings like those which have been lately destroyed. The short time which was needed to reduce large piles of buildings, and apparently well built, to rubbish, is enough to create disquietude among a great many of the owners of property in London. Most Londoners have the utmost confidence in the power of the fire brigade. But in the late fires, in Wood Street and Leicester Square, all that the best organised brigade in the world could do was to limit the area of destruction. There were no complaints uttered of delay in the arrival of help or of deficiency in the water supply, and on those occasions it is easy to make people dissatisfied; the wind was not unfavourable, and there was little difficulty in securing positions from whence to operate upon the flames. But although circumstances might be said to aid the brigade, the buildings were doomed from the first appearance of the fire.

In the case of the Alhambra the completeness of the destruction is especially remarkable, if it is remembered that the architect of the building has given much attention to the preservation of buildings from fire. The paper which Professor HAYTER LEWIS read at the Conference of Architects in 1871 is enough to show that for many years he made a special study of the action of fire on materials, being well aware that in building science failures are always instructive. We may assume, therefore, that if anything was left undone which would have made the Alhambra secure, it was not owing to an oversight on the part of Professor LEWIS. And this leads us to consider one of the chief causes of the destruction of buildings.

Now we have no hesitation in saying that what contributes most to the existence of buildings which cannot withstand a fire is a false notion of economy on the part of the proprietors. A building which has any pretence to be considered "fire-proof" is necessarily more expensive than one in which there is no provision against danger. It is not a question of skill, but of outlay. Building owners, speaking generally, will not sanction the additional expense by which so much safety can be ensured. They prefer to run the chance of fire, or, in other words, they assign the risk to the insurance companies. Unfortunately for good building the companies are too ready to undertake the risk. The competition between offices is so keen that much will be done to attract clients, and in the scramble for business buildings of all classes are too often confounded together. The notion prevails in offices that by taking a certain number of years an average may be struck, and that since loss is inevitable, there are times when it is useless to be over-particular in investigations. If buildings were fully fireproof there would be no necessity for insuring; the very existence of companies is dependant upon the probability that there is weakness in the most careful construction when it has to be tried in the fire. Let the insurance offices be more stringent in the assessing of hazardous structures; let allow-

ance be always made when precautions have been taken to diminish risk, and we should find a decrease in the number of insecure buildings. There is little surprise when such a building as the Alhambra is burnt, for flimsiness is in the public mind generally associated with theatres, and heretofore the authorities did little for the protection of playgoers. But the Wood Street warehouses are in a different category. In such cases, although the value of buildings and stock may be covered by the insurance, there is a loss which cannot be recouped. The temporary suspension of business drives customers to other houses, and there is no certainty that they can be brought back again. It is said that one of the Wood Street firms will in this way suffer a loss of 100,000/ on the spring trade alone. A danger of this kind might be supposed to suggest itself when the large warehouses in Wood Street were about to be erected. But if it did, no means appear to have been adopted to provide for the contingency. If the floors had been constructed of concrete, and if the ironwork had been protected by the same material, the loss must have been minimised. The Haymarket Co-operative Store owes its safety to the concrete which covered the beams and columns, and what has been efficacious in the West of London is not likely to be a failure in the City.

### GLOUCESTER CATHEDRAL AND ITS ARTISTIC CHARACTERISTICS.\*

THE estimates of anything from an artist's point of view are apt to be as various as the minds that make them, and commonly share the same fate in their reception, being either coloured or limited by every variety of taste, opinion, or capacity. A naturally good taste, helped by a congenial spirit and occupations, is a pleasant possession, but it is a better guide to begin with than to end with, for fine art is a deep well to draw from; it covers a wide space, it penetrates far below the surface of things, and it appeals to a wide range of sympathies, embracing subjects near akin to science and poetry, philosophy and religion. It is this last that has most to do with the arts which have combined to produce these sacred buildings, where architecture, consecrated to its highest purpose, has appropriated from every art beside all such elements of religious expression as could contribute to its own completeness. Thus was this great Abbey of St. Peter once complete, as it stood in the fulness of its beauty, its pride of beauty; but troublous times have intervened and left a wreck. Those who have read the history of such establishments as this have sickened at the repetition of wreck and ruin which has been their fate; devastations by fire and sword, by the irruption of hostile and Pagan tribes, reducing the monasteries and churches to ashes, Christianity itself being all but extinguished; and what is yet more painful, the fitful wantonness of our own people, whose passions, once aroused, have been like the bursting of a pent-up storm which seems to revel in ruin. Such was the impulse which now above three hundred years ago swept down, in succeeding tides of desolation, those monuments which, during past centuries, the highest culture, poetry, and religion had produced. Those who raised the storm had their reasons; some high-minded and pure, some base and contemptible; but not so the multitude, for a mob is not actuated by the refinements of religious opinion. It was no nice perception of varieties of faith that aroused their ignorant fanaticism. They had no thought nor wish to change an item of their creed; but it was the resentment of a discontented multitude, discontented, not with their religion, but with their oppressed condition, utilised by the partisans of politics and religion, goaded on by its own sense of injury, injustice, and suffering, and fanned into a flame of destruction by any pretext that could serve the purpose of its unreasoning vengeance. The Church had lorded it over much; its exactions and its presumption had often pressed hard upon the people. So the day of retribution came; and, as usual, where blind ignorance took part, reform was ruin, and the loss irreparable; and here in this that once was among the richest and most beautiful of national monuments bare walls remained, and all that had clothed them with life was no more.

#### *The First Abbey at Gloucester.*

It had been under happier auspices, and in days of a purer faith, now just twelve hundred years ago, that the first Abbey of St. Peter at Gloucester had its beginning. It was founded and endowed by Kings, and Royal dames were its first abbesses. Its buildings stood near those around us. On the north side of the choir of the present Cathedral, and next to the high altar, is a monument known as that of the Viceroy Osric, the noble-born friend of Ethelred, the second Christian King of Mercia, by whose authority he founded this Abbey. This monument is the tribute of the last Abbot to the

\* A paper read by Mr. T. Gambier Parry at the meeting of the Gloucester Cathedral Society, and reported in the *Gloucester Chronicle*.

man who, eight hundred years before, had laid the first stone of the first Abbey of St. Peter. The recumbent figure holds the model of a church, which is interesting as a piece of archaeological reverence on the part of a sixteenth-century Abbot; for the character of its façade, roof, and tower is of the earliest type of Norman work, or even before it. The figure, unworthy of the Royal name it bears, is such that the Puritan iconoclast, dealing ruin right and left, passed it by with a smile, that the very ugliness of such a "graven image" saved him the trouble of breaking it. At the time of the foundation of this Abbey (A.D. 681) society was so broken, and private life so harassed by the disturbance of lawlessness and war, that as Christianity was fast spreading and arousing in men's minds aspirations for a better mode of life, for which no peace was found in their precarious homes, establishments were founded as refuges from the noise and storm around them, and as centres of religious life. Such were those of St. Hilda in the north, or St. Ethelburga in the east, and of Osric in our south-western Gloucester. But within a century the troubles prevailed, and war with all its vice and tumult occupied the ground, and the years of the first Abbey of St. Peter were numbered. Never were the first fair blossoms of the early year more mercilessly withered by the biting winds of spring than were those first fair homes of peaceful life and charity ruined by the violence that marks their chequered history. So ends the first age of our Abbey. Its inhabitants were terrified, scattered, lost; and of their place and buildings not even the tradition of a memory remains. We may yet, however, form a fair idea of them, for it must be remembered that no art is isolated; it comes of that which was before, and hands on its lamp of life to those which follow it. The character of all buildings in all countries has of course depended first on climate and then on the nature of the materials at hand, and the ability of the people. All round Gloucester in those early days were vast forests, on one side covering the great part of what is now Worcestershire, on the other side the wide range of our Forest Deanery; and yet nearer, the picturesque outline of what we still know as the Hill of Robin's Wood; and just over Severn, but close at hand, where the aged oak of Lassington and the Higham chestnut tree link our degenerate woodlands with the heroes of primeval forest. Such then was the wealth of building material, as easily got as the stubborn oak would yield to the axe, and as cheaply as the Severn boats and rafts would bring it; and the builder of the first Abbey of St. Peter fetched it home, as Chaucer describes one in the Miller's tale:

"I trow that he is sente  
For timbre, that our Abbot hath him sent."

There is still, in that once forest land of Cheshire, a fine example of the timber buildings of early times in the church at Warburton, where the piers and arches of the nave are formed of large oak trees cut in half lengthways, based on stone blocks, and, joining their curved forms above, produce the arcades on which the whole superstructure is borne. A timber-arch still marks the place of the north-west doorway, and the chancel is of similar construction. Time and trouble have left us few examples; but there are so many valid grounds on which to formulate our ideas that it needs but little stretch of imagination to rebuild the first Abbey of St. Peter. Like the first great church on the wild island of Lindisfarne, it might have been built with wood, and thatched with reeds. Its aisles may have been arched with oak like those at Warburton; and its tower like that near at hand at Upleadon, where the long upright oaken timbers, with white panels between them, are like those which Holinshed admired in the buildings of old England which "are commonlie so strong and well timbered that there are not above foure or six or nine inches between stud and stud." Thus may we easily imagine that group of monastic buildings, bright with the contrast of dark oak and white panelling, with its long cloistral enclosure, and all the apartments for refectory, dormitory, and guest-house, with its church and its tower rising above them, on a site chosen for its quietude, on the further side of what was then the sparkling stream of the Twyver, whose banks, covered with willows and alder trees, separated it from the town; an ancient town, whose British and old Roman buildings, picturesquely mixed together, with the Severn rolling beneath them, with smiling meadows all around it, and the background of the beechy Cotteswolds, had won for it the title of "the Fair City" (*Caer Glouwe*). Such might have been, and probably was, the pleasant scene that presented itself when, just 1,200 years ago, King Ethelred came to visit his brother Wolfere's widow, or the sister of his friend Osric—Kymberga, the first Abbess, whose name, modernised into Kymbrose, is still familiar to the poor of Gloucester. There is yet, however, another picture that we could draw, by no means so likely to be true; but to illustrate the state of the arts in England at that time, and particularly of such as might have been found at Gloucester, it may be as well to take it. If the age had been dark, it certainly had been of all things darkest in relation to the arts; but before the foundation of this abbey the day of their revival had risen. From Iona to Canterbury Christianity was the dominant religion. It spread as an element of light and peace, and the under-current of its influence prevailed. Men woke to the horror of the crime around them. An ideal altogether new was introduced into their life. The reality instead

of the mere superstition of spiritual existence was forced upon them. The conviction weighed heavily on many minds. Men craved for quietude, and yearned to escape from a life they had learnt to hate. A new light had dawned upon them, and with it a sense of the beauty of that light. It awoke their dormant faculties of mind, heart, and imagination, and opened a fresh vista to the purpose and direction of their lives. Monastic life afforded the only refuge. Monasteries were the homes not only of religion but of learning, and then the arts came in to minister to them both; and thus their spark was kindled. Some years before that time two men had come upon the scene whose enthusiasm fanned that spark into a flame. St. Wilfrid and his friend Benedict Biscop had learnt what art was among the grand relics of the South, and had returned from years spent in Italy and Gaul, not only to introduce the customs of the Roman Church among his old British fellow-Christians of the north, but to build them churches, till then unthought of, with finished masonry, with lead for roofing, and glass for windows. Their story has been too often told for me to repeat it here, or do more than to remind you how they had brought with them from France and Italy artists and workmen to revive the art of building, and to teach the English the mysteries of painting and making glass; and how they founded monasteries and built churches, adorned with pictures and relics, service books, sacred vessels, and embroidery.

#### *Early Christian Churches.*

The earliest Christian churches of the south appear to have been constructed with the three clearly-marked divisions of the sanctuary, nave (with or without aisles), and narthex, for the ministry, the congregation, and the catechumens. Among the most interesting relics that time and revolution have spared is the underground church built by St. Wilfrid at Hexham. It was built about ten years before the foundation of the Abbey at Gloucester, and is a complete model of the early Christian churches, with a chancel, a nave with aisles, and a narthex opening to the staircase which leads down to it, denuded of course of all that may have once embellished it, of small dimensions, but in perfect preservation, constructed of materials which seem to tell the tale of their origin in the great wall of Hadrian, which is near at hand. But before the building of this crypt, and about twelve years before Osric began his work at Gloucester, St. Wilfrid had built a church at Ripon, about which Leland quotes this glowing description from Eddius, that it was "a basilica constructed of wrought stones from the foundation, and divers pillars and porticos formed part of its arrangement." This church was dedicated to St. Peter in the presence of Kings Egfrid and Elwin. An underground chapel still remains of Wilfrid's work at Ripon.

#### *The True Founder at Gloucester.*

To return to Gloucester. If we are to accept the document given by Dugdale, Wolfere the King, and not his brother and successor Ethelred, was the real founder of this Abbey. Gloucester had but lately been added to his kingdom of Mercia, and he is there stated to have enlarged and beautified the town of Gloucester and laid the foundation of the Abbey. Laying the foundation may simply mean the assignment of lands for the establishment of the Abbey. Then his brother and successor took up the work, and hence his charter of foundation to Osric. But Wolfere had been at Ripon, and must have seen Wilfrid's great church there. The bias of Ethelred's character was to peace, to the arts of peace, and to a religious life, as shown by the end he chose for it; for, after thirty years spent in the weary work of ruling, he retired to the Monastery of Bardley, among the fens of Lincoln, and there died. St. Wilfrid had been his intimate friend and his guest at Bardley, and it is a fair inference that the works as well as the character of such a man must have exercised strong influence on a mind so entirely sympathetic as that of King Ethelred. It is also fair to infer that Gloucester must have occupied a prominent place in the mind of the whole royal family from the facts just mentioned about its foundation, from Wolfere's widow being its second abbess, and, further, that the succeeding king and his friend Offa, king of the East Saxons, were among the number of its benefactors. All this points but one way. I have no wish to exaggerate the supposition, which can only be based on inference; but Gloucester evidently held no common place among the noblest and wealthiest of the land, who had thus centred their interest and influence upon it. Once more, and I leave it in your hands. Builders have been always reckless pilferers, and at these times no such idea as the sacredness of antiquity had entered their heads. Gloucester had been a Roman city—a wealthy one, with every building required for its commercial, military, and religious establishments. But these were then in ruins, and we may rightly fancy their massive sides and angles, like the great buttressed walls and nooks of many a mediæval cathedral, covered and filled in with hives of houses piled up against them for support and shelter. But those mines of building stone were used for other purposes, as badly or as well as the world may think it; and just as the first subterranean church at Hexham was built of the pilfered ruins of Hadrian's wall, so might the first church of St. Peter at Gloucester have owed its building materials to the wrecks of the walls, the Pretorium, the Forum, and the Temples, of which we now trace the foundation, the mosaics, and the bases of their ruined architecture.

*Bishop Wolstan and Gloucester.*

However that might have been, little occurred to affect the architecture of those buildings till the beginning of the eleventh century. I am not concerned here upon the history of the Abbey, interesting as it is in all respects, except as regards the story of the arts which have been associated with its building; otherwise there would be much to say here, and subsequently also much that for consistency sake I must omit. The really important change in the circumstances of the place, in those early days, occurred when, under Bishop Wolstan of Worcester, in A.D. 1022, it was changed from an establishment for secular clergy to a monastery under the rule of St. Benedict. The bishop found the church richly endowed, two of the Mercian kings having been, a few centuries before, its benefactors. The place was so important and the opportunity so great that he took the bold course of reconstituting the whole establishment, and of consecrating it afresh under the new title of St. Peter and St. Paul. I am well aware how often in ancient chronicles larger establishments than this at Gloucester are described as having a *lignea basilica*; and smaller ones as being, in plain English, built of wattle and dab and roofed with straw. But at the time I am speaking of stone was used in building quite small churches, such as the one still nearly perfect at Bradford-on-Avon; and stone was then also used where in some places it would have to be brought from a distance, as at Deerhurst. Here at Gloucester all sorts of stone was easily obtained. The herring-bone masonry at Ashleworth and the reticulated work on the chancel at Dymock may be possibly of that period. On such an occasion as I was describing, some change in this building almost of necessity occurred, and we might then have seen rising above Bishop Wolstan's church a tower of that peculiar style that was then in vogue, marked by its masonry of long and short stones alternately, and even more marked still by the long narrow strips of stone, slightly relieved from the rubble surface of the walls, and dividing them into long upright panels, the divisions of the stories of the tower being also marked by horizontal strips of the same sort, and the angle-headed window-openings formed also of two short pieces leaning against each other. It is easy to trace many features of the marble architecture of Greece and the Lycian monuments to the wooden construction out of which they had grown; and here in Anglo-Saxon times we find when stone was used for walls the principal features both of construction and ornament were derived from the wooded framework, with its white wattled panels between, which had been the primitive style of the country; and further on still we may perhaps be allowed to trace, from those long flat strips of stone, the tall, thin, and plaster-like projections, which constantly divide in a similar manner the façades of Romanesque and Norman buildings, all having their distant origin in the oak building of former days. Such, in the year 1022, may have been the tower of the newly-constructed abbey on the banks of the Twyver.

*Bishop Ealdred and the Abbey.*

But the great change was yet to come. A subsequent bishop, a man of great ability and ambition, formed the scheme of a still more important establishment. His name was Ealdred, to whose lot it fell to crown both Harold and William of Normandy. He was not a man to do small things. His vigour may be inferred from the remonstrance he addressed to William the Conqueror, which brought the Conqueror on his knees before him, in presence of his court, on the floor of Westminster Abbey. He held for some years the sees of Hereford and Worcester, including the present diocese of Gloucester, and he subsequently became Archbishop of York. If he and Wolsey could have interchanged their dates of birth, he might have played the part of Wolsey. This man, recognising the importance of the opportunity, acted on his resolve, and laid out a great scheme for the future Abbey nearer to the city. The sites almost invariably chosen for monasteries had been solitudes of sea coast, forest, or fen; and in course of time the cottages of their dependents so accumulated as to change their solitude to a city. But here at Gloucester the city existed close at hand. The original monastery of St. Kymburga had chosen its site in a quiet place, beyond the Roman wall, among the groves of alder trees, which stretched upwards from that island of the Severn which from them still holds its ancient name of Al-ney. But now the opportunity occurred for the foundation of an important establishment, capable of service both for its own inmates and for the city. He chose the new site and there he built it. According to Abbot Frocester's history this remarkable man was consecrated Bishop of Worcester in 1058, *i.e.* eight years before the Norman Conquest, and it records that he constructed the Abbey church *de novo* from its foundation, and rededicated it according to its original title of St. Peter's.

*Abbot Serlo and the present Cathedral.*

The next we hear of any building is in the time of the first Norman abbot, Serlo; and of that work we only learn that the first stone of the *Glevornensis ecclesia* (the Gloucester Church) was laid in 1089, twelve years after the Conquest, and was consecrated with great pomp in 1100. Thus the great Abbey of which the bulk now stands was completed. It had been a gigantic undertaking; and we can easily imagine the workmen sitting down

within the western wall to contemplate their finished work. They saw before them the vista of a grand arcade, on massive piers, and in the distance closed by an apse behind the high altar, and covered in from end to end by a flat ceiling of wood, panelled and painted, as the fashion was. Right and left along the nave and choir, and all round the apse, vaulted aisles added to the grandeur of effect; beyond the choir were three chapels with groined roofs, and apses round their altars; and at the opening of the choir, north and south, were transepts, with chapels projected from them eastwards. In the centre, where the four great arms of the building met, rose a tower which might have been of wood, otherwise it probably was like that on Osric's tomb, with an interior arcade, and open like a lantern to the church below, as that of Tewkesbury was in Norman times. All round above the aisles of the choir was a spacious groined triforium, with chapel for chapel and altar as below; and beneath them all a lower church (now mis-called the crypt), with chapels, aisles, and groins, and altars repeating all that was above. Nor was this nearly all, for that was but the huge shell which enclosed the finer things of sculpture and glass, embroidering and metal work. But time would fail to tell of all outside, the transept towers, deep doorways richly carved, the great chapter-room, and the gloomy passage of the slype, with its long arcade leading out to the burial-ground; and all this vast and varied work of one style throughout, complete and beautiful in its unbroken unity. Those workmen may well have looked with awe on this gigantic product of their hands. The foundation for it would alone have been a thing for giants. But was all this work really theirs? Had the short term of eleven years sufficed to devise, to organise, to finish, such a work as that—to collect its mountain of materials, with all the painful strain of transport to overcome, and all the rudeness of their machinery? As they sat there weary beneath its shade, had they in that short space of fleeting years shaped and finished such a work as this? If I had been one of those who had to answer, I should have answered "No." In that group of workmen there sat one who was a master among them, a man of some age and evident intelligence. A young monk of the Priory of Tewkesbury, but lately come to Gloucester, joined them, and asked many questions about the building; so the old mason told him this story.

*A Mason's Story.*

He said: "I am a native of Deerhurst. My father was a builder there, and he sent me to the Monks' School at the Priory. I saw a great deal of building work under my father, for he did all the work for the Priory, and when the rich Earl Odda built a Royal Hall close by the old church of the Priory, my father built it for him. There was a very busy bishop at Worcester then; his name was Ealdred; he was a great friend of the Earl's, and came and blessed his new buildings for him. But the biggest place the Bishop had to do with was here at Gloucester! and King Edward (God bless him) was often here; for the place is a strong one, with that old wall and the castle down by the Severn, and the marshes out beyond; and there's a sight of business done by the boats that come up from the sea. So King Edward liked the place; and the Bishop, who was always wide awake to business (so he's got made Archbishop of York now), used often to come here; for the King liked all Church work and buildings and so forth, and had a number of Frenchmen about him; and as the Bishop was a great traveller, they got on very well together. The first time the Bishop came to Gloucester he brought me with him from Deerhurst, for he knew the Abbey here was in a poor way, and that I had a good knowledge of building and all that from my father. We found the place in a bad state; and the Bishop thought to please the King, and to get the King to help him, if he tried to build a large church like what the King was building then near London. So the Bishop and I talked it over; and the new Abbot here, Wilstan, he too thought to please the King, so we worked together and laid out a place for it, close to where the old Roman wall was, so as to make it the chief Church of the city; with the Abbey buildings snug and quiet on the other side. The Bishop had been in France and had seen all that was doing there; but he said it would be no use putting our English men to work like that, but to build strong and simple work like what our folk could do best. So we struck out the plan on the ground, and I was frightened when I saw how big the Bishop meant to build it, and I told him he'd never do it. So he set me over the work, and I got a lot of men and things together, and we began at the east end, and there the under-croft was built, with low vaults, and large blocks of masonry to carry those above. Against them we built small columns to carry the groins. There were some small columns in the old ruined place close by; so we put them in the middle, under where the high altar was to be; they were like some I remember among the old Priory buildings at Deerhurst. So we got on, and put up the piers of the choir—those big rounded ones that you see out there round the altar, such as our men could do, for they didn't like the sort the Bishop wanted, which was the French way of work, large square ones with lots of angles and notches and little shafts in them, which our folk weren't accustomed to. So we worked in our own way, and after some years we got the choir all done, and ceiled it over flat with boards. Outside the church we built the slype leading out to the burial ground, and we ceiled it plain like the under-croft; and we built a long wall where

the cloisters were to be, which is now the prior's garden. There was an arch in that wall which opened into the slype, and two others into the Chapter House, which was a very large room built of wood, where good King Edward used to meet his Witan most years in winter time. And there was a long dormitory over the slype, which was built of wood too, but all those wooden buildings were burnt down. We were at work at the cross transepts at the same time, for the King was building his big church near London on a plan like a cross, which was quite new to us; and the Bishop here, thinking to make a fine thing and to please the King, was set on making his new church like the King's. We got on with the transepts, and built part of their east walls and the chapels in them; but we never got any further, for the Bishop was always about the Court, and liked to have all the nobles about him, and he spent his money too fast with them. As soon as we got the choir ceiled he got the King's friends about him, and the Abbots of Malvern and Pershore, and the Priors of Tewkesbury and Deerhurst, and many more, and there was a great feast, and he blessed the new church in the name of St. Peter. But he left us then, for the King was so pleased with him that he had him made Archbishop of York; and he stopped all the work here by seizing three or four parishes about here to pay himself back for what he had spent, so there was no money to pay the men. And then the good King died, and the men went away to fight under King Harold, for they didn't want the French Duke William. So the place was left not half done, and so it remained for many years. But what grieved me most was that by that bishop's way of living, and the cost of that great building, and his taking away the worth of those fine parishes from the abbot here, the place was ruined; and the poor monks went away, for they had no means of living here any more; and Abbot Wiltan, with his heart nearly broken, left us and went to Jerusalem and died. So all our work was left to go to chance. After that things were changed a good deal in England, and our old bishop went from York and crowned the Frenchman King of England in good King Edward's own church, down by the Thames at Thorney. After brave King Harold's death some of our masons went to work for the French at Dover Castle, but I stayed here and did work at St. Oswald's Priory close by and St. Kyneburg's up in the town. Some six years after that we had a Frenchman made abbot here, one Serlo, who had been an abbot before in France; and when he came here he found the place very poor, for Bishop Aldred had ruined it, and there were only two old monks and a few boys left in the place. But the choir and all that we had done pleased him much; and he sent for me, as I knew all about it, and I went over it all with him. It was all sound but the groining of the under-croft, which had cracked, for we had had bad lime for mortar, and for many years there was no one here to care about it. But he was pleased at Bishop Aldred's plan, and as the choir part for the monks was done he took to the nave, as Bishop Aldred had laid it out, and he ordered me to see to the building of it as a great church\* for the town people, and he got the Bishop of Hereford here to lay the first stone of this work. But there was an earthquake that year, which made our old work in the under-croft all the worse; so some while afterwards he made us underbuild it with strong piers and arches, as you can see if you go down there. Many of our men soon came back, and the French abbot wanted them to build as they do in France; but our men didn't take to it; so we went on the same plan with those big piers as in Bishop Aldred's choir, only taller. But the Frenchman was not satisfied with our plain work; so we got stone carvers here, and all the arches were carved as you see, and the mouldings above too, and the groings of the new aisles are carved, and all the work we did for him looks richer than any we did before; but the masonry looks the same, for the same men did the best part of it. And the French abbot was so fond of rich work that when we put in the strong groins down in the under-croft he had them carved too; and there is a chapel down there on the right near the east end that he had made very rich with little shafts and arches; we could only put them up there by standing them out against the old work, and these were carved too. You'll always know the work we did for him, for he was never pleased without some rich work somewhere about; and we finished the transepts and the tower, and finished it above with a wooden steeple, and we built the new Chapter House just where the old one was burnt, and put little arches, all richly cut and carved, along the sides of it; but you'll never find one scrap of our old work with anything like that upon it, or anything else but strong and plain. The last thing we did was the flat ceiling all along, and some Frenchmen came and painted it in squares and patterns, black and white. And now we've done it all, and to-morrow we shall have four bishops here to open the church to the people and bless it. Your old Priory at Tewkesbury is in a poor plight, and, if ever your prior there wants men, he'd better give us the work, and we'll put it up strong for him like this; that is what our men can do, for it's the English way of work." So ended the old mason's story, and all the group dispersed.

(To be continued.)

\* In Abbot Frocester's History this building is described as the *Glewormensis Ecclesia*.

## ANCIENT GREEK PAINTING.

IN his third lecture on "Ancient Greek Painting" at University College, Mr. Newton treated of the painters who flourished in the reign of Alexander the Great and his immediate successors. Among these Apelles was pre-eminent, not only on account of his great talents, but because of the conspicuous position he occupied at the courts of Philip of Macedon and Alexander the Great. He was the pupil of Ephesus, the Ephesian, and also of Pamphilus, and after this double training, first in the Asiatic and then in the Sicyonian school, attained a technical perfection which embraced the excellencies of the greatest masters, his contemporaries or predecessors, surpassing them in the combination of these qualities. He made many portraits of Philip and Alexander. The latter is said to have forbidden anyone else to paint his likeness. Some of these portraits of Alexander were of an ideal character. In the temple of Diana at Ephesus was a picture in which Alexander was represented wielding a thunderbolt, which, with the king's hand, seemed to stand out from the panel. Of this picture it was said that it represented the invincible Alexander painted by the inimitable Apelles. In another composition Alexander was grouped with the Dioscuri and Victory, and in a companion group Apelles painted the king in a triumphal car with War following him bound as a captive. After this picture was taken to Rome the Emperor Claudius cut out the head of Alexander and substituted that of Augustus. Other portraits by Apelles, such as those of Clitus, Antigonus, Neoptolemus, were probably treated in a more realistic manner. By common consent of antiquity the *Venus Rising from the Sea*, by Apelles, was adjudged to be his greatest work. This was originally dedicated in the temple of Æsculapius at Cos, but was afterwards taken to Rome by Augustus. Another work by Apelles was the allegorical composition in which he represented Slander, personified by a female figure, and combined with other personifications, such as Ignorance, Suspicion, Envy, Conspiracy, Deceit, and Remorse looking back towards Truth. It had been inferred from Lucian's description that this composition was a product of the reason rather than of the imagination, but the subject may have been treated in a very noble and impressive manner. What seemed to have distinguished the works of Apelles from those of all the other great masters of his time was their grace and charm. This he claimed for himself as his special merit. He himself admitted that he was inferior to his contemporary Melanthios in composition, and to another contemporary, Asclepiodorus, in aerial perspective. It was, perhaps, for this reason that he does not seem to have produced historical pictures with many figures. Pliny attributed to Apelles the invention of a kind of varnish by which the brilliancy of colours was tempered and harmonised. For such a purpose painters would now use glazes, but it was not clear how the same result was arrived at by a varnish which, according to Pliny, was made of burnt ivory. Several interesting anecdotes were preserved of Apelles, which showed that his success did not lead to the boastful arrogance which is so conspicuous in Zeuxis and Parrhasius. He manifested a generous appreciation of the merits of his contemporary Protogenes, and brought him into notice by offering a large price for his works when that painter was living in comparative obscurity at Rhodes. Protogenes finished his works with an elaborate minuteness, reminding us of Albert Dürer. They had, in the judgment of Apelles, but one fault—they were deficient in grace. Of the pictures by Protogenes, the titles of very few had been handed down to us. The two most celebrated were those of Ialysos, a Rhodian hero, and his Satyr reposing, which was painted during the siege of Rhodes by Demetrios. He was said to have laid four successive layers of colour on the Ialysos, and to have spent eleven years over it. Of the other painters contemporary with Apelles, the most celebrated are Aetion, whose picture of the marriage of Alexander and Roxana is described by Lucian; and Theon, who painted mythical subjects, and is described by Quintilian as an imaginative painter. Antiphilos, the rival and enemy of Apelles, painted not only mythical and historical subjects, but also caricatures, and was not admitted by ancient critics among the artists of the first rank. Peiraiikos in the same period excelled in subjects of *genre*, such as barbers' shops. Timomachos, whom Brunn places in the period of the successors of Alexander, though, according to Pliny, he lived in the time of Julius Cæsar, painted three celebrated subjects in ancient tragedy—Medea about to slay her children, Ajax, and Orestes with Iphigenia.

Professor Newton's fourth lecture at University College on Greek painting dealt with the paintings on Greek fictile vases from the earliest period till the close of the second century B.C., when the art of ceramography probably ceased to be practised. The lecture was illustrated by many drawings of vases of all periods, of which the earliest specimens were from the islands of Rhodes and Melos. In the archaic stage of ceramographic art the style of drawing probably approximated very nearly to that of the contemporary paintings on walls and other surfaces, and this similarity of style must have prevailed as late as the time of Polynotos. The lecturer exhibited drawings of the celebrated cup, formerly belonging to Mr. Bale, and of the equally-admired cup from Camirus, discovered by Mr. Biliotti. On the former of these cups is a group of Athene, Pandora, Hermes; on the latter, Aphrodite riding on a

swan. Both these designs are painted in several colours on a white ground, and are remarkable for the beauty of the drawing, which presents characteristics such as we may conceive to have belonged to the school of Polygnotus. After the improvements in chiaroscuro and aerial perspective, introduced by Apollodorus and Agatharcus, and perfected by Zeuxis and Parrhasius, it is obvious that the line of demarcation between painting and the subordinate art of ceramography became much more strongly marked. The vases which were produced in the best period of Greek painting do not attempt to imitate the effects of light on colour which were accomplished by the great masters, their contemporaries. The vase painters never lost sight of the technical conditions of ceramography, and, while observing faithfully these conditions, they produced designs which for decorative fitness and beauty have never been surpassed. In these designs the shape of the vase determines and controls the composition. Thus in the tall *amphora* from Nola and Vulci the narrow field of the picture seldom contains more than two figures, and the outlines of those figures are generally kept very distinct, foreshortening and complicated grouping being avoided. The colouring is nearly monochrome; the natural red colour of the clay is used for the figures except in the case of the Athenian *lekkythi*, on which the figures are polychrome on a white ground. From the time of Alexander onwards the character of ceramography changes. The shapes of the vases are less refined; they are often on a much larger scale. In the pictures compositions of many figures are often crowded in, without due regard to the relation between the shape of the vase and the design with which it is decorated. The colouring is often polychrome, gilding is introduced, and sometimes the principal figure is painted white, the others being left the natural red colour of the clay. The lecturer illustrated these remarks by a drawing of a beautiful vase from Rhodes, representing the surprise of Thetis by Peleus on the seashore. Thetis herself and Eros are painted white and the wings of Eros blue. Admirable as the drawing of these figures is, the innovations in ceramography which it exhibits must be regarded as the beginning of a decadence which in the later vases after Alexander shows itself in the careless drawing and in a certain effeminacy in the choice and treatment of subjects. The finest vases of this later period are those from Kertch, in the Museum at St. Petersburg, and those from Ruvo, in Southern Italy. On a survey of the subjects of vase-pictures through the successive centuries during which ceramography was practised, we find that, on the first introduction of the human figure in the design, mythic personages engaged in war or the chase predominate; as the art advances, gymnastic and agonistic subjects and scenes from real life become more common; and after Alexander's time we find compositions in which Dionysius, Eros, and Aphrodite play a leading part, also scenes representing mourners at a tomb, and a few compositions of many figures which may be adaptations of the designs of great masters.

### THE ROYAL ACADEMY.

ON Saturday evening Sir Frederick Leighton distributed the prizes and medals awarded to students in the Royal Academy Schools for paintings, drawings, and models submitted in various competitions this year. The ceremony took place in the lecture-room, which was filled with students and their friends.

The President said: Although it is only in alternate years that your attention is asked to an address from the chair, it seems, nevertheless, desirable that you should learn at each distribution of prizes, if only in a few brief words, what is the general impression made on our minds by the competition of the year as a whole, inasmuch as the mere award of a limited number of prizes does no more than single out certain individual works of especial merit, and conveys no information on this head. Well, I am very happy to be able to tell you that in every class, except, perhaps, one, the general impression this year is a distinctly gratifying one to those who watch anxiously the working of these schools—that is to say, to one and all of us—for, whereas the average of merit is not inferior to that of other years, we have in three several competitions felt justified in offering an additional award. The first of these competitions is that for the Creswick prize, in which several works are of considerable merit. The prize itself being definitely limited by the bequest, could not, of course, be doubled. We have therefore resorted to a *proximè accessit* in the case of the second best work in the competition. The next additional award takes the shape of a second medal in the unusually large competition for the cartoons of a draped figure, while the other is a third medal in the class of architectural drawings from an existing building—a class in which the competition is of marked excellence. Of the other competitions the most remarkable is that of a set of six drawings from the life—a competition which has fully deserved the three prizes given in it. The paintings of a figure from the life are not, I think, beyond the average in merit, and I regret that they are not more numerous, but the large scale of several of the studies is much to be commended. I cannot too strongly impress upon you again, as I have on former occasions, the great value and importance of carrying out your studies on a large scale. Whatever the scale on which it is your intention eventually to work, you will

always be gainers by studying in the first instance on a large scale. The competition in sculpture shows marked signs of the benefit of our new school, but the satisfaction I feel in making this announcement is sadly marred by the thought that the gifted youth to whom the second award has fallen has been stricken down by death on the very threshold of a bright career. David Wade has ceased to live, and a wreath of *immortelles* hung before his successful work is a token of the respect and sorrow of his young fellow-students—a feeling in which we, his older brother artists, warmly and heartily join. A prize has been given also in the class of designs for a fresco for the decoration of a public building, but I regret to say that I have not yet the much desired satisfaction of seeing one which would justify the higher honour of execution under the auspices and at the expense of the Royal Academy. Very few things would give me more sincere personal pleasure than to announce such an award from this place, and I hope you will not long withhold that pleasure from me. I spoke just now of one competition in which the average is not fully reached, I alluded to that for the Armitage prize, in which the drawings have fallen below the standard we expected of you; and I regret this shortcoming the more on account of the importance of the qualities this prize is chiefly founded to develop. I mean the qualities of dignity and style in form and composition. Now these qualities are much wanting in the designs sent in, and, indeed, the lack of these qualities is the dominant impression left in my mind by all the designed work in this year's competitions. It is that want which is felt in the design for a fresco, and careful, meritorious, and good in other ways, as are the cartoons of a draped figure, they, nevertheless, lack that style, that nobility of form, and that elevation of character which the subject given imperatively demands. This is not the time to dwell at any length on this point, yet I could not but allude to it, and I must earnestly beg you to pursue it for yourselves. To aid you in that pursuit, I will, in conclusion, urge you to study with unwearied admiration the works of the greatest master of style this country has known—the works of John Flaxman.

Mr. F. A. Eaton, Secretary, then called up the successful students to receive the prizes and medals at the hands of the President. First to come was Mr. R. O. Rickatson, the winner of the Creswick prize (30*l.*) for a landscape painting—a scene of quiet restful beauty, with an old gabled farmhouse standing in deep shadow, as the last pale rays of daylight streaming through a rift in grey clouds pour “on dewy pastures, dewy trees,” and are mirrored in a placid, sedge-bordered pool. Mr. Herbert Lyndon was *proximè accessit* in this competition. Mr. William Carter, son of the well-known animal painter, came next, and returned again and again to the dais, his success having been, if not unprecedented, at least extraordinary. He had won four first places, gaining silver medals in the several competitions for the painting of a figure from the life, and for the drawing of a figure from the life, and for the first prize (50*l.*) for a set of six drawings of a figure from the life. Mr. W. M. Loudan, who gained the second silver medal for the painting of a figure from the life, was congratulated by the President on his appearance later on to claim the second silver medal in sculpture for a model of a figure from the life—his success in this direction being a sign that the President's efforts to encourage young painters in the Academy to enlarge their culture by a study of plastic art are already bearing fruit. In the competition for a cartoon of a draped figure, the subject set was taken from the Odyssey, when Penelope, to put an end to the solicitations of her suitors, has proposed to marry the person who shall first bend the bow of Ulysses, and to the joyous hall returning,—

Bears in pensive state

The unbended bow, and arrows wing'd with fate.

The silver medal and prize (25*l.*) were awarded to Mr. Bernard Evans Ward, but an extra medal was given in this competition to Miss Margaret Dicksee, a sister of Mr. Frank Dicksee. The first Armitage prize (30*l.*) and bronze medal was awarded to Mr. Horace B. Fisher for a design in monochrome for a figure picture on a subject selected from that period of Jewish history when there was no king in Israel; when every man did that which was right in his own eyes, and the young men of the tribe of Benjamin seized for brides the daughters of Shiloh, who had come out to dance in the vineyards. Mr. Fisher also carried off the second prize (25*l.*) for his set of six drawings of a figure from the life. Miss Mary Drew gained the prize (40*l.*) for a design for lunette decoration—an allegorical illustration of *Music*. Mr. Henry Alfred Pegram was another double prizeman, and won the first prize (30*l.*) for a model group, *The Good Samaritan*, and the prize (10*l.*) for a model of a statue. Mr. R. T. Fallon was awarded the first prize (50*l.*) for a set of three models of a figure from the life in the competition to which the president alluded in his sympathetic remarks on the untimely death of Mr. Wade. The travelling studentship in England (60*l.*) was awarded to Mr. W. G. B. Lewis for a design for a public library

Mr. Norman Gething will read a paper entitled “Hearts in our Art” at the meeting of the Birmingham Architectural Association on Tuesday, the 19th inst.

## THE WORK OF THE KYRLE SOCIETY.\*

THE Kyrle Society, by adopting the name of the "Man of Ross," proposes, I fancy, to do its work in his spirit, and gild the ordinary work of assisting the poor by carrying down to them those cheering influences of natural and artistic beauty which do so much to change the habitation into the home. The London Society, in its published statement of what it proposes to do, thus describes its aims:—

I. To decorate by mural paintings, pictures, gift of flowers, and other means, workmen's clubs, schools, and mission-rooms used for social or religious gatherings, without distinction of creed.

II. To lay out as gardens any available strips of waste ground, and to encourage the cultivation of plants not only in windows, but also in areas and back yards.

III. and IV. To co-operate as far as possible with the National Health Society in securing open-air spaces in poor neighbourhoods, to be laid out as public gardens, and in getting rid of smoke.

The efforts of the committee are directed to preserving open spaces both in town and country. In London it assists in securing pleasure-grounds for the people by inducing the owners of squares to throw them open at certain times and under proper regulations, or in other cases by effecting the conversion of long disused churchyards into public gardens. In the country the committee endeavours to arouse public attention to the great importance of rural open spaces to all. It enlists the sympathy of landowners in the needs of the people, and encourages the dedication of private lands to public use. It also co-operates with the "Commons Preservation Society" in securing equitable arrangements in regard to common land.

For these purposes donations either of money, objects of art, cut flowers, plants, shrubs, and bulbs will be gladly received by the hon. secretary. It will, however, be evident that any personal help which can be given in the decoration of rooms, &c., distributing plants and flowers in poor districts, or singing in the voluntary choir, is most valuable, and the committee gladly welcome all who offer such aid.

The second half-yearly report for 1881 shows how these aims are carried out.

The decorative branch decorated the girls' school at St. Mary's, Battersea, at the request of Canon Erskine Clarke, the vicar, who furnished the necessary funds. One side of the room being occupied by a row of windows, the scheme of decoration was confined to the opposite wall. At a height of about 7 feet from the floor is a band, 2 feet 6 inches deep, of dark green canvas, on which are painted flowers illustrative of the four quarters of the world. Over the two principal doors are panels representing, respectively, girls coming to and going from school; while a third, leading to a classroom, shows the scholars at their work. These groups of figures are painted in dark red outline on a pale yellow ground.

The decorations intended for the typhoid fever wards of the London Fever Hospital were completed, and consist of twelve flower panels; and a screen, which forms a division between the two compartments of each ward, has been decorated with some tiles, the gift of a member of the society.

A group of five panels of zinc, painted pale blue, and on them in large letters the verses on the "City Sparrow" by Miss Williams, has been placed in position in the playground in Baker's Row, Whitechapel. Above, below, and flying in and out between the lines of the verses are introduced the sparrows, each panel representing them in different circumstances—on the house-top, among the summer boughs, or hunting in the snow for the winter dole of crumbs. This group of five panels is set in rough cast plaster, and is protected from the weather by an ornamental oak canopy. High brick walls enclose the ground on three of its sides, and it is with a view to lessen the unsightliness of the surroundings that this decoration has been placed there.

A decoration has been sent to the Princess Louise Home for Girls at Wanstead. It consists of a supermantel of panels in pale yellow, painted in black, and fitted with small shelves; these panels are painted with branches of honeysuckle and wild roses, a bird's nest poised on a branch, and summer flowers growing below as in a field; branches of wild roses with bees form an arch over the upper panel, and partly cover a lettered commemoration of a gift of 500*l.* to the institution. In the same room six figure panels, placed on the lavender-coloured walls, represent work and play. These figures, painted on a yellow ground, very prettily indicated "Knitting," "Hanging out Clothes," "Ironing," "Gathering Fruit," "Making a Pie," and "Skipping."

The room used for chapel and dining-hall in Bethnal Green Workhouse was decorated with banners of dark-red American cloth, on which were painted in oils appropriate texts and emblems. They were so arranged as to fill the spaces on three sides of the room, and on the fourth a text has been arranged to fit into the panels of the gallery which runs along that side.

The Society also gave a border of Walter Crane's pictures, mounted on red linen and varnished, to a room used for mothers'

\* From a paper by Professor Lindsay, read at a preliminary meeting in Glasgow.

meetings, at St. Leonard's, Shoreditch. A grant of pictures was given to a mission hall at Peckham, and a loan of pictures to the Home of the Marylebone Branch of the Society for Providing Trained Nurses for the Poor.

The musical branch of the Society gave five oratorio performances in churches and chapels in the poorer parts of London, besides ten miscellaneous concerts.

The open spaces and the smoke abatement branches are content to aid other public associations, such as the National Health Society; but the kind of work done may be inferred from the facts that the proprietors of two sets of gardens were induced to open their grounds to their poorer neighbours during certain fixed hours on the condition that a care-taker was appointed to see that no damage was done, and that the Society voted the sum of 25*l.* to pay for a caretaker for the Munster Square Gardens for one year. This London Society which does so much work grew out of small beginnings. About ten years ago a few old friends and pupils of Miss Octavia Hill, whose good deeds among the London poor are well known to every one, met and started it; and it has grown little by little until five years ago it took public shape at a public meeting, and now has three distinct branches, each with a committee and secretary of its own. The work is all done by volunteers. Volunteer artists do the decorations, and volunteer singers render the oratorios and give the concerts. The Society provides the materials for the decorations and pays for their mounting, but the designs—usually furnished by artists who approve of the work and are glad to give their aid—and they are executed by members of the association. The musical branch pays a teacher to train the choir and to lead at the concerts, and when an oratorio is given an organist is also paid.

In Nottingham the Kyrle Society has united with several other benevolent associations to form a guild or organisation of various kinds of work among the poor, but its objects and modes of carrying them out are the same as in the parent association in London. Last year it decorated the Children's Hospital with appropriate subjects, and it spends a large portion of its work in promoting by cottage flower shows the brightening of poor homes by such flowers as hyacinths, fuchsias, and geraniums.

The Birmingham Society has only been two years in existence, and has in the short time made great progress in that energetic town. It divides its works into three branches—decoration, music, and window-gardening. Its first annual report states that the special aim of the Society is to supplement the efforts of those who are striving in various ways to raise the people to a higher level, by increasing the stock of pure and innocent pleasure open to the hard-working poor, and thus leading them to seek and to find enjoyment in something higher than the gin-palace, and more refined than the music hall. The decorative section seeks to beautify the rooms used for social gatherings among the industrial classes and the poor, such as workmen's clubs and mission rooms, also hospital wards and corridors, work-houses, Board schools, and so on. It began with a large room, opened under the auspices of the Lady's Useful Work Association, and meant to be a place of recreation for the young women employed in the work-rooms of large drapery establishments during their few hours of leisure. The room was made more attractive and homelike, the walls were brightened with pictures, and the shelves with ornaments. A few pictures were presented to be hung in the outer hall of the Homœopathic Hospital, where the patients wait until their turn comes to see the doctors in residence. The governor of the workhouse asked the Society to decorate the sick children's wards, and the poor little creatures have now something bright to look at. The schoolrooms of the Lawrence Street Mission, dingy and dull beyond description, were hung with large painted panels, water-colour drawings, and photographs, which the Society has been assured are a source of great delight to the very poor people who frequent the rooms. The musical section gave concerts to the convalescent patients and nurses at the General Hospital, to the very poor people in the neighbourhood of the Lawrence Street Mission, and to the bedridden folk in the workhouse. Perhaps the most interesting part of the work of the Birmingham Society was done in the window-gardening section. The report says that it was touching to see from what distances poor people came in pouring rain from the lowest parts of Birmingham to get a few plants wherewith to brighten their dingy homes; and all this has been done by a society which numbers 150 members, mostly subscribing only 2*s.* 6*d.* The Mayor of Birmingham, Mr. Richard Chamberlain, brother of the President of the Board of Trade, is president, and has doubtless infused some of his own energy into the Society there.

Mr. James Hey Davies, of the Manchester Academy of Fine Arts, has been commissioned by the Manchester Art Museum Committee to produce the first of a series of studies in trees. The studies are intended for exhibition, with a view of representing the beauties of every class of tree life, supplemented with a drawing underneath each finished painting, showing the details of the tree represented. Mr. Davies's first example will be a study of the ash in winter.

## NOTES AND COMMENTS.

THE exhibition of models for the equestrian statue of ETIENNE MARCEL, to be erected at the Hôtel de Ville, is now open at the City of Paris Pavilion, in the Champs-Élysées. Seventy-five sculptors have competed, and the jury will give their verdict next week, at the same time as in the competition for the execution of LEDRU-ROLLIN'S statue, designs for which are also on show in the Pavilion.

THE plans sent in for the rebuilding and extension of the Sorbonne have been displayed at the same place during the past week. The competitors, who number twenty-seven in all, are all of French nationality, foreign artists having been excluded: the list includes the well-known names of BALLU, E. DE PERTHES, NEVOT, DEFRASSE, FORMIGÉ, MENJOY DE DAMMARTIN, &c.

It has been often suggested that if iron columns and box girders could be filled with water and kept cool during a fire, they would cease to be the most dangerous parts of a structure. But so many objections have been derived from the failure of experiments that this mode of protection has been latterly disregarded. Mr. J. M. HOOKER, architect, of Sevenoaks, has obtained provisional protection for an invention which he claims to be free from the defects of other arrangements for introducing water. Near the upper edge of each girder it is proposed to form rows of holes or slits in the web. The girders being in connection with the main, the water is turned on when a fire occurs, and fills the interior of the girder, overflowing through the slits on the burning material beneath. Where the girders exist already it is proposed to fix perforated pipes alongside of them. The columns can also be utilised as conduits. Among the advantages claimed for this system is that it is available for lintels over iron doors. One of the dangers attending the use of iron arises from its expansion when heated. It would be obviated by Mr. HOOPER'S plan, which is at least deserving of a trial.

MR. BERNARD SMITH is about to publish a volume of sketches in Spain which will form a companion to the "Continental Sketches," which have been received with favour by the public. From an examination of the proofs we are enabled to say that the thirty plates in the volume are admirably drawn, and that the subjects are always interesting. Spain is less known than it deserves to be, and the beauty of many of the buildings shown in the volume will be a surprise to those who have been called "stay-at-home travellers."

THE members of the Metropolitan Board have been horrified at the vandalism of the District Railway Company in breaking holes in the Embankment roadway for the purposes of ventilation. But what is proposed has been authorised by Parliament. Railway companies have been for many years allowed to treat buildings—old and new—as if they were heaps of earth, and objections have been set aside because they were supposed to be "sentimental." The pet piece of construction belonging to the Board is about to take its turn of injury, and the members are zealous in its defence. But if they had displayed any interest in the amenity of London before now, there need be little fear of the Embankment. If Ludgate Hill—one of the most picturesque roadways in the metropolis—could be destroyed by a hideous piece of ironwork, if monstrous stations are allowed to be erected on the finest sites, how can railway directors be expected to reverence the Embankment and to exempt it from their operations? BRINDLEY maintained that Nature made rivers in order to feed his canals; and it is, we suppose, the belief of engineers that all things must be utilised for their advantage. The directors and engineers are but carrying out the provisions of their Act, and if the Embankment is to be saved, a concession or a subsidy will be expected by the company.

UNDER the management of M. HENRY BOUTET, the aquafortist, for the art portion, and of M. HENRI SECOND for the letterpress, a new high-class monthly review is about to appear in Paris under the title of *L'Art Moderne*. Each number of the publication is to contain several original sketches by well-known artists, and a full page *eau-forte* engraving not previously published.

A SCHOOL of theoretical and practical teaching is about to be opened at the Louvre in the former apartments, off the Cour Lefuel, of the Governor of Paris. M. BERTRAND, member of the Institute, will deliver the lectures on the national antiquities; M. PIERRET, those on the historical monuments existing from the reign of CHARLEMAGNE. M. REVILLOUT will deal with the explanation of demotic papyri; M. LEDRAIN will lecture on Phœnician epigraphy; and M. FÉLIX RAVAISSON takes the department of the history of ancient art.

THE South Kensington authorities have generally tried to secure some attractive novelty for holiday times. This season they have been most fortunate. Mr. JONES'S bequest by itself should be sufficient to bring crowds from all parts of London. It supplies, too, a need of the Museum, which has not been rich in examples of various periods of French art. Many of the greatest artists of France are represented in the collection. The value of the objects is probably half a million. It is known that to one dealer in London Mr. JONES paid 190,000*l.* from time to time, and there were others who were able to obtain patronage that was almost as munificent. It is a fortunate circumstance that the nation has secured so important a bequest, and it is to be hoped that the returns of the visitors to the Museum will equal those which represented the visits of the public at times when objects were shown which could not be said to possess artistic interest.

A PARIS paper announces that Prince FILANGIERI, the well-known writer and *savant* of Naples, has just offered to the Louvre Museum a collection of works of art valued at upwards of 2,000,000 fr. The circumstances that have led to this magnificent gift are rather amusing. The prince some time ago offered the collection to the City of Naples, his native place. Shortly afterwards he received a demand from the District Superintendent of Taxes for 300,000 fr. (12,000*l.*) as donation tax under the existing law. At sight of this singular letter he hurried to Rome, and laid the matter before M. MAGLIANI, the Finance Minister, who was obliged to inform him that he had no power to release him from the strange debt incurred by his generosity. In face of this declaration, the prince decided to withdraw his offer, which had not yet been officially accepted by the authorities of Naples, and closed with that of the French Minister of Fine Arts, who previously had placed at his disposal three rooms in the Louvre for the reception and exhibition of the collection. Matters thus stand for the present. It is said that the Italian Ministry has introduced a measure into Parliament to exempt donations of this sort from payment of the tax. It is probable, however, that the law will be too late to answer its immediate purpose, for Prince FILANGIERI can scarcely be expected to change his plans a second time. In the meantime, the Paris press is naturally elated at the result of the present extraordinary state of the Italian law.

MR. ALFRED CROSS, of the firm of CROSS & WELLS, was buried at Hastings on Saturday last. Mr. CROSS, who was born in 1830, commenced the practice of architecture at an early age, and he built the Ship Hotel in Greenwich when he was only twenty-two. Afterwards he left London for Hastings, where he resided until his death. Mr. CROSS was associated with several of the public buildings in the town besides a great number of houses and shops, and was for a time connected with the Duke of BEDFORD'S estate in London. Most of the local architects attended the funeral.

ALTHOUGH the system of a progressive income-tax has never hitherto found favour in the eyes of the French people, the Municipal Council of Paris has adopted the principle in its assessment of house property and levying of direct taxes. Thus in the city budget for 1883 we find the following rates adopted for the *contribution mobilière*:—For tenancies assessed at from 400 fr. to 599 fr. the occupant will have to pay 6½ per cent. on the assessed value; from 600 fr. to 699 fr., 7½ per cent.; from 700 fr. to 799 fr., 8½ per cent.; from 800 fr. to 899 fr., 9½ per cent.; and from 900 fr. and upwards, 10½ per cent. Tenants paying less than 400 fr. per annum, or assessed under 400 fr., will be entirely exempt. Such are the rates adopted by the Council, but it must be said that they have not yet been sanctioned by the Minister of Finance, whose approval is necessary before they can be enforced.

## ILLUSTRATIONS.

EAST AND WEST GATEWAYS, HOLLOWAY COLLEGE.

A VIEW of the tower of the Holloway College was lately published in *The Architect*, and we now give views of the large gateways, which have also been reproduced by the ink-photo process from drawings by the architect, Mr. W. H. CROSSLAND, and exhibited this year at the Royal Academy. The gateways are in direct communication with the principal parts, among others the picture gallery, for which Mr. HOLLOWAY has already purchased paintings to the amount of 60,000*l.*, and he generously proposes to expend a further sum of 40,000*l.* on the gallery.

It may be stated here the bricks which were used in the erection of the college have been supplied by Mr. T. LAWRENCE, of Bracknell. Nearly eighteen millions of his well-known bricks were used.

DRINKING FOUNTAIN, LYTHAM.

THIS drinking fountain is being erected by Lady ELEANOR CICELY CLIFTON on an open space in front of the market-house at Lytham, and the design has been prepared with a view to harmonising with the surroundings.

The outer part has the base of Yorkshire stone moulded and well elevated on a circular platform of three steps. The upper part is formed with clustered pilasters of English oak with carved panels and capitals, the superstructure also being of English oak covered with red tiles.

Round the frieze is placed the following inscription:—"Eleanor Cicely Clifton erected this fountain in memory of her husband, John Talbot Clifton, who died at Hamman Rhea, Algiers, April 16, 1882."

The inner pedestal and basins are of Yorkshire stone surmounted by the Clifton arms, and having the niches and drinking jets encircled with dolphins and other appropriate ornament in bronze. The carving throughout has been specially designed to suit a seaside locality, seaweeds, fishes, and shells being introduced in the panels and other parts.

In addition to the four drinking basins a trough for horses and dogs is provided on one side.

Mr. JOHN ROBERTS, of Bolton, is the contractor, and Mr. R. KNILL FREEMAN, F.R.I.B.A., of Bolton, the architect.

ST. ANDREW'S CHURCH, REDRUTH.

THIS church was referred to in the paper which was read lately by Mr. SEDDON, at the Architectural Association. Geometrical drawings of the buildings were published last week in *The Architect*.

DESIGN FOR A SUBURBAN CHURCH.

## THE SOCIETY OF ENGINEERS.

THE twenty-eighth annual general meeting of the members of the Society of Engineers was held on Monday evening last, the 11th inst., in the Society's hall, Victoria Street, Westminster. The chair was occupied by Mr. Jabez Church, President. The following gentlemen were balloted for and duly elected as the Council and officers for the ensuing year:—As President, Mr. Jabez Church; as Vice-Presidents—Mr. F. E. Duckham, Mr. Arthur Rigg, and Mr. C. Gandon; as ordinary members of Council—Mr. R. Berridge, Mr. Perry F. Nursey, Mr. A. F. Phillips, Mr. W. Schoneyder, Mr. Arthur T. Walmisley, Mr. T. H. Hovenden, Mr. Henry Robinson, and Mr. John Waddington; the three last-named gentlemen being new members of Council; as Honorary Secretary and Treasurer—Mr. Alfred Williams; and as Auditor—Mr. Alfred Lass. The proceedings terminated by a general vote of thanks to the Council and officers for 1882, which was duly acknowledged by the Chairman.

**Berne Cathedral.**—Canon Dr. Bock, the well-known antiquary, who has been making an examination of the relics belonging to the cathedral of Berne, declares it to be richer in archaeological treasures than almost any other Protestant church in Christendom, Canterbury Cathedral included. The money worth of the treasures he estimates at upwards of 4,000,000 francs. He has found many interesting objects, hidden away in cases which had not been opened since the Reformation. A supposed carpet, part of the spoil of the battle of Morat, described as Charles the Bold's horsecloth, proves to be the mantle of that prince, as Grand Master of the Order of the Golden Fleece; and possesses an intrinsic value, apart from its associations, of 50,000 francs.

## THE ARCHITECTURAL ASSOCIATION.

THE third ordinary meeting of the Association was held on Friday evening, the 8th inst., Mr. E. G. Hayes, President, in the chair.

The PRESIDENT called attention to the proposed exhibition of architectural drawings to be held in Edinburgh, circulars of which were distributed among the members. Votes of thanks were awarded for donations to the library by the Council of the Sanitary Institute, and Mr. J. A. Gotch.

The Hon. Librarian, Mr. H. W. PRATT, stated that the new catalogue of works in the Association Library was now on sale, and that it was well worth being purchased by every member, as the cost was merely nominal.

Mr. COLE ADAMS, as Secretary of the Association Travelling Studentship, said that no notice had appeared in the Brown Book of the munificent gift of 100*l.* received from the Sketch-Book Committee in aid of the studentship fund; neither was there any mention of the fund. As secretary he was engaged in getting in the subscriptions, and the committee would be in a position to publish a balance-sheet in the next year's issue, when the opportunity would be taken advantage of to record their appreciation of the generous donation of the Sketch-Book Committee.

Mr. WOOD urged that more support should be given to the Advanced Class of Construction in the way of attendance. He considered that as their senior members were willing to sacrifice valuable time to give them the advantage of their experience, the least they could do was to show their appreciation of it.

The PRESIDENT said that, in consequence of the honour done by the Association in electing him to the presidential chair, he had had the privilege of attending the interesting ceremony at the New Law Courts on the 4th inst.

Mr. F. A. FAWKES, Fellow of the Horticultural Society, then read a paper on

## Horticultural Buildings.

Mr. FAWKES began by saying his object in preparing his paper had been to embody such information and points relating to the construction of horticultural buildings as were outside the province of the gardener, and which did not usually come within the knowledge of architects; and this without discussing questions of architectural design or constructional detail that architects were probably better informed on than he was. The words, hot-house, greenhouse, glasshouse, so frequently used indiscriminately, divided themselves into two classes—growing-houses and showing-houses. Growing-houses, again, divided themselves into three sections—those in which plants were grown in pots on stages, or at a certain distance from the glass, comprising simple greenhouses, planthouses, houses for bringing on bedding stuff, some descriptions of orchard-houses, and plant-stoves without bottom heat; secondly, houses in which foliage was trained along the roof, such as vineries; and thirdly, houses in which root action was to be stimulated, such as cucumber and melon houses, pine succession and fruiting houses, pits with forcing and propagating beds, plant-stoves containing heated beds, &c. After observing that he would confine his attention to growing-houses, Mr. Fawkes said that the peculiarly trying conditions under which horticultural buildings existed, such as the varying temperatures of the inside and outside, the moisture-laden air of the former, the exposed character of the structures, the uncertainty of our climate, the necessity for durability, solidity, and yet the minimum of obstruction to light, warranted every precaution being taken that the materials used should be thoroughly sound, the construction such that there should be no crevices for the retention of moisture or harbouring of insects, and that the buildings, by subsequent periodical painting and repair, should be kept in a good state of preservation.

The first main point in connection with a growing-house was to determine the pitch of roof most advantageous for various purposes. When the sun's rays struck a sheet of glass, some of those rays could not pass through; the more nearly sunlight struck a roof of glass at right angles, or within 30° of a right angle, the less obstruction to the rays of light did the glass afford. The next point was how to obtain the maximum impingement of the sun's rays at, or as near as possible to, a right angle, for the position of the sun relatively to the earth was always varying. On the shortest day with us in London the sun rose about 50° east of south, attained an altitude at twelve o'clock of about 15° above the horizon, and set about 50° west of south. On the longest day the sun rose about 50° east of north, attained an altitude of about 62° at twelve o'clock, and set about 50° west of north. If we wished to build in the latitude of London a greenhouse of which the roof should receive the sun's rays at right angles on December 21, the roof must be built at an angle of 75° with the horizon; whereas on June 21 the angle would only have to be 28°. For ripening purposes, to ensure accuracy of the highest degree on any particular day and place, it would be necessary to take the latitude of the place, and from it subtract the sun's declination between the vernal and autumnal equinoxes; or to it add the sun's declination between the autumnal and vernal equinoxes, and the required inclination of roof would be obtained. In the *Nautical Almanack* the sun's declination for every day in the year would be found. Exactly at the equinoxes, when the planes of the equator and ecliptic coincided

the latitude of the place equalled the angle which the roof must make with the plane of the horizon. These principles were only necessary where heat and light was required under the most advantageous circumstances, as for ripening fruit trained along the roof at a certain date. In most cases, for plant and flower growing, and where pot plants required to be near the glass, a low pitch economised space and artificial heat, and was better than a higher pitch. He recommended an angle of from  $26^{\circ}$  to  $30^{\circ}$  lower than which rain was apt to drift in under the laps. For fruit growing along the rafters, where the maximum sun influence was required for ripening, from  $36^{\circ}$  to  $44^{\circ}$ , or a mean of  $40^{\circ}$ ; for wall fruit, where the glass must be as near the wall as possible,  $60^{\circ}$  to  $70^{\circ}$ , and a specially narrow house was advisable.

The most natural form was the *lean-to*, and the best aspect would be facing the south. Mr. Fawkes explained that as in a part of the year the sun rose and set so far north the early morning and late evening sunlight would be lost, and according as the aspect deviated from due south aspect, the sun would strike earlier or later. Having brick protection from the north, and glasswork facing south, other things being equal, a lean-to was easier to heat than a house in which the glasswork was exposed in every direction. The span, the next form of house, was used where no high wall existed or was required; for building at right angles to, and in combination with, a range of lean-to houses against a south wall; where minimum height was required, so as to cause as little obstruction as possible; when comparatively small plants required to be easily accessible, and yet near the glass, and when from local circumstances this was not so easily effected in a lean-to; when the sun's rays were required to reach all parts of a plant; when great length of rafter was unnecessary, and when the length of a house was to be north and south, and each side required an equal amount of solar rays. This direction gave the best aspect for a span house. A sort of compromise between the lean-to and the span was the three-quarter span. This was useful when the back wall of an otherwise lean-to required to be as low as possible, that the wall might form the minimum obstruction; also to let light in at the back, or for utilising early or late sunlight, which would otherwise be lost; and when maximum length of rafter was not a *sine qua non*. It was impossible, however, to give a *résumé* of all the combinations which could be constructed.

When a number of houses were required they should be planned compactly without straggling; buildings for consecutive operations should be in consecutive order, so that the boilers should be in a convenient position for their work, and that each building might suffer nothing from combination with the others. Site and levels were important considerations in the planning. The site being frequently a matter of choice, there should be no trees or other objects to obstruct the sun's rays, and the site should be that which would best suit the conditions of aspect, drainage, stokehole, furnace, chimney, potting-shed, fuel-shed, and other buildings, retaining a particular view, &c. If the ground were not level, the exact nature of the inequality should be ascertained; if fairly level in the direction of the length of the buildings, well and good. If the ground fell in that direction, various courses were open for adoption. In any case it was advantageous for the boiler to be at the lowest end, when in many cases excavations for a stokehole might be avoided. Where the ground was perfectly horizontal, the question of floor levels must be considered. He had generally made the floor levels (diagrams referred to) correspond with the ground levels. If there were a difficulty of drainage, or the boiler could not be sunk as low as necessary, it was often advisable to raise the floor level. On the other hand, it might be necessary to sink the floor line below the ground line, that the houses might form the minimum obstruction, in which case great care must be exercised in the drainage, or the houses would be perpetually flooded. Houses used to be sunk to retain the heat, but with existing facilities for heating it was now unnecessary. Houses comprising one range should have their floors on the same level; steps from one house to an adjoining one should be avoided, but, if necessary, parallel disconnected lines of houses might occupy different levels without inconvenience. There should in all cases be easy means of intercommunication between all houses for a wheelbarrow.

In constructing the roof of a glasshouse, obstruction to the sun's rays must be avoided, yet the structure must be durable and substantial, and lateral thrust must be avoided. The rafters should be sufficiently deep for the purpose, but not so deep as materially to arrest the oblique rays of the sun. A roof well tied with light iron tie-rods would enable the rafters to be shallower. As to whether the roof should be of framed lights or not, from his own experience he would say a sash-bar roof with T-iron purlins between the rafters was lighter, had less material, was not so liable to get out of repair by rotting, and would, in fact, answer every purpose better than the heavier and more substantial sash roof. The advantages of a sash over a sash-bar construction were that the roof could be practically stripped, if for cultivating purposes the maximum amount of air were required at any season, and the house could be taken down without the necessity of taking out the glass. For clear glazing, 21 oz. English sheet was generally used. Thinner than this was not advisable, nor was Belgian glass so desirable as English. For fixing the glass he had come to the conclusion that for purely growing horticultural houses no system

was more advantageous than putty-glazing, and it was far from perfect, for putty was apt to peel off, crack, and form crevices for the retention of moisture and insects, and cause the woodwork to rot. Then it was troublesome to renew putty-glazed glass, as well as put it on in the trouble instance.

In some systems of mechanical glazing the glass was held in place by metallic clips, in others by compressible metallic bars, in others between strips of vulcanite or other elastic material, the glass and elastic being held in position by wood or metallic capping and screws. In other systems the glass was dropped into grooves. In all these systems the glass came in contact with a metallic or an elastic substance. In the former case there must be a sufficient amount of "play," or the glass would break. In the latter case the elastic substance gave far more trouble to gardeners than putty properly made and applied, chiefly on account of internal moisture, excessive variations of temperature, and atmospheric influences. If, on the other hand, the glass had any "play" hot air escaped; the house could not be properly fumigated; crevices for retention of water by capillary attraction abounded; subsequent freezing of the water and breaking of the glass were liable, and the crevices which held the water would harbour insects. For other than growing houses mechanical glazing might frequently be employed with advantage.

The most usual form of ventilator was a framed light, hinged at the top and opening from the bottom outwards. Sliding sashes for roof ventilation were almost out of fashion except for simple frames, low pits, and houses in which the roof required to be practically stripped at certain times. Sliding lights were cumbersome and unmechanical, the roof had to be abnormally heavy, and obstructed greatly the solar rays. Both top and bottom ventilators should extend along the whole length of a house, except perhaps in the case of the top ventilators of a span, or three-quarter span, which might often be arranged alternately on each side of the ridge. Continuous ventilators being necessary, consecutive lights might be made to open simultaneously, or each arranged to open separately. Unless, however, there were a great number of lights to manipulate, or unless they were not easily accessible, it was generally advisable to adopt the latter course, for it might not do to have exactly the same area of ventilation along the whole length of a house; at one part there might be plants which required a more constant and copious renewal of air than at another part. If lower vertical lights or ventilators were opened separately, then the ordinary notched hand "set-opens" might be used. If top roof-lights were opened separately, then a quadrant bar, terminating in an eye, might be fixed to each light, and actuated by a cord held by a counterbalance weight or a hook in an adjoining wall or mullion. When, however, to save time, from the large number of ventilators to open, or from inaccessibility—as, for instance, when a vine border or a great width of staging in front of ventilators necessitated their being opened simultaneously—the best gear consisted of a pair of double-jointed arms attached to each light, and keyed to a bar held in blocks fixed to the mullions, the partial rotation of the bar and opening of the lights might be effected by a handle keyed on to the bar at any part, moving in and pinned to a quadrant or half-circle; or the motion could be conveyed by a connecting-rod to some distance. Similar apparatus might be used to actuate top-lights. Double-jointed arms were better than other forms, for they offered no obstruction to pots, plants, foliage, &c.

Roofs had occasionally to be wired to support foliage trained near them. In a lean-to you should take two flat bars turned edgewise and suspend them at back and front by holdfasts, bolted at back through the wall and at front into the mullions. Then at the necessary intervals wires should be stretched by means of raidisseurs to these two bars. Intermediate parallel bars, dependent upon the length of rafter, might serve to support these wires. The wires could thus be at short, long, or irregular intervals; or at any time and as often as required the distance apart of the wires might be altered. In this way they helped to tie on the roof, enabled painting and repairs to be more easily effected, and were more easily adapted to the wants of the gardener than fixing wires permanently and separately at right angles to rafters. He generally employed galvanised iron wire about No. 12 B. W. G., each spaced some 10 inches from the glass. With regard to the interior arrangement of the three classes of growing houses, to speak of the first, the points to be observed in planning the staging were: facility of drainage from pots; economy of space; accessibility; proper distance from glass—depending on height of plants to be grown. For ordinary plant growing the usual lattice-wood stage composed of 3 inch by 1 inch laths, with three-quarter spaces between them, was suitable. When, however, pots or plants required to be plunged in damp moss, sand, shingle, &c., then carefully drained concrete, slate, or zinc-lined wood stages might be necessary. The chief characteristics of a vinery, which belonged to the second class of growing-houses, were: training-wires along the roof; a prepared border, about 3 feet deep; provision for thoroughly draining this border, and for preventing roots of vines planted in it from penetrating to the subsoil. If the subsoil were of a retentive nature, then there must be concrete or other impervious base; on this rubble; then turf, grass downwards; then the compost forming the border proper. If the sub-

soil were of a porous nature, the concrete base might be omitted. It was generally considered best for the border to run outside as well as inside, therefore the front wall should be built on arches, or composed of iron uprights filled in above ground line by slabs of slate. The total width of a border should equal the width of the house. The chief characteristic of the third class—forcing-pits, &c.—was an arrangement of hot-water pipes to heat the soil of which the bed was composed, supplementary and independent of the pipes for atmospheric heat. The pipes might be carried through the bed itself; or, better, they might be carried through an air-chamber under the bed. In this position the vapour-troughs with which they might be fitted were more accessible, and was a better arrangement than that which necessitated water passing through the bed before it could be vaporised by the pipes.

In the treatment of conservatories or showing-houses several points were to be kept in view. A conservatory must be treated as one of the reception-rooms of the dwelling-house, and without departing from its strictly horticultural character, there should be an endeavour to make it approximate architecturally both inside and out to the rest of the dwelling-house. The functions of growing and showing must be regarded as separate, or in case of necessity a compromise must be effected or the conditions of the one would succeed to the detriment of the other. In a conservatory the eaves had frequently to be from 9 to 12 feet high and interior staging dispensed with; the site was generally dependent on proximity to a drawing-room or hall, where frequently the sun did not reach it. A conservatory required heavier scantling than a growing-house, and to a certain extent obstructive ornamentation. He would say they should, in designing a conservatory, construct it in harmony with the adjoining or surrounding architecture; give as much light as possible; ornament the construction. In the interior, he would say: throw away stages, hide the pots, and show natural beds and banks of foliage and flowers massed with artistic irregularity. There should be an ample paved space—not a mere path, but a space that a table and a chair or two might be placed in, and the conservatory should be regarded rather as a lounge than as a place to walk round in single file. If the size and nature of the conservatory permitted, rockwork, a fountain, or sculpture, might find a place in it. Baskets of hanging foliage looked well. Bare walls as well as other parts might have creepers on them. A grass mat or two might be thrown down here and there, and a parrot advantageously introduced. Sometimes an awkward space in the brickwork might easily be turned into an aviary. In fact, without sacrificing the strictly horticultural *raison d'être* of the structure, a judicious combination of art with nature would intensify the enjoyment derived from a conservatory, and the beauties of plants and flowers might be absolutely enhanced by the introduction of such artistic accessories as he had mentioned.

A vote of thanks was proposed to Mr. Fawkes for his paper by Mr. Cole Adams, and seconded by Mr. P'Anson, and supported by Mr. H. W. Pratt. These gentlemen in their remarks commented on the excellent series of drawings by Mr. Fawkes, which were hung around the room, who had admirably suited them for the purposes of the lecture.

Mr. FAWKES then replied, and the meeting adjourned.

### FIRES IN THEATRES.

MR. DION BOUCICAULT in a letter to the daily papers writes:—

The materials employed in building and furnishing theatres, both before and behind the curtain, may readily be rendered fire-proof if architects, builders, and managers would take the trouble and precaution so to provide. The process by which wood and textile fabrics can be made incombustible is not new, nor tedious, nor expensive, nor protected by patent. The entire of a theatre and its contents, including wardrobe, might be so treated at an outlay of less than 500*l*.

After the occurrence of the Brooklyn fire an exhibition was held at Wallack's Theatre, New York, in the presence of the heads of the fire department of that city. An ordinary scene was set on the stage; a large heap of wooden chips and billets several feet in height was placed in the midst. These materials had previously been treated by a simple process, which, it should be stated, does not apparently alter any textile fabric, even the most delicate muslin, in appearance, or in any sensible manner. A flexible hose one inch in diameter was fixed to the gas-main, and a flame was caused to issue from the nozzle about 6 feet in length, spreading to 2 feet in diameter. This torrent of fire was applied to the scenery and the heap of chips without affecting them in the slightest degree. The flame, rather alarming in dimensions and intensity, was held there until the officers of the fire department declared they were satisfied that the materials were incombustible.

A building constructed of such materials should be inspected and tested by qualified, skilled authorities, who, after being satisfied of its condition, might give a certificate to that effect. A copy of the paper should hang in every entrance, and be printed as a

standing part of every playbill. This precaution should serve to allay apprehension among the spectators, and greatly lessen the chance of panic.

Some years ago I ventured to suggest that theatres and all places of public amusement should form a mutual insurance company, with special rules and regulations, and with an experienced staff of officers to travel round inspecting theatres to ascertain and certify the rules and regulations were adhered to. Such supervision and care it would be the interest of the theatres to exercise over each other. The exorbitant premiums now paid to insurance offices would be reduced, and the marketable value of theatrical property be measurably enhanced. Any theatre reported careless and unsafe would not only forfeit its insurance and be struck off the books of the company, but no other prudent office would accept a risk on it; and thereby its marketable value would be deteriorated. The Lord Chamberlain might insist that the muslin skirts worn by the ballet should be fireproof. I know by experience the risk incurred when the stage, during a pantomime, is laid down with ground rows of gas over which these skirts float. Clara Webster was burnt alive in sight of the audience from an accidental touch of her ballet skirt to a gas-burner. If this poor child had rushed among the corps de ballet, it may be left to the imagination what a horrible scene would have ensued. Yet no adequate precaution has been taken to provide against the recurrence of such a catastrophe.

### FIRES AT COUNTRY MANSIONS.\*

THE announcement that a country mansion has been totally or partially destroyed by fire has come to be recognised as one of those inevitable contingencies that are bound to occur at intervals comparatively of short duration. A fire, no matter where, is a disastrous occurrence at any time, although there may be occasionally some consolation in the fact that it paves the way for much needed improvements. The great fire of London was considered at the period of its occurrence an almost unparalleled calamity, but we have no doubt now that it was, on sanitary grounds alone, productive of the greatest possible good. But the destruction of some rare specimen of ancient domestic architecture, containing perhaps an invaluable collection of art treasures, and itself rich in historical associations, has no redeeming feature; and when such a calamity occurs on a large scale, we cannot but feel that a national loss has been sustained.

Although there is no doubt that the destruction of many old country mansions is the result of carelessness, or at any rate might have been avoided with the exercise of some care and forethought, yet the greater portion have, I think, come to an untimely end from causes which it was very difficult practically to provide against.

I am led up to this remark by a paragraph in *Baily's Magazine* for November anent the loss by fire of Everleigh House in Wiltshire, in which, with the best of intentions, it is suggested, with the view of preventing conflagrations, to have every fireplace, flue, and hearth examined and all timbers too near the fire removed. If a mansion is undergoing thorough reparation, there would be perhaps no obstacle in the way of taking up all the hearths, removing all the grates and chimney-pieces, stripping the plastering off walls in the line of flues, and making a general search for wood beams, wood bricks, wood bond, and joint wedges; but I submit that in an inhabited house the occupier, as a rule, would prefer the risk of fire rather than have every room reduced to a state of chaos, and the fittings perhaps irreparably damaged. Nothing short of what I have described would render it certain that dangerous wood had been removed, and even then the flues themselves might be defective. I grant that no very great danger should be anticipated from the proximity of wood to the chimney-flues between the top of the wainscoting or skirtings and the ceilings or under side of cornice; but the element of danger exists all the same, for wood blocks have been found inserted over the fireplace for the purpose of fixing a chimney-glass or overmantel thereto, and wood blocks also for securing the bell-pulls, or bell-cranks; and I have myself seen a block of wood removed from a chimney-breast about midway between floor and ceiling, which went into a flue, and the existence of which can only be accounted for by assuming that it was placed there for one of the above purposes, or was the end of a putlog inserted at the time of building, and for some reason or other sawn off instead of being withdrawn.

The destruction of old country mansions may be traced usually to one or other of the following causes:—1. Lightning. 2. Constructional defects—that is, those which originate from improper construction, and which can only be ameliorated, viz., defective flues, fireplaces, and hearths (so called, but more truthfully bad carpentry in fixing wood contiguous to or into chimney-stacks and fireplaces), timber beams under hearths, or wood bearers for supporting the hearths, and carelessly-arranged heating apparatus, hot-air flues, hot-water pipes, and iron stove-pipes. 3. Spon-

\* A paper, by Mr. Thomas Potter, read at the meeting of the Clerks of Works' Association on the 4th inst.

taneous combustion. 4. Accidents, or, more properly speaking, carelessness of a more or less positive order, such as dropping lighted tobacco on carpets, smoking where there is straw from packing-cases and wine-bottle covers, shavings, or firewood, or in the lamp-room, overturning of oil lamps, setting light to window-curtains, reading in bed, insufficient control of lucifer-matches, carelessness with gas, leaving fires unprotected in the grates at night, carrying lighted benzoline or oil lamps and candles where straw or shavings accumulate from the unpacking of goods, and some others that would appear to rank next only to incendiarism.

With regard to lightning, this may be considered as one of the causes of fire, the danger from which may be reduced to a minimum by the use of lightning-conductors. But these may be rendered useless if not properly constructed or fixed, or if the area to be protected is guarded by only one conductor. The general rule appears to be to place a single lightning-conductor on top of the highest chimney, and this is assumed to be sufficient to protect the entire building, no matter how large, from the electric fluid, but the Lightning Rod Committee appointed by the learned societies to investigate the subject came to the conclusion that, although the highest point attainable was the proper one to fix a conductor, the area of protection was limited, and the line of limitation was obtainable thus?—From the point of the conductor draw an imaginary line at an angle of 45 degrees till it reaches the ground. The latter is on the circumference of a circle of which a perpendicular dropped from the point of the conductor would be the centre. The figure, in fact, would be a cone, the conductor point being the apex, and all the buildings standing on the base of the cone might be considered free from danger; of course there would be as many conductors needed as the magnitude of the buildings required. Where there are lightning rods, it is essential that all underground gas-pipes, water-pipes, or metals of any description be kept a respectful distance from the ends of the rods which are buried in the ground, or the electric fluid, instead of passing harmlessly away in the great storehouse of electricity, the earth, may get transmitted where least expected. With regard to defective hearths, fireplaces, and flues, it is estimated that about three-fourths of all the conflagrations in town and country arise from these causes. But the description of the cause of such fires is varied; sometimes we read of over-heated flues or defective flues, or, as at Ingestre Hall, from timber beneath the hearth-stone. Practically the fault is not that of the flues themselves, but of the careless manner in which timber is brought into almost direct communication with them. What is known as a "defective" flue may arise from various causes; it must be remembered that when the chimneys of old country mansions were built, climbing boys were their scavengers, and the conditions under which the soot was removed were far more favourable to that process than by the sweep's machine. Many of these flues are irregular in size, and usually much larger than the present ordinary house flues, and the result is, the sweep's brush, being too small for the opening, only dislodges such portion of the soot as it happens to come in contact with; and another disadvantage is that the sweep's brush is round, while the flues are square, so that the corners or angles of the flues seldom get thoroughly cleaned out. Still other disadvantages arise from the fact that these old flues, while they often travel for some distance in a perpendicular direction, suddenly go nearly flat, and form what the sweeps call "dead slants"; and as the elastic rods of the machine can only bend to a certain curve, the angles of these "dead slants" remain unswept, and, in addition, afford receptacles for an accumulation of soot, which, becoming heated, takes fire and smoulders for a considerable time. Occasionally there are in some chimneys what appear to be recesses made at the sides of the flues, probably as resting-places for the climbing boys; and these recesses and the "dead slants" are the points of danger, as the brickwork becomes hot; while the pargetting of the flue having probably been scraped away by the periodical application of the sweeping-machine, the mortar joints of the brickwork get, in course of time, partially disintegrated.

As an instance of the danger from these places, I remember, some years ago, a case where a strong smell of smouldering wood pervaded a bedroom of a mansion. After searching for some considerable time without success for the origin of this smell, smoke was seen to come up between the joints of the flooring; and on tearing up the boards, the mortar joints of the bricks between the floor and ceiling were found to have disappeared. On cutting a hole in the brickwork, a large quantity of soot in a burning state was found in a flue, of which these loose bricks formed a portion of the side wall. Of course, the inevitable shavings were discovered below the floor-boards adjoining the flue, and these were in a charred condition, evidently on the point of bursting into a flame. Now, had a general search been made for wood, no one would have thought of looking below the skirting-board for danger, especially as this flue appeared to pass in quite another direction.

Another source of danger in old mansions is the existence of bond timber in walls; this is practically unknown now in new buildings, but the builders of old were apparently profuse in their use of wood bond, and, unfortunately, they often, with the view of rendering it efficient, built it in the middle of the walls; and I

have found, during some alterations, bond in the centre of a wall within a few inches of a chimney flue, and blackened from heat. No search could possibly have detected the existence of this element of danger. Cliefden Mansion, near Maidenhead, was destroyed by fire in 1849, and attributed to wood bond timbers running into a flue.

Chimney beams, consisting of oak timbers 9 or 12 inches square, were usually employed instead of what we know now as the "chimney bar." I can find no record as to when chimney bars were first used; but wood beams are known to exist in houses less than 150 years old. All chimney beams that I have come across appear to have been fixed about 5 feet from the floor, and in many old mansions I have no doubt these beams still exist, a chimney bar having been subsequently employed without removing the beam, and a course of bricks built in between the bar and the beam, which would give about the right height for a modern grate. Now, when this beam is plastered on the outside and hidden from view, and a grate is perhaps badly fixed, leaving flat ledgments for soot to accumulate on the inside, we may guess the amount of risk incurred. Loughton Hall, burnt many years ago, is an example of a mansion burnt through the chimney beam taking fire.

An instance of the difficulty of being able, no matter how careful a search is made, to find out and remedy the danger existing from imperfect flues, occurred some years ago at a large public building in the North of England. I forget for the moment where, but at the time the hall was occupied by a number of people, when smoke was seen issuing from behind the architrave of a door, and on removing the same what is described as a "cavity" was found, into which burning soot had dropped, not, I believe, from the flue, but from a "pocket" in the chimney, the soot, it appears, having got there through the "with" or division between the flues and pockets having either got damaged or been improperly constructed. I think, therefore, we may safely assume that chimneys which have been built perhaps hundreds of years, cannot, under any circumstances, be vouched for as safe—at least, not from any amount of external examination; and this was my view when, some years ago, it became absolutely necessary to take preventive measures with regard to some suspicious flues.

My first idea was to cut away the breasts in the line of flues, and insert terra-cotta or fire-clay pipes the whole of the way, but the damage that would ensue in the execution of this project to costly finished walls, rendered it practically out of the question. I found, however, that the flues, although irregular in sectional dimensions, were in no case less than 18 inches square, and that they went much straighter than ordinary modern house flues, and with these two advantages ascertained, at some trouble, I determined to try and put a new flue into an old one by commencing near the top of the chimney. On the upper, or attic floor, therefore—making sure there was no timber above that point—I cut a chase into the flue 5 feet in length, and large enough to admit a flanged flue-pipe of 9 inch bore. Two pipes were then cemented together with a quick setting cement—Roman I think—so as to have them in lengths of 4 feet each. A long rope was passed through the pipes, and attached to an iron bar made to securely clip the bottom of the pipe. The 4 feet of flue-pipe was then passed down the brick flue, and another 4 feet having been cemented thereto, and allowed to get thoroughly firm, the 8 feet of flue was gently lowered, when another 4 feet was added, and the *modus operandi* was continued till the throat of the fireplace was reached. The rope had, of course, to be passed through each additional 4 feet of flue, and secured over an iron rod fixed in the brickwork above, while the cement joint was hardening. When an unfortunate "dead slant" was reached, there was no choice but to cut out the brickwork, have another start with the pipes, and make the connection between the upper and lower portions of the new flue sound and perfect with similar pipes, which was of course no great deal of trouble. On the face of it this would perhaps appear anything but a feasible project, but the actual result was a great success, as the breasts that had to be cut open were fortunately in rooms where it was of but little consequence. One flue I was enabled to pass down through a room whose height was 24 feet from floor to ceiling without disturbing the wall, a great piece of good fortune, as it was lined with marble for a considerable distance above the fireplace. Several chimneys were treated in this way, and all successfully. The Act of Parliament had occasionally to be evaded, as a boy was sent up, if needed, to "ease" the pipes whenever they took to lodging on any "set-off." It was of course necessary to allow the cement joints to get thoroughly secure before sending the flue on its way, and also to well secure the pipes at the bottom, otherwise the sudden appearance of the chimney flue tumbling into the fire might at some future time create some astonishment and alarm. The grates necessarily had to be taken out, except where they were not enclosed over the fireplace. This work was done ten years ago, and no bad result has followed—in fact, an advantage arose, inasmuch as the draught was increased. Before leaving this portion of my subject I might mention with regard to flue-pipes, as an instance of the difficulty with which any improvement is forced upon public notice, that the original inventor and patentee of pipes for use in the construction of flues found his invention so little appreciated that, after persevering for some considerable time he

was obliged at last to sell his stock for drain-pipes at a very reduced cost.

Some discussion has taken place at times as to whether flue-pipes cause the soot to drop into the fire, and I find this is so, unless a good long easy bend is given to the line of flue, and very much so if the flue-pipes are glazed. It is for this reason I assume that flue-pipes are now made unglazed. Circular or elliptic flues are necessarily much more efficiently cleaned than square or rectangular brick flues, and the up-draught is much greater. It is obvious that circular pipe-flues require sweeping oftener than the ordinary kind, at least where they are swept; for I know of a number of cottages built in a country village thirteen years ago where not one has ever been cleaned, for the occupiers, to show their confidence in the fire-resisting properties of their pipe-flues, simply push up an armful of shavings occasionally and burn them out; and the flames coming out at the top pretty regular is considered by the neighbours as evidence of the tidy habits of the respective occupiers. A good deal more might be said as to flues and flue-pipes, but not connected with fires at country mansions, and therefore inadmissible; but I have no hesitation in stating that whole socketed terra-cotta or fireclay flue-pipes, well jointed together and encased in the ordinary brickwork of a chimney, and the cavity between the perimeter of the pipes and the brickwork filled in with concrete made of coke and cement, are—as far as danger from fire is concerned—like “Cæsar’s wife,” above suspicion. Butt joint-pipes and socketed pipes with two sides cut off, cannot, I think, be considered so safe as whole socketed pipes.

In connection with brick flues there is another point as far as regards mansions in some parts of the country—viz., that a great deal of wood is often burnt, and that flues get foul much quicker therefrom than when coals only are used; and also that the resins contained in wood appear to create flakes of soot of large dimensions, and more readily inflammable than those engendered from the use of coals alone. Having made the flues all right, if the grate has to be removed for the proper fixing of the first flue-pipe, it will be well to search the fireplace opening for wood plugs, and, at any rate, to well parge or plaster both sides and back with Portland cement and sand made from crushed coke or broken bricks—a material which will stand heat as well as any I know of—and, if a chimney beam is found to exist, to have it out at any cost. Hearth slabs if cracked or showing danger may have to be taken up; but I suggest that a marble or stone curb, just now in common use in good houses, can be fixed; and if the hearth slab be of ordinary stone or other material of common character which it would be no loss to lose sight of, a tile hearth on half an inch thick of Portland cement bedded on the slab would render any danger from wood which may be beneath practically out of the question, and the inch higher which the hearth would be above the floor should not be noticed. As the fireplaces are mostly in or about the centre of the walls, and as the beams to carry the floor joists are usually also in the centre, it follows that the ends of the beams often run into the chimney, and should always be looked upon with suspicion, and have, in fact, been the origin of many conflagrations. Wood chimneypieces and overmantels—even wood coal-boxes—are all more or less “little helps” to a big fire, although not to be classed amongst the dangerous factors; so are wood dadoes, wainscottings, and skirtings, not necessarily of themselves so much, as the fact that they conceal the brickwork contiguous to chimney flues, and render the discovery of possible danger thereabouts difficult to detect. The battening and plastering—or, as is to be found in many old houses, battening and canvassing—of brick walls is fraught with danger, as not only are the walls most likely plugged with wood in all directions, but the battens being fixed vertically form so many shallow flues, up which and behind the plaster the flames have no check whatever. Had the battens been fixed horizontally this evil would to a great extent have been avoided.

Fixed marble or stone curbs in place of fenders are an element of safety, as pieces of burning coal or wood falling out of the fire and lodging beneath the ordinary metal fender and igniting the carpet is avoided; so also are the slow combustion grates, with the fire-boxes resting on the hearth, as the burning embers cannot by any possibility fall outside the fender curb.

With regard to heating apparatus of all kinds other than the ordinary fireplace grate, old mansions stand at a disadvantage, inasmuch as no provision was made in the more ancient ones for anything of the kind. Heating-stoves, whether of iron, fire-clay, or terra-cotta, are safe enough in themselves if care is taken that they stand clear of all combustible materials, but it is the iron flue-pipe necessary for carrying off the products of combustion which must be recognised as the dangerous element. If the iron pipe is led into a brick flue, the point of connection made sound, and no inflammable material within some feet allowed, they are of course fairly safe; but in Brecknockshire some years ago, according to a newspaper report, a fire broke out in a country church and was discovered to have been caused by a bird having built its nest at some point contiguous to an iron stove-pipe, which, when heated, set the nest on fire; here, however, wood must have been not far away, possibly the flue-pipe was carried up through the roof between the rafters, and the nest might have been in the roof and out of sight.

Hot-water and hot-air appliances are necessarily and usually only indirect causes of fire, inasmuch as the heat from the pipes and flues parch all woodwork they happen to be near, and render it therefore ready to ignite with the smallest provocation. In new buildings, of course, wood is kept a respectful distance from any danger points; in old buildings this is impossible, and walls, floors, and ceilings have to be cut away wherever required, and contiguous woodwork protected in such manner as seems most desirable. The small-bore or high-pressure hot-water heating pipes must be, I think, more dangerous in this respect than the larger ones. The question was raised some years ago, and it was attempted to be proved that wood might be ignited by being placed for some considerable time against a hot-water pipe, but this is not, I believe, now considered probable.

Hot-air flues should be constructed of some unflammable material, but I knew of one some years ago made of wood, but lined with the thinnest sheet iron, and which joined the heating chamber; when a “big heat” was got up, it was almost impossible to bear your hand on the wood casing. No expense should be considered in making the room where the heating furnace is placed, and the adjoining fuel room, perfectly fireproof. In old mansions these are generally placed in the basement, and often near the centre of the building, so that there should be as little loss of heat as possible from long flues or pipes.

(To be continued.)

### THE ORDNANCE SURVEY OF ENGLAND.

THE completion of the Ordnance Survey of Scotland has given occasion to some remarks upon the apparent dilatoriness with which the survey in England has been conducted. Major-General Cooke, the Director of the Survey, assigns the want of adequate funds as the cause of the delay.

The progress of the cadastral survey has depended, he says, entirely on the sums voted by Parliament for its execution, and it has always been the endeavour of the Director for the time being to get these sums increased. Until 1880, however, the greatest apathy prevailed in the country as to the progress of the survey, and it was impossible to get more money allotted to it. In that year the question of facilitating the transfer of land was brought prominently forward, and, as a good map of the country on a sufficient scale is one of the most important desiderata for dealing successfully with that question, the attention of the country and of Parliament was called to the great desirability of completing the Ordnance Survey at an early date and the apathy which previously existed was suddenly exchanged for an urgent demand for acceleration. At the rate at which the Ordnance Survey was progressing with the grants then allotted by Parliament, its completion could not have been looked for before 1900. Arrangements have now been made by which the cadastral survey, including the publication of the maps, will certainly be completed by 1890 and probably by 1889. A still further acceleration can be made if sufficient funds are provided, which will result in its completion certainly in 1889, and possibly in 1888.

The accuracy of the Ordnance Survey depends upon a complex organisation which cannot be suddenly and indefinitely expanded, and the Director considers that any further acceleration is impossible without a great increase in cost and a diminution in accuracy which it is difficult to estimate.

### THE ALBERT EXHIBITION PALACE.

THE first general meeting of the Albert Exhibition Palace Co. (Limited) was held last week at the Offices, Palace Chambers, Westminster; the Duke of Teck, G.C.B., in the chair. The President, in moving the adoption of the report, said he was glad to meet the shareholders, in compliance with the statute, even though the proceedings would be purely formal in their character, as there was no business to transact. The difficulties naturally incident to the formation of all large companies were numerous, and in this instance, owing to peculiar circumstances, they had been exceptionally great, but they had now been surmounted. Their main object was by enlightened management to promote technical education in the various arts and sciences among all classes, and to afford rational enjoyment and recreation of an elevating tone and character. The site on which it was intended to erect the palace was admirably placed, being within 100 yards of the York Road Station on the Brighton line, and within a very short distance of stations on the Chatham and Dover and South-Western Railways. There were also close at hand two steamboat piers upon the Thames, at one of which, he was informed, no fewer than 25,000 persons were frequently landed in one day. There were also tramway and omnibus services to all parts of the metropolis. The palace would overlook Battersea Park. The motion was seconded, and the report unanimously adopted. The President having expressed his readiness to answer any questions, a shareholder, who was a member of the Wandsworth District Board of Works, stated that there was throughout the whole of

that district a strong feeling in favour of abandoning the unmade portion of Warrener Gardens, in order to carry out the designs of the palace in their entirety. A resolution had been adopted at that Board in favour of that course, and he urged the council not to relax in their endeavours to accomplish this object. The proceedings then closed.

### EDINBURGH ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on the 6th inst., the president, Mr. McGibbon, in the chair. The President stated that the Exhibition Committee were getting on very well with their arrangements, and there was every prospect of a successful exhibition. Promises of architectural drawings had been obtained from the principal architects in Edinburgh and London; and a large number were expected from Glasgow and elsewhere. The Duke of Buccleuch had promised the loan of some of the celebrated Canaletti drawings, as well as a model executed by Kemp; and proposed contributions had been intimated by Lady Ruthven, Lord McLaren, Professor Archer, Messrs. R. Phené Spiers, J. R. Findlay, and others. It had not yet been quite arranged who was to open the exhibition. The conversazione was to be held on the 22nd inst., and it was hoped that the President of the Royal Scottish Academy would perform the opening ceremony. Mr. Leonard A. Wheatley then read a paper on "Building and Architecture in Babylonia and Assyria." In the course of his remarks he gave an account of the Assyrian people and the sources of our information as to their history and architecture. "The large mounds on which the palaces were built were stated to be formed of bricks, and the inscriptions told of forced labour employed on them. The summit of these mounds was reached by flight of steps, traces of which were found at Persepolis. The plan of this palace showed the size and number of the rooms and courts. The method of transporting stones was described, and it was explained that the cities of Nineveh and Babylon were of such size that gardens and parks were included within their walls, and that the temples were of great height—two mentioned by Ferguson being of seven storeys. The houses were placed wide apart. The Assyrians, although conversant with the use of the arch, introduced it only for portals and smaller openings. The ceilings of their large halls were supported by wooden columns, the stone one of Persepolis having had, undoubtedly, a wooden prototype. The paper was illustrated by means of drawings and diagrams. A vote of thanks to Mr. Wheatley terminated the proceedings.

### SOCIETY OF ANTIQUARIES OF SCOTLAND.

THE first of the monthly meetings of the Society for the present session was held on Monday, Dr. Arthur Mitchell, vice-president, in the chair. The first paper read was "An Examination of the Newton Stone Inscription, Aberdeenshire," by the Right Hon. the Earl of Southesk. The Newton Stone had been 70 years known to antiquaries, and yet its double inscriptions had not been satisfactorily read. Through the kindness of Mr. Gordon, the proprietor of the estate on which it stands, he had enjoyed ample opportunities of studying the monument, and he had also had the advantage of photographs taken from new points of view. After an elaborate investigation of both inscriptions, letter by letter, he came to the conclusion that the Ogham inscription answered to the first part of the literal inscription only, that both these were renderings in a Celtic dialect of a brief sepulchral formula; but that the concluding part of the literal inscription was mythological—a religious invocation. The characters in which it was written, he thought, were analogous to the Greek letters written by Irish scribes in such early Irish manuscripts as the Book of Kells. The rendering of the inscription which was the result of his investigation in some respects closely agreed with that of the late Mr. Brash, and made it commemorative of "Eddi, daughter of Forrar, of the race of Jose," the last word being equivalent to Huas, the Solar god, who was the same as Dionysus and Bacchus. The Ogham part of the inscription, he thought, was for the priests, and the other part for those initiated in the mysteries. The second paper, by Dr. Daniel Wilson, Principal of the University of Toronto, Hon. Mem. S.A. Scot., was "A Notice of the Runic Inscriptions in St. Molio's Cave, Holy Island, Argyleshire." After referring to the interest excited by the discovery of the remarkable series of Runic inscriptions carved on the interior walls of Maeshow, in Orkney, Dr. Wilson remarked that the series in St. Molio's Cave, though fewer in number, were specially interesting as being, in his opinion, memorials of some of those who were engaged in the memorable battle of Largs. From the Norwegian account of King Hakon's expedition, we learn that after the battle the King sailed past Cumbræ to Melansay, or Molio's Isle, which protects the entrance to Lamlash Bay, and there lay with his ships for some days. The cave of the Celtic saint is little more than a sea-worn recess in the rock about 25 feet above the present sea-level, and would doubtless be visited by parties of the Norwegians seeking supplies of water from the Saint's well. The roof and sides of the

cave are covered with rude marks, crosses, monograms, and other carvings of different periods, and among these are several inscriptions in Runes, which were copied and deciphered by Dr. Wilson in 1850 and 1863. They consist chiefly of the names of individuals with the addition of the formula "carried this," but one seems to be of a satirical description. Dr. Wilson devoted part of his paper to a critical examination of the style and lettering of the inscriptions, and concluded with a description of St. Molio's chair, or stone bench, a projection in the cave which is thus named, and which recalls many other memorials of early Celtic saints of a like kind, which he instanced and described. He also called attention to the fact that the cave has attracted the attention of visitors, and that some of its interesting inscriptions have already been defaced. The third paper was a "Notice of the Battle of Glenshiel, June 10, 1719," by Alexander H. Millar, F.S.A., Scot.

### ANCIENT EGYPTIAN ARCHITECTURE.

A LECTURE was lately delivered at the Castle Museum, Nottingham, by Mr. R. Phené Spiers on "Ancient Egyptian Architecture." Mr. T. C. Hine occupied the chair, and briefly introduced the lecturer. Mr. Spiers reminded his audience that the antiquities of other countries faded into insignificance when compared with those of Egypt. Exhibiting a plan of that part of the country in which those antiquities were chiefly found, the lecturer described the configuration of the valley of the Nile, and said the principal historical monuments were to be found between Cairo and the second Cataract. The population of that land was at one time 7,000,000, but it had now dwindled down to 4,000,000. The Pyramids, their age and dimensions, formed prominent objects to which the lecturer devoted his remarks. The tombs and the royal chambers were spoken of in detail, and, in order to give some idea of the size of the Great Pyramid, he observed that thirty museums of the size of that at Nottingham Castle could be placed within it. The tombs of the kings and queens at Thebes were described, and attention was called to the remarkable skill in design and architecture which the ancient Egyptians possessed, as disclosed by the explorations of Belzoni and more recent travellers. The temples of Egypt, like those of all pagan countries, differed from Christian cathedrals, in that none but the king and the priests were admitted into them. The ruins at Luxor, containing representations of the victories won by Sesostris, were described, as were also those at Carnac. Of domestic architecture no traces remained, and all that could be gathered in this respect was what was to be found in the ancient monuments; but he would strongly recommend his hearers, if they should happen to be in London, to visit the approaching exhibition of Alma Tadema's pictures, for that great artist, though he had never been in Egypt, seemed to know more than any one else of Egyptian architecture. As regarded Cleopatra's Needle, the lecturer said that although it had been placed in a magnificent thoroughfare in London, he did not think the site, from an æsthetic point of view, was a desirable one. The chief essentials of Egyptian architecture were that they were designed with a view to produce a profound religious impression.

At the close of the lecture, a vote of thanks was proposed to Mr. Spiers by Mr. Fussell, and seconded by Mr. Felkin.

The lecture was illustrated by a large number of excellent drawings.

### THE WOOD STREET FIRE.

THE vast destruction of property in Wood Street, London Wall, and Philip Lane will doubtless not be without its practical lessons for those who are interested in this class of property. Many doubts will be set at rest—the relative value of fireproof construction, size of areas, well-holes, heights and cubical contents of buildings will be subjects of fresh investigation. Iron doors, double or single, appear to be of little use in stopping the progress of the flames. They are either split by the water when heated, or, as may be seen where they remain in position, they are so bulged that the flame licks round them and past them; while iron girders and columns, as their custom also is under fire, have twisted and buckled, dragging away walls in their writhing, which would otherwise have proved sufficient to prevent the spread of the calamity.

One noteworthy feature in this fire is the fact that the flames spread along the roofs and so downwards, parapet walls not being effectual when large masses of burning material were shot up and scattered broadcast over the whole area, portions of the burning debris being seen as far as St. Paul's Churchyard.

The number of warehouses destroyed is sixteen or seventeen, the total area of the damage being about 52,738 feet super. Messrs. Rylands & Sons' warehouses occupy the largest area, two of them being on the Curriers' Company's estate, whose picturesque hall so narrowly escaped, a portion of the roof to tower only being damaged by fire, and the remainder of building by water.

Large building operations will now speedily be put in hand. Messrs. J. & J. Belcher, the architects of the Curriers' Hall, and a large portion of Messrs. Rylands' premises, will rebuild the whole of their property. Messrs. Ford & Hesketh will no doubt be

engaged on Messrs. Foster, Porter & Co.'s, where the fire originated, the premises having been erected by them.  
 This is an excellent opportunity for the much-needed widening of Wood Street, an opportunity which may not occur again. From Messrs. Foster & Porter's corner to London Wall is nearly 400 feet.

#### New Museum of Science and Art, Dublin.

SIR,—With reference to your editorial remarks on the proposed new Museum of Science and Art, Dublin, at p. 359 of the *Architect* of the 9th inst., I am directed to point out that it is erroneous to state that Colonel McKerlie, the Chairman of the Board of Public Works in Ireland, was one of the Committee of Selection.

The fifth member was Sir George Hodson, Bart., so that all the members of this Committee were Irish gentlemen.

I am, Sir,  
 Your obedient servant,  
 Office of Public Works, Dublin: THOS. LONG, B.A.,  
 December 13, 1882. Private Secretary.

SIR,—In your article on the above subject the main point at issue has been completely overlooked. Public opinion in Dublin—and not, as you seem to infer, disappointed Irish competitors—has pronounced not only all the five designs unsuitable, but also the site on which the building was to have been placed.

The Treasury are in possession of a very large piece of ground, and adjoining premises could readily be acquired on moderate terms; yet it is proposed to squeeze the Museum into a corner, where it will overpower and darken Leinster House and Kildare Street, and the area of which is so limited that competing architects experienced the greatest difficulty in providing the stipulated 100,000 feet of floor area.

The learned societies of Dublin, the Royal Irish Academy, and Royal Dublin Society were not consulted either as to the site or designs; both the city members, and those for the University and County Dublin, were all ignored; also the Lord Mayor and Corporation of Dublin.

Surely the Dublin public and representative bodies like the above are not to stand by and allow "the Department" to force on them a Museum of incongruous design on a contracted and unsuitable site.

It is much better that the question should be fully debated and ventilated than when it is too late.

You object to the matter being reopened, as being unfair to the competing architects. No one wishes to act unfairly with them; by all means let them be paid liberally for their plans, for they are not to blame, as the choice of site did not rest with them.

You urge the Government to proceed with the erection of the Museum irrespective of Irish opinion; but you seem to forget that two years ago the designs for the Glasgow Municipal Buildings were found unsuitable. Mr. Corson, the author of the selected design, was paid the prize (750*l.*), and a new competition was instituted, with the result that Mr. Young's design was selected. If it was open to Glasgow to change its mind, Dublin has infinitely more cause for demanding the reopening of a question on which it was never consulted. Not only are the designs artificially restricted to an unsuitable site, but the space apportioned to the collection of the Royal Irish Academy is one-sixth of that actually occupied at present in the Academy houses and proved to be insufficient, some unique historic objects being stored in cellars.

I enclose a report of the proceedings at the meeting held at the Mansion House on the 25th ult., which will explain the state of affairs better than I can in a short letter. Dr. Lyons, M.P., the Lord Mayor, the Secretary of the Royal Dublin Society and Treasurer of the Royal Irish Academy, unanimously condemned the present scheme.

Having been appointed one of the committee to urge the authorities to pause before it is too late, must be my apology for troubling you with this letter.

Yours faithfully,  
 198 Great Brunswick Street, Dublin: JOHN L. ROBINSON.  
 December 12, 1882.

SIR,—Without attempting to prejudge or prejudice the case, it is only fair to the other competitors that assertions such as those contained in your last issue should not go unchallenged; but doubtless many, including the "other competitors," will be anxious to know when and to whom the announcement spoken of was made—viz., that Mr. Freeman's designs had been chosen by the "Committee of Selection"; and certainly the information as to Mr. Freeman's building being the best lighted, &c., &c., that is not in accordance with "general opinion." On one point I cordially agree with your correspondent, *i.e.*, a prompt

decision of the competition is desirable, in order to check a "spurious agitation," and, I may add, written self-praise, in favour of a particular design, which is manifestly unfair to the other competitors.

You will, I am sure, give as much publicity to this as to the letter of your correspondent.

JUSTITIA.

#### CHURCH BUILDING AND RESTORATION.

**St. Stephen's-by-Launceston.**—A contract for the restoration of this church has been entered into between Mr. Burt, builder, and the trustees of the church lands of the parish, and the work will be at once proceeded with under the direction of Messrs. Hine & Odgers, architects, Plymouth, whose plans have been approved by the Charity Commissioners. The contract amount is about 1,400*l.*, and provides for the renovation of the walls, roofs, and floors. The fittings and furniture will be provided by subscription. The church, which is of much historical and architectural interest, was collegiate before the Conquest. There is an arch on the north side, which was probably connected with the college, otherwise the present church is fourteenth-century. About eighty years ago it was badly treated: the roofs were then closed up with flat plastered ceilings, garnished with rosettes of the period. The open-timbered roofs will now be restored.

**Edinburgh.**—St. Thomas' (English) Episcopal Church, which was built in 1842 by the late Mr. Cousin, has been entirely reconstructed from plans by Messrs. Wardrop & Reid, architects. The original Norman style has been retained. Formerly the Rutland Street front had to be kept in conformity with the adjoining dwelling-houses, but now considerable modifications have been introduced. On this side a row of double-light windows, divided by stone mullions, and showing atop the round arch, have been constructed, and filled in with cathedral tinted glass. The pillared balustrade has given place to an ornamental frieze, and at the east end of the building a suitable doorway has been opened up, over which there has yet to be built a handsome porch. The interior arrangements have been entirely remodelled. The old high-backed pews have been replaced with more modern open seats of solid oak; the gallery has been narrowed, allowing more open space above the area—and the front done in oak, with arched panels. The fine Norman roof, formerly wainscotted, has been repainted in bright colours, bringing into relief its characteristic features, and imparting to the church a cheerful appearance. The arched windows above the cove have, like the rest, been filled in with tinted glass. A Norman arch with dog-tooth ornamentation, and supported by clustered pillars, has been constructed in stone to mark off the chancel from the church; the chancel roof has been groined, and at the back of this part of the edifice a stone arcading has been erected.

**Whitchurch.**—A new chapel has been opened at the work-house, built in old English brick and half-timber style, and furnishing accommodation for 130 persons. Mr. Walter Webb, of Whitchurch, is the architect. The contractors were Messrs. Corfield & Dodd, also of Whitchurch.

**Frodsham.**—The parish church has been reopened after restoration, carried out from the designs of Messrs. Bodley & Garner, of London, Mr. Speechley acting as clerk of works.

**Sudbury.**—The church of All Saints, which has undergone extensive restoration, has lately been reopened. The architect was Mr. Fawcett, of Cambridge; and the contractor was Mr. F. W. Jennings, of Sudbury; Messrs. Grimwood & Sons and Mr. E. Keogh—both of Sudbury—being entrusted with the stonework of the windows. The cost of the restoration is something over 1,000*l.*

**Southmolton.**—The church of Nymet St. George, known as Georgenympton, about three miles from Southmolton, has been reopened after restoration, which has been carried out from the plans of Mr. E. H. Harbottle, of Exeter, by Messrs. Luscombe & Son, builders, of Exeter, at a cost of 850*l.*; the total cost of the improvements amounting to about 1,000*l.*

**Walkern.**—The church of St. Mary, Walkern, near Stevenage, Hertfordshire, has lately been restored at a cost of nearly 2,000*l.*, under the supervision of Mr. H. R. Gough, F.R.I.B.A., the builder, engaged being Mr. J. Lister, of Aston, near Rotherham. The church was reopened on the 30th ult. by the Bishop of Colchester.

**Coggeshall.**—The Congregational Chapel, Coggeshall, has lately been reopened after undergoing works of renovation. Messrs. Gardner & Son, of Coggeshall, carried out the work, the amount of their contract being 1,350*l.* The plans were prepared by Mr. Charles Pertwee, architect, Chelmsford.

**Walkden.**—The new church, which has been opened, affords accommodation for 720 persons, and has been constructed of brick and stone, at a cost of about 2,000*l.* The architect is Mr. G. Fell, of Spring Gardens, Manchester; and the contractor, Mrs. Gerrard, of Swinton.

**Hamilton, N.B.**—On Saturday the memorial-stone of the new United Presbyterian Church at Burnbank, a mining suburb of Hamilton, was laid. The style of the new church is Early Gothic.

The tower is 14 feet square, and rises to a height of 127 feet to the top of the vane. The accommodation is for 562 persons, with provision for side galleries, giving a total of 654 sittings. The plans also show a hall seated for 136 persons. Mr. D. Macnaughton, I.A., Glasgow, is the architect. The estimated cost is over 3,000*l*.

### SCHOOL BUILDINGS.

**Bedwelty.**—A new infants' school for the Bedwelty School Board has been opened at Troedrhgwain, on land owned by the Tredegar Iron Company. The builder is Mr. W. Leonard, of Tredegar, and the contract amounted to a cost of about 5*l*. 4*s*. per scholar.

**Birmingham.**—New Baptist Sunday Schools have been opened at Sparkbrook. The schools, which adjoin the church, are Gothic in style, and provide accommodation for nearly 600 children. Mr. W. Hale is the architect, and Mr. W. Charley the contractor. The cost of the schools, including fittings, &c., is about 1,600*l*.

**Pensnett.**—A new Board school in connection with the Kingswinford parish has been opened at Bromley Lane. The new building will accommodate 400 children—viz., 280 in the mixed school and 120 infants. The cost is 4,000*l*. Mr. Thomas Robinson, of Stourbridge, is the architect, and Mr. Guest, the builder.

**Derby.**—Christ Church Schools have lately been reopened after extension and rebuilding, carried out under the direction of Mr. J. R. Naylor, architect, Tennant Street, Derby. The new schools, though accommodating 360 children—nearly double the number provided for in the old building—occupy the same space on the ground, and are not carried to so great a height. The cost of the work has been about 1,300*l*., at the rate of 3*l*. 12*s*. per head. Mr. Hewitt was the contractor for the general work, the iron roof being supplied by Messrs. Handyside & Co., the heating apparatus by Mr. Jerram, and the gasfitter's work by Mr. E. Haslam.

### NEW BUILDINGS.

**Poor-law Offices, Leicester.**—The foundation of the new offices has been laid. The buildings will comprise a Board-room, about 40 feet square, with which the offices of the clerk to the Guardians will be connected. There will also be offices for the superintendent registrar, vaccination officers, waiting-rooms, store-rooms, and other necessary apartments; and at one end of the Rupert Street elevation will be accommodation for the caretakers. The principal entrance will be by Pocklington's Walk. The front elevation will be in Classic style, of red brick, with Matlock and Bath stone dressings. There will be a stone plinth, pilasters, and a pediment over the principal entrance. The Pocklington's Walk elevation is about 80 feet in length, and the Rupert Street elevation over 100 feet, including the caretakers' rooms. The architects are Messrs. Redfern & Sawday; Mr. C. Wright, of Upper Kent Street, is the builder.

### ENGINEERING WORKS.

**The Channel Tunnel.**—The seven-foot heading of the Channel Tunnel at Sangatte, near Calais, has now been advanced to upwards of half a mile, and is progressing very satisfactorily. The Beaumont boring-machine is cutting at the rate of one metre an hour. The face of the heading is now perfectly dry, and is following a course halfway between the gault and the green sand, the inclination of the gallery having been raised slightly to avoid driving into the softer gault. Several faults of a few metres vertical displacement have been cut into, but no water of any great importance was met with in this broken ground. The quantity of water which found its way into the heading averaged every minute one litre per metre of heading driven, but this has been considerably reduced. The machine is cutting the ground so rapidly as to overtax the means at present available for removing the dirt, which is being done by manual labour. It is contemplated to employ ponies shortly for this purpose, and if the work is continued, the Beaumont compressed air locomotive will be introduced.

**Diaries for 1883.**—The manufacturers of diaries are earlier than usual in the field with their books, and the quantities which now appear suggest that the keeping of a diary is more common than formerly. Messrs. Hudson & Kearns have been inspired to greater efforts by the success of last year's diaries, and those for this year contain many improvements. The diaries for architects and builders contain, as usual, much of that kind of information which is most often in request, and the additions relating to legal matters are really valuable. The blotting pads of the firm are undoubtedly the best of all we have examined. It is needless to praise the diaries of Messrs. Letts, Limited, for they are universally known, and for general use they are never likely to be supplanted. One advantage they have is the superior quality of the paper. Messrs. T. J. Smith & Co. are always able to produce a large diary for a very low price, and in consequence can secure a large demand. Their diaries for 1883 are of various sizes and are all good as well as cheap.

### GENERAL.

**Mr. Connell**, of Newcastle-on-Tyne, has been appointed Quantity Surveyor for the Middlesborough New Public Buildings.

**Mr. John Bevan**, of Bristol, has been successful in an open competition for the completion of St. Paul's Church, New Swindon, and erection of vicarage. He has also recently been appointed architect for the new church in St. Andrew's Park, being the third church entrusted to Mr. Bevan under the Bristol Church Extension Commission.

**Mr. R. Medley Fulford**, of Exeter, read a paper on Brittany at the *conversazione* held last week by the Exeter Diocesan Architectural Society.

**Mr. Herbert Guthrie** at the meeting of the Liverpool Architectural Society on Wednesday read a paper, the title of which was "Heat from a Sanitary Point of View, and Some Features it may Introduce into the Architecture of the Future."

**Mr. William Morris** on Tuesday evening delivered an address to the students of the Leek School of Art.

**Mr. S. Thomas**, City Surveyor of Bristol, who was called in to adjudicate on the plans for a new market at Bideford, has awarded the first place to "Economy and Simplicity," the second to "Experience," and the third to "Devonia." The Bideford Town Council not being able to come to a decision, have decided to confer further with Mr. Thomas.

**The Leamington Corporation** on Monday determined to expend a sum of 2,000*l*. in ornamenting the front of the new municipal buildings.

**Messrs. R. Gay & Co.** are now manufacturing their well-known "flat" as well as "glazed." Both qualities have recently been used in painting Lloyd's Rooms at the Royal Exchange, and have given great satisfaction.

**Mr. J. E. Ellison**, ventilating engineer, Leeds, has had conferred upon him the highest award (silver medal) at the Bradford Industrial Exhibition for his conical-perforated bricks and "Radiator" ventilators. The bricks are being used in the Hull, Barnsley, Aston, Croydon, and other infirmaries. The "Radiators" have been recently fixed in St. Matthew's Church, Leeds, St. Mark's, Dewsbury, and numerous chapels, schools, &c.; and we are informed that they have given satisfaction in every instance.

**Limington Church**, Somerset, which was the first preferment held by Cardinal Wolsey, to which he was presented by the Marquis of Dorset, has been re-opened. The church had fallen into great decay, and in 1870 the chancel was rebuilt by the friends and neighbours of the then rector.

**Extensive additions, alterations, and improvements** have just been completed to Brampton Brian Castle, Herefordshire, from the designs and under the direction of Mr. T. Nicholson, F.R.I.B.A., architect, Hereford. The works have been very ably carried out by Mr. James Clutterbuck, of Gloucester.

**Mr. G. G. Hoskins, F.R.I.B.A.**, has prepared designs for the reseating, lighting, and ventilating Holy Trinity Church, Darlington. The work will be carried out forthwith.

**The Old Archbishopal Palace** at Croydon is likely to be removed, and the site used for cottages, unless the property can be purchased. The Ecclesiastical Commissioners are the owners.

**Messrs. R. W. Wynnfield & Co.**, of Birmingham (successors to Messrs. Camm Brothers), have obtained the Gold Medal at the Bradford Exhibition for their stained glass windows.

**The "Snape Memorial Window"** in the Cathedral of Newcastle-on-Tyne has been completed. It was designed by Mr. W. H. Atkinson.

**The Preston Town Council** on Wednesday decided to promote a Bill in Parliament for the improvement of the navigation of the Ribble and for the construction of docks.

**The Memorial Stone** of a new Established church at Oatlands, Glasgow, designed by Mr. John Honeyman, of Glasgow, has just been laid.

**The Dumbarton Burgh Buildings** were destroyed by fire on Monday. The School of Art, which was being constructed in the upper part of the buildings, should have been opened this week.

**The Northampton Town Council** have referred to a committee for consideration the question of accommodation at the Town Hall, which it is alleged is not sufficient for the requirements of the town.

**A Town Hall** is to be erected in Elgin.

**Efficacy of Steel Doors.**—On Saturday, shortly after the Prince of Wales visited the ruins of the fire in the City, Messrs. Foster, Porter & Co. were able to reach their "strong room," the entrance to which is secured by a pair of Chubb's massive steel doors. With very little trouble Messrs. Chubb's men opened the doors; and the room was then entered by the directors, who found all the contents uninjured. Several tons weight of books were quickly removed, and it may be mentioned that though there were safes inside the room, the books which were lying outside the safes were uninjured by fire.

# The Architect.

## THE ARCHITECT'S GHOST.

HE *cause célèbre* which has occupied one of the courts of law for so many weeks past, and which has aroused almost still more interest in the world of artists and connoisseurs, can scarcely have failed to awaken here and there behind the scenes of the architectural profession a peculiar kind of uneasy feeling, if no more. Is there or is there not such a functionary as the Architect's "Ghost"?

The account which has been given of the manners and customs of the Sculptor's Ghost is not only amusing, but dramatic. You ring the door-bell. A hatchway opens in the studio floor. A listening ear is strained. You send in your card. A silent shadow glides downwards through the floor. It disappears, and the flap closes over its head. You are admitted. You find the great artist absorbed in his great work, his spirit in the empyrean. You have to pull him by the sleeve before his thoughts return to the level of the earth and of you. But he is glad to see you, nevertheless, and glad to think that you are gladdened by the inspection of his great work. After a few happy moments you take your leave, and the silence of ineffable repose settles like a pall upon the chamber of imagery. The trap is raised again. The ghost reascends. The task which you have interrupted is resumed. Roman augurs winked to each other across the altars of the gods; but there is no winking here. When SOCRATES and his demon walked alone together, and worked out the secrets of wisdom, this was at least more akin to the transcendental brotherhood of the studio: the fashionable sculptor and the provider of "artistic assistance" work out in secret the mysteries of English statuary, and why should the world be any the wiser?

Whether there may be a great deal of truth in this, or none at all, we do not at present care to inquire; the case is one of those which, in a "commercial country," may be left to the judgment of commercial men. That is to say, when a product of even the highest art is, as a work of sculpture must always be, to the purchaser an article of trade value, it is useless for purists to pretend to shut their eyes to the fact that an occasional producer, if in any way conscious of his own deficiencies—and who is without them?—may easily persuade himself to supplement his own art by that of some artist "to the trade." The question, then, which we now propose for consideration is how far anything of this kind prevails in the practice of architectural design, and to what good end or ill.

Now we need not boggle at the admission that certain classes of architectural practitioners in a large way of business (this is the appropriate phrase, however vulgar some may think it) have done their designing wholly by other hands. Neither need we hesitate to declare that we do not wholly approve of this. The Architect's Ghost, in the eye of many a true critic, exists only to be denounced; like ARTEMUS WARD'S Indian, he is "pison wherever found." And we are glad to think that this view of the case is coming to be more cordially accepted amongst architects every day. In other words, the principle is being more and more widely and firmly accepted that the professed architect who does his designing by another hand, not because he has no time at command, but because he has no ability, is scarcely a true man.

There are "firms," for example, who "do" architecture as they "do" rent-collecting, valuations for probate, surveys of dilapidations, compensation claims, sales by auction, and (the connecting link) the laying out of land for building. The customers of such extremely commercial "houses" are not, however, deceived in architectural matters as the wicked say the fashionable sculptor is capable of deceiving fine ladies and gentlemen. The fact is generally pretty plainly stated that "we keep a gentleman who attends to our architectural department," and so the matter ends. There are builders also who "keep their architect;" but neither in this case is he a ghost so much as a sort of substantial artisan carrying off three or four sovereigns loose in his waistcoat pocket every Saturday at noon, and holding office subject to a week's notice on either side. The real Architect's Ghost is quite another kind of man.

Moreover, there are two classes of Architects' Ghosts, the indoor and the outdoor.

Now when an architectural practitioner is falling into the sere and yellow leaf, and is no longer physically able to work all night, or even after dinner, at the drawing-board—or when, although in middle life, he is so much occupied with the business of administration that he perhaps cannot sit down to the drawing-board at all—no man of common sense would grudge him the help which is to be obtained at the hands of an assistant of high class, who understands his manner, can interpret his hasty sketches, and has learnt to identify himself with his spirit. To such a lieutenant the ablest master may be permitted to hand his memoranda and dimensions, and his rough idea, as it is called, of how to treat the subject; and although the subordinate may not be able to do all that the master might, yet it may be felt that necessity has no law in such circumstances, and that it would be but an affectation to speak of the design as the work not of the one but of the other. Cases can even be imagined in which not a single line of the roughest of rough sketches has been done with the master's own pencil, and yet the product shall be his own as honestly as if he had worked out every part of it. The test is simply this:—whether he could have done it as well for himself had circumstances permitted; and the probability is that he could have done it better, and a great deal better. Indeed in architectural work this state of things may be recognised more readily than in almost any other kind of artistic work whatever. For the drawing is not in fact the design. Moreover, the design, if it be truly architectural—that is to say, constructionally rather than only superficially artistic—has in a great measure to work out itself rather than to be worked out, growing like the tree, from germ to sapling, from sapling to branch, and from branch to flower, by a natural gradation and development, in which, just as it alone works, the first inspiration contains within it the essence of all.

But the architect who employs the aid of a ghost is, as we have already hinted, the very respectable tradesmanlike gentleman who cannot do the design himself because he never knew how, and whose time is fully occupied by choice in what is called "getting the business." He is a sort of agent or traveller for architectural work; and so far, indeed, he is the right man in the right place; for all the fault we find in him is that he does not confine his pretensions within this very useful limit of fact, but considers it necessary to profess to do that also which he knows is beyond his power.

The ghost in such a case is, as we have observed, of one of two classes. Either a high-class assistant lies *perdu* in the office, in a position which is certainly humiliating, or a designer "to the trade" is employed, whose manner is strictly his own, and whose work in many instances can be as clearly read by those who are behind the scenes, as if they had seen him do it. Now both of these modes of proceeding, we are glad to acknowledge, are falling more and more into desuetude every day; and therefore, far from experiencing any desire to exaggerate the evil, we will now take leave to offer what may almost be an excuse for a practice which need no longer awaken the apprehension of those who wish well to the art.

For after all, as everybody knows, what the English public want from an architect is primarily the skilful and financially successful administration of their building business in one way after another, and only very secondarily indeed the introduction of the delicate finesse of artistic design. The profession of architects, consequently, as constituted by those external influences which are necessarily the strongest, is held to consist of little else than expert building agents. In nine cases out of ten, therefore, the clients do not care a button what means are adopted to put the polish on the plan, as they may be supposed to say; and as for being fastidious on the point of personal authenticity and individuality, the idea cannot be got into their heads at all; as even the late Mr. STREET came to know to his cost, when a churchwarden roundly told him one day that he understood a certain restoration was to be done, *not* for the sake of the architect's individuality, but for something much more intelligible.

We are not by any means afraid, therefore, of the Architect's Ghost. We can never cease to sympathise with that most estimable class of our highly educated younger men who are obliged to remain in the position of assistants year after year when they have long been perfectly qualified to do business for themselves, and we do not hesitate to plead their cause when they ask for more direct recognition than they receive; but

their case is one of the inevitable grievances of all business, and cannot well be helped. Nor do we fail to see the important use occasionally of the "architect to the trade," and certainly we cannot help respecting his abilities. As time wears on matters will, we hope, get better in many ways besides these, and the wise will wait.

A word more to those who are both wise and young. To get into good practice as an architect is, if the truth may be told so plainly, not so much a matter of skill in art as of aptitude for, as the bagmen say, "securing orders." It is easy enough to do the work; the difficulty is, how to get it to do. Look this fairly in the face, and many things are explained, and many offenders exonerated. We must take the world as we find it.

### THE RENAISSANCE IN ITALY.\*

THERE are few subjects which are more attractive than the history of the Renaissance in that country which of all others is most closely connected with the movement. But it would be impossible for any one man to write that history in its fulness, or even so much of it as relates to art. The evidence of what was done by Italian artists during a few centuries would have to be sought not only in out-of-the-way villages, but in all the galleries and museums of Europe. The lives of the artists have yet to be fully investigated, and the discoveries of Messrs. CROWE and CAVALCASELLE suggest how much awaits patient labour among records. The history of a single school—nay, often the history of a single artist—is enough to engross the attention of a writer, although he may have a German's industry; and it must be allowed that few of the books which treat of such fragments of the Renaissance can be said to be complete.

Mr. LEADER SCOTT suggests the vastness of the subject by calling his large quarto "An Illustrated Sketch," which does not presume to call itself a history. "It is only," he says, "a pictorial guide through the intricate mazes of the arts during the four centuries in which they grew, developed, and culminated." But his book is a guide which is comprehensive and impartial. It may be compared to the map of the world in an atlas, which enables us better than the other maps to understand the relative size of the various countries. From Mr. SCOTT's volume students can realise how much was done in the different schools of Italy, and it consequently forms the very best work which can be used by those who are about to commence the study of Renaissance art. Mr. SCOTT has had the benefit of Mr. CUNDALL's experience in the collection of illustrations, and it may be said that the woodcuts, while suggesting the styles of the artists, do not represent the works which are so commonly selected for the purpose as to become wearisome.

People speak of the Renaissance as if it were an absolute creation at some definite time, and a sign that the Dark Ages were ended. But it is impossible to fix the date of its origin. The forces of which the Renaissance was the result were always in operation. During the darkest period in Europe law was administered which was derived from Roman codes, there was a Roman language and literature used by the Church, and there was art which, however rude, represented Roman work. Europe, in fact, never lost its hold of that ancient civilisation which must be considered to be the main element of the Renaissance. The appearance of NICCOLA PISANO at the end of the twelfth century is, however, taken as marking the beginning of a new era in art, and although he may have had contemporaries who were equally influential, NICCOLA's name stands out most prominently in the history of the time.

According to tradition the character of his sculptured figures was derived from a study of a Greek sarcophagus, which stood in the Campo Santo of Pisa. But he was not satisfied with using classic work as a means of inspiration, he copied whole figures. The drunken SILENUS became MOSES, and the boy supporting the jolly but helpless satyr was draped and converted into a sort of acolyte. No satisfactory explanation of those wholesale adaptations has been given. They were most likely the result of poverty of invention and incompetency; but as NICCOLA is one of the patriarchs of art, it is almost a crime to suggest that he was deficient in ability. He may have thought that more value would be attached to work for which there was ancient authority; but whatever was the reason he set a bad example to those who followed him. We sup-

pose, too, that the introduction of voluminous draperies as a clothing for Scripture characters is owing to him. NICCOLA's prophets and saints are antique Romans in dress as well as in features, and the absurdity was perpetuated for many a century. Costume became conventional, and artists like MICHAEL ANGELO and DA VINCI in their representations of secular scenes drew forms of garments which were never worn by men. It cannot be said that the influence of NICCOLA upon painting and sculpture was altogether beneficial. In regard to architecture, Mr. RUSKIN characteristically declares that the first Christian architecture is to be seen in the cusped arches of NICCOLA's pulpit; but as so simple a form as a cusp was likely to be familiar to everyone who made circles with a pair of compasses, we need hardly go to Pisa for its origin, and we must seek elsewhere for the beginning of Gothic architecture.

GIOVANNI PISANO seems to have had more originality than his father. His adaptation took a different form, for the figure of a saint on the east front of the little Santa Maria della Spina in Pisa is a portrait of NICCOLA. The introduction of contemporary portraits in Scripture scenes was afterwards common enough, and sometimes it was employed to secure an unenviable notoriety for an artist's enemy. Mr. SCOTT says that the truths which the two great pioneers (NICCOLA and GIOVANNI) foreshadowed were "carried to Florence by ARNOLFO and ANDREA PISANO, and in that soil, so favourable to art growth, they developed into the great movement of the Renaissance." The influence of ARNOLFO in Florence must be recognised, especially upon the architecture, but it is not so clear about ANDREA. He co-operated with GIOTTO; but, as Mr. RUSKIN says, GIOTTO, while remaining entirely uninfluenced by the educated excellence of ANDREA PISANO, gradually bent the Pisan down to his own uncompromising simplicity.

There is some trace of classic art about the draperies of GIOTTO, especially in his sculptured figures, but he is rather to be considered as the first representative of that recognition of nature which is one element of the Renaissance. He was not a student of the nude, although in one of the campanile panels he shows the sculptor employed upon a nude figure. His attention was given rather to the life around him, exalting it while he depicted it, and in doing so he rendered more service to art than by imitating antique reliefs. "When one thinks," says Mr. SCOTT, "that until this time art was confined to conventional forms and unemotional figures, the life in GIOTTO's works becomes especially remarkable. Determined to bring the old Christian stories home to his beholders in a mode they can understand, he sometimes becomes too realistic to be quite scriptural—as in placing a maid spinning in the room next that in which St. ANNA kneels praying, and in representing the Holy Family in the flight into Egypt accompanied by serving men."

GIOTTO was the friend of DANTE, and his pictures may have been in unison with the poet's mind before he became a wanderer. But DANTE's rigorous justice—giving every man his desert and no more—is exemplified more in the fresco of the Campo Santo of Pisa, which is always likely to be attributed to ORCAGNA, than in any of GIOTTO's works. Life and Death, trim gardens that recall BOCCACCIO, chasms that open into the Bottomless Pit, demons who torture souls before hell is reached, monks in quiet convent gardens, hunting parties, and the horrors of lidless coffins are intermixed in this terrible picture. The Death Angel spares none but the monks and the wretched beings who—lame, blind, and deformed—vainly appeal to him from amidst a thicket of thorns. GIOTTO had too much human kindness to have painted such a scene; but, however fearful, it indicates progress. There is much realism in the costumes. Some of the figures are supposed to be portraits, and, according to Mr. RUSKIN, the mendicants "are among the first existing examples of hard study from the model." But in the landscape there is the usual conventionalism, and the birds and animals are painted regardless of scale. This picture, for moderns at least, is of great importance, for it is evidence of the heights and depths reached by artists when it was painted—that is towards the close of the First Era. Yet the authorship of it—whether it is by ORCAGNA, DADDI, or LORENZETTI—is never likely to be ascertained.

The Second Era—or "The Development," according to Mr. SCOTT—comprises a great part of the fifteenth century. Among the men who are representative of it may be named the architects BRUNELLESKO, MICHELOZZI, ALBERTI, the sculptors Ghiberti, Donatello, Luca della Robbia, Verrocchio, and the painters Fra Angelico, Squarcione, Jacopo Bellini,

\* "The Renaissance in Italy: an Illustrated Sketch." By Leader Scott. Published by Sampson Low, Marston, Searle & Rivington.

MANTEGNA, and SIGNORELLI. It was a time when Greek literature might be said to have been revealed to Western Europe. Before that time the few who were desirous to know Greek were compelled to journey to Constantinople, and, in consequence, the literature was almost unknown. On the capture of Constantinople by the Turks it was supposed by some scholars that darkness was again about to overspread the West. A cardinal who was afterwards known as Pope PIUS II. then wrote: "A little light will remain perhaps among the Latins, but that, I apprehend, will not be long, unless God from Heaven will look upon us with a more favourable eye." The fall of the city was, however, an advantage, for a number of learned Greeks fled to Italy, where they were well received. In Florence especially Greek literature, of which the great citizen DANTE knew little, was studied with enthusiasm. "The pursuit of the old learning," says Cardinal NEWMAN, "became a passion. As the crumbling cloisters of the East were ransacked, and manuscripts were found and deciphered, as the ruins of pagan edifices were excavated, mounds of earth removed, and the sculptures of classical art disinterred, an uncontrollable excitement, an intoxication, seized upon the classes which were engaged on the work. It seized upon young and old."

The artist, we are told, is the child of his time, and the power exercised by the new learning is manifest in the buildings, sculpture, and painting of the fifteenth century. In the decoration of the buildings mythology was blended with church history. On the façade of the Certosa or Carthusian monastery of Pavia, "medallions of Roman emperors and pagan deities fill the base, while statues of saints and martyrs fill the niches of the pilasters." The doorway from the Stanga Palace, which is also illustrated in Mr. SCOTT's volume, is covered with reliefs of classical subjects. We see the spirit of that age in the enterprise of SQUARCIONE, of Padua, who "turned his attention to the art of the ancients and travelled in Italy and Greece, bringing home various casts, made by himself in plaster from the beautiful antique statues which he saw." He was well rewarded, for no less than one hundred and thirty-seven scholars were attracted by the casts to his workshops. MANTEGNA, who was his favourite scholar, exemplifies the use which was made of SQUARCIONE's fragments of architecture and sculpture. His best known work, the *Triumph of Julius Caesar*, in Hampton Court, and the frieze in the National Gallery, could only have been produced by an artist who had antique details before him. The *St. Sebastian* in the Belvedere Gallery, Vienna, is suggestive of a model standing in front of some of the casts which had been specially arranged for the occasion. Nor is it too much to assume that the elaborate architectural backgrounds which are introduced in so many pictures of that time are also due to the interest which was taken in antique work. It would be difficult for a fifteenth-century student to bestow the least attention on fragments which were carved by Greek hands without becoming aware of the shortcomings of the figures which appeared in the Italian works of the First Era. There is consequently a marvellous contrast between the figure subjects of the fourteenth and those of the fifteenth centuries. But it is not all owing to the old work. The nude model was more often employed; and to it rather than to the antique may be ascribed the vigour of the works of SIGNORELLI, and the beauty of the idyllic figures of GIORGIONE. The fashion of introducing contemporary men and women into the pictures of scriptural subjects was not without its use. However incongruous a crowd of Florentines might seem in a picture representing a miracle of ST. PETER, it was requisite that they should be accurately represented, and in this way realism was encouraged. Many of the figures of the saints which now are supposed to be ideal were portraits. This is plain from one of SAVONAROLA's sermons, in which, addressing painters, he said:—"The young men say of this or that maiden, 'This is *Magdalen*,' or 'that is *St. John*,' because you paint figures in the church which resemble this woman or that. You painters act wrongly; you introduce worldly vanities into the Church." It was an age when many antagonistic forces were in operation. Nature and idealism, paganism and Christianity were contending, and it was impossible to foretell which of them was to be paramount. The precious manuscripts and works of art, which were sought after so eagerly, and were all but worshipped, could, at a monk's request, be tossed into the fire; a still greater spirit of sacrifice is evident when artists turned monks. On the other hand, the feasts of the heathen were kept like saints' days, and there was a

desire to revive the cultus of heathen mysteries. With so many and such discordant elements existing in the "Development," it is not surprising that signs of decay appeared soon after the Culmination of the Renaissance.

That Culmination forms Mr. SCOTT's Third Era, and in the opening chapter upon it he mentions one circumstance which is somewhat remarkable:—

A study of the chronologic lists given in this book will show a curious fact, that the beginning of each century marks a crisis in art, and that the intermediate years lead up to that crisis. The year 1300 marks the very centre point of the careers of GIOTTO, DUCCIO, and SIMONE DE MARTINO in painting, and of ANDREA PISANO in sculpture. In 1400 FRA ANGELICO, the greatest purist, and MASOLINO, the leader of the naturalists, had just begun to win fame as painters. Ghiberti was beginning to be known as a sculptor. During the whole century their scholars were aiding in the great movement, and the year 1500 saw the climax of art. At that time all the groups of men of genius which mark the Culmination were gathered together in Florence.

— The works of the artists of the third period are of course better known than those which were produced in the earlier periods. The men themselves were entitled to be called many-sided. One of them, LEON BATTISTA ALBERTI, the architect, was a "brilliant courtier and artist, who could tame a horse as easily as he played his lute, and could pierce his adversary's armour in the lists as calmly as he designed a fine building in his studio." In versatility he was surpassed, however, by some of his contemporaries, and indeed it may be said that if there had been less of that quality it would have been better. The greatest genius of that age, or indeed of any other, was DA VINCI, yet how marked is the contrast between his powers and his performances!

In describing the Third Era Mr. SCOTT devotes a great part of the available space to a consideration of what was done by MICHAEL ANGELO, RAPHAEL, and TITIAN, and to be acquainted with their works is to possess the key to the art of that and the subsequent age. Mr. SCOTT is not carried away by his enthusiasm. He recognises the fact that the greatest artists of the Culmination were sometimes dangerous guides to follow. Thus, in speaking of the Sistine *Last Judgment*, he says:—

As a lesson of Christianity it falls dead; that which inspires only awe can never teach the religion of CHRIST. In its influence on art it is almost as deadly; the great power and terrible charm attracted a crowd of followers, but in their hands the force of MICHAEL ANGELO, without his intense spirit, became coarseness, just as the tenderness of RAPHAEL, in his followers, without his sentiment, became weak sentimentality. Thus, the two greatest artists, by their very inimitable perfections, were the starting-point of the decline. MICHAEL ANGELO's own words "My knowledge will give birth to a tribe of know-nothings," have proved prophetic. That which in him is sublimity, becomes coarseness and audacity when imitated by lower natures.

These words deserve attention at the present time, when so much is heard about the benefits that are to be derived from a study of the works of MICHAEL ANGELO. To a man of congenial spirit they may be inspiring, but in other cases their value is less evident, and one of the most absurd sights is to see a student whose capabilities are fitted to deal with homely things aping the terrible manner of MICHAEL ANGELO.

It is mysterious and inexplicable to find the Culmination of art succeeded by the Decline. No man was able to take the torch from DA VINCI, RAPHAEL, or MICHAEL ANGELO; and although art was fostered genius could not be created. However interesting to the philosopher, the fourth period was not productive of the Baconian "fruit," and the student may ignore it without loss. Mr. SCOTT does not occupy many pages with his history of "The Decline," and we admire his judgment in being reticent. The needs of the student have been kept in view throughout, and in consequence men who are unworthy are not brought forward into prominent positions, as they are in some books on the Italian Renaissance.

---

The Royal Manchester Institution on Wednesday awarded the Heywood gold medal to Mr. H. Clarence Whaité, for his drawing of *A Stronghold of Edward I.*, which found a purchaser at the opening of the present exhibition at the price of 262*l.* 10*s.* The medal is the twenty-ninth and last awarded under the old constitution of the Institution, and founded by Sir Benjamin Heywood in 1834. Mr. Whaité took the gold medal in 1862 with *The Rainbow*, and the Heywood silver medal in 1854 with *The Expulsion from Paradise*.

## FIRES AT COUNTRY MANSIONS.\*

*(Concluded from page 387.)*

HAVING travelled over most of the ground relative to fires which originate from constructional causes, and which probably are the origin of four-fifths of those which destroy country mansions, we come to spontaneous combustion. Although in warehouses and shops, where oils and general merchandise are kept, spontaneous combustion is recognised as an occasional cause of fire, it can scarcely be considered as a very dangerous one in the case of country mansions, and probably there are only two ways in which it might occur. The rays of the sun on a hot day have been known, where the windows face the south, to become focussed sufficient to ignite woollen materials lying on dressing-tables. This is not a usual circumstance, but it has been the cause of fires, and at any rate might be avoided in hot weather by covering up the dressing-tables with some less inflammable material. But where spontaneous combustion is more likely to occur is in the lamp or oil room, where lamp oils, oils for domestic use, cotton waste, lampwicks, and oily rags predominate, and where the lamp-trimming business is performed. Here the lamp-room should be fireproof in all respects, and have an iron door leading therefrom, nor should it communicate with any other apartment. No more rags, dusters, or cotton waste should be kept than necessary, and the lamp oils should be kept in closed iron tanks. To show the possibility of a fire from spontaneous combustion I take a case which occurred in 1854:—"Shortly before the fire at Gloucester Cathedral the workmen who had been engaged in polishing the throne, and other carved woodwork in the choir, left off, it being six o'clock. Three hours afterwards the fire was discovered in a pew in front of the throne, where they had left their tools and materials. The men had been employed in applying boiled oil and turpentine in equal proportions to the woodwork, rubbing it with dry cotton rags, chiefly portions of old cotton stockings. These, after use, were placed in a rush basket and set on the pew in front of the throne. This was exactly the place where the fire broke out three hours afterwards."

"Experiments have been made with the view of ascertaining distinctly whether the fire might not have been caused by spontaneous combustion. The men employed placed their rags, saturated with oil and turpentine, in a rush basket as before. In an hour the outside of the basket was found to be warm, and soon after the rags began to smoke. In two hours a continuous and strong cloud of smoke escaped from the basket, and in three hours the whole burst into a flame. This experiment, we are told, was tried twice with the same result, and it fully accounts for the fire at the cathedral on the 8th inst., and doubtless for many others."

Assuming this to be substantially correct, and there is no reason to think otherwise, but little more need be said as to spontaneous combustion, except that when the origin of a fire is attributed to some unknown cause this may have had something to do with it.

With regard to accidental causes of fire at country mansions, these range from cases beyond personal control, such as stumbling and upsetting oil lamps, to those that come almost within the range of incendiarism, and at any rate are cases of gross carelessness and want of common sense. What for instance can be said of a man who would blow out a gaslight and leave the gas not turned off in an unfrequented place? But I have known this in a mansion, and unfortunately we read of many accidents from people who will take a lighted candle or lamp to find out the cause of a gas escape. One of the leading insurance companies stated at a meeting of the shareholders soon after the introduction of lucifer matches, that that invention cost them 10,000*l.* a year extra for compensation. But the danger from lucifer matches might be almost entirely avoided if the safety matches only were used—those which are stated to "light only on the box." Rats will run away with lucifers if they find them, and in their progress through small apertures it is not at all unlikely they may rub against a piece of wood and ignite the phosphorus, which would cause the rat to drop it at once and leave it burning. Wax tapers are worse still, as to an enterprising rat they are objects of special research, and afford him quite a banquet.

The introduction of dinner lifts and luggage lifts into old mansions—some of them reaching from the basement to the attic floor—are dangerous should a fire break out in the former, as nothing better could be devised to rapidly carry the flames from the lower to the upper regions, and all intermediate combustible spots. Iron flap doors should be adapted to each floor to close the well-hole of the lifts, but I believe this is very rarely done. Gas meters should be attended to by day, and the gas at meter should of course be turned off at night; and, in case of fire, notice conveyed to the gashouse at once that it may be shut off there also.

Plumbers working on roofs using fires for their hot metal are credited with being the originators of many fires—Canterbury Cathedral a few years since to wit.

From the prevention we now come to the extinction of fires, which must be of course a matter entirely different from the

system adopted in towns. A large cistern or cisterns on the roof from which iron mains shall lead through the building, and to which hose pipes placed in convenient positions can be attached—say in every corridor and on every landing—has been recommended; but this cannot be considered sufficient, for old mansion roofs were never made to carry a heavy additional weight in the shape of tanks of water sufficient to put out an extensive conflagration. Every 1,000 gallons of water weighs 4 tons, and nothing less than 20,000 gallons should be available for fire purposes; moreover, the friction and consequent loss of head or power would render the fire hose of very little avail in the upper storey. Fire hose or hydrants inside a mansion, no matter how supplied with water, would, I think, be unsafe to rely upon entirely; for instance, assuming the fire to break out in the night, and to have gained some headway, the half-dozen or so indoor men-servants would probably think more of their own safety than in forming themselves into a temporary fire brigade; or the state of terror which such a disaster would occasion in the dead of the night would entirely prevent them doing what was most needed and at the precise place, while those outside who were brought to the building by the alarm of fire would be quite incapable or unwilling to thread their way through the intricacies of winding passages and corridors.

A considerable amount of public attention was some years ago given to a means of stopping a conflagration by the use of vessels containing certain chemicals, which, on becoming mixed by means of a blow given to a spring attached thereto, generated a powerful gas. This was proved to be far more effectual in arresting a fire than water; but unfortunately the effect would be as fatal to the user as to the fire, and to remedy this goggles have to be put over the eyes and a shield tied over the mouth; the vessel is then strapped on the back, knapsack fashion, and with the nozzle and diminutive indiarubber tube in hand the process of fire extinguishing is performed. Although no doubt effectual at the commencement of a fire, it is apparent this can be of no use if it has assumed serious proportions, and the dangerous nature of the contents would prevent many from having such a fatal material strapped to them. Still, it is a useful machine—a "little help"—and might, and perhaps does often, prevent a "bigger help" being needed. A suggestion was made in one of the journals at the time when it was thought that this gas was going to prevent all extensive fires in the future, to confine it in tanks at various points and lay it on to every room of every house, to be turned on with a tap where required, as with ordinary gas or water. Possibly the householders of the period thought it was as pleasant to run the risk of being burnt to death as to be asphyxiated by any slight escape or accidental turning-on of the gas. But this perhaps was quite as sensible a suggestion as one by another writer, who, after a large fire in London, seriously proposed that all the water mains might be laid along the streets on top of the houses, so that someone had only to go on the roof and turn on a large tap, and what at the commencement was a fire, would in the end become a deluge.

Equally as useful are the small hand-engines on two wheels, which can be carried or wheeled through any door, but must necessarily be supplied with water from the nearest taps by means of buckets. The advantage of these little engines are that the water can be directed to a considerable height, where, perhaps, it would be impossible to reach—or the heat would be too great to approach with ordinary hand-buckets. It is needless to say that where a smell of burning wood is discovered and cannot be detected, the spot should not be left night or day—for it might smoulder for many hours—and that water should be got ready for immediate use if required.

But there are many mansions where scarcely any facilities exist for the extinction of fires; and, on the other hand, there are many where every possible means within reason are adopted, and if I describe the means at one of the latter class that comes within my knowledge, it will answer the purpose as well as any other I can adopt.

My typical mansion stands on an eminence miles away from any fire-engine. Below it runs a river, and behind, but about half a mile distant, the ground rises very considerably. At the river-side and at some little distance from the mansion is a water-wheel, and formerly this wheel was the motive power which forced the water from a shallow well near the wheel, to a cistern on the roof of the mansion. At present an Artesian well near to the water-wheel supplies the water, which is forced by the wheel and a treble barrel pump through a 4-inch cast-iron main to a tank made in the ground on the distant hill three-quarters of a mile away, 40 feet above the level of the highest part of the mansion, and holding 20,000 gallons. About half-way between the water-wheel and the tank, and at the nearest point to the mansion, a 4-inch branch is taken off the main, and carried first all round the mansion, and then in the building to ordinary domestic service cisterns on the roof. On its way to the roof 2-inch branch pipes are taken off, and to these branches are attached hydrants at various landings and accessible parts of the building. On the outside, hydrants are placed in the ground about 60 feet apart, attached to the 4-inch pipe. The underground tank, holding 20,000 gallons, in addition to serving the mansion with water for domestic

\* A paper, by Mr. Thomas Potter, read at the meeting of the Clerks of Works' Association on the 4th inst.

use, supplies also a farm and all the buildings which the pipes pass on their way from the pumps. But as the water in this tank is being continually drawn for general use, a larger open reservoir, holding 100,000 gallons, has been made near thereto, the water in which is entirely reserved as an auxiliary supply in case of fire, and is prevented from entering the main by a stop-cock placed on the same. Three hundred feet of fire-hose with nozzles already attached hang on pegs just within the building for the outside hydrants, and other hose pipes are suspended over each of the inside hydrants. Here then is every facility for discharging an immense quantity of water on the highest part of the building as soon as the hose can be attached to the hydrants. But, in addition, fire-buckets hang in a row in the hall; electric alarm bells are fixed to each external doorway; a fire annihilator stands ready to be buckled on any one who has no fear of being asphyxiated; telephonic communication exists between the mansion and the stables, the home farm, and the clerk of works' house, so that help could be obtained quickly; also telegraphic communication to the nearest town; a watchman perambulates outside the building all through the night, whose movements are known by a tell-tale clock, the register of which is carefully taken every morning; and fire-ladders also hang up adjoining the house, and which will reach to the roof.

Of course, in case of accident, there are stop-cocks at different points of the main. But these are usually kept open, and in addition a white post is placed against each, on which is distinctly painted "Fire cock, turn left to right," and the keys for these hang at the nearest convenient place, well known and constantly in sight of all whose business brings them near thereto.

It is obvious that in the case described the conditions are favourable for an efficient supply of water at high pressure. Were no such facilities available, a steam-engine would of course be necessary to pump the water, and a water-tower built, having a large iron tank on the top.

I am told that the cost of maintenance of the whole system of water supply and distribution described does not exceed 100% a year, excluding the wages paid to the watchman, which are not taken into account, as his functions are more especially to arrest the progress of any one having burglarious proclivities. I might incidentally mention with regard to the appliances in use for the protection of mansions from fire, that both leather and india-rubber hose are unsuitable, not only on account of their weight and cumbersomeness, but more especially because they are liable to crack when not in pretty constant use; and that the best for the purpose is "Vaucher's canvas hose," which is light, economical, and capable of standing a high pressure of water. The water in iron mains should not be allowed to remain there more than a month, otherwise the oxidation of the iron has an injurious effect upon the hose when the fire appliances are all under trial, which, of course, should be at stated intervals.

But there is a weak link in the chain, even in the arrangements I have just described; for should a fire break out in the night, some considerable time would elapse before sufficient help could be obtained, and in the meantime, unless kept in check, an uncontrolled fire raging in the midst of a mass of parched timber and other combustible materials would probably defy the endeavours, no matter how energetic, of men with no experience as firemen. This is a difficulty not easy to cope with, although I believe an instructor is sent from the London fire brigade to many private residences in the country at a low charge, to give instructions how to act in case of fire. It is a well-known fact, however, that many persons when called upon in an emergency at a moment's notice to assist at some sudden calamity for which they have had no intimation and no previous experience of a similar character, "lose their heads," and some extraordinary tales are known and told of the doings of people placed in that position. Incidentally I might mention that formerly the members of fire brigades in country towns (and London also most probably) were selected from mechanics and others employed in building operations, probably because they were more accustomed to "run ladders" than any other class, and I believe this system still obtains in some parts of Germany and other portions of the Continent.

It is passing strange the money expended on ways and means for the prevention of fires, and of the actual money loss sustained through fires, and yet to find that nine-tenths of the buildings erected appear to be built expressly to be burnt. Let the casual observer take his stand in an ordinary building when "in carcass," before any plastering is done or flooring is laid, and look around him: he will find the wood very fairly distributed for a good fire—or rather a bad one; and then let all the wood that is to come in for finishing be distributed about—plastering laths, floor boards, doors, stairs, skirtings, fitments, &c.; then add the wood furniture, and he will behold—

Wood to the right of him,  
Wood to the left of him,  
Wood in the front of him,  
Wood everywhere.

I find in a country house just erected, and standing on an area measuring 56 by 36 feet, that the actual weight of wood of all description used in construction thereof is about twenty-nine tons. Now what chance is there of checking a fire which, unobserved, has made considerable headway in an area of 224 superficial yards,

in which there is heaped up as much wood as took twenty-nine horses to draw there, and no means of obtaining water except as much as can be pumped up by an ordinary hand-pump from a well?

A writer in the *Manchester Courier* some years ago stated that in Japan the law was that the occupier of every house burnt down, whether accidentally or otherwise, should be beheaded, and the same writer follows up this statement by gravely remarking, "There are very few fires in Japan." Now this law might be profitably copied in this country with certain amendments. For instance, transfer the onus of responsibility to the builder, make the law provisional, say for the next twenty years, and to apply only to buildings erected after the passing of the Act. This would do more towards rendering our habitations fireproof than all the moralising and preaching that has taken place these last forty years; and when once fireproof buildings were found to be as easy to erect as combustible buildings, no one would occupy one of the latter, with the chance at some future time of being roasted alive. I grant builders would raise personal objections to an Act of Parliament that would virtually hang the sword of Damocles over their heads for the rest of their days, but every national benefit must of necessity press heavily on an infinitesimal portion of the population for a time. Seriously, the saving of valuable property and valuable lives, simply by making our habitations to all intents and purposes fireproof, will not be accomplished until it is made penal to build them otherwise. The thin edge of the wedge has been inserted in certain rules and regulations laid down by the municipal authorities in large towns with regard to the use of wood in buildings; but beyond this, with our national disinclination to do matters different from our forefathers, no further steps will probably be taken to prevent loss of life and property from fire for the next century or so.

I must plead in extenuation of all weak points contained in this paper, that it is a subject upon which, compared with many others, but little has been said or written; on that account, however, perhaps it may be the more interesting to the members of this Association. At any rate, if it be the means of helping to prevent in the future such losses as have lately occurred in the burning of Ingestre Hall and Clevedon Court, my time will not have been wasted in drawing attention to "Fires at Country Mansions, and Suggestions for their Prevention."

At the conclusion of this reading a hearty vote of thanks was accorded to Mr. Potter for the very able manner in which the subject had been brought before the members.

The discussion of the paper was postponed until the next monthly meeting.

## THE PROGRESS OF ART.

AN address was delivered lately by Mr. W. B. Richmond at the distribution of prizes in the Salisbury School of Art. He said: A few weeks ago I was standing among the columns of the Parthenon at Athens; several hours, indeed several days, I spent there, and they naturally made me think a great deal and very seriously about the occupation of my life. I came to the conclusion that a great artist must be the possessor of three faculties: he must be a poet, a philosopher, he must be a workman. Now with regard to Greek art, about which I shall speak to you first, we cannot understand that duly and properly unless we understand something of the occult subtilty of the Greek mind. We cannot understand that beautiful building the Parthenon without we understand something of science, and we cannot understand the marvellous union that there is in that building of scientific truth and of exact proportion unless we know something of the marvellous subtilty of that construction. Now I may tell you an astonishing fact about that building, and this is the preface to the other remarks I shall make concerning art—that in that building of the Parthenon there is not a single straight line. This is designedly so. We shall see as I go on how such subtilty of invention on the part of the architect, also on the part of the sculptor was carried out; and although we know little about Greek painting, in all probability, from what we do know of it from the writings of Pliny, that same subtilty of invention and execution was existing. For the workman, the builder, it would be impossible to go to a better school than is contained within the walls of that ancient building. I climbed to the top and paced among such stones as had not been injured by the numerous earthquakes with which the city has been pursued, as it were, for many centuries, and so beautiful is the building of that temple that you cannot put a penknife between the stones. Now you must remember that these stones are not fastened together by mortar; they are simply placed one on the top of the other, and every one of those huge blocks of marble has a small portion of the curve in its short line, which dominates the whole line of the building. Here is the design. Where is the art? Why in standing among those mighty columns a sensation of pleasure, of dignity, and repose comes over the soul of man that it is impossible to explain. Is it alone association? Is it only because among those columns some of the greatest thinkers of the world have stood? No; it is not alone that. It is because the dominant feeling in the mind of the architect who designed that building was nobility. But there was another

feeling, and that feeling, which has always prompted the highest art in all times of the world, a religious feeling. The Parthenon was the sacred temple of the Athenians; it was to be the most beautiful temple in the world, it was to be perfect in every respect—absolutely perfect in design and construction, because it was a sacred place. So much for the building.

Now let us come to the sculpture. Not only was the place to be absolutely beautiful, but the first sculptor of the age, Phidias, was employed to adorn it, and let me tell you with what hearty and artistic fervour he adorned that building. High up, almost out of sight, were the figures fashioned, and placed there never to be seen in certain views after they left the study of Phidias, never to be seen again absolutely and entirely. Indeed it was not until the figures now standing in our British Museum were taken down that any idea could have been formed as to the minuteness of the exquisite workmanship of them. In conception they were perfect, and in execution they were equally perfect. I will give you one little instance. In one figure is a small portion of drapery hanging over the foot, which never by any possibility could have been seen from below, and yet with religious fervour the sculptor has finished this little bit of drapery with as great minuteness as the carver would have fashioned the smallest piece of his work. This union of great conception and minute workmanship has always existed in the greatest times of man.

And now let us leave the Greek work and travel on to Roman. The Greek was a lover of beauty, but not so much of character. The Roman was a magnificent workman, but he had no ideal; for any ideal he had to go to the Greek. He had little invention in art, but he had a marvellous power in realising character. In the splendid busts executed in the best time of Roman art you have clear, characteristic portraiture. Probably the world has never seen better; but there is no ideal, no romance about the Romans. The time comes when romance in art seems to be wanting. We pass over that period of time, and we naturally come to St. Mark's, of Venice, where we see the culmination of all the romantic. There we see perfect design, perfect execution, fanciful ornaments, playfulness of design, perfectly unrivalled in the world. Art was put aside, it appeared almost dead at the time, until the great workman came from Constantinople and made the basilica of St. Mark. There was next to no art in Italy. Then the great artists scattered themselves over Italy. Cimabue and Giotto were outcomes of this class, and by degrees, by the accumulation of true science, the country retained the impulse towards the beautiful and did not allow mannerism to stand in the place of spontaneity of motive and progress. She kept head knowledge without losing childlike simplicity until the great culminating moment came—probably the greatest event the world of art had ever seen—when Michael Angelo came to light. Here we seem to stand on the border of an abyss; it is so splendid, so ideal, and yet so natural, that in studying his work one cannot but feel that a step further in either direction will throw his work into something of a monstrosity. And this happened: because those painters who followed Michael Angelo, not having his genius, his simplicity of mind, and his knowledge, copied his things and produced exaggerations—for they always were exaggerations—and so degraded that which in point of fact was only grand, and thereby they made caricatures; so art died out. But there was a moment in Venice when realism came in for a time; for the study of nature after all is the only safe ground on which we can tread. It is no use having fanciful ideals; we must reduce our ideals to fact. We are dealing not only with ideas, but we are dealing with the close facts of nature, with which our ideas can be compared. Now, ladies and gentlemen, it is about this subject of the study of nature that I should like to have a little talk with you. And let me talk with you as if you were all painters and I were simply another painter standing up amongst you.

I know by experience that the intimate and daily study of nature is the only chance for the artist, but how is he to go about it? Sometimes I think I do not know myself. I disagree—and here I must be egotistical—in a very large measure, with what is called the modern system of art education. I disagree entirely with that habit of making elaborate and simple drawings from any inanimate object. I think it a waste of time. I think that what an artist should cultivate as much as possible is certainty and yet rapidity of execution. All the beautiful effects of nature, all the most beautiful actions of the human body, all the most beautiful expressions of the human face are extremely fleeting, and if a young man accustoms himself to catch them coldly and coolly, to go half asleep over a simple drawing, however beautiful is his production rather than awakening his faculties he is deadening his faculties of perception. However beautiful his drawing may be ultimately when finished, I do not think that such a student has added to his artistic faculties one jot. I am obliged to say what I think, because this is the only way in which any remarks of mine can be of any use. Now I have said that all the more beautiful things in nature are those that are passing. And how are we to cultivate that rapidity of hand which would enable us to express with certainty and precision that which our eye perceives, and which we long to execute? It is a matter of habit; it is distinctly a matter of habit—a thing which any young student can cultivate. My advice to every lad in this room who is studying art is simply

this—whatever you admire—be it a beetle or a beautiful woman—draw it. And if you draw a beautiful woman do not only see that the eyes are divinely placed in the head, that the nose is straight, that the mouth is regular, but try to see what there is in the expression of the face—which points to the beauty of the soul within. For we must all remember that there is not an action of our lives which does not leave a mark in some measure upon our physiognomy. It is not my business to moralise, but I may make this digression to say that if there is a thing that ought to prompt us to live beautiful lives it is that not only our souls suffer, but our bodies also from immoral lives. Now I have been looking around this room with a considerable amount of care. I have seen a great deal of good work, a great deal of painstaking, admirable work, and I think that on the whole the direction is good. It has often been my privilege to be permitted to make an address of this kind, and I have seen many collections of this sort. I am not a man who goes about flattering. I do think that this is a very remarkable collection of the results of youthful efforts—I am not going to say of great works of art, for they are not. But they show painstaking care, and in many cases very considerable artistic perception. There is a set of drawings, all evidently done from life, where a countryman is holding a scythe. Well, if I had been posing that model I should have endeavoured to make that man take the position absolutely of mowing. I should have said to my pupils, "Make a sketch, remember the motive; you want to draw, and draw it as well as you can." What would you have found in that case? You would have found that there had been generally taken a different view of the same action. The master would have been led to see the idiosyncrasy of each mind; he would have been able to judge absolutely of the capacity of the student for reproducing action. It is a very easy thing to talk, but it is a very difficult thing to teach. I have had considerable experience in teaching and know the difficulty; I know how disappointing it is, I know how heartrending it is at times, and I must say I think that your master has a great deal to be congratulated upon. I must congratulate you upon having such an excellent master, because the drawings round this room are clearly and neatly done. You have a thorough and efficient master.

Now before I close my few remarks I should like to say a few words about my friend Mr. Morris. I do not know whether you have read his lecture on art; if not I would strongly advise you to provide yourselves with it. You will see that art, after all is said and done, is not only painting pictures, making figures and statues, but is something a great deal more than that. To make root in society it must be as much the object of the poor man to have beauty around him as the rich man. It is possible for the very poorest of us to surround himself more or less with what is beautiful. There is no longer any excuse for bad taste; there is no longer any excuse for people being squalid and dirty. People can be refined and elegant if they only are simple. Upon the simplicity all great and beautiful art depends; upon the simplicity all great and beautiful lives depend. It is not the grasping after a station to which you do not naturally belong that makes a gentleman; it is not the grasping after a fashion that you cannot afford to carry out to its best that makes you appear a rich man when you are not. If you cannot afford to buy a magnificently carved chair, like that of the chairman of this meeting, have a simple one with plain square legs, but have it made as strongly as possible—do not let it fall to pieces when a heavy man sits upon it. If you cannot afford to have a Persian carpet, have an oaken floor, and if not an oaken a deal floor, but let it be kept clean and looking bright and beautiful, giving pleasure to everyone coming into the house. I do not know whether you understand the direction of my marks, but I mean that taste is in a great measure almost associated with fitness, that it is not because you cannot afford to have most splendid things that you should not have beautiful things. There is no greater mistake than to imagine that a thing to be beautiful must be ornamental. Proportion has more to do with beauty than ornamentation. You may have a most ornate chair, and it may be hideous; you may have the simplest chair, and it may be beautiful by the simplicity of proportion. Do not imagine that because you cannot buy magnificent furniture your furniture must necessarily be ugly. There is one thing I should like to say before I stop. You know now that in these days there is no reason why we should read bad literature; there is no reason why every person around Wiltshire should not cultivate his mind by good literature. By cultivating one side of the mind you are cultivating the other sides of the mind, and are constantly raising your minds into loftier levels of thought. Not only are you raising it if you read good literature, and raising it also by looking at fine pictures, but you have all the advantages which it is impossible to say you could have had twenty years ago. Now I would advise you all to avoid as much as possible looking at bad art; avoid reading any book but the best. Only think what advantages you have now in England. You may have for a shilling one of the most beautiful works of art in the world; for a few shillings you may become the possessor of the noblest poetry—Shakespeare and Milton. Why, then, should not every Englishman be a cultivated person? I do not know, ladies and gentlemen, that I have anything more to say. I have kept you all too long. It has been my endeavour, in a few

remarks, to show that art is a very honourable thing indeed ; that in the exercise of it the finest part of man's mind is brought into action, and we seem all to appreciate it. Every one of us in this room may be a sharer of its beauty and its glory.

### THE CHANNEL TUNNEL.

A LECTURE was delivered in Glasgow on the 14th inst. by Professor Boyd Dawkins on "The Channel Tunnel and the Physical History of the Straits of Dover." The lecturer said there was a time when this country formed part of the Continent, from which it is divided by the "silver streak." The North Sea in the remote period referred to was occupied by a broad valley ; and the Straits of Dover, as we know them now, were represented by a long line of chalk downs, analogous in every part to those chalk downs which are seen in the neighbourhood of Dover. At that early time, when Britain formed part of the Continent of Europe, the country was covered by a great series of confluent glaciers, and man and the wild animals he hunted wandered into Scandinavia and North Germany, until they were brought within sight of the great icy regions of the Arctic. As the presently dividing area became submerged, the climate, formerly severe, became temperate. Such animals as the woolly elephant and the woolly rhinoceros did not survive the change, but the greater part of the wild animals which were living in the preceding period still exist. During the time this submergence was in progress geologists had obtained evidence that man made his first appearance here. He was known under the name of the Eocene hunter, and was interesting in every way, not simply because he was the first of the race who are now living in Europe, but simply and solely because he was the man who introduced domestic animals into the country, as well as the arts of spinning, weaving, and winding. Although the silver streak had begun to be developed at the close of the pliocene age, yet during the time the neolithic farmer and herdsmen were in this country the submergence had not yet been finished. During the last-mentioned period men were almost totally unacquainted with the use of metals and bronze using. People first made their appearance in this country at the close of the neolithic age. In these times the "silver streak" was no defence to the inhabitants of Britain, as successive invasions by Continental peoples plentifully showed. Whoever commanded the sea approach would always rule the island. It therefore seemed to the lecturer that the question of tunnel or no tunnel was practically a question of who shall be rulers of the sea, and so long as Britain was master of the sea, Mr. Dawkins did not think we need be very fearful about the tunnel being made. After refuting the objection urged against the tunnel being opened that it would destroy the national character, the lecturer proceeded to speak of the various schemes that had been suggested during this century to minimise the barrier to commerce through our being separated from Europe by the silver streak. The first proposal was of making two galleries beneath the sea, the upper one for horses to gallop over, and the other one for drainage. The time it was thought horses would take to pass over this gallery was one hour. The next scheme was devised by a Frenchman in 1834, who thought a tube put down at the bottom of the sea might be of use as a means of communication. An eminent citizen of Glasgow, Mr. James Young, took up that idea individually many years afterwards, in 1858. The original proposer of this means of communication gave up the notion, and in 1858 came to this country and had an interview with Prince Albert and Lord Palmerston with the view of getting Britain's co-operation with France in carrying out some useful plan. The Prince Consort was favourable to the establishment of such a connection with the Continent, but the Minister opposed it, and addressed the stinging remark to Prince Albert, "You would think quite differently if you had been born in this country." The Queen was pleased with the project, and wrote to Lord Palmerston—"You may tell the French engineer that if he can accomplish it I will give him my blessing in my own name and in the name of all the ladies in England." In 1868, it was interesting to note, a petition was presented to Napoleon III. from a number of distinguished English people asking his Majesty's support for the construction of a submarine tunnel, intended to connect the railways of England with those on the Continent. Curiously enough the very first name appended to that petition was now in the same position in the list of petitioners against the tunnel in 1882. In 1870 the French Government applied to the English for their views, and what support they would give to the project, but negotiations were broken off at the time of the Franco-Prussian war. In 1872 the British Government, through Lord Derby, replied that they would offer no opposition to the scheme provided they were not asked for any loan or grant in connection therewith. On the strength of this argument the French Government granted authority to a company in 1875 to set about the tunnelling of the Channel bottom. While no formal treaty was ratified, yet there could be no doubt that Britain at that time entered into an international agreement, which was practically of the same value. In the same year an English company was formed, and a Bill passed to enable them to carry on certain under-

takings, the notion then in vogue being that the English and French were to work the excavations into the centre of the Channel, where they would meet and establish the passage. Nothing, however, was done at this side until in 1881 Sir Edward Watkin and the South-Eastern Railway Company obtained a Bill from Parliament allowing them to undertake some preliminary experiments in boring to be carried on. As a result of these investigations, it has been found that the geological part of the problem of tunnelling the Channel can be satisfactorily solved. On both the French and English cliffs they had most conclusive evidence that the chalk was of exactly the same character, and from the wonderfully accurate observations of the rocks at the bottom of the sea there could be no doubt that the chalk was perfectly continuous from side to side. The main difficulty in making the tunnel would be in working in rock which was not watertight. Of the cliffs, the upper portion is composed of rock not watertight, and the lower on grey rock is watertight. Consequently the scheme which begins its working in dry rock, and runs through dry stone the whole way across, is, so far as Mr. Dawkins knew the geological aspect of the question, the only one which could be satisfactorily carried out. There was no reason to anticipate faults or fissures in the rock through which water would get into the tunnel. In the 2,000 yards already pierced the tunnel was so dry that it did not require any pumping at all. Nor was there any need for special ventilation, for while the boring machine, worked by compressed air, was in motion, the air given off was perfectly sufficient for ventilation. Mr. Dawkins described the machine used for cutting the rock. It makes between two and three revolutions a minute, and at each turn cuts 8-16th of an inch from the rock. The rate at which that machine worked is something like 18 yards a day, and there was every reason to suppose that a stronger machine will be able to work at the rate of something like 30 yards a day. The French, working at the rate of 18 yards a day, had cut 600 inwards. The probable cost of the undertaking the lecturer estimated at 6,000,000*l.*, which would be borne by the South-Eastern Railway Company, the London, Chatham, and Dover line, and the French railway companies. He felt perfectly certain that Englishmen would benefit greatly by the formation of the tunnel, among other good results being the removal of the insularity of our national character. He would not say that the making of a channel tunnel would be taken up in earnest just immediately, but he felt certain that if we did not do it now we should do it later. It was entirely a matter of time.

### TRUE AND FALSE ÆSTHETICISM.

THE annual meeting of the Glasgow School of Art was held on Monday. Among the speakers was Professor Jebb, who said he should like to say a few words about the æsthetic movement. In the first place, he should speak of the word "æsthetic." Parody could sometimes destroy permanently one's pleasure in a poem. It was the equally unfortunate privilege of cant to destroy or debase the meaning of a word, and he feared that the æsthetic movement had permanently destroyed the originally noble and significant word, which meant what one perceived oneself, not what other people perceived. Now, the mistake of the æsthetic movement could be very simply defined. It consisted in leaving nature. No art could have a real life unless that life was of the age to which the art belonged. They might make art live by the imitation of dead externals, whether they belonged to the Middle Age or to ancient Greece. Æstheticism had been an evil in so far as it was the senseless and extravagant imitation of externals without any perception of the relation which ought to exist between such exterior things and the life of the age in which they were being reproduced. He should like to say that he absolved Mr. Ruskin of any fault in relation to the æsthetic movement, for Mr. Ruskin had always taught that the best art must be honest and sincere, and must, if it was to be really good, spring from an earnest and noble moral motive. He did not say that Mr. Ruskin had not sometimes pushed that doctrine to an extreme. Still, apart from such excesses, he desired to give Mr. Ruskin, as all did, entire credit for the noble way in which he had asserted the truths, the necessary truths, of the sincerity and earnestness of the higher art. It was not Mr. Ruskin who had taught people to believe that orthodoxy of art depended on the personal manifestations of sunflowers or knee-breeches. The æsthetic movement was over, and he (Professor Jebb) thought it was well over, as measles were well over. It was a malady that was certain to come—or something like it—in such a movement towards art as had been going on in this country. It was a disease that was past, and it was well past. It had not been taken too seriously, and now that it was over—thanks partly to the genial correctives administered by *Punch*—let them remember that it had done some good. It cast ridicule on the noble things which it burlesqued ; it also did something to kill the ugliness against which it protested, and he should say that when the epitaph of the æsthetic movement was written it ought to be remembered that, with all its absurdities, æstheticism protested against some very ugly and absurd things, and that it had done something towards killing them.

## NOTES AND COMMENTS.

M. NENOT should be a gratified and happy man, for it is given to but few in the ranks of the architectural profession to gain such distinction at the outset of their career (M. NENOT is barely thirty years of age) as has fallen to his lot. It will be remembered that a few months ago he carried off, against numerous competitors, the first prize of 2,000*l.* in the international competition held at Rome for plans for the erection of a monument to the late King VICTOR EMMANUEL.

He has now been again successful in the competition for the reconstruction and extension of the Sorbonne, in which about thirty other architects took part. The jury consisted of twelve members appointed by the Government and six others elected by the competitors themselves. For the first prize, at the first ballot out of seventeen votes recorded NENOT received six, BALLU four, LARCHÉ four, FORMIGÉ two, MARIAND one; and no one having the absolute majority a second vote became necessary; and on this occasion M. NENOT was awarded the prize by no less than eleven out of seventeen votes. The other nine competitors, who by the conditions of the contest are entitled to prizes, were placed in order of merit as follows:—MM. LARCHÉ, BALLU, FORMIGÉ, GALERON and VAUDROYER, MARIAND, COISEL, BREASSON and CAMUT, L'HEUREUX and HERMANT père et fils. It became the duty, therefore, of M. ALPHAND to announce to the Council Municipal that the place of honour had been awarded to M. NENOT, who is to be charged with the carrying out of his plans. This remarkable young artist is a native of Paris and a Prix de Rome, in which city he finished his studies at the Medicis College. In 1871 he received the military medal for distinguished bravery on the sanguinary field of Bourget.

A COMMITTEE has been formed in Manchester to purchase the remaining sketches of the late JOHN LEECH. There are about 200 subjects, comprising political cartoons, illustrations to *Bentley's Magazine*, *Punch*, DICKENS's works, and sporting sketches. The sum required is, for 150 drawings, 1,000*l.*; for the 200, being the whole remaining works, 1,250*l.*, and the subscriptions already amount to about 400*l.* The project has been supported by Sir F. LEIGHTON and several of the Royal Academicians. Mr. MILLAIS, in writing to the Committee, said: "Very few of *we* painters will leave such good and valuable work as he has left—work which in great part is historical." According to Mr. BOEHM, one of the greatest artists was JOHN LEECH. Mr. BENTLEY, the publisher, in his letter says: "Where shall we find any other artist illustrating society with the grace and refinement he did, with the airy, delicate humour, with the manly sense, with the perfect purity which marked everything which proceeded from his pencil?" It would be difficult for any committee to purchase works that would be more popular than JOHN LEECH's. His sketches in South Kensington are always an attraction.

THE subject of competition fixed upon by the Académie des Beaux-Arts for the Achille Leclère Prize is "a hall suitable for meetings and distributions of prizes in a large public school or collegé." The plans must provide for the comfortable seating of 3,000 persons in an amphitheatre surrounded by galleries, and in connection therewith must be a reception room capable of containing 200. The site allowed is not to exceed 70 mètres in width, but the depth is not fixed. The number of competitors is expected to be very large.

THE inauguration of the first Exhibition of the International Society of Painters and Sculptors took place on Tuesday last, the 19th inst., at the Georges Petit Gallery, in the Rue de Sèze, Paris, and attracted a large attendance on the whole. The works of MM. DAGNAN, CAZINET, and BASTIEN-LEPAGE appeared to carry off the principal honours, although those of MM. DUEZ, EDELFFELDT, SARGENT, LIEBERMANN, and W. STOTT were also freely commended.

THE Société Centrale des Architectes last week elected its officers for the coming year, the following being appointed:—M. QUESTEL (member of the Institute), president; A. NORMAND and DE JOLY, vice-presidents; LUCIEN ÉTIENNE, principal secretary; PAUL WALLON, assistant-secretary; MOUNIER, press-secretary; RAULIN, librarian; FEYDEAU, treasurer; BAILLY (member of the Institute), ROLLAND, and UCHARD, auditors.

THE Commission appointed to examine the project for the erection of a Crystal Palace in the Park of St. Cloud has reported in favour of its adoption by a considerable majority. The next step is to obtain the authorisation of the Chambers, which is not likely to be refused after this favourable report.

It is announced that the Munich Artists' Association will hold in 1883 a great International Exhibition in the Royal Crystal Palace at Munich, from July 1 to October 15. The King of Bavaria has accepted the patronage of the Exhibition, the royal Government delegates a representative to the Committee, and will promote the undertaking in all respects, giving gold medals to be distributed by an International Jury. Every State or every group of States, acting in unison, may form an independent collective exhibition. In conformity with this rule Germany will arrange a Collective Exhibition of works of German artists, with a committee of selection, composed of members of the Artists' Associations of all the principal art-centres in Germany. Another noteworthy feature is, that the different States may be represented by delegates in the Central Committee. It is supposed that the chances of selling works of art will be favourable. A lottery will ensure the sale of a considerable number of works, and at the last International Art Exhibition in 1879 the purchases amounted to about half a million mark. The Honorary President of the Central Committee is CARL VON PILOTY, Director of the Royal Academy of Fine Arts, and the Secretaries are M. HERMANN ARNOLD and M. EDUARD HEINEL. Among the members of the Committee are many eminent artists.

ACCORDING to the *Augsbourg Gazette*, the remains of a Roman city have just been discovered in Bavaria, near the famous line of earthworks raised by the Romans between Ratisbon and Cologne to withstand the incursions of the German tribes. Near this city, which has been identified with the Abusina of Pentinger, has also been found a Roman fortress, larger in extent than even the Taunus Castrum, which for long past has been a favourite place of pilgrimage for archaeologists.

VICTOR-FLORENCE POLLET, the celebrated French engraver and water-colour painter, died last week at Mayenne, where he had been staying during several months for the benefit of his health. He was born in Paris in 1811, studied, first, under INGRES and PAUL DELAROCHE, and then, after entering the studio of RICHAUME, carried off, in 1838, the Prix de Rome for engraving. His best-known works are—*The Violin-player*, executed at Rome after RAPHAEL; *Joan of Arc*, after INGRES; *The Well of Salome*, after BEDA; and as water-colours—*Idleness* and *Lydia*, now in the possession of the Baroness de ROTHSCHILD; *The Bath*, *The Siesta*, *Songes d'une fille d'Eve*, &c. POLLET was a Knight of the Legion of Honour, and member of the Amsterdam Academy.

THE Committee of the Society for the Protection of Ancient Buildings suggest that every owner of a valuable old house should have all the flues carefully examined by some competent surveyor, and all cracked hearths taken up to see whether any joists pass immediately under them. In no case should the fire be raked out of the grate on to the hearth, as is often done with the mistaken notion of greater safety. Grates are constructed to hold lighted fuel, and hearths are not. Again, much harm is done to old houses and their contents by the habit of shutting them up from light and air, with closed windows and shutters, and not keeping up steady fires when the owners are away. Damp and want of air are enemies to all old pictures and woodwork, and, moreover, on the return of the owner roaring fires are hastily lighted to warm the damp, chilled rooms, causing a quite needless risk. Lastly, the Committee wish to warn every fortunate possessor of one of these grand old houses of the serious damage done to all panelling, stucco, and metal-work, as well as to pictures, books, and furniture, by the use of gas with its acid fumes.

FRENCH art has experienced a further and serious loss in M. POIRSON, a young painter of the greatest promise, who was carried off last week by inflammation of the lungs at the early age of thirty-three. Among his best-known works are—*The Absolution*, *The Old Captain*, and *The Pensioners*. He issued from CABANEL's studio, and secured a medal at the last Salon.

## DESIGN FOR GLASGOW MUNICIPAL BUILDINGS.

THIS design was submitted in the late competition by Mr. R. P. PULLAN, F.R.I.B.A. The plan is based upon the diagram furnished to competitors. Certain modifications were made in the sizes and proportions of the rooms, but the general arrangement is that suggested by the Town Council. A flight of steps leads from George Square to a spacious and lofty vestibule, two storeys in height, over which is situated the council-chamber on the second floor. The vestibule leads into an octagonal hall, whence branch off the main staircases. The corridors throughout are wide and well lighted.

A certain dignity of effect is the result of sound classical proportion and symmetrical arrangement of the elevations. In order to attain this the Palladian style has been adopted. On a comparatively plain rusticated basement stand ranges of Corinthian columns and pilasters, occupying two storeys in height, and running all round the building. This would tend to give a palatial character to the edifice, from whatever point of view it was seen. A bold attic storey with panelled pilasters between the windows, and surmounted by an open balustrade, crowns the whole composition. A lofty octagonal tower, finishing in a dome, rises from above the octagonal hall in the centre of the elevation towards George Square.

## DESIGN FOR THE BIRKENHEAD TOWN HALL.

WE publish this week the design for the above, which was prepared by Messrs. A. VICARS & JOHN O'NEILL, architects, of Somerset Chambers, Strand, W.C.

The style of architecture adopted is a free treatment of Italian Renaissance, designed to harmonise with the surrounding buildings.

The materials proposed to be used were bricks, faced externally with Storton stone, on the four fronts; the open area to be lined with white glazed bricks, for the more efficient lighting of the corridors and staircases. The muniment-rooms, strong-rooms, corridors, landings, and entrances would be of fireproof construction, vaulted with Portland cement concrete and wrought-iron girders. The muniment-rooms in basement for public records would be accessible from the fireproof corridor and staircase. The doors and window-shutters to muniment and strong rooms would be of iron. The timber would be best Memel or red pine; the roofs covered with slates and lead. To insure dryness, the entire area under building would have a bed of concrete.

The buildings are arranged round the four sides of the site, leaving for light and ventilation a central open area. All the rooms look towards the streets. Three entrances are provided to give access to the several departments; and there is a private staircase from the mayor's kitchen in basement to the serving-room on first floor. The mayor's apartments, council-chamber, and committee-rooms are placed on the first floor, approached from the principal staircase. The mayor's apartments and council chamber communicate, and form a handsome suite of apartments. The offices for the town clerk, borough treasurer, the gas and water, and the water engineer's offices, being the departments to which the public will require most frequent access, are placed on the principal floor. As the second floor has the best light for a drawing office it is partly apportioned to the borough surveyor. A heating chamber and coal store is provided in basement. In the roof there are two large rooms, each about 40 feet square, available for storage; there is also a spare room, 21 feet by 9 feet, on second floor, and a room in basement, 16 feet square, for gas-meter and stop-valves for water service.

A large hall, with platform, retiring-rooms, and gallery, is provided, suitable for entertainments and public meetings. It is accessible from two of the principal staircases, and a private staircase from Brandon Street to the platform and retiring-rooms. There is a private entrance from the mayor's apartments to the platform.

It was proposed to heat with hot water the municipal rooms on first floor and the whole of the corridors. The ventilation would be effected by air-shafts carried up in the walls for the outlet; the inlets for the supply of fresh warmed air to the rooms to be in connection with ventilating grates in the fire-places.

The area of the departments is 31,807 superficial feet, exclusive of entrances, staircases, landings, lavatories, and the

corridors, which have a minimum width of 9 feet, and ample provision for lighting. As to the cost, the building was designed not to exceed the sum of 42,000*l.* mentioned in the instructions.

## DESIGN FOR BIRKENHEAD TOWN HALL.

THE second design which we publish is the joint production of Messrs. HOULT & WISE, of Liverpool, and Mr. F. J. CONNELL, of Birkenhead. In their report which accompanied the design they stated that the plans embraced the following, the full accommodation that was desired:—A hall for the public; separate entrances near the most frequented offices; separate entrances to the basement; all the rooms lighted from the streets; reception-rooms facing the square; the chief departments on the same floor; and the first floor reserved to the use of the mayor, the council, and the committees. Also that the areas of the rooms and the departments exceeded those desired, and spare rooms and vaults were provided in anticipation of the future requirements.

Their estimate of the cost was 42,000*l.* if carried out in a very plain manner, exclusive of elaborate finishings, fittings, decorations, clock, bells, &c.

## COTTAGE IN THE GROUNDS OF BACHE HALL, CHESTER.

THIS is a small house for a landscape gardener, situated in the picturesque grounds of Mr. R. S. HUDSON'S residence, near Chester. The walls below are of red Ruabon bricks, from Mr. J. C. EDWARDS' yard, and above they are either tiled with Staffordshire red tiles, or are of oak timber framing, with white cement panels. The roofs are covered with Shropshire strawberry tiles. This part of the grounds, called the Pinetum, contains a large and valuable collection of pines and firs, the dark foliage of which forms at all times of the year a becoming background to the cottage. The ground plan shows the arrangement below. Upstairs there are four good bedrooms. The contract was 700*l.*, and the contractors Messrs. REECE Bros., Tarporley. The architect was Mr. E. A. OULD, of 24 Newgate Street, Chester.

## TREWERN HALL, MONTGOMERYSHIRE.

THE view of this "Bit of Old Montgomeryshire" has been reproduced from a drawing by Mr. THOMAS E. PRYCE, A.R.I.B.A., which was exhibited this year at the Royal Academy. Trewern Hall is a type of house not at all uncommon in Montgomeryshire. Once the abode of a land-owning family, which either from poverty or other causes has become dispossessed of its estate, it now forms but a portion of a larger property, and is used and occupied as a farmhouse.

The plan is the ordinary one of the period, a large hall entered directly from the porch communicating with the other apartments on the ground floor, about 35 feet long by 18 feet or 20 feet wide (speaking from recollection only).

The date, 1610, with the initials "R. F.," is inscribed on the inner face of the doorway head to the porch. This part may be of a later date than that of the main part of the building, corresponding probably with the date of the erection of the gable to the right of the porch (which is of much rougher workmanship than the rest), and also probably with the date of the insertion of the low six-light bay window in the hall, which apartment was originally lighted by a range of small windows, continued round the flanks of the porch, which is now in a very mutilated condition, the sides being plastered and bricked up, and the front filled with modern lattice wood-work.

The corner posts average about 10 inches by 10 inches scantling with quarterings, showing about 7½ inches on face by 5½ inches thick, placed about 10 inches apart, the interspaces being filled with "wattle and dab," and lathed and plastered again on the inside. The house altogether is a very interesting specimen of the timber work with which this district abounds, but which, sad to say, is year by year becoming rarer, and suffering greatly where not actually pulled down from modern alterations and what is strangely termed "the civilising and improving spirit of the age."

T. E. P.

The Nassau Archæological Society has been conducting excavations at the old Roman fortress on the Saalburg, near Homburg. A set of Roman tiles, on which are inscribed tables of the wages paid to Greek labourers employed by the Roman builders, has been discovered.

## GLOUCESTER CATHEDRAL AND ITS ARTISTIC CHARACTERISTICS.\*

(Concluded from page 379.)

WE may easily imagine how imposing was the scene when that grand church was opened to the people. Good Abbot Serlo had won his way by the greatness of his character and his piety. "Ecclesiæ murus, virtutis gladius, buccina justiciæ," are the words written to his memory by William of Malmesbury. The wealth and work of that good man attracted other good men to him; and among them was one Peter, his prior, who succeeded him as abbot—a man of literary and artistic pursuits, who first began a library here, and collected rich mass-books and embroidery, and filled the treasury with valuable things, amongst which was the famous Gloucester candlestick, now in the safe custody of the South Kensington Museum, which, with all its grotesqueness of design and ornament, is no mere relic of antique curiosity, but a work of such excellence as, even in these fastidious days, to command our surprise and admiration. It must have been a heart-breaking scene for the good abbot and his art-loving prior to witness, only two years after their dedication festival, their glorious abbey church devastated by fire. The great roof and painted ceiling lay smouldering upon the floor. But as, thank God, in so many human affairs good comes out of evil, the terror and ruin of those recurrent flames, which scar the history of all such buildings, brought about the use of stone vaulting, which, both for skill and beauty, became the consummating glory of mediæval genius. After four destructive fires the first work of Gothic vaulting here, which the monks of the Abbey devised and worked at with their own hands, was, however, not an artistic success. They cut and maimed the features of the fine old Norman clerestory, and placed their thin weak work too low, destroying all the original grandeur of effect. If it were just at all to stigmatise the arts of Romanesque or Norman times as grotesque or rude, there was yet about them that breadth and vigour of purpose which are the best elements of grandeur. But here in this first pointed vaulting was a grievous and irreparable injury, destroying all sense of proportion throughout the whole building.

### *The Cathedral and the Fine Arts.*

If our subject here were either archaeology or history, such events as these old walls have witnessed, when the last Saxon Edward trod these aisles or met his Witan on this very spot; or when the Conqueror William came to Gloucester at Christmas time to hunt the neighbouring forests, or met his Parliament within these very walls; or when the child King Henry III. was crowned upon those very altar steps; or when in solemn stateliness the murdered Edward was laid beneath these stones—such events as these would afford the opportunities of most picturesque description; for by ancient chronicles, by illuminated manuscripts, and by inference from similar events well known elsewhere, we could paint those pictures to the life. But our attention here is limited to those arts of ancient days that we see illustrated around us. If then we cast the eyes of our imagination backwards to those wondrous times, marked as they are by the contrasts of intense refinement with intense barbarity, we shall find in the broken record of their arts, such as the great religious houses present either to our memory by their records, or by their relics to our eyes, such works of surpassing beauty, such evidences of exquisite piety, as are enough to cool our pride and engage our deepest sympathies. If we remember how those arts of the Middle Ages grew in beauty and strength, not by imitation or by rote, but from the womb of creative genius; if we reflect how deep are the sentiments, the sympathy, the aspiration they express, we trace through their means the broad action of that humanity which is indeed the beating of the human heart from generation to generation, forward to ourselves, whose sense responds to every syllable of their poetry, or backwards, far backwards, to the days when one who was a poet, a prophet, and a king poured out his heart in such words as these: "I have set my affection on the house of my God, I have prepared onyx stones, and stones to be set, glistening stones, and of divers colours, and all manner of precious stones and marble stones in abundance, and gold for the things of gold, and silver for things of silver"—or to one who followed in such work, and added to it blue and purple and crimson and fair linen—or to the ancient seer, whose inspired sense of the future glory of Christ's Church broke out in such rhapsody as this: "Oh, thou afflicted, I will lay thy stones with fair colours, and thy foundations with sapphires; I will make thy windows of agates, and thy gates of carbuncles, and all thy borders of pleasant stones." Among the relics of this once great Abbey of St. Peter's there are the evidences of such enterprise in art, such record of the devotion of men's lives, their thoughts, their piety, their skill, as are better felt than told. They are their own interpreters. But we might tell of such things as these—how that some forms of art seem to have sprung up first here at Gloucester, such as the fan-vaulting of the Cloisters; and the web of screens and tracery of a style before its time, that enrich St. Andrew's aisle; or of that

master genius of architecture, whose name is among the great unknown, fired by the success and beauty of that work of Abbot Wygmore, and impelled by an enthusiasm approaching recklessness, that broke through the eastern apse, changing its gloom into a flood of light; and paring down the venerable walls, covered them with a film of tracery, and then threw up a vault of network stone so playful, so light, as seemed to need nothing but the air to carry it. We might still further tell of the qualities of ancient glass, so refractive as to turn it all to jewellery; or of that masterpiece of refined colouring still traceable among the shreds of ruin on the reredos of the Lady Chapel; or, again, we might praise the successful audacity which poised the great tower in mid air, and crowned it with embroidery in stone; or we might instance the monument and statue of King Edward II., perhaps the finest mediæval work of marble in England; or the unique bracket monument in the choir; or the art of encaustic painted tiles, and the treasures of history and genealogy which their heraldry contains. But all these things are rather for the study of years than for this passing hour. Take, rather, one broad glance at this mighty fabric. Place yourself where you can command the view, or wander in the aisles and see that great work in the completion of its beauty, as it was on the morning of that day (all but three centuries and a half ago) when the Prior met the King's Commissioner and surrendered the abbey for its dissolution. How different from what we see it now, denuded of its colour, poor in sculpture, robbed of those important features which made its architectural effect harmonious and complete, and others added which are an injury and a hideous disgrace. Of what it was we know enough by history and by inference to build it up again; but words will not build, and description would fail to bring adequately before you the full effect of what the art and the devotion of centuries had accumulated within its walls. In front of you would rise the great central rood on its loft, approached by stairs in the aisle upon your left; and beneath it the two altars for the people's church, placed right and left against the stone screen which parted it from the choir, each altar with its background of sculptured niches and coloured statuary. If there is a feature more remarkable than others, even now, it is the multitude of stone screen work about the choir and its aisles and transepts; but in those days we know of at least two more, which must have had imposing effect, at the end of each aisle of the nave; but these and what not more are swept away. Within the choir (without a word of disparagement of the present work, but rather otherwise) who can doubt what the high altar and its re-table must have been, as the work of that unsurpassed genius who changed the grim old Saxon apse into a wonder of gracefulness and light? Then all round this choir, its aisles, and its chapels, now, alas, empty and disused, but then with their apses filled with sculpture and their walls covered with storied painting; and last, not least indeed, that incomparable Lady Chapel, now desolate, but then a wonder of coloured walls and windows, and such a reredos as neither our fancy nor our skill could replace, now a blackened wreck; but then a work of highest art, and of exquisite workmanship in sculpture and in colours, before which we can only stand admiring, grieved, and silent.

Turn, then, from these materials to the moral of their tale. The Church in those days had its enemies, some just and learned, some ignorant and unjust. Rightly or wrongly it is not our business here to discuss, the Faith of Christianity as it then presented itself, whether in the plain guise of its primitive truths, or modified in the passage of centuries by all that ignorance, superstition, or the poetry of romance had done to darken or adorn it, the people were content, and they received the recompense of their simple faith. It was to them the light and the solace of their lives in an age of hardship and rough company. How natural, then, their reverence and regard for all that these sacred walls contained, that brought to their faithful eyes the assurance of consolation and support. The altars were their sanctuaries of refuge. The quiet aisles, whose peace was only deepened by the echoes from the world without, were their resting-places. Architecture had embellished them, sculpture had enriched them, and painting, which was then the poor man's literature, had covered them with stories, suggesting thoughts of devotion and peace. But what are all these arts? Does any estimate of them that we can take exhaust their nature? Whence come they? For what do they exist, if it be not for their power of appeal from man to man? Of what good that lofty choir, if it be but to enclose a vague and useless space; of what good to raise above it that great tower, if it be but to pile up senseless stones; for what the bulk and body of the great minster itself, if it be but a mass of meaningless masonry? No; but as the spark is that lights the candle, so has the touch of fine art illuminated those stones. The hands of their builders are dead, but their art lives; and their heart, their mind, their devotion, their very lives, still animate those monuments.

So ends my story; and the moral of it all is this—The foundation of all fine-art lies in that *relationship* which exists between the things of material and the things of spirit; and the degree of its perception and the power of its use is the gauge of all art's genius. By force of that relationship fine art testifies to that Divine life which underlies the whole sphere of man's mortal state. She testifies to the utter inadequacy of all material things

\* A paper read by Mr. T. Gambier Parry at the meeting of the Gloucester Cathedral Society, and reported in the *Gloucester Chronicle*.

to measure the range, or to satisfy the aspirations, of that which is itself illimitable, the human soul. She is herself that soul's interpreter. Her greatest works are but symbols. She is conscious of her own feebleness, and of those impenetrable clouds which dim her mortal sight. But she is conscious also of that light which shines beyond those clouds, and by an impulse of desire and faith she stretches out her arms to the heavens, and, silent, she binds around her lovely brow this motto: "What is not seen is the Eternal!"

### MR. MUNDELLA ON APPLIED ART.

ON Monday evening, Mr. Mundella, M.P., Vice-President of the Council, presented the prizes to the successful students of the West London School of Art.

The annual report of the head-master, Mr. John S. Rawle, showed that 558 students had attended the school during the year, being one more than had attended the previous year. The day classes were attended by 160 students and the evening classes by 398. The school fees received amounted to 868*l.*, while the Government payments for results were 435*l.*, being the largest amount earned by any art school.

Mr. Mundella, in addressing those present, said that he had been induced to accept the very cordial invitation of the chairman, Mr. Thrup, to be present on that occasion, because he had been informed by the Art Director of South Kensington that this was a school of great promise, and was one of the best in the metropolis, and ought to do excellent work in the future. It had also been stated that the school contained great art elements, which were especially deserving of encouragement and support. The institution was composed in a very large measure of two classes—namely, the employers of art workers and the persons who were engaged in industrial, decorative, and ornamental art work. It was by the aid of such a school as this that the lace manufacturers of Nottingham were able to hold their own aggressively against the lace manufacturers of all the world. It was with the object of encouraging applied art that the Government founded and subsidised art schools. The first Government grant that had ever been made for the purposes of art training was made in 1836, when a sum of 1,500*l.* was granted to the Board of Trade, who administered the gradually increasing annual grant from that date down to 1854, when the duty was transferred to the Science and Art Department. It should be clearly understood, however, that the object of the Government in making these grants was not to increase the number of pictures which were annually rejected by the Royal Academy, but to give technical art training to those who were practically engaged in the industries and manufactures of the country. Speaking on that occasion as Vice-President of the Council, he was only expressing the opinion he, himself an employer of art labour, had long since formed when he stated that South Kensington had been eminently successful in accomplishing the object for which it had been established. He had already shown that the first grants in aid of technical art training had been very small at the commencement. But in 1851 the first Great Exhibition was held. Perhaps but few present could remember that Exhibition, but he remembered it well, because he had not only been an exhibitor in it, but he had been a commissioner for his own locality. He had, moreover, a very lively recollection of the character of British art which was shown at that Exhibition. It had appeared to him in 1851, and he held the same opinion still, that if all the British art work of the first half of the present century, with its wall papers, its decorations, its hangings, and its heavy furniture, had been collected in one vast pile and burnt up, the world would not have been any the worse for it. Of one thing he was quite satisfied, and that was that whatever fashionable craze might prevail in the future, no one would ever dream of making a collection of the furniture and other works of decorative art of the first half of this century. We might well look with pride upon the productions of the days of Queen Anne, which had been designed by men who, although they made furniture, were great artists, of the days when Flaxman designed for Wedgwood, and when the architect left the impress of his genius, not only on the structure of the house, but upon its very door knocker. It was impossible to compare those beautiful works of art with the clumsy productions of later times without astonishment that the taste of this country could have so immensely degenerated. Our deficiencies in this respect were, as he had already stated, made clearly apparent in the Exhibition of 1851. In matters of this kind it was as well to be perfectly frank and open in giving credit to those to whom we were indebted for restoring a healthy tone to the national taste, and, in his opinion, the country owed a great debt of gratitude to the late Prince Consort for the stimulus he had given to our art industries, our art manufactures, and our art teaching. What had happened to our art schools since 1851? Undoubtedly they had been largely subsidised by Government, but they had also received considerable support from those who, like the committee of that school, had put their hands deeply into their own pockets in order to promote their success. It must be remembered that these schools had had in the first place to educate the customer, then the teacher, and then the workman. He recollected the time when, in Nottingham, no manufacturer would have dreamt of employing an English designer,

and it really seemed as though it was believed that English art had entirely died out, and that, whenever an art workman was required, they must go abroad, and notably to Paris, to fetch him. Now, happily, those times had passed away altogether, and it was known that Englishmen possessed more originality and more true artistic feeling than was possessed by Frenchmen. Frenchmen had a great advantage over us in this respect—that they lived in an atmosphere of art, and that they had their regular art classes, but every successive Exhibition showed that in the matter of art England had gained enormously upon Continental nations. Thus in the Exhibition of 1878 Frenchmen stood aghast at the sight of the productions of our art manufacturers, which showed them how greatly they had fallen behind in the race. Where now was to be seen our heavy and inelegant mahogany furniture; our carpets, with their lions and tigers and impossible animals; our hideous wall-papers, with their baskets of fruit and gaudy colours? These atrocious productions had all disappeared, he hoped never again to return, and their place had been taken by works of art of the graceful design and exquisite workmanship which now gave us so much pleasure and enjoyment as we saw them in our shop windows in walking along the streets of London. While, however, we had undoubtedly achieved a great success in the cultivation of a taste for applied art, we could not afford by any means to rest content with our present advance. It was true that this development of artistic taste had enormously increased the demand for our art products throughout the world, and had given a great stimulus to our export trade; but we must not forget that we were about to be exposed to a very severe competition. Let them see for a moment how this great advance—of which we had a right to be proud—had been brought about. The amounts spent by South Kensington since the Science and Art Department had taken up this branch of instruction were—in 1862, 12,000*l.*; in 1871, 30,000*l.*; in 1877, 62,000*l.*; and in 1881, 70,000*l.*; thus showing a very large annual increase in the sums expended upon art teaching. The number of persons receiving art instruction in elementary schools was—in 1857, 30,000; in 1862, 71,000; in 1871, 166,000; in 1877, 541,000; and last year 850,000. The art classes had gone on increasing from 3,000 in 1857 to 23,000 in 1881. The provincial and national schools of art numbered in 1852, 11,000; in 1863, 13,000; in 1871, 21,000; in 1877, 29,000; and in 1881, 32,000. These figures showed that we were making a very steady progress in art teaching, not only in the metropolis, but throughout the country. The total numbers who had received art teaching in institutions aided by the State had been, in 1857, 43,000; in 1862, 87,000; in 1871, 212,000; in 1877, 610,000; and in 1881, 917,000. Therefore we were doing something considerable, after all, in the way of art teaching in this country. South Kensington, however, was by no means satisfied with what had been done, either as to the numbers taught or as to the method of teaching pursued, and it was already intended to take a new departure and to effect great improvements in the existing system of art training. As he stood at the table he was surrounded by the prizes which he had been called upon to distribute to the successful competitors. The time, however, had now passed when in his opinion it was necessary to bribe students into taking an interest in their work by giving them prizes, and he thought that it would be well to spend the 10,000*l.* given annually in prizes in giving the students greater facilities for pursuing their studies and in founding free scholarships and travelling studentships. Seeing that the soldier died willingly for the sake of a little iron cross, it was not too much to expect that artists would consent in the future to give up those prizes, worth perhaps a few pounds, and accept in their place certificates of merit which would mark far more clearly the progress which they had made, provided that they were afforded additional facilities for study. This was one of the subjects that was occupying his attention at the present moment. The reason that the authorities at South Kensington were not content with the progress that had been made was this—that, as he had said before, we were threatened with a competition in the future which it was impossible to disregard, and the danger of which could not be exaggerated. He had recently been in France for the purpose of inquiry into the new system of education which came into operation in that country on October 1 of this year, and while there he spent some time in endeavouring to ascertain what progress the French were making in giving instruction in art. He must say that he was perfectly astounded by the facts that had come to his knowledge on the subject. He had seen in Paris placards 6 feet long offering gratuitous instruction in art to every person employed in certain trades who would come and accept it. He found schools of art which were attended by hundreds and thousands of students established in every part of the country. These schools were supported, not only by the Government aid, but by the different municipalities out of the local rates and taxes. Thus, all the artisans of Paris and a large number of those in the country were receiving gratuitous art instruction. The municipality of Paris expended 32,000*l.* in this way last year, and that sum will be largely exceeded during the present year. He had brought home with him the Paris Budget for education for next year, and he found from it that that city, with its population of 1,900,000, would spend on education double the amount that was expended for the education of the four

millions of people who lived in London. In saying this he was telling them a fact which the people of England ought to be made acquainted with, because before long they would have to meet with its consequences. Last year a commission had been appointed to inquire into technical education throughout Europe, and when the commissioners came home they would pour into his ears the different facts in relation to the subject which they had collected. They had already informed him that they had been astonished at the lavish expenditure which was now being incurred by all continental nations for the purposes of education, they having been stirred up to do so very largely by the example of this country and by rivalry with others. At Rouen artisans might be seen in large numbers working at their studies at night, with their coats off for two hours on five or six nights in the week, diligently improving their minds and acquiring skill at the conclusion of a hard day's work. At Liège, in Belgium, with its population of 100,000, 6,000 young men were at work in the Art and Science Schools every night. Only recently in Paris 300 artisans engaged in a competition in modelling, and were at work from nine in the morning until five in the evening. In these circumstances, we ought to fear lest by our own negligence and lack of enterprise we fall back in our industrial career, and nothing would do so much to keep our industries and manufactures to the front as art teaching. There was another point to which he desired to refer before he sat down, and that was with regard to the feeling that was too apt to be entertained in this country that decorative and applied art was degrading to an artist. He trusted that before long we should entirely get rid of that false notion. He had the high authority of Mr. Ruskin for saying that there could be nothing degrading in producing a work of art, even though it took the form of a piece of furniture. It must not be forgotten that the Italian artists of the Renaissance began their careers in the workshop, and that it was only by degrees that they developed into the skilful men they became. So much for the work which art training produced; but they must not lose sight of the enormous advantage it was to the worker himself. Possessed with a knowledge of art, he felt his work cease to be a mere dull, mechanical drudgery, and his labour in producing that of which his mind could appreciate the beauty became a pleasure instead of a toil. In conclusion, he must express the pleasure with which he looked upon the works of art around him, and the hope he had that the school would have a great future before it. The right hon. gentleman then proceeded to distribute the prizes, and the proceedings terminated.

#### RAPHAEL'S SYSTEM.

THE catalogue of Mr. Malcom's drawings by the Italian masters which are about to be exhibited in Glasgow contains the following reference to the system of building up forms from the skeleton:—

"Two drawings for the well-known composition of the entombment of our Saviour—a panel picture now in the Borghese gallery in Rome. These very celebrated drawings, separate studies for the same group, illustrate each other, and it is not a little remarkable that from Raphael's time to the present they seem never to have been separated. They should therefore now be described together. They are both pen drawings in bistre. Obviously they were executed at about the same time, but which of the two is the prior one is not quite obvious; perhaps the more finished and elaborate one of the two may nevertheless be the earlier. It represents a group of four draped figures, being the Virgin in a swoon, upheld by three female disciples. This group, which is immediately recognisable in the picture, nevertheless underwent various changes and modifications in the successive stages of the elaboration of the cartoon, and its final settlement on the panel. It is not, however, necessary to describe in detail the points of difference which exist. Doubtless the drawing was one of the detailed sketches which immediately preceded the cartoon. The companion drawing, although less elaborate, is perhaps more powerful and masterly in its execution, and is in the highest degree interesting in itself. It represents two figures, viz. the fainting Virgin and one of the females who is sustaining her, and three studies of heads of the females forming the group on a rather larger scale, drawn separately on the sheet. The most remarkable feature of this drawing, however, is that the two full-length figures, whilst in the exact attitude of the finished group, represent skeletons only, whereas those of the previous one display them as living draped figures. The drawing, therefore, confirms the indications of Vasari, to the effect that at a certain period of Raphael's career he entered upon a careful and laborious study of the human figure, both from the living and the dead subject, and that with this view he carried on the practice of dissection, or availed himself of the services in this respect of practical surgeons of his acquaintance. In all probability Vasari himself was acquainted with these very drawings, which, until within the last thirty or forty years, were preserved together in the family of the Marchese Autaldi, of Pesaro, to whom, with many similar treasures, they had descended by succession from Tomotes della Vite, the friend and legatee of Raphael himself. Both these drawings are engraved

in facsimile in Woodburn's 'Lawrence Gallery,' and one of them (that with the draped figures) had been previously engraved in the sixteenth century by one of the followers of Marc Antonio. The celebrated picture for which these studies were prepared was painted in 1507."

#### MR. WILLIAM MORRIS ON ART STUDY.

THE annual meeting of the Leek Art School was held last week, when the prizes were handed to the students by Mr. William Morris. Afterwards an address was delivered, in which Mr. Morris spoke of the importance of using their eyes diligently, as well as their minds and their hands, as a means of curing the bored and anxious expression of the Anglo-Saxon countenance. With regard to real artists, not pretenders to the title, nothing could be more noteworthy than the pains which they took: they were for ever bent on making the best of their talent. He urged those who had made up their minds to study art not to play with the matter. Most men had some gifts towards the arts which could be brought to light if they had opportunities for developing them, and that showed the meaning of the schools of art which had been established to teach people to use their eyes and to eschew drawing down blinds on sunlit landscapes. These opportunities for developing their talents would show them what they could attempt and what they had better leave alone. Nearly as many people could be taught to draw anything that would stand still as could be taught to write, but many people were incapable of learning to write. Now, though a man might draw well in a sense, and not be an artist in any sense, still the acquirement of the art would be useful to him even then, and it ought to be taught more widely and more systematically than it was, even looking at it from that point of view. If a man could learn to draw not only mechanically but artistically, and in such a way as to make it obvious that he had pleasure in the drawing, then he could lay claim to be an artist of some sort. In striving to find out what sort, he would doubtless have difficulties and disappointments, but all would come right in the end, so as he was honest in the work. There was room for artists of all capacities, from the greatest to the least; but to be a pretender, a bungler, was not to be a humble artist—it was to be no artist at all. All artists could not be Michael Angelos, but all could be worthy fellows and helpmates for him. Every great artist would do full justice to any piece of artistic work which was good and sound of its kind. But a great man who would be sympathetic, even indulgent, for all genuine work would have nothing but justice for empty pretence. Art students should remember this and not be too mild in judging themselves, however kind they might be to others. Ever so little of the artist added to a handicraftsman made him a better man to employ, to say nothing of the effect of art on himself, as giving some additional pleasure and interest to his life. The schools of art were not intended to turn out what were conventionally termed artists; they were intended, first for general artistic education, and, secondly, for the special education of those who made designs for industrial art. There must be no confusion of the different grades of artists, for such grades must exist, but there must be no sharp distinctions if they were to have art worth the trouble, widespread and "understood of the people"—if they were to have a popular art. If things continued to go on as they were now going there would be on the one hand a great body of artists so called, most of them turning out unsatisfactory work, not for lack of talent, but because their talent would be misapplied. They would be compelled to be more or less useless because they were more talented than their fellows, and so be set to supply fine arts, and not being really artists enough for that demand would have to supply a substitute for it which would receive very languid attention from the public in general, yet more attention than it would deserve. Above the heads of these would be a very few men of genius, who at the expense of great toil and suffering would have acquired real mastery over their art, and would produce works of a high quality, but which would not in the least be "understood of the people," partly from their fault or their misfortune, partly from the fault or misfortune of the people. All this would supply the languid demand for the more intellectual side of art: the fine arts; but there was still a demand for the less intellectual side—namely, the ornament of the industrial arts, that side of it which should be done by handicraftsmen. But how was that to be supplied if things went on as they were going? First at the top of the tree would come a very scanty, however precious, fruit—the art done by great men struggling under difficulties; then lower down the fruit would be tolerably plenteous, though unripe and of little use as it was; lastly, a very strange fruit indeed, which nobody would want, and which nobody would be willing to pay for, but which would go on being produced from a sort of habit. That would be the position of ornamental art, so called. There was one comfort, that such a state of things could not last very long. He should hope man would still have some longing for beauty left in him. Surely, first of all, he would remember that no pyramid could stand on its apex, but must stand on its base. He would know that before anything worthy to be called art could exist it must be longed for by the people, and he would look forward to the day when no one, save a few curious exceptions, men with

diseased minds, would fail to understand art and to demand his due share of it. In that day, though there would be gradations from the humblest to the most elevated, there would be no sham art, because every man who worked with his hands would find out his real and proper place and do his best in it, and between all handicraftsmen there would be mutual help and sympathy. To those who did not rightly know what art meant, or had not leisure or opportunity to think what a dull blank the total loss of it would make in all men's lives, the necessary sacrifices to be made before art could be born again might seem great, and over great if they could see them rightly all at once. He had taken note of many strikes, and he must needs say, without circumlocution, that with many of them he had heartily sympathised; but when the day came that there was a serious strike of workmen against the poisoning of the air with smoke or the waters with filth, he should think that art was getting on indeed, and that the schools of art had had a noble success. Meanwhile, he fancied that most of them would agree with him in thinking it was a hopeful token that all classes showed signs of uniting to prevent the robbery of commons, which till quite lately had gone on unchecked in England. The more individuals were kept in due order by the public, the more public rights were respected, the nearer grew the chance of the new birth of popular art. What he meant by art, what he was really interested in, was not the prevalence of this or that style, not the laying on the public taste, whether it would or not, a law that such and such a thing must be done, but rather a general love of beauty, partly for its own sake and because it was natural and right for the dwellers on the beautiful earth to help and not to mar its beauty, and chiefly because that external beauty was a symbol of a decent and reasonable life. Material prosperity was a thing which, according to their way of dealing with it, would be either the helpful servant or the cruel tyrant of civilisation. If it was still their servant, bid it give back to England the green fields which it had wasted; bid it turn its terrible power to the task of giving them something worthy to supply the place of the stored-up loveliness of ten centuries of which it had robbed the homes of England. And if they found that it would not obey them, and that it was their master and not their servant, what should they do then? Two courses were open to them. One was to pretend to believe all was well; the other was to resist the tyrant till he was reduced to the old condition of servant again. It was no light task, but the worst part of it was making up their minds that it had to be undertaken. There were those who now desired money unreasonably, and distressed themselves and their neighbours very much in the acquisition of it, who strove for it for reasons which would no longer exist if civilisation should get into the right road again. He knew some of the reasons of the nature of fencing oneself against the intrusion of barbarous ugliness, or the desire for the possession of works of art. The time would come when no one would need money for such purposes, for ugliness, in the work of man's hands, which was now the rule, would exist no longer; when there would be humble but satisfying art in private dwellings and lofty, soul-inspiring art in public places; in short, nature here unspoiled, there helped in her loveliness. Let them compare that with the track of waste and squalor which the misnamed monster Commerce left behind now, and join in hastening forward the day when the motto of their country should be "One for all and all for one."

### PROPOSED MUNICIPAL BUILDINGS, NOTTINGHAM.

THE Corporation of Nottingham invite designs for the new municipal buildings. The preliminary designs are to be sent in before March 15. The *Nottingham Guardian* says that a careful calculation has been made in the Borough Engineer's office of the supposed requirements which will have to be met. These are of the most various character, including the Town Clerk's and Clerk of the Peace's office, the Consulting Engineer's and Borough Surveyor's offices, the Borough Analyst's department, the Borough Accountant's office, Rate Collectors' offices, the Medical Officer of Health's and the Nuisance Inspector's offices, the offices of the Water and Gas Committees, a fire station, a central police station with cells and drill-shed, police courts with accommodation for the clerk and assistant clerks to the magistrates and for the magistrates themselves, and stores and other rooms needed to carry on the multifarious businesses of the town. The calculation shows that the least space which ought to be provided to meet these wants is about 100,000 square feet of flooring. As the cattle market altogether only contains about 120,000 square feet, it would be just possible to erect upon it a one-storey building giving the required area, and set back a very short distance from the surrounding streets. This, however, would absolutely fill up the whole of the site, and it is therefore proposed that the offices, &c., shall be placed in a two-storey building, which, affording equal accommodation, would only occupy half the ground, the other half being thus left for air and light spaces. It is not intended that the buildings shall be of a highly ornate character, and, indeed, it is not impossible that a distinct intimation may be given to competing architects

that any attempt to copy the style of architecture adopted in the University College, which is so near the site as almost to invite comparison, will not be considered favourably. The principal material to be used is brick, with stone dressing, and the whole erection will be made as unpretentious as a public building of the sort can well be. The cost, it is estimated, will be about 100,000*l.*, which it is hoped may be raised by the following methods:—By the sale of the existing town-hall, central police and fire station, gas and water offices, and municipal offices, about 70,000*l.*; by a call upon the funds of the gas concern, 20,000*l.*; and by a similar call upon the funds of the water concern, 10,000*l.* It is hoped that the plans of the competing architects will be in a condition to be laid before the committee about next March, and that other preliminary matters will then have so far advanced towards settlement that a substantial advance may at once be made. An opposition to the final adaption of a scheme of so great magnitude is developing itself, but to what extent it may go there are no present means of judging. Before any scheme involving the alienation of the cattle market from the uses to which it is now put be adopted, however, the antecedent condition must have been complied with that another suitable site on which to hold the market must have been found. This, it is thought, has been done in the Eastcroft, with the owners of property in which place negotiations have been for some time proceeding—negotiations which, if successful ultimately, will probably admit, in addition to the other works proposed, of the building of a wholesale fish market, where fish which has just been conveyed into the town by rail may be bought under the hammer, instead of being disposed of in the present unsatisfactory way to the different retail dealers.

### LEEDS ARCHITECTURAL SOCIETY.

A CONVERSAZIONE of the Leeds Architectural Society was held on Tuesday, at the new offices of the School Board, which were adorned for the occasion with works of art of various kinds.

The President of the Society, Mr. J. D. Fraser, F.R.I.B.A., supported by the leading architects of the town, early in the evening took up his position near the top end of the room, and gave a sincere and hearty welcome to those who had responded to the Society's invitations, and he expressed a hope that, with the valued help of their kind friends, whose names appeared on the programme, they would be able to spend a pleasant and instructive evening together. As you are doubtless aware, he said, the Society is now in the seventh year of its existence, and though comparatively young I am happy to say it is vigorous and flourishing, in spite of many difficulties, one of which has been the want of a permanent home, which we have now acquired. And we now hope that our future will be one of extended usefulness, mutual help, and prosperity. Although for many years past the medical and legal professions have had their societies and associations for instruction and social intercourse, the architectural fraternity have only recently (at any rate in the provinces) made an effort at combining for their mutual benefit as members of the same profession. Short as our existence as a society has been we are already beginning to feel the benefit of it, and to find that, principally through its means and that of kindred associations, the public are taking more interest in the doings and sayings of the architectural world. The recent revival, or rather I should say the birth, of what is popularly known as art feeling in this country, and which no doubt owed its origin in a great measure to the International Exhibitions of 1851, 1862, and 1867, has not only led to improved taste in the matter of dress, furniture, and other surroundings, but it has awakened a keen interest in the queen of all arts—that of architecture. So long as an intelligent and discriminating interest is taken in our art by an educated public, so long shall we be obliged, for our own good fame and honour, to do our utmost to act up to the highest traditions of our art. Before distributing the prizes, the drawings for which are placed in the adjoining room, I feel it is necessary to point out that the want of a settled habitation has also told very seriously against the classes, and, consequently, the work produced by the students, which I feel confident will be remedied in the future, as we shall now be enabled to enter into a more systematic course of instruction under the guidance, help, and encouragement of the senior members of the profession.

The prizes were six in number, and were as follows: A prize of two guineas, offered by the President for design for an hotel and drawing of an old house at Shipley, awarded to Mr. A. Gaunt. A prize of Ruskin's "Seven Lamps of Architecture," offered by Mr. John Tweedale, awarded to Mr. Alfred Williamson, for designing work done at the class meetings of the Society. A prize of an album, offered by Mr. J. R. Watson, and awarded to Mr. Frank B. Howden, for designs for a settle and two chairs. A prize of Sir G. Gilbert Scott's "Lectures on Mediæval Architecture," offered by Mr. Cribb (of the firm of Marsh, Jones, & Cribb), awarded to Mr. J. H. Roodhouse, for design in colour for the decoration of the side of a room. A prize of two volumes on "Building Construction," offered by Major R. W. Moore, and awarded to Mr. G. Stevenson, for an interior perspective view, in colour. A prize of

the Science and Art Department's volume on "Building Materials," offered by Mr. W. H. Thorp, and awarded to Mr. Alfred Williamson, for measured drawings of the old oak screen, St. John's Church, Leeds.

### HAMPTON COURT.

AT the inquest on the body of the woman who was burnt in the fire at Hampton Court, Mr. A. B. Mitford, C.B., Secretary of the Office of Works, said that about six years ago the system for extinguishing fires at the Palace was entirely reorganised. A brigade was formed of fifteen persons, of whom four were resident in the Palace. There were monthly drills, and they were periodically inspected by Superintendent Palmer, one of Captain Shaw's officers. Superintendent Palmer's advice in all matters relating to the brigade and fire services had been exactly followed. Mr. Palmer was recommended for this service by Captain Shaw, and in following his advice it was considered that what was done would have the approval of Captain Shaw. There were fifty-five hydrants on the main, which were constantly charged. In addition, there was a fire-main laid on the roof behind the parapet which would enable the firemen to deluge the whole of the roofs with water, and to the existence of this main he attributed the prompt extinguishing of the recent fire. There was a steam fire-engine of 30-horse power, capable of pumping about 700 gallons of water per minute and of throwing six large jets to the highest part of the Palace. The boiler of this engine on its trial raised 100lb. pressure of steam in ten minutes, there being 16° of frost at the time of the trial. Besides there were two manual engines and a fire curricule, three hand-pumps, a hose truck, seventy-five fire-buckets, and a fire-escape of Captain Shaw's pattern. In the picture-galleries were fourteen internal hydrants and twenty external hydrants. Six new corridor engines and two hand-pumps full of water were kept on the landings. Printed instructions, with full information for all persons about the Palace, were hung in prominent positions near the hydrants. The Palace fire brigade had been successful and had taken prizes at various competitions. With regard to the suggestion of placing a tank on some part of the Palace, it appeared to him that the main laid along the roof really gave greater security, for with the powerful engine to charge it there was practically the supply of the Thames. He could not suggest any additional measures that would be an improvement on those already provided for dealing with fires.

### BIRMINGHAM ARCHITECTURAL ASSOCIATION.

THE second ordinary meeting of the session was held on Tuesday last, at Queen's College, the chair being occupied by Mr. J. P. Osborne. The following gentlemen were elected and two others proposed as new members:—As honorary members, Messrs. W. Doubleday, G. R. Faulkner, S. Horton, J. King, James Ernest Stanbury (Barrister), and Thomson Plevins. As ordinary members, Messrs. C. E. Bateman, A. J. Craddick, A. Hale, T. W. F. Newton, and Tom A. Smith. After a paper by Mr. Norman Gething on "Hearts in our Art," had been read, a vote of thanks was accorded to the reader of the paper, on the motion of the chairman, seconded by Mr. W. G. Mantle, and supported by Messrs. F. G. Hughes, F. Simon, and the secretary, F. W. Franklin Cross.

### THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE fourth ordinary meeting of the Institute of British Architects was held on Monday evening; Mr. Ewan Christian, vice-president, in the chair. The death, on the 3rd inst., was announced of Count V. Vespignioni, architect to the Vatican at Rome, and corresponding member. A paper, followed by a discussion, was read by Mr. Gale, the holder of the Godwin bursary. A report of the proceedings will appear next week.

**The Regent's Canal and City Railway.**—The Regent's Canal, City, and Docks Railway Company, which obtained an Act of Parliament last session, after a protracted and expensive contest in the Parliamentary committee-rooms, have commenced the purchase of lands along the line of route, with the view of immediately entering upon the construction of the line, and have just completed an important purchase in the neighbourhood of Aldersgate Street. The project includes the construction of a station in that locality, not far from the Aldersgate Street Station of the Metropolitan Company; and for the station of the new company, and the general purposes of their undertaking, the company have just purchased the large area of land on the south-eastern boundary of the City in Golden Lane. The land, which has for some time past been vacant, and which contains 45,336 feet, has been bought from the local authorities for the sum of 80,592*l.*, being at the rate of nearly 2*l.* per foot. It is stated that the purchase-money is intended to be applied to the erection of artisans' dwellings in Petticoat Square, eastward of Golden Lane.

### An Evening at the "Institute."

SIR,—It is now thirty years and upwards since, as a student at the Institute, it was my privilege very regularly to attend its meetings. Then the prominent figures in the old room in Grosvenor Street were Professor Cockerell, Professor Donaldson, Mr. Fergusson, Mr. Tite, Mr. Papworth, and occasionally Mr. Gilbert Scott and Mr. Edmund Sharpe; Mr. Bailey and Mr. Scoles acted as secretaries. On the 4th inst. it was my pleasure to attend the meeting for the first time since becoming a member. One's memory went back to former days, and the impressions of those days revived; they contrasted strongly with those of to-day's experience. Let me not presume to say favourably or unfavourably, but the whole tone and manner seemed changed. Reflecting on the why and the wherefore, the conclusion which predominated in one's mind was, that competition and the spirit of competition had wrought the change. The subject of the evening appeared to me as a stranger to be treated on one side and on the other with a bitterness which did not come altogether of the love of art, or of friendly professional association. But it is to the subject itself—notwithstanding that it was tacitly voted out of time—that I would venture with much diffidence to recall attention.

Though holding a very strong opinion as to the general merit of the design exhibited last Monday evening, and also as to that shown at the Academy during last summer, I would now confine my observations to a single point in the controversy. Mr. Ewan Christian, in criticising what had fallen from a previous speaker, took us back to the intentions of the architect of St. Paul's as to the decoration of the building generally. He could not have pointed to a more fitting consideration. Let his observation be carried further, and taken to the dome itself. What did Sir Christopher Wren do with it? He treated every other portion of his building architecturally. The dome he left a plain surface. Is it to be supposed that this was accidental? or that, as its designer, he had not finished with it? Was it not rather, considering its form, its distance from the eye, and the proportion of light which he had given to it, that it was his direct intention that its surface should remain flat, and its treatment should be of that character and not, in mockery, painted architecturally? Had he wanted deep recess and high relief, why did he not structurally provide them? In the room of the Institute there is what might perhaps be called a miniature dome. It has ribs and coffers, and was, no doubt, intended to be architectural. Suppose it were desired to decorate this feature, and the artist employed proposed to fill up all the coffers, and to reduce the surface to a plain one. What would the Council say to this? Is it likely they would accept it as a true interpretation of the original design? It is unlikely. Then may it not be with equal reason asked, when Sir Christopher Wren left his dome as a plain surface, why should it be architecturalised after one fashion or another?

There were two schemes before the meeting, one elaborated, the other roughly but cleverly sketched. Did either satisfy those who have thought about the subject? Nay, more! Did the model of the two great artists exhibited in the summer do this? Did not even the enthroned figures in that design appear in perilous situations? Was there not a consciousness of uneasiness about the whole treatment? Of the design brought forward by the reader of the advertised paper there is perhaps little to be said in its favour, as its principles of treatment really appear to revoke the intentions of the designer of the dome. Of the sketch and description given by Mr. Stannus of Stephens' design no mature judgment could be formed, as they offered but inadequate data. The observations by Mr. Armitage the painter, and by Mr. J. P. Seddon and Mr. Neville, rather pointed to the idea that elaborate pictures in the dome were not desirable; and, indeed, that they would be practically useless because invisible from the floor to a great extent. This idea was not carried beyond a mere suggestion, but is it not one which is worth pursuing? It leads to the view that neither an elaborated architectural treatment nor a pictorial one in high relief is advisable, but that everything suitable to the circumstances of the case might be attained from a flat style of treatment. As to subject. Suppose that one of our great landscape painters were asked to paint the dome as a simple sky effect, choosing his own time of morn, even, or noonday, and dealing with it with a view of reproducing some faithful aspect of the dome of heaven. Would not that be as much as most critical visitors to St. Paul's would be content with? But a flat style of treatment would not be inconsistent with a figure subject. The great doom of mankind would be an appropriate one. The Great Judge as a central figure, with His holy angels accompanying Him, and then on the right hand and on the left the righteous of all nations and kingdoms who will first rise to meet Him.

Judging from his writings, it seems to have been a long-cherished ambition of the late Sir Gilbert Scott to build a large Gothic dome, but it never was gratified. As a frontispiece to his

"Mediæval Architecture" he gives a rough sketch of a dome treatment as designed by him for the Law Courts. Is there nothing in this appropriate or suggestive in the matter of the treatment of the decoration of the dome of St. Paul's?

Yours truly,  
C. L.

December 9, 1882.

#### Dublin Science and Art Museum.

SIR,—Referring to the article on the above subject, I beg leave to state that the writer is in error as to the question which is now being debated with most interest here. It is the question of the *site*, and not of the *design*.

Your obedient servant,

J. RAWSON CARROLL, F.R.I.B.A.

176 Great Brunswick Street, Dublin :

Dec. 13, 1882.

#### Middlemen in Art.

SIR,—The *cause célèbre* which is at present attracting so much public attention, and more particularly the attention of artists of every kind, is, I think, one that cannot fail to be productive of some good; and whether or not the gentleman whose artistic merit is called in question deserves the epithet which has been applied to him, the result of the trial is likely to be wholesome and purifying. That some so-called artists and authors contrive by a judicious application of the persuasive guinea to reap the honours and rewards due to works which they have not executed, and could never hope to, is a fact pretty well known to most of us who make our living by our art; and that this state of things is an institution as old as it is ugly we are told in Isaac Disraeli's "Curiosities of Literature," where some very startling instances of literary imposture are revealed. Indeed, it is pretty certain that matters have been in a much worse state than they now are, though their present condition is far enough from being a satisfactory one. Such a trial as that now pending is probably a great surprise to many of the general public, who would scarcely expect to find the huckstering spirit rife among artists, and would never have looked for such malodorous reports among men of eminence and fame. To them this case will come like a revelation; and if, as will most likely happen, it determines them in future to bestow their commissions more warily, the consummation will be a happy one.

The reason of the existence of such imposture originates, I think, among artists themselves. It is, unfortunately, the case that business acumen is but seldom the companion of excellence in art. The artist is too often thriftless, generous, and careless in matters mundane. With the gifts of a Turner for painting, or a Foley for sculpture, he is in business affairs the inferior of any solicitor's office-boy. This fact is only too readily and joyfully grasped by those who supply a lack of artistic merit by a decided mercantile talent and a not too nice sense of honour—the middlemen, in fact, whom the public so bountifully fees, and would so gladly dispense with. It is devoutly to be hoped that these gentry will receive a blow where they feel it most—namely, in their pockets.

In our own profession—by which I mean architecture—middlemen are not unfrequent. By these I do not mean men who allow important work to be done by an assistant; for it is, of course, obvious that an architect may and must receive a far greater share of skilled assistance than would be becoming in a sculptor or painter. But I have known and know now of men who are utterly destitute alike of practical knowledge and artistic talent, men who are incapable of doing anything whatever by themselves, and who yet enjoy not only a lucrative practice, but the fame which of right belongs to some retiring artist in their office, whom they in turn remunerate sparingly enough. The practice of men like these cannot but be ill-conducted in the main, and they reflect little credit on our profession as a body. Dirt, we are told, is matter in the wrong place, and these gentlemen are certainly in their wrong place. I cannot help thinking that it would have been not only better for us, but better by far for them, had they made choice of some other calling, for surely their talents are thrown away in a poor profession like ours; when had they but elected to be butchers or hucksters, they might soon have had both hands deep in the pockets of the public.

There are again within the pale of our profession men who, on the strength of knowing of one or two clever draughtsmen and designers, who are glad of any employment, will advertise themselves as ready to undertake any kind of work on moderate terms; when they have obtained it, they sub-let it to the artist on considerably *more* moderate terms, and realise a fat commission at the expense of the profession to which they cannot properly be said to belong. It would surely promote a healthier state of things if architects would endeavour to make sure that they are dealing with the artist at first hand, and so dispense with these agents—barnacles who stick to the bottom of the architectural craft, and who might be cleaned off with much advantage.

The middleman, it has been said, *must* "live." But as Tallyrand said, "Je n'en vois la nécessité." So say I, and I think so say all of us.

I am, yours, &c.

W. M.

#### LEGAL.

##### Court of Sessions, Edinburgh. Second Division.

(Before the Lord Justice-Clerk and Lords YOUNG, CRAIGHILL, and RUTHERFURD CLARK.)

DAVISON AND OTHERS v. JAMES RITCHIE. MILNE v. JAMES RITCHIE AND OTHERS.

THE respondent in these reclaiming notes, James Ritchie, a builder, St. Andrews, raised an action against the reclaimers, William Davison, hotelkeeper, and John Gamble Paterson, club-master, St. Andrews, for payment of 395*l.* as the balance of the price due to him by them for work done in the building of two villas at the Scores of St. Andrews. In support of his claim, Ritchie said that John Milne, the architect for the defenders, had accepted his offer to do the work, and had the authority of the defenders to accept his offer to do the work for 1,646*l.*, and that they afterwards homologated his acceptance of it; and, also, that it was a custom of trade for an architect to have power to make such contracts on behalf of his constituents. The defenders, on the other hand, denied Milne's authority to accept an offer higher than 1,447*l.*, the alleged custom of trade, and their alleged homologation of the contract. The Lord Ordinary (Kinneir) gave judgment for the pursuer for the sum sued for, and found the defenders liable to him in expenses. In the second action, Milne asks the Court to set aside the contract for 1,646*l.* on the ground that it was obtained from him by fraudulent representations and concealment on the part of Ritchie, and was granted under essential error; and also to set aside a decree in absence obtained against him by Davison and Paterson in an action of relief. The Lord Ordinary, in this case, sustained a plea maintained for Ritchie, the builder, that Milne had no title to sue, and dismissed the action as against him, allowing it to proceed as against Davison and Paterson.

The Court (Lord Rutherford Clark dissenting) recalled the last-mentioned interlocutor of the Lord Ordinary, repelled the plea stated for Ritchie against Milne's title to sue, and remitted the case to the Lord Ordinary, on the ground that, in the position in which he is now placed between the builder and the owners of the villas, the architect has a material interest for seeking to be restored to the position in which he was before the contract was signed. In the other action of payment, their Lordships continued the case to allow the owners to consider whether they will sist themselves as pursuers in the action of reduction.

#### ARCHÆOLOGY.

**Sandown Castle.**—The demolition of all that remains of Sandown Castle, near Deal, which was temporarily suspended by order of the War Office authorities, is now proceeding. When the work was commenced it was thought that it would require only the pick of the excavator to disintegrate its masonry; but this has proved quite the contrary, in a way which has astonished the officials of the Royal Engineers Department, under whose direction the work is being carried out. So firmly are the blocks of stone and other material set in the cement in which they were originally laid that they can only be removed by blasting. The excavations are now proceeding in what was originally the gun rooms of the castle and the basement, where the strength of the structure is very remarkable, the cement in many cases proving harder than the stone employed. Up to the present time about one-third of the castle has been demolished, the quantity of material removed being about 500 tons. The material is being conveyed by rail to Dover Castle, where it will be used, in accordance with a suggestion by the Archæological Society, in the construction of a residence for the General Commanding the South-Eastern District, at Constable's Tower, near what is known as the "old entrance" to the castle.

**North Gosforth Chapel.**—At the last monthly meeting of the Newcastle Society of Antiquaries Mr. Sheriton Homes read an account of recent investigations made by him in and about the ruins of the ancient chapel at North Gosforth. He stated that of the history of this chapel but little seemed to be known. In all probability it was, like its neighbour at South Gosforth, a chapel of ease to St. Nicholas'; for in the year 1598, the same curate, Umfrid Sicomen, did duty at both places. The architectural remains of the chapel are very meagre, but from the dado, with its splay course running all round the walls, and the character of the doorway, it may probably be dated about the time of the transition from the Norman to the Early English style of architecture, or the early part of the twelfth century. The building is simple in plan, consisting of the chapel proper (equivalent to the nave in larger structures), 38 feet 5 inches by 17 feet within the walls, and a chancel 18 feet 5 inches by 14 feet 4 inches. The whole of the walling was trenched round to the foundation, inside and outside of the building, and carefully examined, but no trace of Roman inscribed stones were found, other than the one in the east wall, noted by Mr. John Bell in 1826. He showed sketches of the building, and of the various sculptured stones found, including a Roman altar; and as Mr. John Bell in 1826 made no mention of

the Roman altar it must have been found since he wrote. This stone has a moulded base and head, but is much weathered, and the inscription eaten out; on the ends, however, with the aid of a side light, may be made out the usual sacrificial implements. Generally throughout the graveyard portions of earthenware vessels and red tiles were found, but in a very fragmentary condition; and the presence of such a variety of pottery, and of the Roman altar, seem to indicate a use of the place as a place of sepulchre from very ancient times.

### TOWNS IMPROVEMENT.

**The New Schemes of the Metropolitan Board of Works.**—Notification has been given by the Metropolitan Board of Works of their intention to apply for leave to bring in three Bills in the ensuing session of Parliament. By the first the Board will ask for powers enabling them to alter or reconstruct the existing bridge over the Thames at Hammersmith, and to stop all traffic during the operations, and authorising them to build a temporary bridge during the alteration or reconstruction of the existing bridge. They will also ask for authority to charge the maintenance and repairs of the carriage and footway of the approach roads to the altered bridge, or a portion of it, on the Fulham District Board of Works and the Mortlake District Highway Board. The Bill will further contain provisions authorising the transfer and vesting in the Board of the undertaking and property of the Poplar and Greenwich Ferry Company, and the abolition of all rights of levying toll on or in respect of the roads known as the East and West Ferry Roads, Poplar. By the second Bill the Board will ask for powers enabling them to amend or repeal sections 32 and 33 of the Metropolitan Streets Improvements Act, 1877, or either of them, so far as they apply to the new streets and street improvements authorised by that Act, and therein described (section 4) under the title of "West End New Streets and Street Improvements," and to make provision as to the accommodation in dwellings of some of the persons belonging to the labouring classes referred to in the 33rd section. The Board have frequently complained of being seriously hampered by the restrictions imposed on them by this section in carrying out projected street improvements. The latest phase of the difficulty was the recent action brought by Mr. Spencer against the Board. Clauses will be included in the Bill conferring on the Board further powers for taking and dealing with the houses referred to in the sections mentioned and for acquiring all interests therein; to confirm (if need be) any purchases, sales, or other dispositions of land, houses, or property under the provisions of the Act alluded to, and any agreements and notices served, or proceedings taken or pending, or payments made by the Board with relation thereto; and to render them valid and effectual, "notwithstanding that some of the provisions of the said sections or one of them may not have been complied with." Authority will also be sought to explain and define the meaning of sections 32 and 33 or one of them. In the third Bill the Board ask for authority to make various new streets and street improvements, &c., within the metropolis, for the compulsory purchase of land and houses, and for other requisite powers in connection with the projected works. One of these improvements involves the construction of a new street from the Holborn Town Hall to St. John Street Road, near the Angel, Islington. It will commence opposite the Holborn Town Hall at the junction of Gray's Inn Road and Clerkenwell Road, and terminate on the western side of St. John Street Road at its junction with Myddelton Place. Another of the projected improvements is a new street in continuation of the street authorised by the Metropolitan and Metropolitan District Railways (City Lines and Extensions) Act, 1879, commencing within the district or Liberty of the Tower, at or near the junction of the street with Trinity Square, and terminating in the district or Liberty of the Tower or the precinct of Old Tower Redoubt, at the drinking-fountain at the southern end of the Minories.

**New Shoreham, Sussex.**—Although the commercial fortunes of this quaint and once important town and port have been in a somewhat drooping state, there are signs that commercial men see its position as being one capable of considerable development. Possessing an abundant supply of pure water, healthily situated under the South Downs, placed midway between Portsmouth and Dover, and rich in history, it is bound to reassert the right to the title of being the "Liverpool of the South," especially as it has become tired of being left out in the cold by the London, Brighton, and South Coast Railway, which has a junction here. It is moving with Brighton in favour of the scheme on foot for a new railway connecting the northern counties and the city of London with it. An extensive building is in contemplation for the manufacture of soap, &c., plans for which, prepared by Mr. Arthur Loader, architect, &c., of Brighton and Shoreham, have, after searching examination, been heartily approved by the Local Board; while a North German firm and a firm of manufacturers north of the Tweed are making inquiries for premises securing a southern outlet as well as good railway accommodation.

**A Project** for tunnelling the Simplon is said to be contemplated in France.

### GENERAL.

**Mr. J. E. Boehm, R.A.**, has been commissioned to execute a marble bust of the late Archbishop of Canterbury.

**Mr. W. J. Muckley** has resigned the post of director and principal of the Manchester School of Art. He was appointed to Manchester in 1862.

**The Art Gallery** of the Peel Park Museum, Salford, has been presented with *A Portrait of Thorwaldsen*, executed by E. Sauti, after Horace Vernet's picture in the Copenhagen Museum. The donor is a former mayor of Salford.

**The Statue of Earl Beaconsfield**, for the National Memorial, is to be cast to-day (Saturday) at Messrs. H. Young & Co.'s works, Pimlico.

**The Statue of the Queen**, by Mr. Woolner, R.A., commissioned by the Committee of the Prince Consort Memorial Fund in Birmingham is now on the eve of completion.

**The Edinburgh Town Council** have decided not to apply for a provisional order under the Electric Lighting Act.

**A Hospital** erected in Glasgow for sick children has been formally opened. The architects of the building are Messrs. Campbell Douglas & Sellars.

**The Clothworkers' Company** have made a donation to the Rev. H. Solly in aid of the establishment of technical classes in the metropolis on the plan of those conducted at the Artisans' Institute.

**The County Court at Birmingham** has just been fitted with one of Clark, Bunnett & Co.'s safety lifts. This company are also fitting their patent self-coiling shutters to the new forts at Lerwick, the Prince's Landing Stage at Liverpool, and the Woodside Ferry, Birkenhead.

**The Liverpool Art Club** will open in February a memorial exhibition of the works of the late Mr. H. K. Browne.

**The British Museum** has received from Cyprus a consignment of curious, small, half-round figures in terra-cotta, mostly draped female divinities rudely modelled after archaic types, and found at Salamis. The Museum has been enriched by a set of the rare prints illustrating the "Triumphs of Petrarch," the designs of which have been ascribed to Fra Filippo. They were found in a volume of poems which formed part of the Sunderland Library, and were sold for 2,000*l*.

**Mr. W. W. Gwyther, F.R.I.B.A.**, was on Monday evening last entertained at dinner at the Café Royal, Regent Street, and presented with a testimonial by his assistants and pupils past and present. Mr. J. W. Stevens, A.R.I.B.A., presided. The testimonial consisted of a morocco album, mounted in silver-gilt, and contained photographs of the subscribers. It was enclosed in a polished oak case and accompanied by an illuminated address on vellum.

**Messrs. John Warner & Sons** have been awarded a silver medal at the Cornwall Mining Institute Exhibition, held last week at Camborne, for their exhibits of mine pumping machinery and pumps and mining tools, which elicited much praise, the president saying that no such exhibit had been made by any firm in the county before.

**The Liverpool Town Council** on Wednesday decided to apply to the Board of Trade for a provisional order authorising the construction of tramways to connect the existing lines within the city, and also to go into new districts both inside and outside the city boundaries.

**The Tender** of Mr. S. Foster, of Kempston, has been accepted, subject to the approval of the Charity Commissioners, for building new class-rooms at the Grammar School, Bedford. Mr. Basil Champneys is the architect.

**A Meeting** has been held in Liverpool to promote the erection of a new hospital which is to cost about 100,000*l*. Towards that amount a sum of 79,000*l*. has been secured.

**Mr. T. Gambler Parry** distributed the prizes in the Cardiff School of Art on the 15th inst.

**The Committee** appointed by the Metropolitan Board of Works to investigate the condition of the London theatres with a view to the protection of the public against fire are continuing to hold frequent meetings. They have under consideration various plans for lessening the dangers which have excited so much alarm.

**The Dean of Llandaff** reopened on Thursday, last week, the parish church at Abergavenny. The lately deceased bishop, who was then very ill and unable to be present, wrote on the occasion as follows:—"The rescue of Monmouth Church from the Palladian style forced upon it in the last century, and of Abergavenny from the barbarism of the early part of the present, are, next to the rebuilding of the cathedral, the most inspiring instances of improved taste, and, I hope, of Church feeling that have occurred in the diocese. Thirty years ago they would have been deemed impossibilities."

# The Architect.

## IRON ARCHITECTURE IN THE UNITED STATES.

HE very practical and sensible endowment which Mr. GEORGE GODWIN bestowed upon the Institute of Architects last year has already produced a useful return, in the form of a traveller's report on the condition of architectural practice in some of the leading cities of the United States of America, which was presented and read at the last

meeting of the Institute by Mr. A. J. GALE, the first holder of the bursary. The visit of this gentleman to the empire of our transatlantic cousins was not a prolonged one, but affairs move so quickly in America that even travellers get over their ground at high pressure, and the paper before us shows that Mr. GALE has followed this rule with every advantage. He did not go West to San Francisco, nor South to New Orleans, but what was to be seen at New York, Boston, Philadelphia, Chicago, Baltimore, Washington, and some minor cities, he is in a position to comment upon with much intelligence, and not a little enthusiasm.

The position of these American towns in the modern architectural world is peculiar. Leading practitioners in a good many instances are found to be working upon the basis of a direct European education, that is to say, as American pupils of London offices and Paris *ateliers*; and, still more noticeably, there are many others whose manner of design is specifically derived from the numerous illustrations of English and French current work which are published from week to week in professional journals; but nevertheless the fact is not to be disguised that the American temperament is still characteristically independent in architectural art as in all else, while in respect of constructive science and inventive appliances it must be said frankly that the precedents of European practice are always received with the full amount of customary scepticism, even if they were not in very many instances ignored with the customary manifestation of self-confidence. What the English visitor, therefore, has to expect to meet with in the way of building novelty is, in the first place, a good deal of remarkable artistic device more courageous sometimes than commendable, and almost any amount that he will take the trouble to discover of what used to be called Yankee ingenuity in building contrivances of all kinds; and it is not too much to say that in both of these respects the theory to which, it will be remembered, Mr. GLADSTONE gave expression a few years ago—that North America is to take the lead of Europe in the next historical development of civilisation—may be considered by its adherents to be sufficiently well illustrated.

As regards art—at any rate, the more grandiose and refined part of art architectural—it may be argued with reason that we are brought face to face more than at home with the growing neglect of such a cultivation of the fancy as prevailed so universally (not to speak of previous instances) in the Middle Ages, and which in modern times has been even still more developed. In France, this neglect does not seem to have yet assumed prominence, but in England we must acknowledge that it has. In all French towns, as a rule, even minor opportunities are still accepted for endowing building operations with complete grace and elegance; whilst public edifices are, as matter of ordinary obligation, designed with the very utmost care, so as to be worthily regarded as national monuments. In England, on the other hand, although we rejoice to admit that the employment of educated architects is every day extending, yet it would be idle to deny that in too many instances the doctrine is unmistakably recognised that artistic design is a superfluity; indeed, sometimes it is but too plainly affirmed to be a mischievous one. In America, therefore, if Mr. GLADSTONE'S principle is to be correctly interpreted in itself, and correctly applied to passing events, we should expect to find the English attitude considerably exaggerated; and so it is. The appreciation of academically artistic building by the multitude, if necessarily small in England, must be still smaller in America; and the doctrine that grace, as commonly understood, may be

dispensed with on principle we can easily understand to be in America not a mere commercial vulgarity, or a consequential affectation, as it is with us, but rather a patriotic principle, affecting the recognition of exotic precedent in opposition to indigeneous indiscipline. The employment of iron to take the place of stone or brick walling, in the character of an American material which is entitled to have an artistic style of its own, is a case in point.

When we hear of a "street front" composed of a cast-iron framework enclosing panelling of brickwork, and having cornices made of galvanised sheet, there are probably few architects in England whose critical powers, however imperfectly cultivated, will not instantly and instinctively reject such a device. But if we were to say nevertheless that this odd kind of art is essentially English, or Anglo-Saxon, or Cockney, or whatever epithet may be most expressive of the circumstance that it is only something of our own after all, however much carried to excess in another quarter of the world, it would be at least difficult to determine that it belongs to any other national category. It is not necessary to despise it so far as this argument goes; we have only to wonder at it a little as an act of daring. The late Mr. STREET on one occasion, in debating some question about iron architecture, made use of a very singular characteristic expression; "We ought to be content," he said, "with the materials which God has given us." He meant, of course, one may say, the materials which belonged to the practice of authentic mediæval architecture, amongst which cast iron had manifestly no place. But it is equally manifest that the modern mind, and especially the modern British mind, could not possibly accept such a dogma; and, indeed, Mr. STREET himself, in the Palace of Justice, had to confess at last the obligation which modern usage laid upon him by employing iron in violation of his own principles. Probably as good an illustration as can be supplied to indicate the connection which exists between iron architecture and the American idea of "going ahead" may be the suggestion that to go ahead in ironwork without restraint is exactly what Mr. STREET, as an ultra-conservative, would have expected the American architects to do.

There are two systems, it appears, of go-ahead iron architecture as practised in America; one called "the skeleton," and the other "the block." Reverting to the first principles, and taking an artistic view of the matter only, we may say that the two systems ought to be described thus:—First, there is the use of columns and beams or arches; and secondly, there is the introduction of iron framing, more or less concealed, for the strengthening of what would otherwise be a too slightly built wall. We do not gather from Mr. GALE'S report that either the column-and-beam principle or that of the arch is being developed to better purpose in America than in England. Indeed, if we mistake not, there are several iron "street fronts" in London already, which are constructed precisely on the American model; and, we may add, so very indifferently designed that the passer-by certainly does not admire them, and only looks at them, if at all, as eccentricities of a particularly vulgar kind. As for the second type, in which an iron framework supports "filling in" composed of unsubstantial brickwork, terra-cotta panels, concrete slabs, or iron plates, this, it would seem, has not been tried at all in England in any serious way; and, if we may tell the truth, we take leave to hope it will never be tried. Prejudice, we well know, is blind to its own prejudices; and no doubt, speaking for not a few of our best architects, and even more of their less pretending brethren, we must confess to a very decided prejudice against iron "street fronts;" but such a thing as a row of houses in Regent Street—when Regent Street comes to be rebuilt—constructed with highly ornamental façades of metal framing filled in with panels of whatever handy material may best serve a cheap decorative purpose, we can only regard as a box and not a building, even if the panels were of the choicest marbles and the "skeleton" of silver and gold.

When it is said that "a style for cast iron architecture has yet to be evolved," and that "the problem of its satisfactory treatment is yet unsolved," we are bound to observe that the principles upon which alone such a style of treatment can be based—that is to say, artistically constructive treatment—are to a very considerable extent sufficiently well understood in England, France, and Germany, if the problem were worth solving. There can be no doubt that if a competition were to be just now set on foot for the design of a Crystal Palace, for example, in a thoroughly philosophical or critical style of art, not only should

we have many carefully considered projects sent in, but quite the usual proportion of successful ones would be discovered amongst them. Street fronts, however, are another thing. Let us plainly say we do not want them, in either cast iron or malleable iron or anything else of the sort. The desire for them in America we can only regard as a symptom of mistaken taste both in building and in art. If the votaries of artistic ironwork will be satisfied with permission to develop it in the difficult interior work which so frequently has to stand behind street fronts, this again we can encourage as a perfectly legitimate field for the exercise of refined ingenuity; and we see no limit to the artistic *finesse* which such a material might then call forth. Here we may gladly admit that a style worthy of the occasion has yet to be evolved, and we will go farther and commend to the best architectural talent of both England and America the problem of its treatment.

## IN SERVIA AND ROUMANIA.

[BY A CORRESPONDENT.]

BY way of sequel to our article "In the South of Hungary," we will now accompany, on their return journey, those members of the Iron and Steel Institute who made the extreme excursion in connection with their autumn meeting at Vienna.

Leaving the domain of the K. K. Priv. St. E. Gesellschaft, and headed by its director, M. LÉOPOLD BRESSON, the little party reached that company's Bazias terminus on the Danube, about sixty miles below Belgrade. Bazias means "the ever windy," an appellation which was certainly not belied on this occasion. After examining the elegant station buildings and the port, the party went on board the Danube Steam Navigation Company's boat for a trip on the most beautiful portion of the Lower Danube, having Servia on their right hand and Hungary on the left.

Proceeding down the stream and leaving the Ausläufer of the Carpathian mountains on the left hand, the little town of Moldova, where the Company's silver ore is smelted, soon came in sight. Shortly afterwards, with high cliffs on either side, the pointed Babakay rock rises in the middle of the river, and a good view of the imposing remains of the Golubacz fortifications was afforded, owing to a slight derangement of the screw propeller. In the cliffs are some ancient clefts called "Mückenhöhle," whence in summer issue swarms of especially venomous gnats, whose bite is said to be death to a horse. Then follow the rapids of Stenka, Apa Serena, and the Buffalo-Gruppe, and soon afterwards the Hungarian town of Drenkova, with the minaret of its Greek Church glistening in the afternoon sun. After passing the cataracts of Izlacz and Tachtabia, and rounding the Greben Fell, the river suddenly widens into a large bay, on which is situated the Servian town of Milanovac, while a little lower, on the left, are the remains of three old Roman towers, the "Tricule," boldly placed on a projecting cliff.

After doing justice to the *table d'hôte* on board, in which figures the rich fish of the Danube, called "Schil," we pass the Jutz rapids, and then the Tissovica Colliery, which was visited by some of the members from Orsova. The coal is in the Lias formation, in fact the measures are pronounced by an eminent authority to be exactly the same as those of Anina-Steierdorf, referred to in a previous article. Owing to the remarkable distortion of the seam, the coal is 100 feet thick, almost too thick for proper working. The colliery has been worked for some years by the English firm of LYELL & Co.; but a few more years will be required to thoroughly develop it. Besides the coal, which is of good quality, a rich deposit of iron ore has been found, and also some excellent fire-clay, so that circumstances are largely favourable for starting a blast furnace.

After passing Tissovica, the most imposing portion of the voyage begins. One is reminded of the Avon at Clifton; but the cliffs are about three times as high. On the small patches of verdure here and there black Egyptian sheep are seen; and black eagles hover over the steamer, though high up in the air, ready to pounce upon any chance prey. The Danube now becomes narrowed into a channel of only 165 mètres wide, but 60 deep, with colossal cliffs, rising like irregular walls on either side. On the left bank is the celebrated Szecheny-Strasse; and on the right holes at regular intervals are seen in the perpendicular rocks, in which the old Romans inserted the timbers on which a roadway was laid. In the middle of this narrow pass is the Kasan Whirlpool; and in the cliff on the

Hungarian side the Vetterani Cavern. At the village of Dubova the width of the river becomes still more reduced, its narrowest width being 112 mètres. The gorge terminates at Ogradina, just below which, on the Servian side, may be distinguished the Trajan tablet cut in the solid rock, though it is now blackened by the smoke of gipsies' fires. Leaving Jeselnicza on the left and Tekije on the right, the steamer comes to her moorings at Alt-Orsova, the last landing place in Hungary.

The town of Orsova possesses little architectural interest, except that the traceried panels under the windows of some of the houses denote their Turkish origin. We put up at the "König von Ungarn," the bedrooms of which, in the second storey, open directly on to a balcony running all round the courtyard, after the manner of an old English hostelry. The chief interest lies in the motley groups seen in the market-place and on the landing quays. Besides Germans and Hungarians, one Englishman, one Englishwoman, and a Frenchman, there are Servians, Roumanians, and Bulgarians; turbaned and mishmac'd Turks, a few Greeks and Italians, and a colony of Zigeüners or gipsies. The Roumanian women carry their babies in a wooden cradle, slung over the shoulder. Here, to the strains of the capital town band, one may see the national Hungarian dance, the "Czardas" (pronounced Schardash), executed with all its spirit and abandon. It consists of two distinct parts, a slow and a quick movement, the air of the first being remarkably weird and mournful; and then, after a pause, during which the dancer takes his partner by the waist with both hands, it is difficult for the eye to follow the rapid movements of the glistening feet.

We accept the obliging offer of a seat in the "wagen" of M. BLot, general manager of the "Société Anonyme Lyonnaise pour l'exploitation des forêts," and drive along the Danube to Ogradina, where the timber is sawn for sending to France, Belgium, Turkey, Roumania, Bulgaria, and even England. Only oak is worked, beech not being worth the carriage. Two hundred men are employed in the forest, and fifty in the saw-mill. Although only started in June last, the works are in full swing, and are on the point of being kept going day and night. The steam-boilers have stepped grates for burning sawdust and refuse wood. The single-cylinder horizontal engine, fitted with expansion-valve at the back of the slide-valve, drives the shafting, which is carried under the floor, and belts from pulleys transmit the motion to several saw-benches. A band-saw (made by E. TOPHAM, Vienna) rapidly takes a slab off the log clamped to a travelling carriage, so as to afford a level surface for subsequent operations by the circular-saw. The works' manager is M. DOMINIQUE LE TEO, formerly engineer in the French Navy, who obligingly gives us every information. It was a glorious day, and on the return journey the beams of the sun, fast approaching the horizon, light up the rich foliage of the trees on the mountain sides, and the gorgeous costumes of the Roumanian peasants, who stop to gaze on a stranger with a similar interest to that with which they are regarded. On the right flows the Danube, full and wide, hastening onwards after having emerged from the narrow gorge in which it has been confined. The glittering surface is broken here and there with a "chaika," or large boat, and sometimes four of them are bound together into a raft for conveying timber down the stream.

Crossing the Gerna, a tributary of the Danube below Orsova, we enter upon the Kunst-Strasse, a straight road, lined on either side with tall poplars, leading to the Kron-Kapelle. This is a Gothic building, octagonal in plan, with alternate courses of white stone and red brick, surmounted by an Oriental minaret, built over the spot where KOSSUTH buried the Hungarian crown and other insignia during the war with Austria. Near it rises the Allionberg, whence a beautiful view is afforded of the corners of Hungary, Servia, and Roumania, which here meet, and also of the Turkish island of Ada Kaleh, in the Danube, with its extensive but now dismantled fortifications. Indeed, one may easily breakfast in Hungary, dine in Roumania, partake of muddy coffee in Turkey, sup in Servia, and return to rest in Hungary.

The island of Ada Kaleh was in 1878 occupied, though not annexed, by Austro-Hungary, and a company of Austrian soldiers is permanently stationed there. With this exception, and that of three families of Roumanians, the inhabitants are exclusively Turks, who have their own government under the Mudur (or magistrate) BEKIR EFFENDI, their mosque, and burying-ground with the quaint Eastern tombstones. In the bazaars of Fazli Sadik may be bought yellow Turkish tobacco

by the Turkish weights of the "oka" and "dirham," as well as a variety of Turkish commodities. The proprietors sit cross-legged on the boards of their cafés; and the dogs are as lean, miserable, and persecuted as they are in Constantinople. Even little girls have their nails and finger-tips stained black by way of adornment; but, over twelve years of age, their features are rigorously concealed by the *mishmak*. There are 520 inhabitants and 128 houses, those with harems, belonging to the principal inhabitants, being surrounded by a garden or vineyard, and jealously guarded by high palings. The population generally is very poor, being chiefly dependent on the outside world for the means of living, and everything is in a shabby and dilapidated condition.

The railway from Orsova to Verciorova terminates the Temesvar and Karansebes branch of the K. K. Priv. Oestr. St. E. Gesellschaft; and at Verciorova, the frontier town of Roumania, begins the Cailia ferrata Romania, or Roumania State Railway, which leads to Bucharest. The station-master, ALFONS VON FEHEMAYR, is quite a giant, being 2 mètres (6 feet 6½ inches) high. At the Customs' barrier is a detachment of Roumanian troops, wearing their quaint one-sided shakos. A little lower down the stream is the last natural obstruction to the navigation of the Danube, which is here 1,100 mètres wide. This is the Eisener Thor, or Iron Gate, where the chain of the Eastern Carpathians crosses the river. When there is but little water the stream rushes violently through deep chasms in the rocks, parts of which rise above the surface, just as the tide used to do past the piers of old London Bridge. When there is plenty of water, however, the rocks are entirely covered; but the passage of this barrier is none the less difficult.

The first station is Turnu-Severin, made up from the Latin Turris (Trajani) Severini; and one observes painted up at the corner of a street "Strada Aurelia, Urb. Traian." Here the Oriental character is still more marked. Fruit, vegetables, and liquids are carried in earthenware pots suspended from the ends of a pole carried on the shoulders. The married women wear a long white veil or handkerchief on the head, with the ends hanging down behind; this is, in fact, the *mishmak*, though not bound closely over the features. The servant girls wear nothing but one white garment, with a kind of apron before and behind, bare feet being the rule both summer and winter, even when the snow is on the ground. The married peasant women only wear, in addition, sandals and a "zeca" or mantle. The Greek church is an imposing structure of quite Oriental type, with effective frescoes outside. The west front has two minarets, the spiral decoration on which winds in different directions. The Roumanian flag—red, blue, and yellow in horizontal bands—flies over the ruins of a palace built, in remembrance of TRAJAN, and destroyed by the Turks in 1837. It is surrounded by the Gradina Publica, or public garden, which is very rich in Roman antiquities. There are several statues, stone coffins, stone altar ornamented with low reliefs, a sandstone pillar, and a portrait in relief of TRAJAN's wife. An interesting object is an old stone well, carefully preserved, even to the iron spout, in the state it was left in by the ancient Romans.

At the usual hour of one we partake of a typical Roumanian dinner, consisting of "ciorba de potroce," a sour soup, with bits of fowl; "mitte," or sausages without a skin, which should be served on a wooden platter; "stufat de vitel cu ceapa verde," veal stew, with fresh onions; "pregitura de mere," apple roll; and Brânză Rumanesca, Roumanian sheep cheese, diluted with wine from Stirmina, the colour of sherry, sweet and rather heady, that has been two years in cask. From this bill of fare the complete Latin character of the language will be apparent; and here it may be mentioned that the currency of Roumania is assimilated to that of France, consisting of leu (francs) and bane (centimes).

After dinner we proceed, by a wood-burning locomotive with spark-arresting chimney, a little way down the line towards Bucharest to see the remains of TRAJAN's bridge over the Danube, which, tradition says, he built to satisfy a whim of his wife; but as she on first crossing chose to jump from the middle into the river, the emperor immediately had the arches demolished, leaving only the piers standing. Those on both banks, built of flat bricks and interspersed with stone, are in good preservation; and eight in the bed of the Danube may be seen when there is not much water. Near the bridge are several floating mills for grinding Indian corn, which are kept going by the current causing a kind of vane to revolve. Near

this place, also, is a Roman camp, as well as the earthworks thrown up during the war with Austria in 1848. Several Roman houses, covered up by the loose earth, were discovered while digging the foundations for the new houses, the greater portion of which have been built since 1851.

We happen to return in the same train which conveys King MILAN of Servia, who certainly did not appear to take any extra precautions on account of the recent attempt upon his life. At Orsova he is received by the courteous station-master, Herr SMODITS, and conducted through the parterres of the station into the elegant refreshment-room. Wishing to set foot upon his dominions, we cross the Danube in a remarkably long narrow boat that looks as if it was the trunk of a tree hollowed out, to Tekije (or Tekia), where we find a triumphal arch erected to receive the king. The country appears very poor, with the natural resources quite undeveloped. The roofs of most of the houses project in front. The women wear green or yellow handkerchiefs on their heads; and the men's trousers, made of thick felt, are buttoned tight in the legs. Postal communication does not appear to be much in demand, as the postmaster had to be roused from his slumbers before a post-card could be obtained; a specimen, however, would not add to the beauty of the stamp-collector's album. After taking a stroll through the village, with which we are not greatly impressed, we partake of supper, consisting of a white cheese and new red wine, still cloudy. Some of the members penetrated to Maidanbeck, in the interior, where HOLLOWAY's patent process for reducing copper ore, in an appliance resembling the BESSEMER converter for steel, is being worked by an English company.

Finally leaving Orsova, we take the train of the K. K. &c. Company before mentioned, and proceed northwards, passing Topletz, with the remains of a Roman aqueduct, and up the wild valley of the Cerna to the town of Herculesbad, at the confluence of the Mehadica with the Cerna. About three miles off are the celebrated Herculesbädern, frequented in summer by about 5,000 visitors, chiefly Servians and Roumanians. The water, strongly impregnated with both sulphur and iron, issues from the ground at a temperature of from 116° to 147° Fahr. The *curhaus* buildings and *cursaad* are imposing and admirably situated, with a background of wood and rock. Passing Mehadia, with a few Roman ruins, we reach Porta Orientalis, the highest point of the line, and soon afterwards Karansebes, the centre of an important wine-producing district. Temesvar, the seat of a Catholic and of a Servian bishopric, is next reached, containing a marble monument to its brave defenders in 1849; but the strong fortifications have now partly made way for boulevards. Passing Hatzfeld, with a large castle belonging to Count CZAKONICS, and crossing the Tisza by several imposing bridges, we arrive at Szegedin.

This was the second large city of Hungary, until about three-fourths of it were destroyed by the floods of 1879. The reason that so great damage was done is, not that the current acquired great force, but that the houses were for the most part built of unburnt bricks, which became saturated with water, and so gave way; those built of burnt bricks, which are about 12 by 5½ by 3 inches, remained. Now, however, building on a better system is going on energetically, tramways for conveying materials extending in all directions. The city still wears an uncomfortable and unfinished appearance, and this is increased by the wretched state of the streets. Their paving offers great practical difficulties, as the soil is so soft that paving-stones soon sink and become absorbed, leaving the surface as bad as ever. It is probable that a judicious system of wood-paving, with the blocks well dovetailed together, would answer; but, owing to their heavy losses, the inhabitants are very poor. A new road bridge, to be completed in August, is being erected over the river by M. G. EIFFEL, of Paris, who has constructed several other large bridges in various parts of the world. The Szegedin bridge over the Tisza is of the lattice-girder arch type, with granite and limestone piers. There are four spans, one of 110 mètres for the river, and the others of 98, 86, and 63 mètres for the flood water. The foundations of the piers for the main span are wrought-iron caissons, sunk to the blue clay and filled with concrete; and the other piers are built upon pile foundations. Granite is used in the piers up to the springing of the iron arches, and a very fine white limestone above, which produces a handsome effect.

Leaving Szegedin, we pass Keeskemet, Nagyörös with its vineyards, and then leave behind the imposing mountains that

we have skirted, and enter upon a wide plain, which extends to Buda-Pesth. At Ultö, however, the hills of Buda or Offen come in sight. Passing Köbánya or Steinbruch, where is one of DREPER'S four famous breweries, and then the Stadt-waldchen and Thiergarten of the Hungarian capital, we soon arrive at Buda-Pesth itself. Having come hither by rail, we return to Vienna by steamboat up the Danube. But, on account of the longer time required to get up the stream, it is better to reverse this proceeding, taking the river at Luir, or at Passau on the Bavarian frontier. Whichever way the trip be made, it is highly important for the tourist to "go light," as anything that cannot be carried in the hand and placed in the railway carriage net is a source of great annoyance and expense.

## THE LESSONS OF THE WOOD STREET FIRE.

[BY A CORRESPONDENT.]

THERE are many important lessons to be learnt from the calamitous conflagration in Wood Street, with regard to the spread and origin of warehouse fires, as well as some timely questioning as to the completeness of those provisions of the Metropolitan Building Acts which have for their object the subdividing of buildings. But there are also some lessons to be learnt by those who care to give attention to the more strictly architectural aspects of a City warehouse.

The constant demands for increased light and space have compelled architects to adopt a system of iron girder and column construction in lieu of the brick walls and stout beams of former times. Unfortunately, the system insures the total destruction of the building when once the fire has obtained a hold. But as clients in the majority of cases insist on this form of construction, it may perhaps be considered to have passed beyond the architect's control. This being the case, and it having become a necessity that a warehouse should be built of iron girders and columns, the architect should be prepared to meet the difficulty in the face, and by legitimate means make the skeleton of girders and columns less hideous. It would seem to be a simple matter; instead of a building of stone or brick or timber, the architect has to deal with one in iron. Iron doubtless is an extraordinary material of certain capabilities, but it meets or is supposed to meet the extraordinary wants of an extraordinary age, and architects are required with some originality and energy to cope with it, but there is no reason why it should not be treated artistically. Stone, brick, and wood have been made beautiful in order to satisfy requirements that were just as extraordinary and original some centuries ago, and bear their witness to architectural skill. But somehow or other up to the present iron girders and columns appear to have eluded the artist's grasp. Modern architects seem to be behind the times, in some things it may be for the best; but if our street architecture is, as in the past, to reflect the wants of those who live or work there, and is in any way to be a credit to the national taste, the architects, though they may disagree with the irresistible desire for change and novelty, should be able to give a character and dignity to their work in consonance with their own sense of what is fit. In too many cases our street architecture and the problem of artistic iron construction may be said to be left to men who have neither the energy nor the power to tackle the difficulty, but, with the genius of speculation builders, shirk the responsibility and so treat trabeated iron construction, with its peculiarly light forms and large open spaces, as to make one believe that the house is built of stone instead of iron, with proper pilasters, fascias, cornices, &c.

Some of the dangers and absurdities of this manner of building have been demonstrated by the recent fire. The girders, as was their nature, expanded under the immense heat and shed the sham architecture into the streets below, like so many premature figs. It was just the same last year at the premises in Cheapside: a perfect rain of stonework took place when the heat began to make itself felt, and at Wood Street the danger from falling slabs of stone dropped from the girders, which stood, was so great that the firemen and others could not remain near it, and a long length of front which should have remained standing had to be pulled down. It was most edifying to behold the exposure of the various shams and tricks by which the stone is attached to the girders, and the pilasters shaved down to the narrowest width to case iron columns; false capitals, with the pegs and wires that attached them to that which they were supposed to support; and the lintels, at the most

3 inches thick, something like the marble slips that used to do duty for mantelpieces in cheap houses.

A lesson of another kind is to be learnt from a visit to Wood Street. Standing alone in Wood Street is a good solid front of red stone and brick, with oak sashes and frames, which seem to have stood well in the midst of the flames. If this part of Messrs. Rylands' warehouses possessed no other qualities, it would be a remarkable example of the superiority of a brick and stone front. The same may be said of the warehouses in London Wall, which, though thoroughly burnt out, are standing as well as could be wished. This is fortunate, for an acknowledged artistic victory has been gained by the quaint gables and fenestration, making with Curriers' Hall a charmingly picturesque group of buildings, the work of Messrs. Belcher, on which they may be congratulated.

Let us hope that the profession will take up this matter of warehouse building, and if they must have iron girder houses, have them without sham stonework. Let some impetus be given by the architectural societies to the study of ironwork with a view to its constructional decoration, either in its casting, rolling, or painting. If architects were to exercise a little wisdom and firmness with clients we might in some instances have brick and stone fronts that are really fireproof, and without much sacrifice of window space. Under these circumstances street architecture would rise from its dubious condition, and some little relief be afforded to those whose duty it is to walk down the City.

## ROYAL INSTITUTE OF BRITISH ARCHITECTS.

AT the ordinary meeting of the Institute, held on the 18th inst., Mr. Ewan Christian, Vice-President, in the chair, Mr. A. J. Gale, the holder of the Godwin Bursary, read a paper describing his

### Tour in the United States.

Mr. Gale began by saying that he was present, at the invitation of the Council, to give some account of his tour as holder of the bursary in the first year of its existence, and in doing this he claimed the indulgence of the meeting. His tour had covered so much ground that it would be possible to refer only superficially to most of his subjects, and to treat of the architecture only from a constructional point of view. The tour had occupied three months, ten weeks being spent in America, viz. in New York, Philadelphia, Baltimore, Niagara, Detroit, Chicago, Albany, Boston, and Newport, Rhode Island. The first month and the last week previous to his return had been spent in New York. Many vast building schemes were in hand in New York. He had had an insight into the work of the New York Board of Health, which body was taking much pains to improve the tenement houses and drainage matters. The supervision of the Board also extended to apartment houses. Vast buildings let off as offices constituted one of the sights of New York, and each new block usually outstripped the last. Foremost among these was the Mills Building in Wall Street, owned by Mr. Mills. It was an enormous square block, nine storeys in height, exclusive of the cellarage or basement. The strong rooms were placed in the basement, as also on the ground and first floors. The floors were arranged in suites of offices and could be divided by partitions into holdings of any size. The offices were heated by hot air, fireplaces being also provided. The lighting throughout was good and sufficient, though some rooms had only borrowed light. At the time of his visit the building was only partially finished, but the whole of the building was already let off. There were entrances to the building from Broad Street and Exchange Place, besides the principal entrance in Wall Street. The Wall Street entrance hall, two storeys in height, was covered with a glass roof, and gave light to the basement through a well-hole. The elevators here were in full use. The height of the basement was 9 ft.; ground floor, 13 ft. 8 in.; and the storeys diminished in height from the second to the ninth, which was 10 ft. in height. The materials for the walls were bricks with red brick facings and terra cotta panelling. The general design was a combination of vertical and horizontal lines, the treatment being mainly classic. The roof was flat, constructed of rolled iron girders filled in with terra cotta bricks and covered with cement. Many of the large buildings were now constructed with this roof. The main staircase of the building was entirely of cast iron, except the treads and landings, which were of slate. The internal or partition walls were of hollow terra cotta bricks, corrugated to take plaster. Mr. G. B. Post, the architect, had kindly taken him over the building and furnished him with the copies of the plans he exhibited that evening. The drawings had been prepared and the house occupied within twelve months from the time the architect had received his instructions. It illustrated the rapidity with which building operations were carried out in the States when commercial interests required it. The heating was effected on the direct radiation

principle, a system apparently held in much favour. The coils standing in the rooms formed no inelegant feature. Mr. Gale said he had gone pretty fully into detail on the subject of apartment houses in his report to the Council, and would only mention a few characteristic features. Exorbitant rents and smallness of accommodation had led to the planning of large blocks of buildings for the middle classes, many being eight and nine storeys high, admirably constructed, and furnished with all modern conveniences and appliances. The bad state of tenement houses, or flats for the poor classes, had engaged the attention of those anxious for the improvement and better sanitation of dwellings for these classes, and a Building Act, amended in 1869 and again in 1880, had been passed in 1867. The New York Board of Health had care of the enforcement of the Act, which there was no doubt had done great good. Plans of all tenement houses had to be submitted to the Board, which took exception to all faults of construction, arrangement, deficiency of accommodation, &c. The higher class of houses in flats, known as apartment houses, were subject to the same restrictions, but in this case there was not the same temptation to overcrowding. They sometimes had large entrance halls with spacious elevators capable of holding six or eight persons, but the best arrangement was to group the suites of apartments round a small central hall or lobby. The servants' department was kept apart, and an entrance court was arranged in the basement for tradesmen's carts, &c., and this gave access to the elevators in the servants' department. It was well lighted and ventilated, and the upper side of the roof formed a carriage-way for the residents. The floors were mostly fireproof. They were constructed of iron joists, filled in with hollow arching blocks and bedded in cement. Generally the buildings were of brick with stone dressings, and had iron roofs slated. The heating was by direct radiation, open fireplaces being also provided. The boilers for heating were placed in the cellars. Some of these blocks were built by associations of intending occupiers, and the right of choice of rooms was put up for auction among them. Plumbing and house drainage came also under the supervision of the Board of Health by a law dating from 1881. Plumbers had to give in their names to the Board and submit details of proposed work. Soil pipes in New York were universally of iron, and must be coated inside and outside with hot coal tar pitch, unless enamelled interiorly. Lead compared with iron as a material was unhesitatingly condemned. The Durham House Drainage Company, adopting the principle of conveying coal gas, through wrought iron mains, with screw joints to prevent leakage, used wrought iron pipes with screw joints for soil pipes, and thus avoided leakage and settlement. The pipes would carry the water-closet apparatus without extra support from the building. Iron pipes could also be suspended from the under side of the ground floor and carried along in the basement at the top, and could be inspected for cleansing purposes, &c. The system was in use at Pullmantown, founded by Mr. Pullman, the originator of the Pullman cars. The attention paid to details in these matters was considerably in advance of what was customary in England.

In Chicago and Boston, as well as New York, ventilation had, owing to the climatic extremes, received great consideration. Two examples of well ventilated buildings in New York were the Presbyterian Church, Fifth Avenue, Mr. Carl Pfeiffer, architect, and the Madison Square Theatre, Messrs. Kimball & Wisedell, architects. The church was 200 ft. by 100 ft., and 60 ft. high, and provided sitting accommodation for 2,000. A tower 100 ft. high, 16 ft. square at base, acted as the air inlet. The air was driven by a fan 7 ft. in diameter over steam pipes or ice in the basement, as the case might be, and the admission of warm or cool air to the church could be regulated at will. The windows were all double. The building was not intended to be fireproof, but in regard of ventilation Capt. Douglas Galton had said it was the best ventilated church he had seen.

The new public buildings at Philadelphia formed one of the most interesting buildings in the States. They occupied a nearly square site, covering, with central court, four-and-a-half acres of ground. This central court also contained a range of buildings. The frontages measured 486 ft. by 470 ft. The basement storey or ground floor, 18 ft. 3 in. in height, was of fine white granite, the superstructure being entirely of white marble, from quarries at Lee, Mass. A large tower in the north front, 90 ft. square at the base, was to be carried up to a height of 535 ft., and crowned with a statue of William Penn. It would then be the highest structure in the world. Ventilation inlets with fans were provided in various towers. The roofing was worthy of note, trusses of rolled iron being used in the construction. The whole of the building had been most carefully designed by Mr. McArthur, whose plans were selected in competition in 1869. The sculpture and carved work in general were from models prepared on the spot under the superintendence of Mr. McArthur. It was estimated that the building, which was begun in January 1870, would be finished in another ten years, at a cost of ten million dollars. The Post Office, Philadelphia, a typical example of government buildings generally, had a fine granite front. The blocks of granite were cut and fitted entirely at the quarries, and put up in the building without use of hammer or chisel. Philadelphia bricks, 8 inches by 4 inches, by 2½ inches, used for the backing, had stood a crushing test of 500 lbs.

for five minutes. This, as well as all the government buildings in the States, was supervised from Washington, where architectural matters formed a branch of the Treasury Department, by Mr. J. G. Hill, under the title of supervising architect. Mr. Hill's last annual report showed many court-houses, post-offices, custom-houses, and the like, in course of erection, each under the care of a fully qualified officer. All drawings were made at Washington and copies taken by photograph. No quantities were supplied, and payment was made on the architect's certificate. The John Hopkins Hospital at Baltimore, one of the most interesting buildings of the kind in the world, was the result of the study by Dr. Billings, of the National Board of Health, of the chief European hospitals, and under his authority all the sanitary improvements adopted had been introduced. Each ward was isolated from the other wards and from its own service rooms. All the wards had the same aspect, the windows facing east and west. Hot water on the low-pressure system was employed as the heating agent. The materials generally were of brick. Messrs. Cabot and Chandler, of Boston, were the architects, and Mr. Niersee, of Baltimore, was consulting architect. At Detroit Mr. Gale said that iron fronts were much used for buildings, and he mentioned that Mr. Gordon Lloyd, nephew of the chairman, approved of them. Among the advantages claimed for iron fronts they were said to be more water-tight, more durable and cleaner than stone or brick fronts, and less expensive. The sashes were of wood and the cornices of galvanised iron, the foundations being of brick. Since the sad experiences of Chicago and Boston every improvement in fireproof construction was eagerly sought after, and one of the great elements of safety was considered to be found in iron construction. Mr. Gale concluded with references to his observations at Albany, Boston, and Newport, and in allusion to artistic matters said there was much to be found which was worthy of a place alongside English work.

The CHAIRMAN said that Mr. Gale had evidently proved himself a worthy holder of the bursary. In listening to the description of such gigantic buildings, he had felt as if he were an inhabitant of Lilliput. Professor Cockerell, he believed, was often in the habit of referring to the description of the building of Solomon's temple, and he was himself reminded of it by hearing of the enormous and costly masses of stone employed, and still further by the description of the preparation of the stone at the quarries, after which, as in the case of Solomon's temple, it had only to be brought to the site and placed in position.

Mr. J. SLATER said that he had never been in America, but it seemed to him to be the place where many practical suggestions could be obtained. He could imagine no better training for an architect, after having studied art and archaeology in Europe, than a visit to the States. The marvellous ingenuity of the Americans, as seen in their mechanical contrivances, &c., would, he thought, prove catching. On some works in the neighbourhood of London he had had a foreman who had been in Chicago; this man was extremely fertile in resources, a thing they often looked for in vain among builders and builders' men. These latter were mostly too conservative, and, working by rule of thumb, had little idea of the principles which underlied building construction. Architects, too, he thought, were rather in danger of getting into a groove, and anything that would lift them out of the groove was an advantage. He anticipated great good would result from the establishment of the bursary. They would find that everything English was not always the best, and this even in an artistic matters, for though they had heard much talk of a Victorian style, its prospects had not hitherto been promising. Two notable features of American enterprise had regard to economy of labour and utilisation of waste products. In a new country, where labour was scarce and costly, they had necessarily been driven to devise all manner of ways of saving or doing without manual and other labour. There was scarcely a town of 6,000 inhabitants but had its telephone, which alone saved a wonderful amount of labour. He had lately read of an American firm who had found a way of condensing charcoal smoke, which before was allowed to pass into the air in large quantities. By condensation, acetate of lime and tar were extracted. It had nothing to do with building, but it showed that a great amount of impurity could be prevented passing into the atmosphere. Mr. Slater referred to an American pamphlet on rural school building. The subject was treated in a most exhaustive way, and yet was so simple and concise that anyone could understand it—strikingly different from the extraordinary instructions issued here by the Education Department. So much value had been attached to the pamphlet, which was published in September 1880, that further publications in connection with the building of higher schools, academies, &c., were proposed. In conclusion, Mr. Slater moved a vote of thanks to Mr. Gale for his paper.

Mr. H. MACLACHLAN, who seconded the vote of thanks, observed that the old buildings of England—abbeys, and so forth—were typical buildings in regard of keeping out changes of heat and cold. An iron shell construction would be very bad for keeping out cold or heat. In regard to the fireproof construction, there was a danger that rust would be able to attack the iron, and one could not get at it to hinder the evil by painting, &c.

Mr. A. T. TAYLOR said he had just come from America and

Canada, and, having gone over much the same ground as Mr. Gale, he could endorse what that gentleman had said. He considered that American architects could no longer be looked on with contempt, for wonderful progress had been made in artistic matters. Great progress was noticeable in private residences, and much was to be met with that would be hard to match in London. The Americans thought nothing of spending fifty or sixty thousand dollars in finishing off a few rooms. On the matter of cast-iron construction he had been disappointed that no special treatment for the material seemed to have been attempted, the lines of a stone building being merely reproduced in iron. The immense height of houses in New York required elevators, and every small block had one, a feature that might well be introduced in London. In consequence of this convenient mode of access to all parts of the building, the rents in the upper part were nearly as high as down below, and there was no difficulty in finding applicants for the upper offices. In regard to the Philadelphia building, it was doubtful if the tower would ever be carried out, but the building showed an immense improvement over anything else he had seen in America. The Treasury buildings at Washington, which were being carried out by the Government, struck him as insipid. The building of it was conducted from headquarters, and that no doubt was the solution. Great ingenuity in planning seemed to be exercised in New York, where land was expensive.

Mr. P. GORDON SMITH considered that plumbing and drainage would be better carried out in London if subjected to one central authority, such as the Metropolitan Board of Works.

The CHAIRMAN said that, unlike Mr. Slater, he had had the advantage of visiting America, and that nothing impressed him so much as the go-aheadness of the people there in every respect. News of an invention, as soon as brought out, was flashed from one end of the States to the other; and if there was anything good in it it was used, and used till it was superseded by something superior. Anything in the shape of an improvement was adopted at once without waiting for some better to be invented. The Chairman instanced the great convenience of the telephone by saying that the lady of the house where he made a stay while in Detroit never had occasion to leave the house to give orders to the tradesmen, as it was all done through the telephone. He had attended a service in the church in Fifth Avenue, New York, described by Mr. Gale, and it certainly was the perfection of luxury—in fact, the one great quarrel he had was that the churches there were too luxurious. The freshness of the air was altogether remarkable, and, while nothing set him dozing so soon as stuffy air, he had quite enjoyed the sermon, and thus he could testify to the practical results of the ventilation in the church. For sound and hearing the building was perfect. As for accommodation, according to his calculation, it would hold 3,000 persons; at any rate, in England 3,000 would be put into it. He was sorry to hear that, architecturally speaking, his nephew had become such a heretic as to adopt iron fronts; this was, however, since his visit to America, or he should have been tempted to scold him. The great store of the late Mr. Stewart, one of the largest in the world, had been entirely constructed of iron, and a terribly bald-looking building it was. If in this country we did not know how to provide against changes, the Americans did, and all their houses were constructed so as to be comfortable in the very coldest weather. A merchant's house which he visited was most comfortable in this respect, the temperature in the house being kept all through the winter at from 65 degs. to 70 degs., no matter how low the thermometer might fall. Steam was used as the heating agent. Walls of houses were, indeed, so constructed that they never suffered from the changes of temperature as we in this part of the world did. The Chairman then put the vote of thanks to the meeting.

Mr. GALE, in reply, said the architectural detail of the iron fronts seemed to be of two sorts. Mr. Stewart's store was, he thought, an attempt to combine in construction columns of Classic detail with elliptic arches, and the result, besides being inharmonious, was as bad as it could be. This he had noticed in all iron buildings in New York and in other American cities also. If he might put in a plea for Mr. Gordon Lloyd, he would say that in his buildings there was certainly no attempt to trifle with architectural features in that way. The second kind he could hardly describe, except by saying that it was a combination of vertical and horizontal lines treated in a manner more suitable for iron construction. Among the drawings on the walls would be found the plans of some school buildings at Baltimore; time, however, had not allowed of introducing that and many other interesting matters. In regard to the iron shell construction, alluded to by Mr. MacLachlan, the air spaces in the fronts, constructed according to one system, gave a great immunity to the building in regard of changes of temperature, and the heating could be easily effected. The extremes of heat and cold suffered certainly made some havoc with the joints, but as far as he could see in Detroit the difficulty was obviated by well lapping the joints, more especially in the solid mode of constructing fronts. Iron columns and girders were practically hermetically sealed, and no rust could get in. Otherwise it would be useless as a fireproof casing for iron, as where air had access fire also would get in.

## THE FRESCOES AT THE MANCHESTER TOWN HALL.

THE remarkable series of scenes from the history of Manchester which Mr. Ford Madox Brown is depicting in the banquetting-room of the Town Hall of that city is, says a writer in the *Times*, progressing rapidly, five of the twelve available spaces having already been filled up. The energy and artistic spirit of the Manchester Town Council in giving encouragement to historic painting of a high class cannot be sufficiently commended, and might serve as an example to other municipal bodies and building committees. That so noble a specimen of modern architecture as the new Law Courts should be devoid of all adequate pictorial adornment is an anomaly which it would be difficult to match in any country but England. In Mr. Madox Brown the Manchester Town Council have found an artist fully equal to his difficult and varied task, and by the time the entire series is finished the magnificent banquetting-hall will present a rare instance of continuous historical illustration and harmonious pictorial design. Thus much may be safely predicted from the five elaborate pictures already finished, the last of which will shortly be displayed to public view. Before entering upon the subjects of the various designs, it will be necessary to say a few words of the process of wall-painting employed by the artist. Its invention seems to have been almost simultaneous in France and England. For Hippolyte Flandrin, the great religious painter, and other French artists appear to employ very much the same medium which Mr. Gambier Parry, quite independently of them, used for his decoration of Ely Cathedral, and which Sir Frederick Leighton adopted from him in his mural paintings at Lyndhurst Church in the New Forest, and more recently at the South Kensington Museum. The object of the process is to secure wall-pictures from the ravages of time to which frescoes proper (like those in the Houses of Parliament) are specially liable in our moist climate. The chief ingredients of the medium used are wax, gum elemi, and copal varnish mixed with spike oil. The painting is done on the dry wall previously prepared with the materials already mentioned, and to secure the perfect absorption of those materials Mr. Madox Brown has exposed the surface to intense heat, following in this the example of Delaroche in his famous *Hemicycle* at the Ecole des Beaux Arts. The result at Manchester is a depth and luminousness of colour equal to the most powerful oil-painting.

What strikes one first on looking at Mr. Madox Brown's pictures is their historical character in the best and strictest sense of the word. The subject in each case is locally and chronologically defined by purely pictorial means, and the motive of the action impresses the spectator with the vividness almost of uttered speech. At the same time there is that breadth and simplicity of treatment which must always distinguish genuine historic work from *genre*, however pretentiously disguised. Mr. Brown's characters, in brief, are not modern people dressed up in fancy costumes, but genuine types of their period as transmitted by the art of that period. It is, perhaps, this strict adherence to the historical type which makes M. Chesneau, in a long and elaborate criticism of the artist's work, conjecture that he actually tries to imitate the pictorial style of the period to which his subject happens to belong. This, of course, is going too far. Mr. Brown, in spite of his eager search for local colour, always remains a modern painter in full possession of the subtleties and intellectual resources of modern art, and the treatment of his subjects, from whatever period they may be taken, shows the common impress of a marked individuality. Fortunately, the artist has not thought historic dignity incompatible with the elements of beauty and even of homely sentiment. It is a curious fact that none of the five designs already executed is without children; in none also is there wanting a female type of elevated conception. The artist must be congratulated upon this fact. A picture without a woman is as intolerable as an opera without a soprano; and, setting aside battle-pieces, there is, among the great works of art which have taken real hold of men's minds, perhaps one only which, from the nature of its subject, labours under the defect above referred to. But even in that one—we are speaking of Leonardo's *Last Supper*—the artist has felt, and to some extent supplied, the want of what Goethe calls the "Erdig Weibliche," by imparting to the features of the Disciple whom Jesus loved almost feminine softness. To make womanhood and beauty essential ingredients of the history of Manchester was a task which might well have puzzled a less ingenious and versatile artist than Mr. Brown.

The subject of the first fresco is the building of the fortified camp of Mancunium by the Romans. The central group consists of the Roman General—possibly Agricola, the Governor of Britain, himself—and a centurion, who presents to his chief the plan of the camp, drawn on parchment, pointing out how the work is progressing. A standard-bearer, grasping the silken, wind-inflated Dragon standard, completes the martial trio. Close to them and holding her little boy by the hand stands the General's wife, an imposing beauty, with hair died bright yellow and eyebrows left dark, after the fashion of Imperial Rome. All around the central group the building work is going forward; large blocks of stone and heavy loads of cement are carried by the Britons and adjusted in

their places by the legionaries, told off as masons for the occasion. The river Medlock and vast oak forests red with the last autumn leaves fill up the background. A striking feature of the picture is the contrast of type between the hardy Britons and their conquerors whose bronzed complexion and dark hair betoken the natives of a southern country unused to the inclemencies of British skies. That feeling is even more forcibly indicated by the General's lady, who, in spite of her furs, stands shivering in the chill winds of November. The idea of the Roman conqueror triumphing over all difficulties could not have been expressed by more realistic and at the same time strictly pictorial means.

The next design takes us from the England of the Romans to that of the Heptarchy, and represents the second powerful element in the history of civilisation—the introduction of Christianity. Edwin, King of Northumbria and Deira, the Venerable Bede relates, was baptised A.D. 627 at York, and the next day 11,000 of his subjects followed his example. His wife, Ethelberga, the daughter of the Christian King of Kent, was, in this as in so many cases, the cause of her husband's conversion, and to her and the great Bishop Paulinus an important place is accordingly assigned in Mr. Brown's picture of Edwin's baptism. It may be objected that the subject of that picture has no immediate reference to the history of Manchester. But the artist refuses to look upon his task in a merely local point of view, and considers himself justified by the fact that Manchester was part of Edwin's dominion, and, therefore, was immediately interested in the king's momentous act. The scene of the picture is laid in a wooden church, the tessellated pavement of which, drawn in careful perspective, shows that it has been erected on the site of a Roman temple. To the left of the picture is the fount in which the king—a fair Saxon—is kneeling while a monk pours the consecrated water over him, Bishop Paulinus—a typical Italian priest—blessing the new convert with his extended right hand, and a cloud of smoke rises from the censers swung by youthful choristers. The foreground opposite is occupied by the Queen, who with pious awe watches the sacred act, and holds by the hand a pretty little girl, the daughter of the king, it may be presumed. The background is occupied by a crowd of soldiers and people whose faces indicate the various impressions with which they regard the ceremony. Again the historic significance of the event is forcibly brought home to the spectator by the general design, no less than by such accessories and facial characteristics as have already been pointed out.

The composition next in chronological order is the most dramatic, and at the same time the most elaborate of the series. The subject is the expulsion of the Danes from Manchester, and an adequate analysis of its many interesting features would far exceed the limits of our space. It must be sufficient to borrow the substance of the description which the artist has supplied for this, as for all of his pictures: The scene, it should be understood, represents the narrow winding street of a wood-built city. A young wounded Danish chieftain, the wearer of many bracelets, is being borne past on a hastily constructed stretcher, his companions endeavouring to protect him and themselves with their uplifted shields from the townsfolk's missiles. In front of this group four men have fallen confusedly one over another on the ground. From a house which faces this scene a young woman has thrown a tile which strikes down the Raven standard-bearer. An aged inmate from the same window throws a spear, the national weapon of the Saxons, while two little boys gleefully empty a small tub of boiling water over the fugitives. One of the most striking features of this powerful composition is a young Dane just on the point of emerging from the rampart gate with the open country beyond, and shaking his sword at his pursuers as much as to say, "Wait till we come back and take our revenge!" The next composition to which we come, scarcely less elaborate than that just referred to, differs from it in spirit as widely as can be imagined. It refers to the establishment of Flemish weavers in Manchester, under the auspices of Philippa of Hainault, Queen of Edward III., an event to which the vast development of textile manufacture in Lancashire is traced. The picture represents a visit paid by the Queen to her humble *protégés* who gather round her richly caparisoned palfrey to display to her the result of their labours, consisting of a fine piece of "Lincoln green" cloth, similar to that worn by the Royal lady herself. Again the chief event is depicted with graphic boldness, and again much careful work and significant byplay is exhibited in the minor figures, among whom a charming row of school children, kneeling on and near the steps of the market cross, is specially worthy of mention. The painting in this work is less powerful than in some of the other compositions, although some fine effects betray the hand of the experienced colourist.

None indeed but a colourist of the first order could have painted the fifth picture of the series, and the last as far as at present finished. The pictorial motive here is a light effect of the most difficult kind. The subject is of more than common interest at the present moment. For the scene is laid in the darkened chamber of William Crabtree, the clothier, of Broughton, near Manchester, who like his friend Horrox, the curate of Hoole, watched the transit of Venus on the 24th of November, 1639. The only light in the picture proceeds from a bright ray of the sun let into the room through a telescope and thrown on a flat surface, which distinctly shows the sun's disc with the planet in the shape of a dark spot on

it. Thence the light is reflected on to the face of the astronomer, who gazes on the long-expected phenomenon with a rapture as intense as it is pathetic. The poetic motive, as distinct from the pictorial motive above alluded to, lies in the contrast between Crabtree's scientific enthusiasm, and the commonplace emblems of his trade which surround him on every side. The room is evidently a kind of garret above the shop, which is seen below through an open trapdoor. The shelves are filled with parcels of goods, filed bills, and other business paraphernalia, and on the floor lies a piece of matting addressed to "Master Will Crabtree, Drapier, Broughton." Moreover, from the pocket of his dressing-gown is dropping a tape-measure, which, however, the astronomer regards no more than the chair which in his excitement he has upset. The real and ideal, it will be seen, are here placed in close juxtaposition. The element of beauty is represented by Mrs. Crabtree, a fair young matron, holding a baby in her arms and restraining with difficulty a little boy from disturbing his father. A long piece of knitting, at which Mrs. Crabtree is at work, is skilfully used as a connecting line between the two chief components of the picture. We have little doubt that when the work is shown to the public many will agree with us in assigning to it the first prize among the series for concentrated unity of design and masterly execution.

A final remark suggests itself. Mr. Madox Brown, from his friendship with Rossetti, who, in a manner, was his pupil, is frequently connected with the Pre-Raphaelite movement. But there is in these pictures less "elective affinity" with anything produced by that school than with Maclise's and Dyce's monumental and too much neglected frescoes at Westminster—as far at least as genuine historic treatment is concerned.

### FIRES IN MANSIONS.

THE directors of the Law Fire Insurance Society, viewing the severe fires which have lately occurred in mansions and private houses, request the attention of their customers to what appear to be the most frequent causes of these fires:—Timber built into or near fireplaces and flues. Hot-air apparatus of every description. Stoves introduced into rooms previously unprovided with them, without professional advice. Workmen allowed to carry out repairs and alterations without proper superintendence; fires being lit without fenders or guards, and candles used without candlesticks. Plumbers lighting fires upon the roof to melt their lead have caused the destruction of many noble mansions. Fires lit in grates not previously used, or disused for a long period, the flues not having been first examined. Chimneys not being thoroughly swept. This should be done at fixed periods, and especially before the return of the family after a long absence. Gas within the house; danger may be avoided if the service pipes are provided with taps, so that the gas may be turned off at night by some person specially appointed to that duty from those rooms where it is known to be not required. Mineral oil lamps are a fertile cause of fire, and demand the greatest caution in their use. Such lamps should have a heavy, flat base to prevent their being easily upset. The oil should always be stored outside the dwelling-house. Lucifer matches have caused immense loss of property and of life. Lying about the house they are trodden upon, and by this and other means ignited. Only matches which can be ignited by friction upon the box should be permitted. Clothes hanging before the fire. Overheated flues. Wood left on the kitchen range to dry for lighting fires in the morning. Reading in bed. These and similar acts of carelessness and causes of mischief can only be guarded against by an inspection of the house by a trustworthy person after the family have retired to rest. It is necessary to give immediate notice of the intention to introduce these or similar additional risks. The fire office will then give advice as to the precautions required to avert danger. It cannot be too strongly impressed upon the inmates of mansions, and indeed of all dwelling-houses, that in case of fire each person should immediately run for water, and continue to fetch it by any means, so long as there is hope of arresting the flames; but at the same time all doors and windows must be closely shut. When water is not available, a fire may be extinguished with rugs, carpets, blankets, or other such materials. When all hope of stopping the fire is at an end, excluding the air must be relied on. A fire may thus be confined to one room, giving time for the arrival of the engines.

An International Exhibition will be held in Calcutta next December. There will be nine principal sections:—1, fine arts; 2, apparatus and application of the liberal arts; 3, furniture and objects used in dwellings; 4, clothing, including fabrics; 5, products of mining industry, forestry, &c.; 6, apparatus and processes in the common arts; 7, food; 8, artisans' workmanship; and 9, children's work. There may also be a loan collection of paintings, sculpture, and works of art generally. The usual gold, silver, and bronze medals will be awarded by special juries of experts. The exhibition will be opened on December 4, 1883, and will close on February 29, 1884.

## NOTES AND COMMENTS.

A GOOD anecdote was repeated by Mr. MUNDELLA, when addressing the art students of Leicester a few evenings since. It happens that Professor ROSCOE, when visiting one of the public schools for teaching science and art in Rouen, asked to see the museum. When he was brought to the gallery he was surprised to see in a glass case in the middle a spiked German helmet or pickelhaube. Pointing it out to the director he asked if that could be called an object for scientific teaching. "Oh, yes," was the reply, "that plays a very important part in the machinery of teaching in this school. When my students seem to relax their industry, when I find them indifferent, when I cannot get them to work as I know and feel they ought to work, I reach down the 'pickelhaube,' and say to them: 'Gentlemen, do you know how that helmet came to Rouen? Do you know that the men who wore those helmets conquered France and held Rouen twelve months in subjection, because they had more cultivated brains than we have?'" Mr. MUNDELLA considered that a moral might be drawn from this story. We may not be afraid of military invasion, but we have something to fear from the cultivated brains of foreigners.

MESSRS. PICART & LAPEYRE, the contractors for the demolition of the Tuileries, have commenced the erection of a hoarding round the ruins. Within the enclosure a space is set apart for the reception of those fragments of the building that have been reserved to the State by reason of their artistic value. In addition to the parts specified beforehand, which amount to 700 cubic mètres, the Government further claims the right of pre-emption of any other fragments discovered in the process of removal that may appear worthy of preservation. M. PICART has received the following characteristic letter, purporting to have been sent by Mdlle. LOUISE MICHEL:—"Citoyen,—I wish to propose to you, in the name of a group of Anarchists, to effect unpaid the removal of the remains of the former den of tyrants. We undertake to have it finished by July 14, the anniversary of the taking of the Bastille by the noble people of Paris. Our brother demolishers of Montceau-les-Mines send you their cordial compliments." M. GARNIER, the superintending architect of the demolition works, has received several letters, including one from the son of the Dutch watch-maker, NAUNDORF, who passed himself off as the Dauphin, son of LOUIS XVI., informing him of the existence of a treasure rumoured to have been concealed in the cellars at the time of the Revolution.

It is announced that works of art sent to Munich for the forthcoming International Exhibition of Fine Arts ought to arrive there between the 1st and 31st of May, and the Committee decline all responsibility for those reaching Munich before the former date. They reserve to a later date their definitive decision respecting the admission of works exhibited in the Paris Salon of 1883.

A PROTEST, signed by a large number of the most eminent French artists, has been addressed to M. LOGEROTTE, the Under Secretary of State, charged with the direction of the Fine Arts Department, against the proposed triennial and retrospective exhibition which the Government is supposed to entertain the idea of organising for the coming year. The petitioners pray that the annual salon, now held under the management of the Society of French Artists, may not be subjected to the rivalry of another exhibition, which, under direct official auspices, could not fail to prejudice both its artistic and financial success. They propose as an alternative to the Government project, a decennial exhibition, organised on a grand international and retrospective basis, which would be eagerly welcomed by artists and the public all over Europe.

THE Roman Congregation of Propaganda are desirous to collect objects which may throw light upon the history, art, morals, and customs of various nations. To allow space for exhibition the Borgia Museum, which was founded in the early part of the century, has been removed to more extensive premises in another part of the Urban College.

WHILE engaged in cleaning out and deepening one of the basements beneath the Salle des Cariatides at the Louvre, the workmen discovered a subterranean room or gallery, which is evidently of very ancient construction. It was found to contain two skeletons and many sculptural fragments; and after a careful examination and reference to the plans of the palace, the architects of the building have come to the conclusion that it formed part of the old Louvre of PHILIP AUGUSTUS, built during the twelfth and thirteenth centuries. This prince, although he did not lay the foundations of the original building, completed and fortified it, constructing within the walls the famous tower or keep, which measured 144 feet round, 98 feet high, with walls 13 feet thick at the base, and 12 feet at the top. Of this tower not a vestige now exists. A staircase is being made to permit the public to descend and inspect the curious room just discovered.

THE Prefect of the Seine and the members of the Council of Architecture this week paid a visit of inspection to the Hôtel de Ville, Paris. The interior work is being pushed on with all possible activity, but that still remaining to be done amounts to upwards of 4,000,000 francs, and cannot be finished at the earliest under six months. MM. BALLUE & DE PERTHES, the architects, have, however, undertaken to hand over the building absolutely complete both within and without before the end of June next. Possession may therefore be taken on July 1, and the new Hôtel de Ville officially opened on the 14th of the same month, the national fête day.

THE BELT libel case has at length exhausted itself, and the plaintiff has been rewarded by a verdict in his favour, and his damages have been estimated by the jury at the enormous sum of 5,000*l*. A new trial will probably be applied for without delay by the defendant, and there are sufficient grounds to warrant the application. The case has given rise to much diversity of opinion. The position of the plaintiff—who to some minds appeared to be fighting single-handed against a host of envious rivals, backed by the influence of the Royal Academy—was one that was likely to excite sympathy. The allegation of forgery, which could not be upheld, was also in favour of the plaintiff. And besides, many of the witnesses who appeared in support of his case were of that class which most impresses a jury. On the other hand, weak points were appearing every day in the evidence for the defendant. The jury knew little about sculpture, but it was not difficult for them to suppose that a similar charge had been made in connection with their own businesses. How few London shopkeepers can be said to be the makers of the things which they claim as their own? If they put themselves in the plaintiff's place the case would assume a new aspect, and it is not unlikely this was done. But if it were possible to have, say twelve French sculptors in the box, would the result be the same?

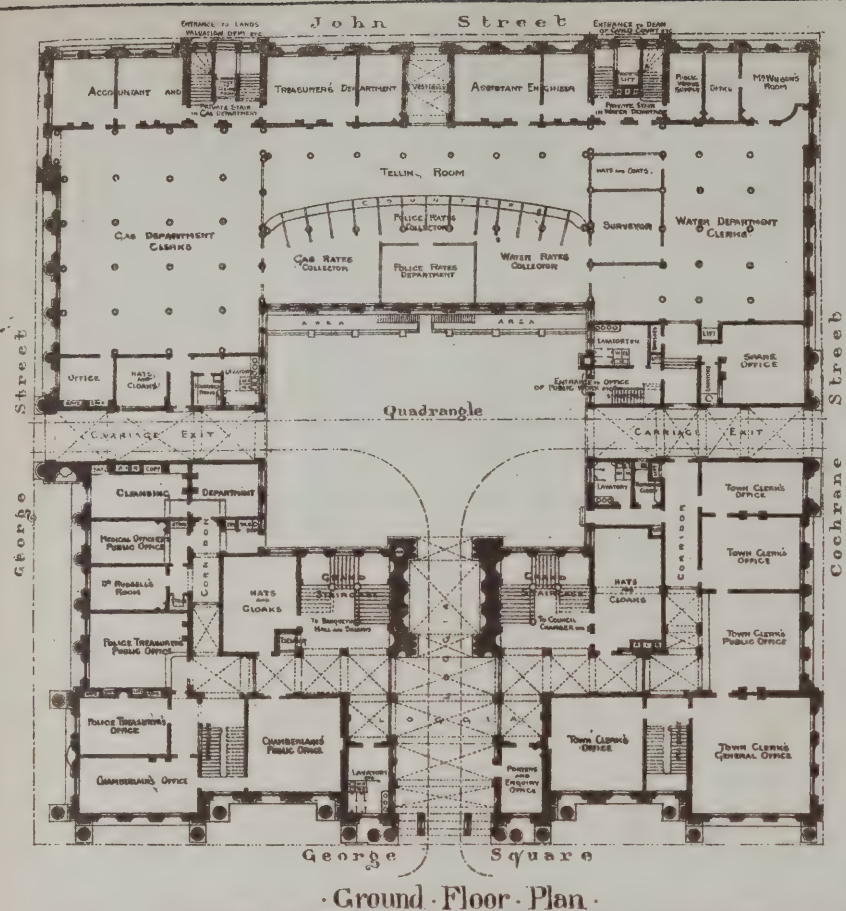

To anyone who is familiar with the ordinary exhibitions of the Royal Scottish Academy the appearance of the galleries at the present time must be a surprise. Year after year no more than a few drawings of buildings are admitted, and they are always hung in positions which secure them from notice. Now about 1,200 architectural drawings fill the rooms, and the only paintings to be seen are portraits of architects. So remarkable a transformation does credit to the diplomatic powers of the Edinburgh Association. The works exhibited form a variety of classes. There are two paintings by CANALETTI, drawings in Greece, sketches by GEORGE and TOM KEMP, the original plan for laying out the new town of Edinburgh, and many views of the old town before the alterations. Modern work is well represented, and it is satisfactory to find that numerous English architects have responded to the applications for drawings.

DURING the course of next year the Académie des Beaux Arts has to award the Prix Chaudesaignes, consisting of 2,000 francs a year for two years, placed at the disposal of a young architect for the purpose of enabling him to visit Italy for that period and complete his studies there. Since its foundation three architects have benefited by it—MM. BENOUVILLE DEFOYE, and MASQUERAY.

## DESIGN FOR THE GLASS

BY MESS<sup>RS</sup> LEEMING

SCULCOATES UNION WORKHOUSE, HULL.  
NEW CHILDREN'S BUILDINGS.

SAM<sup>l</sup> MUSGRAVE, ARIBA.  
ARCHITECT, HULL.

Twitchen House, North Devon.  
EDWARD BURGESS, ARCHT.

ELEVATION TOWARDS NEW STREET.

ELEVATION  
COMMERCIAL STREET.

ELEVATION  
AUSTIN FRIARS.

DESIGN FOR THE MUNICIPAL BUILDINGS, NEWPORT.

BY REGINALD BEESLEY, ARCHITECT.

## ILLUSTRATIONS.

## DESIGN FOR GLASGOW MUNICIPAL BUILDINGS.

THE design illustrated is one of the ten premiated in the late competition, and shows the perspective view submitted in the final list, together with the plans of the two principal floors. In choosing a massive and monumental version of classic, the authors sought to produce a design worthy of one of the finest sites in Europe, surrounded as it is by architecture of no common order. The Merchants' Buildings, on the opposite side of the square, seemed to challenge a rival, which was attempted to be produced in the present design. The plans follow, in many respects, on the lines laid down by Mr. CARRICK, the City Architect, especially in the location of the several departments. A complete system of heating, ventilation, and sanitary arrangements, devised entirely by the architects, accompanied this set of drawings. Messrs. LEEMING & LEEMING, architects, of Northgate Chambers, Halifax, are the authors of the design.

## TWITCHEN HOUSE, NORTH DEVON.

THE illustration of Twitchen House is a reproduction by the ink photo process from a water-colour drawing which was exhibited at the Royal Academy. The architect is Mr. E. BURGESS.

## DESIGN FOR A FONT.

THIS design is also a reproduction from a drawing by Mr. ARTHUR J. COOKE, exhibited in this year's exhibition of the Royal Academy. The font is intended to be built of Caen stone, with the diaper ornament to bowl of red Dumfries. The small shafts to base to be of red Devonshire marble.

SCULCOATES UNION WORKHOUSE, HULL.  
CHILDREN'S BUILDING.

THIS building, now fast approaching completion, has been erected by the Board of Guardians of the Sculcoates Union, Hull, for the purpose of accommodating the pauper children away from "the house."

It is situated at the rear of the workhouse proper, and is approached by a separate entrance from Hilda Street at right angles to the Beverley Road, Hull. It is intended to accommodate upwards of 300 children, and consists of two blocks, each containing school and day rooms on the ground floor, and having dormitories on the first and second floors respectively. The central portion of the building consists of rooms for the schoolmasters, mistresses, and matron, and also embraces the whole of the administrative department. The building is of plain red brickwork throughout, all attempt at architectural treatment being rigorously eschewed in order to keep the cost down to the most economical point.

The architect employed by the Guardians was Mr. SAMUEL MUSGRAVE, A.R.I.B.A., 18 Trinity House Lane, Hull.

## DESIGN FOR MUNICIPAL BUILDINGS, NEWPORT, MONMOUTHSHIRE.

THE design which is reproduced this week was submitted by Mr. REGINALD BEESLEY, under the motto "Economy." The principal entrance is from Commercial Street, with a wide and well-lighted corridor leading to the grand staircase, where there are also two other entrances, both of which are from New Street. The police-court was placed on the first floor on account of securing better ventilation. It fronts New Street and has separate entrances both for the public and officials. The prisoners will be brought by a direct staircase from the cells to the dock, and the witnesses have also a separate staircase. The magistrates' room adjoins the court, as also does the clerks' room. The assembly-room, which is approached by the grand staircase, is on the first floor, and fronts Commercial Street. The ventilation of the various rooms would chiefly be effected by the arrangement of the windows, fireplaces, &c., but a special means of ventilating the court and assembly-room would be provided by TOBIN'S and BOYLE'S patent ventilators. The court and assembly-room to be lighted with sun-burners, the remaining rooms and staircases with gaseliers. The walls throughout would be built of brick, the cornices, caps, bases, plinths, &c., being of local stone. The estimated cost of the works was 24,450*l*.

A Wrought iron Screen has been placed in the new church of St. Peter, Plymouth. It was designed by Mr. G. H. Fellowes Prynne, and the ironwork was wrought by Messrs. Ellis & Rice.

## THE LATE MR. C. C. OGLE, A.R.I.B.A.

THE following correspondence has passed between the Secretary of the Institute and Mr. J. Hebb:—

"Royal Institute of British Architects, 9 Conduit Street, Hanover Square, London, W., Dec. 19, 1882.—Dear Mr. Hebb,—I am directed to inform you that the Council yesterday took into consideration your hint of the 4th inst. respecting the desirability of expressing the gratification of the Royal Institute of British Architects at the steps just taken by the Government to inquire into the death of Mr. C. C. Ogle, an Associate, who was murdered a few years ago at Volo, in Thessaly. Mr. Ogle, as you doubtless know, was then acting, not as a representative of the Institute, but as a correspondent of *The Times*, and the Council, therefore, consider that they are not in any way called upon to interfere or to express any opinion upon what the Government may deem it right to do in such a matter. I am, yours very truly, WILLIAM H. WHITE, Secretary.—John Hebb, Esq., Metropolitan Board of Works, Spring Gardens, S.W." "Metropolitan Board of Works, Superintending Architect's Department, Spring Gardens, S.W., Dec. 22.—Dear Mr. White,—I beg to thank you for your letter of the 19th inst., communicating the decision of the Council of the Institute with regard to the re-opening of the inquiry into the circumstances of the death of Mr. C. Chaloner Ogle. While acknowledging the courtesy of the Council in taking the matter into consideration, I cannot refrain from expressing my regret that the Council should apparently feel so little interest in the fate, and so little regard for the reputation, of a deceased member of the Institute. Mr. Ogle was not only killed by the Turks, but his memory was most cruelly slandered by the Turkish Government, who alleged, in justification of his murder, that he was killed with arms in his hands, fighting on the side of the insurgents in Thessaly, at the time he was assumed to be discharging the duties of a special correspondent for a newspaper. This scandalous charge was denied and amply disproved at the time of his death, but will no doubt be reiterated. The Council point out that Mr. Ogle met with his death while acting as correspondent of *The Times* newspaper, and not as a representative of the Institute; and that, under these circumstances, they do not feel disposed to express an opinion on the subject. Mr. Ogle was an architect and a member of the Institute. This, I should have thought, was a sufficient title to the sympathy of the representative body of the profession, and I am at a loss to understand the reluctance of the Council to join in expressing the satisfaction which every member of the Institute must feel at the resumption of an inquiry which, in the interests of truth and justice, should never have been postponed. I am, dear Mr. White, yours faithfully, JOHN HEBB.—William H. White, Esq., Secretary Royal Institute of British Architects."

## THE EXPLORATION OF ASIA MINOR.

MR. W. M. RAMSAY, who has just left England to resume his archaeological researches in Asia Minor, recently delivered a lecture to members of the Hellenic Society and others on "Phrygia in its relations to Greek art, literature, and history." After pointing out how its grand physical features were reflected in the somewhat gloomy legends of the people, and how the Phrygians were as a nation far more under the domination of priesthoods than their kinsmen the Greeks ever were, Mr. Ramsay showed that Phrygia was quite cut off from the sea save for one great highway running down from Celenæ to Miletus. Upon this highway, used as a trade route in very early times, depended the whole history of Asia Minor in Greek and Roman times. When Constantinople became the capital of the Roman world the road-system of Asia Minor was revolutionised; new roads were made to connect the provinces with the capital; towns built upon or near the old western route fell into decay. Going back to earlier times, Mr. Ramsay brought arguments to prove that long before the Persian conquest a well-developed civilisation existed along the north side of the plateau of Asia Minor; that there was regular and frequent communication between Sardis and the countries beyond the Halys; and that this communication was carried on, under conditions of order and settled government, along a well-constructed road with a bridge over the Halys. This civilisation was connected with the Phrygian king Midas, whose historical character, enveloped as it is in mythology, has been proved beyond a doubt by the discovery of a tomb inscribed with his name. The destruction of his kingdom by the Cimmerians, about 670 B.C., made a lasting impression on the Greek mind. After this, Phrygia fell under the power of the Lydian kings; its political power never revived, and its art, the strong individuality of which was proved by monuments, lost its national character, until finally Greek art took its place. Alexander's conquest of the country in later times was merely the continuation of a genuine social revolution which the cemeteries of Phrygia showed to have been long going on. Mr. Ramsay proceeded to show that the existence of such a civilised State within reach of Greece, and inhabited by a race kindred to the Greeks, must have had its effect on the development of Greek art. Resemblances were dwelt upon and reason given for believing that the Oriental influences commonly recognised in early Greek art

might have found their way to Greece overland through Phrygia as well as by sea from Phœnicia. Sinope was probably an outlet for Phrygian exports to Greece. It had been proved by Professor E. Curtius that Oriental carpets exercised no small influence on the beginnings of Greek art; and as Phrygian monuments exhibited marked traces of the same influence, it was highly probable that these carpets were carried to Greece through Phrygia; probably many such carpets were made in Phrygia itself. The occurrence on Phrygian tombs of the device of two animals symmetrically placed face to face, as on the famous lion-gate of Mycenæ, was another fact pointing in the same direction, especially when taken in connection with the consistent tradition of the Phrygian origin of the house of Pelops. The lecturer then proceeded to show how the relations between Greece and Phrygia might similarly be traced in early Greek literature and in the legends. In conclusion, he touched upon certain Christian inscriptions whose recent discovery seemed to throw light on the condition of the early Churches in Asia Minor. Professor C. T. Newton, who was in the chair, in thanking Mr. Ramsay for his able and suggestive memoir, expressed the hope that others would be found to follow in his footsteps, whether under the auspices of the Hellenic Society or of the Universities. The clues he had indicated ought to be traced, and if possible cleared up once for all by a trigonometrical survey of the whole of Asia Minor. It may be added that the 500*l.* required to enable Mr. Ramsay to continue his researches for the next five years has not yet been all raised. Subscriptions to the Asia Minor Exploration Fund will be gladly received by Mr. George Macmillan, 29 Bedford Street, Covent Garden, or may be paid in to the account of the fund at Messrs. Roberts, Lubbock & Co., Lombard Street.

### THE INSTITUTION OF CIVIL ENGINEERS.

THE annual general meeting of the Institution was held on December 19, Sir W. G. Armstrong, C.B., F.R.S., the President, in the chair.

In the report of the Council it was remarked that the steady progress which throughout had been characteristic of the Society showed no sign of diminution, and that the Institution occupied a higher position now than at any previous period of its existence.

During the past session 238 candidates had been elected, and 90 names had disappeared from the register, leaving a net gain of 148, which had increased the aggregate of all classes to 3,385, irrespective of the students. Of the latter, 149 had been admitted, and 104 had been removed from the list, leaving an effective increase of 45, and making the total number 707.

Whatever development the work of the Institution might take in the future, the "Minutes of Proceedings" would always rank as its most important production, constituting the tangible and useful result of its labours, and the ground upon which its claim was mainly based to the consideration of the profession. There was one notable distinction between the contents of the early volumes and those at present issued, viz. that the papers reserved for reading now were of a more debateable character than formerly. Attention was specially directed to the "Correspondence" appended to the reports of the discussions. Originated with the idea of eliciting opinions from persons known to be well acquainted with the subjects brought forward, but who were unable to attend the meetings, the value of this departure from pre-established usage became particularly manifest as the debates assumed a more controversial character, inevitable when principles were being considered. It was now deemed better to include accounts of executed works, unless of remarkable novelty and magnitude, or unless illustrative of principles likely to evoke discussion, in Sec. II. of the Proceedings, which was devoted to original communications accepted by the Council for printing without being publicly read. In the award of premiums, no distinction was made between the two classes of papers.

Respecting the financial condition of the Institution, it was stated that the income proper for the year ended on the 30th ult. had amounted to 12,898*l.*; whilst the capital and trust fund receipts were 3,527*l.* and 432*l.* respectively. On the other hand the general expenditure had reached 12,788*l.* This amount included 1,500*l.* on account of the repairs and decoration of the premises; as well as 5,806*l.* the cost of producing the four volumes of "Minutes of Proceedings."

The Council had recently received a communication which recalled the memory of one of the founders of the Institution. This gentleman, Mr. Henry Robinson Palmer, was well known to the last generation of engineers as Telford's chief assistant, and as a Vice-President of this Society. He died in the prime of life in 1844, but his widow survived until this year. Desiring that the honourable connection of her husband with the profession should be perpetuated, she, by a memorandum attached to her will, directed that a sum of 1,500*l.* (less legacy duty) should, on the expiry of a life interest in it, be devoted to found a scholarship at Cambridge University, tenable by the son of a civil engineer who needed the help, the holder to be from time to time nominated by the Council of the Institution. The present Council, for itself and its successors, had accepted the trust.

The report having been adopted, cordial votes of thanks were passed to the President, Vice-Presidents, and Members of Council, for their zeal on behalf of the Institution; to the auditors for the time and trouble they had bestowed in verifying the accounts; and to the secretaries for their services.

The scrutineers announced that the following gentlemen had been duly elected to serve on the Council for the ensuing year: Mr. J. Brunlees, President; Sir J. W. Bazalgette, C.B., Sir Frederick Bramwell, Mr. E. Woods, and Mr. G. B. Bruce, Vice-Presidents; Mr. B. Baker, Mr. J. W. Barry, Mr. G. Berkley, Sir John Coode, Mr. E. A. Cowper, Sir James N. Douglass, Mr. A. Giles, Mr. H. Hayter, Dr. W. Pole, Mr. R. Rawlinson, C.B., Mr. A. M. Rendel, Dr. C. W. Siemens, Mr. D. Stevenson, Sir William Thomson, and Sir J. Whitworth, Bart., other Members of Council.

### YORK ARCHITECTURAL ASSOCIATION.

A MEETING of the York Society was held on the 21st inst. in the Saloon, Victoria Hall, Goodramgate. There was a large attendance of members to hear the first of a series of papers, contributed by members of the association, bearing upon the art and science of architecture, read by Mr. J. Perry, on the "Present Aspect of Architecture in England." Mr. Walter G. Penty, the President, occupied the chair.

Mr. Perry, after referring to the position of architecture as a liberal art, and assigning to an architect the title of artist and craftsman, defined art as the visible or perceivable expression of the creative faculty of the human mind and imagination; and in referring to the architecture of York, said: We need only take a ten minutes' walk from where we are to one of the oldest buildings in our land built by natives, and look upon a piece of undoubtedly genuine Saxon architecture. I allude to the tower of the church of St. Mary's, Bishophill Junior. In another ten minutes, by crossing the new bridge, we can, at St. Denis and St. Margaret's Churches, see Norman work of a pure and richly decorative character; and wandering leisurely on we can in the various churches in the city see specimens of the Early English Decorated and Perpendicular, the Tudor, and Elizabethan styles; while in the glorious Minster we can by careful and painstaking survey study specimens of its numerous styles in their purity and richest beauty.

On the motion of the President, seconded by Mr. Wm. Brown, a hearty vote of thanks was accorded to Mr. Perry for his valuable paper.

### ASSYRIAN BAS-RELIEFS AT ROME.

THE correspondent of the *Standard* in Rome writes:—I have been enabled by special permission to inspect personally the Assyrian bas-reliefs which were casually discovered in the subterranean vaults below the Vatican Library in seven cases. They had been given to Pius IX. by Signor Giovanni Benni, First Dragoman of the French Consulate at Mossul, in 1855, and had been altogether forgotten. They are placed in a long gallery of the Library of the Vatican, where so many priceless MSS. are preserved, and are inserted into the wall spaces beneath the windows. They are altogether sixteen in number, of which two are inscriptions. One of the latter is especially interesting to students of Oriental Archæology, inasmuch as it contains words strange to such eminent authorities as Professor Sayce, of Oxford, and Canon Fabiani, of Rome. The former gentleman (who is at present in Tunis, and is expected to make some interesting studies of Carthage) visited the Assyrian bas-reliefs in the Vatican a short time ago, when he was on his way to Africa. The Commendatore C. M. Descemet, to whose courtesy and intelligent explanations I am much indebted during my visit, this morning told me that Professor Sayce began to read the larger of the two inscriptions in his (M. Descemet's) presence, and soon remarked that there were in it forms and words unfamiliar to him, and pointing to a hitherto unknown idiom, or variety of the Assyrian language. Canon Fabiani is unfortunately not well enough at present to visit the Vatican, but tracings of the two inscriptions were submitted to him, and he at once made a remark similar to that of Professor Sayce. The smaller inscription is more legible. Both are cuneiform, but the larger differs in the form of the letters, as well as of the words, from those with which the erudite are familiar. Copies of them, as well as of what may be called the pictorial bas-reliefs, have been sent to the well-known M. Oppert, at Paris, who considers them of high interest.

I was accompanied this morning by an artist, whose painter's eye was immediately struck by the spirit and faithfulness of many of the delineations. There is, amongst many other instances, the outstretched arm of an archer who has just shot off his arrow and is grasping his bow, admirable for vigour and truth of modelling. Also a kneeling camel—a most difficult animal to draw, as all painters know who have tried him—is portrayed to the life.

The first bas-relief we come to on entering the gallery represents the Assyrian Divinity Nisroc. The god, who is eagle-headed, bears the symbols of the four elements; he carries a pine cone in

one hand to represent fire, a sort of bucket for water in the other, has large wings to indicate the dominion of the air, and the earth is beneath his feet. Another sculpture represents a king adoring the sacred tree, or tree of life, the leaves on which are identical in form with those on a similar tree depicted in the illustrations to Sir Henry Layard's well-known work on Nineveh. Also a group of grooms or servants holding horses bear many points of resemblance to the illustrations in Sir H. Layard's book. For example, the trappings and adornments of the horses are nearly identical in both. There is an interesting group of persons passing a river—presumably the Tigris—on a raft. It consists of two women, a soldier, and the ferryman. All the passengers sit with their faces forward, seen in profile by the spectator, whilst the ferryman stands behind them and steers with a long pole or oar. Another group seems to represent travellers on a journey. The foremost figure carries a sack or bag slung behind him, and something like a small chest on his head, whilst his companion, a female, bears a child astride her shoulders, in the exact attitude with which Eastern travellers are familiar at the present day. Both figures are nude. The sculpture in which the kneeling camel occurs represents a field of battle after the fight is over. Dead and wounded lie on the ground, and the camel is about to be laden with their spoils. To the same category of warlike representations belong the archers alluded to above, of whom some are shooting off arrows, whilst another man holds a huge clypeus or shield, behind cover of which the bowmen take aim; and also the very remarkable bas-relief portraying the siege of a city, with scaling ladders, and a spirited presentment of the killed and wounded being hurled from the battlements. In the costume and armour of the soldiery, and the general conception of methods of warfare, this sculpture singularly reminded me of some of the scenes on the Empress Matilda's famous tapestry at Bayeux. But undoubtedly the superiority of design and perspective is largely on the side of the Assyrian artist. It is noticeable that several of the faces portrayed belong to a high and even beautiful type of humanity—especially fine specimens, one might say, of the Caucasian race—whilst others show a more Arabian or Semitic type. In fact, M. Descemet considers one of the faces to be distinctively Jewish.

### THE ARCHITECTURAL EXHIBITION IN EDINBURGH.

THE Architectural Exhibition in Edinburgh was formally opened in the Galleries on the 22nd inst. Mr. Macgibbon, the President, in welcoming the assembly to the exhibition, said that that duty had fallen into his hands owing to the health of Sir William Fettes Douglas, President of the Royal Scottish Academy, preventing that gentleman being present. Sir William, however, cordially approved of the exhibition, and they regretted his absence, as, had he been able to address them, it would have connected the exhibition with the Academy, and would have reminded the public that architecture was included in the range of arts over which Sir William presided. The President then went on to show the great difference between paintings and architectural drawings. A painting was in itself a complete work of art, while an architectural drawing was only the representation on paper of the real design—the building itself being the completed work of art. It was therefore only natural in the great pressure for space in the Academy that architectural drawings, which were but the shadow of the things they represented, should give place to real and actual works of art in the form of paintings and sculpture. For the same reason the latter were also more attractive to the public, and thus it came about that a good exhibition of architectural works was a thing unknown amongst them. It by no means, however, followed that such an exhibition might not be most interesting and instructive. That, at least, was the view of the matter taken by the Edinburgh Architectural Association, and they resolved to make the experiment of bringing together a large collection of paintings, designs, and other delineations of architectural subjects, hoping that such an exhibition would not only be useful to those connected with the profession, but also interesting and attractive to the public. This idea accorded well with the nature of the Association. Although an Architectural Society, it did not limit its membership to the ranks of the profession, but endeavoured, by opening its doors to all, to diffuse a knowledge of architecture and create an interest in the art amongst the public at large. In order to make the exhibition as attractive as possible, the Association had not limited it to strictly architectural drawings, but had invited paintings, engravings, photographs, and all kinds of illustrations bearing upon architecture. It would thus be seen that the Society had done what they could to bring, as it were, into a focus illustrations of the architecture, not only of our own times and our own country, but of all times and every country; for it was one of the leading characteristics of architecture that its monuments were not limited to any particular time or place—they were universal, and of all times. The history of architecture might be said to be co-extensive with that of man, or, at least, with the history of civilisation. After referring to some leading features of the exhibition, and briefly tracing the operation of various influences in the development of

architecture, Mr. Macgibbon remarked that one direction in which modern architecture was endeavouring to keep abreast with modern civilisation was in clearing out densely crowded and insanitary localities. In the principal cities both at home and abroad improvements of this description had for many years been in progress, and we had around us many fine examples of the splendid buildings which had been substituted for unhealthy dens. Whether for business purposes or for dwellings for the working classes, it was characteristic of the times that all aimed at striking architectural effect. In carrying out improvements it had sometimes been found requisite to remove many picturesque and interesting examples of ancient architecture. In this respect their "own romantic town" had suffered severely; but they might congratulate themselves that so many beautiful reminiscences of the old picturesque houses and closes had been preserved by the industrious and artistic pencil of the late James Drummond, G. Manson, and other artists. The Architectural Association is also doing a little to preserve a record of some of the old buildings by annually publishing a sketch-book containing measured drawings and sketches of old Scotch architecture furnished by the members. The revival of Gothic architecture had had, among other good effects, that of turning attention to the remains of the ancient churches, and had led in many instances to their careful preservation. It was hoped that this exhibition would still further contribute towards that desirable result; and it was also anxiously hoped that, by showing the value and importance of the old Scotch castles and houses, it might lead to a greater interest being taken in these buildings also, and some means being adopted to preserve them from the decay and demolition to which they were nearly all rapidly yielding. Mr. Macgibbon concluded by expressing the thanks of the Association to the contributors to the exhibition.

### THE FIRES OF THE WORLD.

THE Fire King (says a correspondent of the *Times*) levies every year a sum almost equal to the British revenue, for it rarely falls below 70 millions sterling, yet modern science feels a keener interest in observing the transit of Venus than in devising means to check such enormous waste of property. We pride ourselves on being eminently a practical people, and although Great Britain is one of the nations that pay the largest tribute to the Fire King, we submit to it as if it were inevitable, and accustom ourselves to regard it as such. It is not so long since our ancestors in like manner paid yearly tribute to the pirate Dey of Algiers, and in later times we allowed numbers of little chimney-sweeps to be suffocated every Christmas, on the same plea of the inevitable. But means have been found to remedy such things, and if we felt a little more concerned about fires we could reduce their frequency and damage probably 20 per cent., without infringing on those rights of the subject, which should be identical with the *salus populi suprema lex*.

The indifference that Englishmen feel in the matter of fires is not peculiar to our race, but shared by most nations, and reminds us of Sheridan sitting before the blazing ruins of his theatre, and observing "That a man has a right to sit by his own fireside." This fatalism paralyses the British Association, House of Commons, Social Science Congress, and Court of Aldermen, and but for the Press the evil would have no vigilant adversary to oppose its progress. Doubtless the reason why philosophers, statesmen, and aldermen fail even to make an effort is because they regard the insurance companies as the born protectors of the public, forgetting that if fires could be prevented, the companies would have to perambulate the streets, exclaiming, "We have no work to do." A good fire is an excellent advertisement for them, and if fires declined one-half their business would languish. Unfortunately, owing to increased negligence, the number of fires is growing twice as fast as the population, and hence the insurance companies are, in general, prosperous, for the more fires the more money London pays yearly to the companies, viz. :—

	1851-60	1861-70	1871-80
Fires per annum ... ..	977	1,430	1,795
Do., per million inhabitants	389	418	465
Insurance premium ... ..	£870,000	£1,130,000	£1,370,000
Per inhabitant, pence ... ..	82	91	95

Thus London at present pays the companies 40 per cent. more than the cost of maintaining 11,000 metropolitan police, and the annual premium is equal to 5 per cent. of the assessed rental of the metropolis. Our forefathers rebelled against ship money, yet we submit to a much heavier impost, one-third of which we could save by a little prudence. But we are parsimonious in our dealings with Captain Shaw's fire brigade, and extra liberal to the insurance companies. The latter are not to be blamed (as when they refuse to insure a fireman's life, unless on very heavy rates) if they are animated less by dictates of philanthropy than by business principles. They even perform some benefit by spreading over the public those losses which would be ruinous to the individual; but

they are not really guardians against fire, nor is it correct to say "the companies have sustained heavy losses," since all loss falls upon the public. Few people have an adequate idea of the enormous sums annually paid to insurance companies, which amount to the average earning of a million able-bodied men, and yet this is much below 50 per cent. of the entire loss to nations by fire, as shown in the following table :—

	Fire Insurance Premium	Rate of Insur- ance	Ratio of Property Insured	National loss by fire	Do. per inhabitant. Pence
United Kingdom	£ 6,900,000	0.25	46 p.c.	£ 9,100,000	61
France ... ..	3,760,000	0.10	75 "	3,200,000	20
Germany ... ..	6,500,000	0.21	74 "	6,100,000	32
Russia ... ..	900,000	0.50	9 "	21,000,000	60
Belgium... ..	400,000	0.10	43 "	500,000	22
Scandinavia ...	300,000	0.27	27 "	1,000,000	35
United States ...	11,600,000	0.90	15 "	22,500,000	105
Canada ... ..	1,550,000	1.10	30 "	4,100,000	230
The World ... ..	31,910,000	0.27	43 "	67,500,000	59

From the above it appears that the loss per head is greater in the United Kingdom than in any other country of Europe, although, as compared with national wealth, Russia suffers more heavily. If we add one-fourth for indirect losses the damage to Great Britain is 1 per cent. of our national earnings, say three days' labour yearly of our whole population. Notwithstanding the increase of fires, they make little or no impression; those at Wood Street and the Alhambra were almost forgotten in forty-eight hours. The companies pay the policies and the builders set to work again on the blackened sites, just as the inhabitants of Guatemala, after each earthquake, rebuild their houses among the ruins that have entombed some of their friends.

It is time to shake off this apathy, and call a meeting at St. James's Hall to petition Parliament if the municipal authorities still turn a deaf ear to Captain Shaw's solicitations. Above all the public should free itself of the delusion that any improvement can come from the insurance companies, since fires are precisely their *raison d'être*, and it is not fair to expect any more of them than simply to pay the policies for which they charge us the trifle of 1,370,000*l.* per annum, which is fifteen times the sum allowed by our opulent city for the support of Captain Shaw's fire brigade.

### AN ORKNEY TILE BED.

A PAPER was read at a late meeting of the Inverness Field Club by Mr. Ross, architect, on the so-called tessellated pavement at Skail, Orkney, which extends along the tops of the cliffs at an elevation of about 200 feet. The cliffs are exposed to the full action of the Atlantic storms, and the spray dashes over them in a westerly or north-westerly gale, and is carried for fifteen or twenty miles inland, making the wells and springs brackish after a storm. The action of the waves has cleared off much of the turf and soil on the tops of the cliffs for many yards inland, and where the upper layers have been displaced to the depth of a foot or two, these tessellated pavements are exposed. The most perfect beds are exhibited where the full force of the waves is broken by the irregularity of the coast. In some of the cliffs, such as at the Hole o' Row, the action of the water has been so severe as to disturb the beds and displace and break the tiles, but about one-third of a mile north of the brooch the pavements are most extensive and perfect. Old writers have noticed them, and so perfect is the structure of many of the tiles of the platforms, that Wallace in 1700 says gentlemen had their fireplaces tiled with them in the same manner as Dutch tiles were and are now set round our fire recess in some fashionable localities. This tile bed extends over several miles of coast, and a considerable distance inland. The portions now exposed run along about a mile of coast, and vary from a few feet to fifty or sixty yards in breadth. He had submitted the specimens to Mr. Horne, who was always so ready and able to assist them in their investigations, and he forwarded some notes regarding the formation of these pavements. The bed in which this remarkable feature occurs consists of a sandy ironstone, or a sandy carbonate of iron, interbedded with the flagstones of lower old Red Sandstone age. A characteristic feature of these bands of ironstone is the system of jointing, which sometimes assumes the regular forms presented at Skail. The joints do not necessarily traverse the underlying or overlying strata, which shows that the feature is inherent in those bands possessing definite lithological characters. In the Scotch carboniferous rocks, the beds of clay ironstone exhibits this feature in a remarkable degree, and even in those cases where the ironstone occurs in the forms of flattened nodules, the same feature is observable. The development of this system of jointing has been hitherto ascribed to shrinkage, but it is doubtful whether this explains adequately the prevalence of the joints. Whether this be the true explanation or not, of this fact we are certain that they do occur in these beds. It is seldom, however, that such an admirable opportunity is afforded of examining a

jointed band where the tabular pieces present such definite geometrical forms as at Skail, resembling, in fact, a piece of mosaic work, or a tessellated pavement. Still less frequently do we find the tessellæ invested with a grey margin or border, like the frame of a picture, as we find at Skail. This phenomenon has attracted the attention of various writers on Orcadian geology, and notably of Fleming, Jamieson, and Heddle. In a paper by Fleming, contributed to the "Edinburgh New Philosophical Journal," vol. viii., a description is given of the appearance presented by this particular bed, and a probable explanation is given; but though in the main correct, it errs in certain particulars, and does not define the nature of the decomposition which takes place along the joints. The system of jointing was developed in the bed long before its exposure to atmospheric action. In this case, the joints were formed, in all likelihood, during the deposition of the higher members of the series. But so long as there was sufficient animal and vegetable matter to reduce any sesquisalt of iron in the water of the sea in which these old red strata were deposited, no decomposition would ensue. But, when the strata were upheaved so as to form a land surface; and when, after prolonged demidation, this particular bed was exposed to the atmosphere and the action of the sea, certain chemical changes would be set agoing. The oxygenated water, percolating downwards along the joints, would convert the protosalt of iron into the sesquisalt, and gradually dissolve it out. This process would advance inwards on both sides of the original joint, which would, in course of time, give rise to the framework enclosing the tessellæ. The colour of the framework is yellowish-grey, while the colour of the tile set in the frame is dark grey. The difference in colour is clearly distinguishable, and the yellowish-grey margin shows the area, along which the decomposition of the iron carbonate, and the removing of the resulting salt, have taken place. But further, when this decomposition has advanced inwards for some little distance from the original point, the sandy framework yields more readily to atmospheric action than the tessellæ, and hence we have a curious domeshaped arrangement of the tiles with depressed margins.

### THE CLAIMS OF ART.

THE prizes obtained by the students of the Cardiff Science and Art Schools were handed to the students at the annual meeting by Mr. Gambier Parry, who delivered an address upon "The Claims of Art upon an Age of Business." In the course of it he said: Art is not a subject for everybody; I do not say that I wish it were so—far otherwise. Our life as a nation depends on the variety of our powers. We want men who will battle with wind, water, earth, and enemies, and we want other men who will grapple with the difficulties of political and social life. It is the great object of education to supply these wants, and education is abused when it fails to recognise the varying tints and hues of disposition, the varying powers and genius of its pupils. That is what I meant when I said that art was not a subject for everybody. Still, I am convinced that if its motives were better understood it would be adopted, at least in its elements, in the education of all classes. Our age is essentially an "age of business." Everything is business, at least to an Englishman. With the multitude everybody is busy. I question whether they are not too busy; whether the fact of there being so little leisure does not lead to its abuse; whether too much work is not quite as bad as too much play. But the question for us is whether this over-work can not be relieved, and this little play be made more profitable by bringing the arts to bear upon them, and to bring those arts within easy reach of all classes. In other matters our call, as a nation, has been clear, and there is no reason why we should not excel in art if only we go about it in the same way. In the past our people did not care for ideal art. Their taste in such matters was naturalistic for that which gave them no trouble to think about. Hence our most popular artists have been the representers of domestic scenes, or simple natural subjects, which told their own story at once, like those of Wilkie and Landseer. The works of those great men, however, were full of poetry; but it was not so much the poetry which those works expressed as the simple facts which they represented that our people cared for most. There was no lack of genius in those arts; what we lacked was the power, the intelligence, the refinement, of the public to draw it forth, to foster, or to appreciate it. But the scene is changing now, and rapidly. Those realities in the romance of discouragement and sorrow which made up the lives of so many of our artists and men of genius are not likely to be repeated. Our people are opening their eyes and their hearts to the beauty of their national artists' works. "Industry and Courage" must be our motto in art as in everything else. We cannot live like lazzaroni on a sunny wall and half a melon, nor like the emancipated slaves of St. Domingo on sleep and a sugar cane. I may say, I hope without offence, that the mere commercial view of things may be, and often is, low, immoral, sordid, and selfish. But the use of the finer arts in connection with commerce is to correct this unhappiness. There is nothing low, sordid, or selfish about them. The arts indeed might be the very handmaids of commerce—

bright and healthy. Their very pleasantness would cheer the spirit of the working man. His hand would work all the more blithely because his heart would be more blithe. He must live by his work—it is his honour to do so. But his mind would be refreshed in the dulness of his work by brighter, happier thoughts. That is the stuff that art is made of for the working man. I therefore urge it upon you as an element in his education on the most utilitarian grounds. And more than that, I urge it on gentlemen of commerce, versed in all the mysteries of home trade and foreign competition, that art is not only a thing desirable for moral and social reasons, but absolutely necessary in our commercial relations with the world. I by no means wish to put art upon stilts; I by no means wish to put it in a false position of importance. But I believe it is this—it is the thing which is wanted to trim the balance of our national character, to correct its hardness, its coarseness, its vulgarity, and to draw out its finer and not the less great and noble qualities. I look upon it as a great field which we have only half cultivated. I believe that thousands of our workmen have been forced into trades unsuited to them, occupations which were repulsive to them. The world has dealt harshly with them. The idea of a common working man having tastes and talents, definite and refined aptitude, and even genius hidden beneath his rough exterior, has been in past times ignored. His heart yearned for other things. He felt like a racehorse harnessed to do cart-horse duty. He became indolent, depressed, dispirited. His temper embittered, his life resourceless, drove him to vice for relief, and then vice drove him into crime. I suspect that this was neither an exaggerated nor uncommon picture, that such a man as I describe, who might have been happy in himself and an honour to his family and his country, became an outcast and a criminal. The capacity for artistic pursuits among our people is being developed with a rapidity that is satisfactory to ourselves and surprising to our neighbours. We have always been a people famous for our ingenuity. Practical art is but cultivated ingenuity. Our art manufactures have begun to compete successfully with those of the most artistic nations. Our art schools are turning out accomplished draughtsmen, and scattering widely a general knowledge of art principles to the advantage and happiness of our people. If, then, by such means as all these we can supply the increasing demand at home and abroad for better style and purer design in all our manufactures, our woven fabrics, our china, our glass, and our metal work, we shall have made a great gain commercially. If by these means we can improve our cities, clear them of the eyesores of modern vulgarity, and erect monuments more worthy of our times, we shall have gained in the cheerfulness of our people, in our own self-respect, and in the honour of our neighbours. If by these means we can supply fresh opportunities of employment, fresh occasions of enjoyment, fresh outlets for the various talents of our mixed English race, I think we shall have made good our claim for development of our national arts on the highest scale; and I trust that we make it with success.

### METROPOLITAN MORTAR.

AT the Worship Street Police Court on the 21st inst. Mr. Bushby gave judgment in a case between the Metropolitan Board of Works and Mr. S. Muncey, builder, Hackney Wick. In August last at the same police court proceedings were taken by Mr. Alexander Payne, the district surveyor of East Hackney (South) and North Bow, against the defendant for using mortar not composed of good sharp sand without earthy matter, as required by the bye-laws of the Board, in which case the defendant was fined 60s., but he continued to use inferior mortar and proceeded to complete the buildings without pulling down any of the condemned parts. The Metropolitan Board of Works therefore were driven to take proceedings, under the Metropolis Management and Buildings Acts Amendment Act 1878, for an order to pull down the houses. The case first came on on November 2, and was adjourned several times on technical points raised by the defendant's counsel. On November 30 the case for the prosecution was heard.

Mr. Besley appeared on behalf of the Metropolitan Board of Works, and stated that the Board, having regard to their duties to the public, felt that the fine of 60s. already imposed would not cure the evil and ensure the use of good mortar in the future; it was therefore necessary for them to ask for an order to pull down under section 17 of the Act of 1878.

Mr. A. Payne, the district surveyor of the district, produced specimens of the mortar and material used for sand, and gave the dates of his various inspections of the buildings. The mortar was not such as is required by the bye-laws, as it was not composed of clean sharp sand, and was full of earthy matter; it easily crumbled and did not adhere to the bricks, and when put in water dissolved into something like mud. There had been no improvement in the building, nor had any part been pulled down.

Mr. Thomas Blashill, district surveyor of the adjoining district, was then called, and stated that he had inspected the buildings with the last witness on November 27, and taken speci-

mens of mortar from the back addition. The mortar was not in accordance with the Board's bye-laws. There was some gritty substance in it; but there was also earthy matter, and it did not hold together or adhere to the bricks. Houses built with such a material would be more damp and unhealthy than if built with proper mortar.

This concluded the case for the prosecution.

The defendant's counsel, Mr. R. B. Muir, then asked the magistrate to take down the following objections:—

1. That proceedings could not be taken against the builder after he had completed the work; they should be taken against the occupier.

2. That the bye-laws were *ultra vires*, as under section 12, 1855, the Board had no power to make bye-laws about mortar; and

3. That the notice of the district surveyor was not explicit enough in specifying what part of the buildings were to be pulled down. He then said he would show that the mortar was in accordance with the Board's bye-laws.

Mr. Uriah B. Broadribb was called, and said he was a surveyor, and manager to Messrs. Reddall & Sons. He had superintended the building of the houses on the estate; he had no fault to find with the mortar from the houses. He produced a sample taken from the back additions; the quality was rather variable. He should say, according to the cottage sort of property, they were of first-class construction.

In cross-examination, witness said he had no specimens that day from the main building. He had given evidence on the former occasion when the defendant was fined 60s. In his opinion that was a wrong judgment, and no part of the buildings had been taken down. Mr. Muncey only found the labour on the job; the freeholder found the materials. Witness saw a large load of sand brought to the job; this was in the beginning of August; the main walls were then up.

Being asked as to where the sand came from before that time, witness mentioned a lot of concrete that had been taken from various roads. It was not his province to superintend the mixing of the mortar. Being asked by the magistrate, he said the name of the freeholder was Mr. J. F. Raw.

Mr. S. Muncey, the builder, was called, and stated that the mortar was composed of Thames sand, mixed in the proportion of two or three of sand to one of lime; there was also a small portion of sifted ballast mixed with it. He was finishing the houses by day-work; the money was advanced by a solicitor, Mr. Raw, at so much a week. He had given notice to Mr. Payne as builder; he was fined 60s. for the mortar, but had not pulled down any part of the buildings. He had had four barges of sand to the houses; there was no perceptible loam in the mortar.

Several workmen were then called and deposed to having mixed the mortar and carted sand on to the job, but they could give no dates.

A local builder was called who produced a specimen of the mortar, which he said was good. In cross-examination he stated that he had served his apprenticeship as a carpenter, but had had a great deal of general experience, and had been the foreman of large works.

The district surveyor was then called, and said he had examined the specimens submitted for the defence; they contained earthy matter, nor was there any evidence of good Thames sand about them.

Mr. Blashill was re-examined, and said that the specimens did not contain Thames sand, and that there was dirt and earthy matter in them.

The magistrate said he would examine the specimens and give judgment on December 21.

Mr. Besley, for the Metropolitan Board of Works, said that if his worship liked to call in the assistance of a professional adviser he would agree on behalf of the Board to pay half the expense whichever way it went.

On December 21 the magistrate said that an analysis of this mortar would cost 21s., and that if either side were willing to pay for this he would have it adjourned to see the result; otherwise he was willing himself to give judgment from the evidence and from the specimens he had seen.

Mr. Burton, who attended on behalf of the Metropolitan Board of Works, said he was quite willing to accept his worship's judgment.

Mr. Raw, on behalf of the defendant, said he was perfectly willing to accept the magistrate's judgment, presuming that, if he decided in favour of the Board, he would allow the points he had raised to be brought before the superior court.

The magistrate then referred to the points, namely, as to whether the builder was the right party to proceed against, whether the bye-laws were *ultra vires*, and whether the notice was vague. He said he could not grant a case upon them; he did not like to send up to the Court of Queen's Bench points which they would pooh-pooh at once. The defendant would have to apply for a *mandamus*. Mr. Bushby then delivered judgment. He said he had heard the evidence and had examined the specimens of mortar produced. Some of these crumbled in the hand; it was no answer for the defendant to bring other specimens which did not crumble unless he could show that the specimens brought by

the prosecution were not taken from the houses, which he never ventured to do. Therefore he ruled that these buildings had not been constructed of solid strong mortar according to the meaning of the Act, and he gave the order prayed for.

Mr. Burton then, on behalf of the Board, asked for costs.

The magistrate said he was not in the habit of granting costs except where there was something like wilful malfeasance; but in this case there really was something like that, because there had been a previous order, and fines inflicted in consequence of this mortar having been adjudged to be bad; but not the slightest action had been taken by the defendant, thus compelling the Board to take fresh proceedings. He should therefore grant the costs, but they would be limited to the costs of one day.

### PRE-HISTORIC ARCHÆOLOGY.

IN the last of his course of twelve lectures at Carlisle on "Europe in Pre-Historic Times," Mr. Marr said that the science of pre-historic archæology was only in its infancy. It had been studied only for about half a century, and the result was that, as in the case of young and flourishing societies, along with the theories which would probably hold good eventually, there were a number of other theories which might be spoken of as working hypotheses which were very convenient, but which might be disproved when more facts were collected. A difficulty which often arose in the study of such a subject was to distinguish between these working hypotheses and those theories which were likely to stand the test of time. He examined some of the difficulties referred to. From the study of the organic remains and the physical character of the deposits in the British islands, it had been established that these deposits had not been formed by any violent action, but that they had accumulated gradually; and therefore they must admit that 50 or 100 feet of sediment containing the relics of man had been formed very recently, as compared with the oldest sediment which did not contain those human remains. Although this was the case, nevertheless the tests which applied to the older deposits might also be applied to the deposits containing human relics. He had told them that in trying to get some idea of the history of any geological deposits there were two kinds of tests to be applied, viz. the test of superposition and that of the existence of organic and other remains. Applying these tests he showed that the classification of pre-historic peoples was such as they had had reason to adopt in this course of lectures. They had no absolute proof of the classification, but the proofs that existed rendered its truth pretty nearly a certainty. Having established this classification, and shown that the order of succession of the pre-historic peoples in the European Continent was as had been taught, river drift man and then cave man of Palæolithic times, neolithic man and the men of the bronze and early iron ages, he passed on to review the sequence of events which had taken place during the periods referred to; and as they had seen that the order of succession in all the arrears of the European Continent was similar he confined himself to a general summary of what had taken place in Britain. Coming to the time of the first trustworthy records, he said that even in historic times both geology and pre-historic archæology were of considerable importance, giving them a clue to important deductions. In the first place to consider pre-historic archæology. They learned from it how different inhabitants of our own island got different characteristics; they learned, for instance, why the inhabitants of Denbighshire were of a swarthy appearance with black hair and short stature, whilst many of the inhabitants of Scotland were tall and very much fairer. They learned that this was because they were of different races, that whereas one belonged to one race the other belonged to another. Then take an instance of the value of geology. Geology also taught us how the inhabitants of different parts of our island came by certain of their characteristics. They found, for instance, that the inhabitant of this district was usually characterised by a considerable amount of strength and physical endurance, whereas the inhabitant of some of the more fertile areas of the south of England was by no means so strong as the inhabitant of this part of the world. They found that this was due to the fact that the northerner, to use a cant term, had had to struggle for existence against adverse conditions of the soil; that in order to cultivate this soil he had had constantly to struggle to get his living, whereas the inhabitant of such areas as Gloucestershire could with little difficulty produce enough of cereals for his own existence. They found that this difference to which he was pointing was owing to the difference in the geological structure of the two districts compared. We had a hardy race reared up in this part of the world, whereas in the south the people were, physically speaking, very much weaker. This was only an isolated instance which he had selected; but from a consideration of similar instances over Britain and Europe, Professor Geikie had come to the conclusion that the geological structure of a country had played a very important part indeed in the physical characteristics of the dwellers therein. Mention of history reminded one of the methods which had been pursued in considering pre-historic

archæology. They were very much the same as those practically which were adopted by historians. He need hardly remind them that the chronicling of a number of facts did not constitute a history. In fact to write a history nothing helped the writer so much as the possession of a powerful imagination; and this powerful imagination had been used even in the writing of trustworthy histories. The same thing was the case in pre-historic archæology as in other sciences. The facts were preserved by nature, and the pre-historic archæologist had to draw upon his imagination to weave a connected history as a historian had to draw upon his imagination to weave a connected history from the facts which were left to him. The classification of the pre-historic ages as had been taught was as well established as English history into different reigns.

### Middlemen in Art.

SIR,—There is doubtless much truth in what your correspondent "W. M." says about "Middlemen in Art;" but is not the architect himself too much of a middleman to join in the hue and cry against them?

Is not, in fact, the position which the architect assumes practically an impossible one in these days? Can he possibly be master of all that is comprised under the head of architecture? And is it not because he has overreached himself, in claiming all that he does claim, that he has fallen (by his own confession) into something like disrepute with the general public?

It is no fault of the architect that he cannot know all that an architect is assumed to know; but whose fault but his own is it that he is assumed to know everything? When a man is found out in one act of pretence, he is, perhaps too hastily, put down as a pretender altogether, but he can hardly complain if that is the case.

Why should an architect be ashamed to acknowledge the assistance he gets from the engineer, the man of science, the artist, or the craftsman, unless he fear that their merit will overshadow his own? And if that be so, what right has he to take the whole credit to himself?

There are architects who are sure enough of themselves to give others who assist them their full share of credit, and all perhaps do so in proportion to their confidence in themselves. But the large body of the profession does as little of the kind as possible, and prefers, for example, to deal with a tradesman who is content with his profit, rather than with an artist who may lay some claim to having "invested the work with artistic merit." The *raison d'être* of such professors is not very obvious, least of all is it so to the "barnacles" upon whom they live.

I am, Sir, yours faithfully,  
NEITHER THE ONE NOR THE OTHER.

### REVIEWS.

#### THE DECORATOR AND FURNISHER.

WE have received from New York the first number of the first volume of *The Decorator and Furnisher*, a monthly journal, of which the title indicates the purpose and pretensions. The list of contributors comprises a chief proportion of names with English addresses attached, but to judge by the specimen number the main bulk of the matter presented to the reader, and the most numerous illustrations, will be, as they should be, of American origin and growth.

The form adopted gives a page almost double that of *The Architect*, inconveniently large in itself, and not due to the requirements of any style of illustration that is useful or appropriate to the subjects. The illustrations given are numerous, varied, and sufficiently elaborate; they include reproductions of sketches by members of a charcoal club, diagrams and patterns, designs for furniture, mantels, cabinets, screens, ceilings, large plates of furnished interiors, a library and a dining-room, and a large coloured plate of decorative combinations in ten colours.

If we are to accept these designs as fairly representative of the present phase of American taste or fashion in decorative furnishing, the opinion is not to be suppressed that the forms which it affects are far too predominantly—indeed, are all but exclusively rectangular. Walls and ceilings are divided into squares and oblongs, chairs have square flat seats and square upright backs, and if the table in the "Dining-room Interior," with all its legs and bars, is to be accepted as a dining table, and the chairs as chairs for the guests, the problem of how the guests are ever to get on terms with their dinner is one of which we should be curious to witness the experimental solution. These observations, however, do but tend to indicate the opportunity which is open to the editors of this new journal to supply both corrective

criticism and improved models. It commences with a display of energy which is most promising for the future, and encourages the expectation that it will keep as clear of being the one-sided advocate of the prepossessions of a narrow clique as of becoming an organ of latent trade advertising. Nothing can be more gratifying than still another example set of a desire to bring into as close communication as possible the thoughts and theories, the works and aspirations of artists and artisans on both sides the Atlantic.

We are only giving an additional proof of sympathy with *The Decorator and Furnisher* of New York if in the interests of gracefulness we urge that whatever good sense may be involved in such paragraphs as follow should only be admitted to its columns in terms very sternly revised:—

"Speaking of good times reminds us that we want some first-class canvassers—some of the kind that can capture a subscription at sight. This seems to be a good opening for some regular lightning-rod purveyors."

Again—"Mr. George R. Halm, whose name is familiar to readers of art papers and lovers of art work, has taken charge of the artistic end of *The American Agriculturist*, and we have no doubt under Mr. Halm's management the success of this long neglected feature will assume the proportions of a boom."

## LEGAL.

Ipswich County Court, Dec. 20.

(Before Sir F. ROXBURGH, Q.C., Judge.)

JACOBS v. BORRETT.

The Employers' Liability Act.

THE plaintiff in this case was a labourer, and he sought to recover 16*l.* 19*s.* 4*d.* damages for loss of work and injury sustained by the alleged negligence of the defendant, a builder. Plaintiff was employed by defendant in taking bolts from the scaffolding of the tower of St. Lawrence Church. He held the punch in his hand, and Mr. Borrett was striking at it with the hammer, when he struck Jacobs's fingers, causing him permanent injury. The claim was laid under the Employers' Liability Act.

It was contended on the part of defendant that the action could not come within the scope of the Act.

His Honour was of the same opinion, but said it needed not to interfere with the action, which was really one to claim compensation for the personal negligence of his employer.

The plaintiff said he was a labourer, and on the 10th of October was engaged by Mr. Borrett in taking out the bolts of the scaffolding around St. Lawrence Church steeple. Whilst so engaged the defendant went up to him and took the hammer whilst plaintiff held the punch, which was then struck several times by Mr. Borrett. Unfortunately, Mr. Borrett once missed his aim and struck the plaintiff's finger with the hammer. It was hurt very much. Plaintiff kept at work till the second day, when he was compelled to go to the East Suffolk Hospital, remaining an out-patient of that institution from the 11th to the 31st October. He did a little work with his other hand in the meantime. The hand, after the 31st of October, began to discharge, and Jacobs was again treated at the hospital. After this defendant said the man would have to make out a claim, and he would give it to the Liability Act Insurance Company. He also asked the plaintiff to copy a piece of paper which he gave him. The claim was made up by three weeks' wages, at 18*s.* 8*d.* a week, and 10*l.* 10*s.* for injury received, and he had received 14*s.* from the plaintiff. He was unable to use the injured hand as in the past.

Plaintiff was cross-examined as to the way in which he was holding the punch; as to the length of the punch; as to his usual earnings, and as to whether he was not employed during the time in which he was an out-patient at the hospital. The paper he had copied was a claim of 2*l.* 4*s.* 9*d.*, which was made out by Mr. Borrett to send to the Liability Act Insurance Company, who, however, considered it was not a case to come under their notice, and then the defendant refused to pay. Plaintiff would then have accepted the 2*l.* 4*s.* 9*d.*, but he should not have thought that sufficient compensation.

The resident surgeon at the East Suffolk Hospital said that one of plaintiff's fingers was broken. The man did some work, but the finger was again broken after being set, and had again to be surgically treated.

In defence, it was contended that the negligence was on the part of the plaintiff, holding, as he did, the punch in an improper way.

Mr. Charles Borrett, the defendant, said he had the contract for refacing the St. Lawrence tower. The plaintiff assisted in taking the scaffolding down, and on the 10th of October he was holding the punch whilst defendant was striking it with a hammer to take out the bolts, when the accident occurred through the improper way in which the man held the punch.

His Honour: Then why did you not tell him of it?

Defendant said he had done so previously. It was quite an incident when, missing the punch, the hammer struck the plaintiff's fingers. The man, however, worked all that day and part of the next, and then, acting upon defendant's advice, he went to the hospital.

Plaintiff had worked since, and had applied to Mr. Borrett for work, making no complaint as to his finger.

Cross-examined: Defendant did send the claim of 2*l.* 4*s.* 9*d.* to the Insurance Company. He had no occasion to caution the plaintiff as to the way in which he held the punch. He saw that he was holding the punch improperly between his fingers.

His Honour said the question he had to decide was whether the injury was caused by the negligence of the defendant. This was proved in the affirmative from the evidence of the defendant himself. He made out himself, for the plaintiff, a claim upon the policy he held in the Insurance Company for accidents to workmen through negligence. It was thus proved that he himself knew there was negligence on the part of some one, and it must have been on the part of Mr. Borrett himself. His Honour accordingly gave judgment for 15*l.* 19*s.* 4*d.*, disallowing 10*s.* of the claim for damage.

## ENGINEERING WORKS.

**Dock Work in Adelaide.**—The chief city of South Australia has taken steps for the construction of an ocean dock of nearly 30 acres in extent, and 30 ft. deep at low water. The site is said to be excellently chosen, and the approach will be of the easiest character. The dock will afford harbourage for vessels of the largest class, and will be provided with modern appliances for docking, loading, and discharging vessels in all states of the weather. Railway communication between Adelaide and Melbourne is being established, and already a line of rail connects the capitals of Victoria and New South Wales, so that within a few years passengers and mails will be landed at Adelaide for all parts of Australia, and will reach their destination by rail, while the goods for other colonies will be discharged into inter-colonial steamers of a class much superior to those now running. The steamers will reload with coal from New South Wales to supply the large ocean steamers in the terminal part of Adelaide. As an evidence of the faith which the South Australians have in the development of their colony, it may be stated that the capital required for these vast works, which cannot be far short of a million, is to be provided by private enterprise.

**Magdalen Bridge, Oxford.**—The works in connection with the widening of this bridge have been retarded in consequence of the October floods. The water overflowed the dams which had been driven across the north-eastern stream, and submerged the work which had been commenced in the foundations of the river piers and abutments, completely stopping the work at that end of the bridge. It has been found necessary to drive a new dam across the river below the bridge, the old one having been so much strained by the force of the water as to be useless. The water has been again pumped out, and the workmen are now busily engaged, night and day, excavating the river bed to receive the inverted arches between the piers of the old and new structures. It is hoped that this portion of the works may be done without further interruption from floods, and to that end they will be pushed forward with all possible speed. The flood has not greatly hindered the progress of the work on the other portions of the bridge. All the piles for the foundations have been driven, and the foundations finished. The massive timber centres, which carried the river arches at the south-west end, have been removed, and the fixing of the balustrade above the arches is about to be begun. There has been but little time lost considering the unfavourable weather of the last three months. The flood of October has done no damage to the new work. The temporary works, however, such as dams and bridge, have been considerably shaken by the force of the stream, and have had to be thoroughly repaired.

## ARCHÆOLOGY.

**The Schaffhausen Onyx.**—The Historical-Antiquarian Society of Schaffhausen have celebrated their fiftieth anniversary by issuing an illustrated eight-paged folio, containing a description and history of the celebrated Schaffhausen onyx, which for several centuries, probably since the defeat of Charles the Bold at Grandson in 1476, has been one of the most cherished treasures of the commune. The illustrations are *chefs-d'œuvre* of chromolithography, and the text is written by the learned antiquary Professor Dr. J. J. Oeri. The figure engraved on the stone is a female wearing a crown of honour, and holding in one hand a horn of plenty, in the other a Mercury's staff. Dr. Oeri identifies the figure as that of Pax, and the cameo, he thinks, was cut between A.D. 68 and 82, probably as a memorial of the reorganisation of the Roman Empire by Vespasian and the suppression of the rebellions in Gaul, Germany, and Judea. The setting of the stone, which is very large and beautifully marked, is to the full as valuable and curious as the onyx itself. It is a masterwork of mediæval art, the significance of which has only of late been rightly understood, consisting of a triple golden wreath of lions and eagles in relief, interspersed with leaves, and ornamented with pearls and other stones of price. On the reverse side is a plate of silver gilt, bearing the effigy, in intaglio, of a knight on horseback. The

inscription shows that the talisman (for such it was doubtless considered) belonged at one time to a Count Ludwig von Frohburg. Dr. Oeri has no doubt that this was Ludwig, the second count of that name, a faithful friend and loyal subject of Kaiser Friedrich II., whom, with his brother Hermann, he accompanied to Basle in 1212. He was at Basle a second time in 1223, and it is on record that he was with Friedrich at St. Germans in 1225, at Rimini in 1226, Montefiascone in 1245, and in 1254 at Verona. Ludwig von Frohburg was evidently one of the most important minor personages of his time. He was closely allied with the Hapsburgs, his wife being Gertrude, aunt of King Rudolf, the founder of the house, and it was probably about the time of his marriage with this lady that the onyx was placed in its present setting. This is inferred from the predominant colours of the jewels, red, white, and blue, with which it is ornamented, and from the fact that the eagle was the cognisance of the Frohburgs, and the lion that of the Hapsburgs. How the cameo came into the hands of Count Ludwig can only be conjectured. Dr. Oeri is of opinion—and there is nothing improbable in the supposition—that the onyx was brought from Constantinople by Orlieb von Frohburg, who was Bishop of Basle from 1137 to 1164, a trusted friend of Konrad III. and Friedrich I., and took part in the Second Crusade. The later history of the gem is obscure, nor can it be ascertained for certain how it came into possession of the Canton of Schaffhausen. No mention of it in the communal "Treasure Book" can be found earlier than 1619, when it appears in a list of objects worthy of being preserved in the vaults of the Stadthaus. But there is a tradition that the onyx was part of the loot made at "the glorious victory of Grandson" by the Schaffhausen contingent of the confederate forces. This is likely enough, or if not at Grandson, then at Morat or Nancy, by them or some of their allies, for the talisman must have been the highly-prized possession of a royal or knightly owner, and only as spoil of war is it likely to have been acquired by a Swiss canton. When the French "redeemed" and robbed the country in 1798 the onyx narrowly missed falling into their hands. It was saved from the depredations of Rapinat, the most rapacious of the commissioners who followed in the wake of the French army, and whose memory is still detested in Switzerland, by Johann Müller, the historian. "The Burgundy relic," he wrote to his brother, "is safe in my desk. It is to be hoped Rapinat will come no more. I should like to steal it." And so, probably, would most antiquaries—or buy it. But the Schaffhausen onyx is now too well guarded to be stolen, and too rich in associations to be sold, even by a thrifty Swiss canton.

### GENERAL.

**Mr. C. H. Cooke, F.S.A.**, has been awarded the thanks of the National Lifeboat Institution, in acknowledgment of his valuable services, during the past twenty-five years, in building, from his own designs and specifications, two hundred and sixty-five lifeboat houses on various parts of the coasts of the United Kingdom.

**Mr. W. J. Boys**, Borough Surveyor of Walsall, died suddenly from apoplexy on Thursday in last week.

**Mr. G. J. Ferguson** has made a report on the condition of the dilapidated parish church of Ormside. The earliest trace of a church there was found to have been built fifty years later than the Norman Conquest, the plan of which edifice could be distinctly followed.

**Mr. Ruskin**, it is understood, has, in compliance with the request of his friends agreed to again accept the Slade Professorship at Oxford, and to deliver the six lectures as stipulated in the conditions of the office.

**Mr. A. T. Walmisley, C.E.**, will commence a course of eight weekly lectures in the hall of the Society of Engineers on January 8, upon Land Surveying and Levelling. The course is comprehensive and useful.

**A Donation** of 2,000*l.* has been received from Messrs. M. & J. C. Williams towards the erection of the transept of Truro Cathedral. Mr. Pearson recommends that the work should be undertaken at once. The cost will be about 6,000*l.*

**Canon Gregory** has appealed to the public for subscriptions towards completing the English church at Rome. The funds in hand are sufficient to carry the walls up to the wall plate, but nothing will be left for the roof and fittings.

**Ryburgh Church**, Fakenham, has been lighted by coronæ and pendants which are fitted with the patent three-wick Hesperus lamp of Messrs. Jones & Willis.

**A Church** is to be built at Stainland from the designs of Mr. Barber, of Halifax, who has been appointed architect.

**Christmas and New Year's Cards.**—In the remarks on cards which appeared in *The Architect* of December 9, the name of another firm was substituted for Messrs. Hildesheimer & Co., whose productions have been signally successful.

**The Washington Monument** has reached a height of 340 feet. During the year 90 feet have been added. It is expected to be completed in 1884, when the entire height will be 550 feet.

**A Memorial Chapel**, school, and manse are to be erected at Epworth, the birthplace of John and Charles Wesley, at an estimated outlay of 7,000*l.*

**Plans showing improved entrances and exits to the Criterion Theatre** have been submitted to the Board of Works. It is proposed to have open areas on two sides at least of the building, the adjoining property having been acquired for the purpose.

**A Steam Tramway** connecting the suburb of Aston with Birmingham has been completed.

**The Archway** discovered in the south transept of Northallerton church, and supposed to be the entrance to the south aisle of an original broader chancel, proves to be a niche for an early stone altar by a piscina being discovered at the right side of the niche, which still bears traces of early English painting.

**A Parsonage** is about to be erected in connection with the district of St. James the Less, Ancoats, Manchester. A site has been selected adjoining the church.

**A Meeting** has been held in Cork, at which it was decided to hold an exhibition of manufactures, arts, and industries next year. A similar exhibition was held in 1852, and was successful.

**The Council of the Surrey Archaeological Society** have passed the following resolution:—"That the Council of the Surrey Archaeological Society, having heard with great regret that there is a probability of the destruction of the ancient Archiepiscopal Palace at Croydon, earnestly deprecate any injury being done to such a venerable monument of antiquity, and are desirous of being placed in communication with any person, or bodies of persons, who are taking active steps with the object of preserving this interesting building."

**The Design** of Mr. Charles Barry for roofing the central space of the Royal Exchange has been selected by the Gresham Sub-Committee.

**A Collection** of Celtic antiquities, formed by the late Mr. G. A. Robinson, has been presented to the Museum of the Yorkshire Philosophical Society, York.

**The Council** of the Huddersfield Technical School and Mechanics' Institute intend to hold a Fine Art and Industrial Exhibition during the summer of 1883, in connection with the opening of their new building in June next.

**Works** have been begun at Langley Castle with a view to rendering part of the castle fit for habitation.

**The subscription** at New York for the pedestal to the statue of Liberty now reaches \$62,210.

**The "Nottingham Guardian"** says that a committee have decided to recommend the Town Council to increase the Borough Surveyor's salary from 400*l.* to 600*l.* per annum. Mr. Brown was formerly Assistant Surveyor under Mr. M. O. Tarbotton.

**The Marble Head of Apollo**, which formerly belonged to Sir Richard Worsley, and was lately found in a shed at St. Lawrence, Ventnor, has been presented to the British Museum by Mr. Pelham. The head has been measured by Mr. A. S. Murray, and has been found to agree exactly in its measurements with the Cyrene and the Choiseul-Gouffin heads of Apollo in the British Museum, and also with the head of the statue of Apollo at Athens.

**A Volume** of allegorical drawings by Jean Cousin, showing the struggle between Man and Fortune, has been reproduced in Paris, under the superintendence of M. Eugène Muntz. It contains about two hundred designs, which have hitherto lain unnoticed in the library of the Institute.

**A Discovery** has lately been made in Pompeii which is well worth noting. Not many days have passed since a quadri-valve speculum of great beauty and in a high state of preservation was turned up. By competent persons who have examined it the mechanism of it is said to be very ingenious. In the National Museum of Naples there are now three Pompeian specula—one a bi-valve, one a tri-valve, and the one just found, a quadri-valve. The last is said to be of a construction so uniform and well proportioned, admitting the expansion of the valves, as to be superior to modern construction. It is noted as a curious fact that in its various dimensions it observes constantly the centimetric measurement.

**Corean Houses.**—A report has been prepared by Mr. Ashton, who accompanied the British squadron to the Corean ports. The town of Wönsan contains about 2,000 houses. The houses consist of a kitchen with an earthen floor, and two or three other rooms, seldom more than 8 ft. or 9 ft. square, with ceilings about 6 ft. or 7 ft. in height. They are of one storey only, with thatched roofs, the eaves being only 6 ft. or 7 ft. from the ground. The framework is of wood, the interstices being filled with woven reeds plastered with clay. The floors are matted, and carpets of thick oilpaper are sometimes seen. There is no furniture.
